# 第二十二章 电磁场协变量子化新方案

本章主要从传统电磁场势量子化方案出发导出电磁场场强协变量子化新方案，主要体现其导出过程，没有体现其完整性，主要是为了验证新协变量子化程式的正确性。后面章节会在两种表象下分别直接给出其完整的场强协变量子化方案。

## 1 电磁场方程的规范势分析 [23, 25]

### 1.1 有质量电磁场方程的规范势描述

$$\text{定理1.1.1.1.} \quad \begin{cases} \nabla \cdot \vec{E} = m^2\phi - \rho, \nabla \times \vec{E} = -\partial_t \vec{B} \\ \nabla \cdot \vec{B} = 0, \nabla \times \vec{B} = m^2 \vec{A} - \vec{J} + \partial_t \vec{E} \\ \nabla \cdot \vec{J} + \partial_t \rho = 0 \\ \vec{E} = -\partial_t \vec{A} - \nabla \phi, \vec{B} = \nabla \times \vec{A} \end{cases} \Leftrightarrow \begin{cases} (\nabla^2 - \partial_t^2 - m^2)\phi = \rho \\ (\nabla^2 - \partial_t^2 - m^2)\vec{A} = \vec{J} \\ \nabla \cdot \vec{A} + \partial_t \phi = 0 \\ \vec{E} = -\partial_t \vec{A} - \nabla \phi, \vec{B} = \nabla \times \vec{A} \end{cases}$$

### 1.2 电磁场方程的一般规范势描述

从上可知, 电磁场方程和辐射规范势方程、约束条件与协变对易关系是相容的, 且标势 $\tilde{\phi}(x)$ 和源 $J_a(x)$ 相对于电磁场是c-数, 不是算子。从这个意义上知标势即静电场不可量子化, 因为它连算子都不是。

从上可知, 电磁场方程约束条件与协变对易关系不相容的, 如何合理重新选择额外引入的 $\phi$ 的对易关系去解决这个问题? 虽然传统是把约束条件不看作算符方程, 作为对物理态的挑选, 但这样做不自然, 所以有必要寻求更合理的势协变方案。

### 1.6.3 两种规范势方程和对易关系联立后的等价性

$$\left\{ \begin{array}{l} \nabla^2 \tilde{A} - \partial_t^2 \tilde{A} = \vec{J} + \partial_t \nabla \tilde{\phi}, \nabla^2 \tilde{\phi} = \rho \\ \vec{E} = -\partial_t \tilde{A} - \nabla \tilde{\phi}, \vec{B} = \nabla \times \tilde{A} \\ [\tilde{A}_i(x), \tilde{A}_j(x')] = i(\delta_{ij} - \frac{\partial_i \partial_j}{\nabla^2}) \Delta(x - x') \\ [\tilde{A}_i(x), \tilde{\phi}(x')] = [\tilde{\phi}(x), \tilde{\phi}(x')] = 0 \\ \phi(x) = \tilde{\phi}(x) + \partial_t \frac{\partial_t}{\nabla^2} \phi(x) \\ A_i(x) = \tilde{A}_i(x) - \frac{\partial_i \partial_t}{\nabla^2} \phi(x), A_0(x) = i\phi(x) \\ [\phi(x), \phi(x')] = -i(1 + \frac{\lambda-1}{\lambda} \frac{\nabla^2}{\square + i\epsilon}) \Delta(x - x') \\ [\tilde{A}_i(x), \phi(x')] = -i \frac{\partial_i \partial_t}{\nabla^2} \Delta(x - x'), [\tilde{\phi}(x), \phi(x')] = 0 \end{array} \right. \Leftrightarrow \left\{ \begin{array}{l} \nabla^2 \vec{A} - \partial_t^2 \vec{A} = \vec{J}, \nabla^2 \phi - \partial_t^2 \phi = \rho \\ \vec{E} = -\partial_t \vec{A} - \nabla \phi, \vec{B} = \nabla \times \vec{A} \\ [A_a(x), A_b(x')] = i(\delta_{ab} - \frac{\lambda-1}{\lambda} \frac{\partial_a \partial_b}{\square + i\epsilon}) \Delta(x - x') \\ \tilde{A}_i(x) = A_i(x) + \frac{\partial_i \partial_t}{\nabla^2} \phi(x) \\ \tilde{\phi}(x) = \phi(x) - \partial_t \frac{\partial_t}{\nabla^2} \phi(x) \\ \phi(x) = -iA_0(x) \end{array} \right.$$

### 1.6.4 规范条件与对易关系的不相容性

推论1.6.2.

$$\left\{ \begin{array}{l} \nabla \cdot \tilde{A}(x) = 0 \\ [\tilde{A}_i(x), \phi(x')] = -i \frac{\partial_i \partial_t}{\nabla^2} \Delta(x - x') \\ A_i(x) = \tilde{A}_i(x) - \frac{\partial_i \partial_t}{\nabla^2} \phi(x) \\ A_0(x) = i\phi(x) \end{array} \right. \text{不相容。} \Leftrightarrow \left\{ \begin{array}{l} \partial^a A_a(x) = 0 \\ [A_i(x) + \frac{\partial_i \partial_t}{\nabla^2} \phi(x), \phi(x')] = -i \frac{\partial_i \partial_t}{\nabla^2} \Delta(x - x') \\ \tilde{A}_i(x) = A_i(x) + \frac{\partial_i \partial_t}{\nabla^2} \phi(x) \\ \phi(x) = -iA_0(x) \end{array} \right. \text{不相容。}$$

从上可知, 规范条件与某个对易关系的不相容。不相容性本质来源于非物理引入的 $\phi$ 。

### 1.6.5 规范条件与对易关系不相容性的解决

推论1.6.3.

$$\left\{ \begin{array}{l} \nabla^2 \tilde{A} - \partial_t^2 \tilde{A} = \vec{J} + \partial_t \nabla \tilde{\phi}, \nabla^2 \tilde{\phi} = \rho \\ \vec{E} = -\partial_t \tilde{A} - \nabla \tilde{\phi}, \vec{B} = \nabla \times \tilde{A} \\ \langle |\nabla \cdot \tilde{A}| \rangle = 0 \\ [\tilde{A}_i(x), \tilde{A}_j(x')] = i(\delta_{ij} - \frac{\partial_i \partial_j}{\nabla^2}) \Delta(x - x') \\ [\tilde{A}_i(x), \tilde{\phi}(x')] = [\tilde{\phi}(x), \tilde{\phi}(x')] = 0 \\ \phi(x) = \tilde{\phi}(x) + \partial_t \frac{\partial_t}{\nabla^2} \phi(x) \\ A_i(x) = \tilde{A}_i(x) - \frac{\partial_i \partial_t}{\nabla^2} \phi(x), A_0(x) = i\phi(x) \\ [\phi(x), \phi(x')] = -i(1 + \frac{\lambda-1}{\lambda} \frac{\nabla^2}{\square + i\epsilon}) \Delta(x - x') \\ [\tilde{A}_i(x), \phi(x')] = -i \frac{\partial_i \partial_t}{\nabla^2} \Delta(x - x'), [\tilde{\phi}(x), \phi(x')] = 0 \end{array} \right. \Leftrightarrow \left\{ \begin{array}{l} \nabla^2 \vec{A} - \partial_t^2 \vec{A} = \vec{J}, \nabla^2 \phi - \partial_t^2 \phi = \rho \\ \vec{E} = -\partial_t \vec{A} - \nabla \phi, \vec{B} = \nabla \times \vec{A} \\ \langle |\nabla \cdot \vec{A} + \partial_t \phi| \rangle = 0 \\ [A_a(x), A_b(x')] = i(\delta_{ab} - \frac{\lambda-1}{\lambda} \frac{\partial_a \partial_b}{\square + i\epsilon}) \Delta(x - x') \\ \tilde{A}_i(x) = A_i(x) + \frac{\partial_i \partial_t}{\nabla^2} \phi(x) \\ \tilde{\phi}(x) = \phi(x) - \partial_t \frac{\partial_t}{\nabla^2} \phi(x) \\ \phi(x) = -iA_0(x) \end{array} \right.$$

只要将规范条件不再看作算符方程, 而是看作对物理态的选择, 则方程和对易关系就完全相容, 不再出现矛盾, 其中 $\lambda = 1$ 是费曼规范,  $\lambda = \infty$ 是朗道规范。

## 2.3 电磁场方程势解的分析与探讨

$$\text{定义2.3.1. } \partial^a F_{ab} = 0, F_{ab} = \partial_a A_b - \partial_b A_a$$

如果得到一个解  $A_a$ , 那么  $A_a + \partial_a \theta$  也是它的另一个解。由于  $\theta$  的任意性, 电磁场方程有无穷多组的势解。但是这无穷多的势解只对应  $F_{ab}$  的同一个解。如果固定规范则相当于从无穷多势解中选取一组解  $A_a$ , 这样势解就没有冗余解了, 并且这时它与场强解  $F_{ab}$  可以一一对应。考虑解的完备性, 对于完备场强解  $F_{ab}$ , 可以由一个不完备的势解  $A_a$  完全得到, 而且这个不完备的势解  $A_a$  也可以由完备场强解  $F_{ab}$  完全确定得到。这时完备场强解  $F_{ab}$  与不完备的势解  $A_a$  一一对应, 并且这时电磁场自旋方程与带规范条件的电磁场势方程完全等价。

### 3.5 辐射规范下势和复场强正则对易-反对易关系汇总分析

从电磁场协变量子化方案可知, 只有  $\delta_1 \pm \delta_2 = 0$  时, 才满足微观因果性, 同时只有  $\delta_1, \delta_2 \geq 0$  时, 才满足几率非负性。所以数学上八种协变对易或反对易方案中, 物理上合理的只有一种: 即  $\delta_1 = \delta_2 = 1$ , 且满足对易关系。其实还有两种, 即  $\delta_1 = \delta_2 = 0$ , 且满足对易或反对易关系, 就是经典情形。

推论3.5.8.

$$\begin{cases} \{a_\sigma(\vec{p}, -\varsigma), a_{\sigma'}^+(\vec{p}', -\varsigma)\} = \kappa(-1)^{\sigma+1} \delta_{\sigma\sigma'} \delta^3(\vec{p} - \vec{p}') \\ \{a_\sigma(\vec{p}, -\varsigma), a_{\sigma'}(\vec{p}', -\varsigma)\} = 0 \\ \{a_\sigma^+(\vec{p}, -\varsigma), a_{\sigma'}^+(\vec{p}', -\varsigma)\} = 0 \end{cases} \Leftrightarrow \begin{cases} \{\Psi_i(\vec{r}, t), \Psi_j^+(\vec{r}', t)\} = i\kappa \gamma^k_{ij} \partial_k \delta^3(\vec{r} - \vec{r}') \\ \{\Psi_i(\vec{r}, t), \Psi_j(\vec{r}', t)\} = 0 \\ \{\Psi_i^+(\vec{r}, t), \Psi_j^+(\vec{r}', t)\} = 0 \end{cases}$$

无论 $\kappa$ 为何值，均满足微观因果性但违反几率非负性，所以是非物理的。

[⇕] [⇕]

$$\text{推论3.6.3.} \begin{cases} [\Psi_{\alpha_\varsigma}(x), \Psi_{\alpha'_\varsigma}^+(x')] = i\sigma_{\alpha_\varsigma \alpha'_\varsigma}^{ab} \partial_a \partial_b \Delta(x - x') \\ [\Psi_{\alpha_\varsigma}(x), \Psi_{\beta_\varsigma}(x')] = 0 \\ [\Psi_{\alpha'_\varsigma}^+(x), \Psi_{\beta'_\varsigma}^+(x')] = 0 \end{cases} \Leftrightarrow \begin{cases} [\Psi_{\alpha_\varsigma}(\vec{r}, t), \Psi_{\alpha'_\varsigma}^+(\vec{r}', t)] = \varsigma \varepsilon^k_{\alpha_\varsigma \alpha'_\varsigma} \partial_k \delta^3(\vec{r} - \vec{r}') \\ [\Psi_{\alpha_\varsigma}(\vec{r}, t), \Psi_{\beta_\varsigma}(\vec{r}', t)] = 0 \\ [\Psi_{\alpha'_\varsigma}^+(\vec{r}, t), \Psi_{\beta'_\varsigma}^+(\vec{r}', t)] = 0 \end{cases}$$

电磁场只有这一种情形，才同时满足微观因果性和几率非负性，才是物理的、正确的。

## 4.6 复场强 $\Psi(\vec{r}, t)$ 算符的量子标积方程(是否最基本?)

定义4.6.1.  $\langle\eta|\dot{\Psi}(\vec{r}, t) + i[\Psi(\vec{r}, t), H]|\varphi\rangle = 0, \langle\eta|\nabla \cdot \Psi(\vec{r}, t)|\varphi\rangle = 0$

定义4.6.2.  $\langle\eta|\partial_a\Psi(\vec{r}, t) - i[\Psi(\vec{r}, t), P_a]|\varphi\rangle = 0 \Leftrightarrow \langle\eta|[P_a, \Psi(\vec{r}, t)] - i\partial_a\Psi(\vec{r}, t)|\varphi\rangle = 0$

它有两个解, 一解是个是算符方程 $\dot{\Psi}(\vec{r}, t) = -i[\Psi(\vec{r}, t), H], \nabla \cdot \Psi(\vec{r}, t) = 0$ 决定的解。另一个解是对所有物理态都是它的真空态的解:  $\langle\eta|\Psi(\vec{r}, t)|\varphi\rangle = 0$ , 所以合起来就是完整的傅里叶展开解。

以上定理把协变性和非协变性、辐射规范和洛仑兹规范统一表述在一起了，十分美妙。尤其第二项明显描述电子之间的排斥自作用能，大于零。同时完全可以按场量进行微扰展开，而无须用电磁势展开，这样整个展开过程都是物理的，没有非物理因素，且规范无关。是否这样可以避免无穷大？无须再重整化？还需进一步探索。第三项是全微分项，可以去掉(?)，此项十分微妙、美妙，它是洛仑兹协变性的保障，也是统一描述的关键之所在。

- 3、根据得到的协变对易规则，进一步得到福克表象的对易规则。
- 4、根据量子场论中能量动量的普遍福克表示，反推出能量动量算符，并验证它们是否是真正的能量动量，进一步确定自旋表示，角动量表示。
- 5、根据能量算符，重新得到与经典方程形式一样的量子算符方程，并验证量子彭加莱代数是否成立。
- 6、考虑相互作用，进行散射矩阵计算等，并与实验对比。
- 7、向高维空间推广，向弦理论推广
- 8、如何用场传播子代替势传播子
- 9、把弦理论看作势理论，那么其对应的场理论是什么？

从上式可知，只有 $\delta_1 \pm \delta_2 = 0$ 时，才满足微观因果性，同时只有 $\delta_1, \delta_2 \geq 0$ 时，才满足几率非负性。所以数学上八种协变对易或反对易方案中，物理上合理的只有一种：即 $\delta_1 = \delta_2 = 1$ ，且满足对易关系。其实还有两种，即 $\delta_1 = \delta_2 = 0$ ，且满足对易或反对易关系，就是经典情形。

从上式可知, 只有 $\delta_1 - \pm\delta_2 = 0$ 时, 才满足微观因果性, 同时只有 $\delta_1, \delta_2 \geq 0$ 时, 才满足几率非负性。所以数学上八种协变对易或反对易方案中, 物理上合理的只有一种: 即 $\delta_1 = \delta_2 = 1$ , 且满足反对易关系。其实还有两种, 即 $\delta_1 = \delta_2 = 0$ , 且满足对易或反对易关系, 就是经典情形。

从上式可知，只有  $\delta_1 \pm \delta_2 = 0$  时，才满足微观因果性，同时只有  $\delta_1, \delta_2 \geq 0$  时，才满足几率非负性。所以数学上八种协变对易或反对易方案中，物理上合理的只有一种：即  $\delta_1 = \delta_2 = 1$ ，且满足对易关系。其实还有两种，即  $\delta_1 = \delta_2 = 0$ ，且满足对易或反对易关系，就是经典情形。

从上式可知，只有 $\delta_1 \pm \delta_2 = 0$ 时，才满足微观因果性，同时只有 $\delta_1, \delta_2 \geq 0$ 时，才满足几率非负性。所以数学上八种协变对易或反对易方案中，物理上合理的只有一种：即 $\delta_1 = \delta_2 = 1$ ，且满足对易关系。其实还有两种，即 $\delta_1 = \delta_2 = 0$ ，且满足对易或反对易关系，就是经典情形。

从上式可知，只有 $\delta_1 - \pm \delta_2 = 0$ 时，才满足微观因果性，同时只有 $\delta_1, \delta_2 \geq 0$ 时，才满足几率非负性。所以数学上八种协变对易或反对易方案中，物理上合理的只有一种：即 $\delta_1 = \delta_2 = 1$ ，且满足反对易关系。其实还有两种，即 $\delta_1 = \delta_2 = 0$ ，且满足对易或反对易关系，就是经典情形。

从上式可知, 只有  $\delta_1 \pm \delta_2 = 0$  时, 才满足微观因果性, 同时只有  $\delta_1, \delta_2 \geq 0$  时, 才满足几率非负性。所以数学上八种协变对易或反对易方案中, 物理上合理的只有一种: 即  $\delta_1 = \delta_2 = 1$ , 且满足对易关系。其实还有两种, 即  $\delta_1 = \delta_2 = 0$ , 且满足对易或反对易关系, 就是经典情形。

## 第二十四章 s-自旋方程的协变量子化方案

自我评述：在本章终于按统一的方式对所有无质量自旋粒子建立了相应的量子场论。无需知道哈密顿量，就可以按统一的新程式对各种自旋粒子进行了量子化，给出了统一的量子化对易规则和能量动量算符形式，给出了部分量子彭加莱代数。但角动量算符只取得部分成功，没有彻底解决，仍需努力。

从上式可知，只有 $\delta_1 \pm (-1)^{-2s} \delta_2 = 0$ 时，才满足微观因果性，同时只有 $\delta_1, \delta_2 \geq 0$ 时，才满足几率非负性。所以数学上八种协变对易或反对易方案中，物理上合理的只有一种：即 $\delta_1 = \delta_2 = 1$  (如果不是1可以归一化)，且对于玻色子满足对易关系；对于费米子满足反对易关系。其实还有两种，即 $\delta_1 = \delta_2 = 0$ ，且满足对易或反对易关系，就是经典情形。

## 8 Penrose全对称方程的协变量子化

自我评述：由于Penrose全对称方程与自旋方程完全等价，所以Penrose全对称方程的协变量子化原则上也已成功完成，只需从自旋方程等价转换过来即可。但直接从Penrose全对称方程出发可以提供一种全新的解法，对有质量粒子的协变量子化有启示作用。由于详细结论已经由自旋方程方法全部得到，所以下面只给出Penrose全对称方程解法的精髓，不再求全，是自旋方程方法的补充。

自我评述：以上的证法不再基于等时对易规则，直接基于协变对易规则，看似更难了，其实是更简单了，因为不要求出复杂的等时对易规则(参看下一节)，即使求出也难于使用，而协变对易规则本身已知且很有规律，也可以分解为自旋基的乘积，整个证明过程基本上只依赖于自旋基的性质，没有复杂的计算。这个证明方法可以推广到其他所有类似情况，从而简化所有类似的证明。其他的几个对易括号也可按同样的方法求出，不再列出。

# 第二十五章 有质量复粒子的场协变量子化方案

自我评述：本章和下一章描述的有质量复粒子，正反粒子不同，数学本质上是复函数，区别于马约拉纳粒子；马约拉纳粒子，正反粒子相同，数学本质上是实函数，后面章节会详细讨论。有质量粒子方案采用与无质量粒子方案相反的步骤，先证明一般自旋粒子情形，再分别研究自旋 $-\frac{1}{2}, 1, \frac{3}{2}, 2$ 的特殊情形。这样做的理由：一是协变量子化新方案经过之前的研究，总体上已经比较明确。二是先证明一般情形，后面的特殊情形就不需再做证明，省去很多麻烦与篇幅，内容更紧凑，也可以更专注于物理。为了证明一般情形，必须先研究Dirac方程自旋基的性质，所以本章前半部分主要是研究Dirac方程自旋基的内容，后半部分才是一般自旋粒子情形的证明。但Dirac方程完整的协变量子化方案还是放在后面章节去研究。在本章按统一的方式对所有有质量自旋复粒子建立了相应的量子场论。与无质量粒子一样，也无需知道哈密顿量，就可以按统一的新程式对各种有质量自旋粒子进行了量子化，给出了统一的量子化对易规则和能量动量算符形式，给出了部分量子彭加莱代数。与无质量粒子一样，角动量算符也只取得部分成功，没有彻底解决，仍需努力。

自我评述：从上可以看出Dirac方程的平面波解有多种等价的表达形式。自旋基的直观选取有好多种，本质上有无限种选法，但它们本质上也是表象等价的，差一个么正变换。无论选取哪一个基，物理是等价一致的。但选的好，计算就方便。但要注意对于无质量粒子，以上几种表达不一定是等价的。

### 1.1.2 非归一化Dirac自旋基(适合任意质量情形)

推论1.1.2.  $(\gamma^a \partial_a + m)\psi(\vec{r}, t) = 0, \gamma^a = (\sigma \otimes \sigma_y, \varsigma I \otimes \sigma_x)$

$$\Leftrightarrow \psi(\vec{r}, t) = \frac{1}{(2\pi)^{3/2}} \int_{\vec{p}=-\infty}^{+\infty} \frac{1}{2E} [a(\vec{p}, E)e^{i(\vec{p}\cdot\vec{r}-Et)} + a(-\vec{p}, -E)e^{-i(\vec{p}\cdot\vec{r}-Et)}] d^3\vec{p}$$

$$a(\vec{p}, E) = (-i\gamma^a p_a + m) \begin{bmatrix} \varphi(\vec{p}) \\ 0 \end{bmatrix}, a(-\vec{p}, -E) = (-i\gamma^a p_a - m) \begin{bmatrix} \eta(\vec{p}) \\ 0 \end{bmatrix}$$

$\gamma^a$ 本章采用以上约定，另有说明除外。

$$\text{定义1.1.1. } X(\vec{p}, \frac{\kappa}{2}) := (-i\gamma^a p_a + m) \begin{bmatrix} \lambda(\hat{p}, \frac{\kappa}{2}) \\ 0 \end{bmatrix}, Y(\vec{p}, \frac{\kappa}{2}) := (-i\gamma^a p_a - m) \begin{bmatrix} \lambda(\hat{p}, \frac{\kappa}{2}) \\ 0 \end{bmatrix}$$

$$\text{推论1.1.3. } X(\vec{p}, \frac{\kappa}{2}) = \lambda(\hat{p}, \frac{\kappa}{2}) \otimes \begin{bmatrix} m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}, Y(\vec{p}, \frac{\kappa}{2}) = \lambda(\hat{p}, \frac{\kappa}{2}) \otimes \begin{bmatrix} -m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}$$

### 1.1.3 归一化无质量Dirac自旋基

$$\text{定义1.1.2. } X(\vec{p}, \frac{\kappa}{2}) = Y(\vec{p}, \frac{\kappa}{2}) := -i\gamma^a p_a \begin{bmatrix} \lambda(\hat{p}, \frac{\kappa}{2}) \\ 0 \end{bmatrix}$$

$$\text{推论1.1.4. } X(\vec{p}, \frac{\kappa}{2}) = Y(\vec{p}, \frac{\kappa}{2}) = 2\varsigma|\vec{p}|\lambda(\hat{p}, \frac{\kappa}{2}) \otimes \begin{bmatrix} 0 \\ 1 \end{bmatrix}, X(\vec{p}, -\frac{\kappa}{2}) = Y(\vec{p}, -\frac{\kappa}{2}) = 0$$

$$\text{推论1.1.5. } \bar{X}(\vec{p}, \frac{\kappa}{2}) = \bar{Y}(\vec{p}, \frac{\kappa}{2}) = \lambda(\hat{p}, \frac{\kappa}{2}) \otimes \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \bar{X}(\vec{p}, -\frac{\kappa}{2}) = \bar{Y}(\vec{p}, -\frac{\kappa}{2}) = 0$$

自我评述：直接用 $m \rightarrow 0$ 得到无质量情形，并不全面，这只是一组解，还有另一组解。事实上无质量情形需要重新分析。

### 1.1.4 Dirac电荷基的定义

$$\text{定义1.1.3. } \mu(\vec{p}, \frac{\kappa}{2}) := \begin{bmatrix} \sqrt{\frac{E-\kappa\varsigma|\vec{p}|}{2m}} \\ \varsigma\sqrt{\frac{E+\kappa\varsigma|\vec{p}|}{2m}} \end{bmatrix}, \nu(\vec{p}, \frac{\kappa}{2}) := \begin{bmatrix} -\sqrt{\frac{E-\kappa\varsigma|\vec{p}|}{2m}} \\ \varsigma\sqrt{\frac{E+\kappa\varsigma|\vec{p}|}{2m}} \end{bmatrix}$$

$$\text{推论1.1.6. } \mu(\vec{p}, \frac{\kappa}{2}) := \frac{1}{\sqrt{2}} \begin{bmatrix} \sqrt{\frac{m}{E+\kappa\varsigma|\vec{p}|}} \\ \varsigma\sqrt{\frac{E+\kappa\varsigma|\vec{p}|}{m}} \end{bmatrix}, \nu(\vec{p}, \frac{\kappa}{2}) := \frac{1}{\sqrt{2}} \begin{bmatrix} -\sqrt{\frac{m}{E+\kappa\varsigma|\vec{p}|}} \\ \varsigma\sqrt{\frac{E+\kappa\varsigma|\vec{p}|}{m}} \end{bmatrix}$$

$$\text{定义1.1.4. } \tilde{\mu}(\vec{p}, \frac{\kappa}{2}) := \begin{bmatrix} \sqrt{\frac{E-\kappa\varsigma|\vec{p}|}{2E}} \\ \varsigma\sqrt{\frac{E+\kappa\varsigma|\vec{p}|}{2E}} \end{bmatrix}, \tilde{\nu}(\vec{p}, \frac{\kappa}{2}) := \begin{bmatrix} -\sqrt{\frac{E-\kappa\varsigma|\vec{p}|}{2E}} \\ \varsigma\sqrt{\frac{E+\kappa\varsigma|\vec{p}|}{2E}} \end{bmatrix}$$

$$\text{推论1.1.7. } \tilde{\mu}(\vec{p}, \frac{\kappa}{2}) = \sqrt{\frac{m}{E}}\mu(\vec{p}, \frac{\kappa}{2}), \tilde{\nu}(\vec{p}, \frac{\kappa}{2}) = \sqrt{\frac{m}{E}}\nu(\vec{p}, \frac{\kappa}{2})$$

自我评述：为何称为电荷基跟后面的具体分析有关，也许这样称呼并不合适。

### 1.1.5 归一化Dirac自旋基

$$\text{推论1.1.8. } u(\vec{p}, \frac{\kappa}{2}) = \frac{\lambda(\hat{p}, \frac{\kappa}{2})}{\sqrt{2m(E+\kappa|\vec{p}|)}} \otimes \begin{bmatrix} m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}, v(\vec{p}, \frac{\kappa}{2}) = \frac{\lambda(\hat{p}, \frac{\kappa}{2})}{\sqrt{2m(E+\kappa|\vec{p}|)}} \otimes \begin{bmatrix} -m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}$$

$$\text{推论1.1.9. } u(\vec{p}, \frac{\kappa}{2}) = \lambda(\hat{p}, \frac{\kappa}{2}) \otimes \mu(\vec{p}, \frac{\kappa}{2}), v(\vec{p}, \frac{\kappa}{2}) = \lambda(\hat{p}, \frac{\kappa}{2}) \otimes \nu(\vec{p}, \frac{\kappa}{2})$$

$$\text{推论1.1.10. } u(\vec{p}, h) = -\varsigma\gamma_5 v(\vec{p}, h), v(\vec{p}, h) = -\varsigma\gamma_5 u(\vec{p}, h), h = -\frac{1}{2}, \frac{1}{2}$$

$$\text{定理1.1.3. } (i\gamma^a p_a + m)u(\vec{p}, h) = 0, (i\gamma^a p_a - m)v(\vec{p}, h) = 0, \gamma^a = (\sigma \otimes \sigma_y, \varsigma I \otimes \sigma_x, \varsigma I \otimes \sigma_z)$$

$$\text{定义1.1.5. } \tilde{u}(\vec{p}, \frac{\kappa}{2}) := \sqrt{\frac{m}{E}} u(\vec{p}, \frac{\kappa}{2}), \tilde{v}(\vec{p}, \frac{\kappa}{2}) := \sqrt{\frac{m}{E}} v(\vec{p}, \frac{\kappa}{2})$$

$$\text{推论1.1.11. } \tilde{u}(\vec{p}, \frac{\kappa}{2}) = \frac{\lambda(\hat{p}, \frac{\kappa}{2})}{\sqrt{2E(E+\kappa|\vec{p}|)}} \otimes \begin{bmatrix} m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}, \tilde{v}(\vec{p}, \frac{\kappa}{2}) = \frac{\lambda(\hat{p}, \frac{\kappa}{2})}{\sqrt{2E(E+\kappa|\vec{p}|)}} \otimes \begin{bmatrix} -m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}$$

$$\text{推论1.1.12. } \tilde{u}(\vec{p}, \frac{\kappa}{2}; m=0) = \frac{\lambda(\hat{p}, \frac{\kappa}{2})}{\sqrt{2E(E+\kappa|\vec{p}|)}} \otimes \begin{bmatrix} m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}, \tilde{v}(\vec{p}, \frac{\kappa}{2}; m=0) = \frac{\lambda(\hat{p}, \frac{\kappa}{2})}{\sqrt{2E(E+\kappa|\vec{p}|)}} \otimes \begin{bmatrix} -m \\ \varsigma E + \kappa|\vec{p}| \end{bmatrix}$$

自我评述：为何定义两种归一化自旋基，与两种不同的归一化方式相对应。又为何如此选择自旋基主要理由有两点，一是分解为两个基的直积，可以简化很多计算；二是其中一个基选为螺旋度，可以充分利用之前的螺旋度分析成果，也可以大大简化计算。

$$\begin{aligned} \text{证明: } \hat{Q}(\vec{p})u(\vec{p}, \frac{\kappa}{2}) &= \frac{i\gamma^a p_a}{m} u(\vec{p}, \frac{\kappa}{2}) \\ &= (-\varsigma \frac{E}{m} I \otimes \sigma_x + i \frac{1}{m} \sigma \cdot \vec{p} \otimes \sigma_y) \lambda(\hat{p}, \frac{\kappa}{2}) \otimes \mu(\vec{p}, \frac{\kappa}{2}) = (I \otimes \frac{-\varsigma E \sigma_x + i\kappa|\vec{p}|\sigma_y}{m}) (\lambda(\hat{p}, \frac{\kappa}{2})) \otimes \mu(\vec{p}, \frac{\kappa}{2}) \\ &= -\lambda(\hat{p}, \frac{\kappa}{2}) \otimes \mu(\vec{p}, \frac{\kappa}{2}) = -u(\vec{p}, \frac{\kappa}{2}) \end{aligned} \quad \square$$

### 1.1.7 Dirac自旋基是自旋、螺旋度和电荷三个算符的共同本征态

性质1.1.1.

## 1.2 四维矢量自旋基的引入

自我评述：为何如此选择自旋基，与后面的具体分析相关，事实上我是在后面的具体分析中提炼出这个结果，然后放到这里进行必要的先行研究，从而使后面的章节可以更专注于物理本身。

$= C_k^{c+d} + C_k^{c+d+1} = C_{k+1}^{c+d+1}$  □

证明:  $\sum_{j=0}^{k-0-d} C_{0+j}^0 C_{k-0-j}^d = \sum_{j=0}^{k-d} C_j^0 C_{k-j}^d = \sum_{j=0}^{k-d} C_{k-j}^d = \sum_{j=d}^k C_j^d = C_{k+1}^{d+1} = C_{k+1}^{0+d+1}, c=0$  □

以上引理肯定是正确的，我大约一年前在书上看见过这个公式，是采用排列组合的方法证明的，但太抽象不够直观，难于看懂。现在我终于找到了以上直观且严格的方法证明了它(2023.10.02)，本质上是数学归纳法。以下是更简洁的证法，但不够严谨、有点含混，但能更能简单明白地看清证明的关键思路。

证明:  $\sum_{a+b=k} C_a^c C_b^d = \sum_{a+b=k} (C_a^c C_{b-1}^{d-1} + C_a^c C_{b-1}^d) = \sum_{a+b-1=k-1} (C_a^c C_{b-1}^{d-1} + C_a^c C_{b-1}^d) = C_k^{c+d} + C_k^{c+d} = C_{k+1}^{c+d+1}$  □

自我评述：以上的表达式与无质量粒子的平面波解形式十分相似，所以物理学本质上是有统一表述的，但要注意无质量粒子的平面波解不能通过以上有质量粒子的平面波解通过  $m \rightarrow 0$  得到，这说明无质量粒子与有质量粒子有本质的区别。

自我评述：以上的证法类似于Penrose方程情形，不再基于等时对易规则，直接基于协变对易规则进行计算，看似更难了，其实也是更简单了，因为等时对易规则不容易算出，即使算出了也难于使用，而协变对易规

则本身已知且很有规律，且可以分解为自旋基的乘积，从而变得简单了。整个证明过程基本上只依赖于自旋基的性质，没有高难度的复杂计算。以上给出了最难的三个对易括号的证明，其他的几个对易括号可容易证出，不再详细列出。事实上，等时对易规则是协变对易规则的特例，所以等时对易规则的证法也可以采用以上的证法(取 $t = t'$ 即可)。

$$\left\{ \begin{aligned} [\psi_{\lambda_\zeta \mu_\zeta \dots}(x), \psi_{\lambda'_\zeta \mu'_\zeta \dots}(x')]_{-2s+1} &= \frac{i}{2^{2s-1}} \frac{1}{[(2s)!]^2} \overbrace{[(m - \gamma^a \partial_a) \gamma^4]_{\{\lambda_\zeta (\lambda'_\zeta [(m - \gamma^b \partial_b) \gamma^4]_{\mu_\zeta \mu'_\zeta \dots})}}^{2s} \Delta(x - x') \\ [rest]_{-2s+1} &= 0 \end{aligned} \right.$$

$$\Leftrightarrow [a(\vec{p}, h), a^+(\vec{p}', h')]_{-2s+1} = \delta_{hh'} \delta^3(\vec{p} - \vec{p}'), [b(\vec{p}, h), b^+(\vec{p}', h')]_{-2s+1} = \delta_{hh'} \delta^3(\vec{p} - \vec{p}'), [rest]_{-2s+1} = 0$$

定理6.3.2.  $[\psi_{\lambda_\zeta \mu_\zeta \dots}(x), \psi_{\lambda'_\zeta \mu'_\zeta \dots}(x')]_{-2s+1} = 2im^{2s} \Lambda_{+\lambda_\zeta \mu_\zeta \dots \tau_\zeta \lambda'_\zeta \mu'_\zeta \dots \tau_\zeta}(-i\partial, s)$

# 第二十六章 有质量复粒子的势协变量子化方案

自我评述：本章换成势的角度描述有质量复粒子，复粒子正反粒子不同，数学本质上是复函数，区别于马约拉纳粒子；马约拉纳粒子，正反粒子相同，数学本质上是实函数，后面章节会详细讨论。有质量粒子方案采用与无质量粒子方案相反的步骤，先证明一般自旋粒子情形，再分别研究自旋 $-\frac{1}{2}, 1, \frac{3}{2}, 2$ 的特殊情形。这样做的理由：一是协变量子化新方案经过之前的研究，总体上已经比较明确。二是先证明一般情形，后面的特殊情形就不需再做证明，省去很多麻烦与篇幅，内容更紧凑，也可以更专注于物理。在本章按统一的方式对所有有质量自旋复粒子建立了相应势的量子场论。与无质量粒子一样，也无需知道哈密顿量，就可以按统一的新程式对各种有质量自旋粒子进行了量子化，给出了统一的量子化势对易规则和能量动量算符形式，给出了部分量子彭加莱代数。与无质量粒子一样，角动量算符也只取得部分成功，没有彻底解决，仍需努力。

## 1 Klein-Gordon方程的对易规则

### 1.1 有质量自旋-n的Bargmann-Wigner方程等价于Klein-Gordon方程<sup>[17, 19, 22]</sup>

定义1.1.1.  $\mathbb{X}_a = [im\gamma_a(\varsigma) - 2S_{ab}(e, \varsigma)\partial^b]C$ ,  $\mathbb{X}_a(p) = i[m\gamma_a(\varsigma) - 2S_{ab}(e, \varsigma)p^b]C$

$$\text{定理1.1.1.} \quad \left\{ \begin{array}{l} [\gamma^a(\varsigma)\partial_a + m]\psi_{[\lambda_\varsigma]\mu_\varsigma\eta_\varsigma\xi_\varsigma \dots}(x) = 0 \\ \psi_{[\lambda_\varsigma]\mu_\varsigma\eta_\varsigma\xi_\varsigma \dots}(x) \text{全对称} \end{array} \right. \Leftrightarrow \left\{ \begin{array}{l} (-\partial^c\partial_c + m^2)\underbrace{A_{ab\dots}}_n(x) = 0 \\ \delta^{ab}\underbrace{A_{ab\dots}}_n(x) = 0, \partial^a\underbrace{A_{ab\dots}}_n(x) = 0, \underbrace{A_{ab\dots}}_n(x) \text{全对称} \\ \psi_{[\lambda_\varsigma]\mu_\varsigma\eta_\varsigma\xi_\varsigma \dots}(x) = \frac{1}{2^n} \underbrace{\mathbb{X}_{\lambda_\varsigma\mu_\varsigma}^a \mathbb{X}_{\eta_\varsigma\xi_\varsigma}^b \dots}_n \cdot \underbrace{A_{ab\dots}}_n(x) \end{array} \right.$$

$$\psi_{[\lambda_\varsigma]\mu_\varsigma\eta_\varsigma\xi_\varsigma \dots}(\vec{r}, t) = \frac{1}{(2\pi)^{3/2}} \int_{\vec{p}=-\infty}^{+\infty} \sum_{h=-n}^{-n} E^{n-\frac{1}{2}} \sqrt{\frac{m}{E}}^{2n} [a(\vec{p}, h)\underbrace{U_{\lambda_\varsigma\mu_\varsigma \dots}}_n(\vec{p}, h)e^{ip \cdot x} + b^+(\vec{p}, h)\underbrace{V_{\lambda_\varsigma\mu_\varsigma \dots}}_n(\vec{p}, h)e^{-ip \cdot x}] d^3\vec{p}$$

$$\underbrace{A_{ab\dots}}_n(\vec{r}, t) = \frac{1}{(2\pi)^{3/2}} \int_{\vec{p}=-\infty}^{+\infty} \sum_{h=-n}^{-n} \frac{1}{\sqrt{2^n E}} [a(\vec{p}, h)\underbrace{\varepsilon_{ab\dots}}_n(\vec{p}, h)e^{ip \cdot x} + b^+(\vec{p}, h)\underbrace{\tilde{\varepsilon}_{ab\dots}}_n(\vec{p}, h)e^{-ip \cdot x}] d^3\vec{p}$$

自我评述：把各自的平面波解代入以上两个等价的方程，并利用傅立叶分量相等性便可容易得到以下两个推论。这好比上面的方程是宏观结构，而下面的方程是微观结构，是数学原子。

此步证明了  $n' = n$  时命题成立。

第四步：根据以上归纳法推理，命题成立，定理得证。  $\square$

以前只是靠直觉、猜测、试探和验证得到了这个定理，时隔两年多(2019-2022)我终于用数学归纳法严格证明了以上定理，看来长久坚持与持续不断的深入思考十分重要，有时候比兴趣更重要。这为完全证明 Behrends-Fronsdal 投影算子公式奠定了基础。

势A和场ψ的反对易关系都有两种等价表述方式，且互为前提和互为因果。既可以从势反对易关系推出一切，也可以从场反对易关系推出一切。这说明对于有质量粒子，势和场两种描述方案是完全等价的。并且可以从有质量粒子的对易规则推得与无质量粒子完全类似的反对易规则，反之则不行。

# 第二十七章 有质量实粒子的协变量子化方案

自我评述：有质量实粒子，即马约拉纳粒子，正反粒子相同，数学本质上完全可以由实函数描述，也可以用复函数描述，但必须满足马约拉纳条件。对于Bargmann-Wigner 方程或Dirac方程描述的粒子，一般来说既可以描述带荷的复粒子，也可以描述不带荷的马约拉纳粒子。两种情形的主对易规则形式一致，但其余对易或反对易括号，对带荷的复粒子一般为零；对不带荷的马约拉纳粒子，其余对易或反对易括号由主对易规则和马约拉纳条件自然得到，一般不为零。在以后章节一般只讨论复粒子情形，也只给出主对易规则，不再专门讨论马约拉纳粒子情形，若要得到马约拉纳粒子情形的量子场论，只需在复粒子情形加上马约拉纳条件即可自然得到。在本章按统一的方式对所有自旋的马约拉纳粒子建立了相应的量子场论。与复粒子一样，也无需知道哈密顿量，就可以按统一的新程式对各种有质量自旋粒子进行了量子化，给出了统一的场、势量子化对易规则和能量动量算符形式，给出了部分量子彭加莱代数。与复粒子一样，角动量算符也只取得部分成功，没有彻底解决，仍需努力，角动量算符问题是新量子化程式的一个亟待解决的难题。

从上面结论可知，为了保持势  $A_{ab \dots \tau_\zeta}$  的实性，参数  $\theta$  取 0 或  $\pi/2$  比较合适，但取 0 更简单。

# 第二十九章 自旋基和CG系数的数学分析

自我评述：本章对于各种自旋基进行了一般的数学分析和逻辑推演，发现自旋基之间变换关系的系数就是自旋耦合系统的CG系数，从而也提供了一种一般求解CG系数的新方法。这个新方法比传统的自旋耦合本征态的求解方法更直观、更具体、更简单，因为新方法完全是构造式的，并且选取的自旋基比传统的更一般、更普遍、更严谨，故而使用起来更方便、更有用，可能对彻底理清量子纠缠能提供一定的帮助。

以上定理可以用全对称的表象变换方法可以很容易得到证明？好像不容易，但可以用下面章节的上升和下降算符方法证明( $\hat{p}_z = 1$ 才成立)。由上可知 $U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta \tau_\zeta}(\vec{p}, h)$ 是自旋本征态，所以展开系数是CG系数，实际计算结果也表明确实就是对应的CG系数。从而也提供了一种统一、规范、直观和完整的计算CG系数新方法。

证明: 采用数学归纳法证明此定理。

第一步:  $s' = \frac{1}{2}, 1$ 时成立:

$$U_{\lambda_{\zeta}}(\vec{p}, h) = \frac{1}{1!} U_{\lambda_{\zeta}}(\vec{p}, h), -\frac{1}{2} \leq h \leq \frac{1}{2}; U_{\lambda_{\zeta}\mu_{\zeta}}(\vec{p}, h) = \frac{1}{2!} U_{\{\lambda_{\zeta}\mu_{\zeta}\}}(\vec{p}, h), -1 \leq h \leq 1$$

第二步: 假设  $s' = s - \frac{1}{2}$ 时成立:

$$U_{\lambda_{\zeta}\mu_{\zeta}\dots\sigma_{\zeta}}(\vec{p}, h) = \frac{1}{(2s-1)!} U_{\{\lambda_{\zeta}\mu_{\zeta}\dots\tau_{\zeta}\sigma_{\zeta}\}}(\vec{p}, h), -s + \frac{1}{2} \leq h \leq s - \frac{1}{2}$$

第三步:  $1 \leq s' = s$ 时:  $-s \leq h \leq s, U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta \tau_\zeta}(\vec{p}, h)$

$$\begin{aligned} &= \sum_{h'=1/2}^{-1/2} \frac{\sqrt{C_{s+h}^{1/2+h'} C_{s-h}^{1/2-h'}}}{\sqrt{C_{2s}^1}} U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta}(\vec{p}, h-h') U_{\tau_\zeta}(\vec{p}, h') = \sum_{h'=1}^{-1} \frac{\sqrt{C_{s+h}^{1+h'} C_{s-h}^{1-h'}}}{\sqrt{C_{2s}^2}} U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta}(\vec{p}, h-h') U_{\sigma_\zeta \tau_\zeta}(\vec{p}, h') \\ \Rightarrow &U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta \tau_\zeta}(\vec{p}, h) = \frac{1}{(2s-1)!} U_{\{\lambda_\zeta \mu_\zeta \dots \tau_\zeta \sigma_\zeta\}}(\vec{p}, h), U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta \tau_\zeta}(\vec{p}, h) = U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta \tau_\zeta}(\vec{p}, h), -s \leq h \leq s \\ \Leftrightarrow &U_{\lambda_\zeta \mu_\zeta \dots \sigma_\zeta \tau_\zeta}(\vec{p}, h) = \frac{1}{(2s)!} U_{\{\lambda_\zeta \mu_\zeta \dots \tau_\zeta \sigma_\zeta\}}(\vec{p}, h), -s \leq h \leq s \end{aligned}$$

此步证明了  $s' = s$ 时命题成立。

第四步: 根据以上归纳法推理, 命题成立, 定理得证。 □

&= h \varepsilon_{a \otimes \dots \otimes b \otimes c}(\vec{p}, h), \quad -n \leq h \leq n \quad \square
\end{aligned}$$

$$\text{定理2.7.2. } \Omega^2(n; R) \varepsilon_{a \otimes \dots \otimes b \otimes c}(\vec{p}, h) = n(n+1) \varepsilon_{a \otimes \dots \otimes b \otimes c}(\vec{p}, h)$$

以上定理可以用全对称的表象变换方法可以很容易得到证明？好像不容易，但可以用下面章节的上升和下降算符方法证明（ $\hat{p}_z = 1$ 才成立）。由上可知  $\varepsilon_{a \dots bc}(\vec{p}, h)$  是自旋本征态，所以展开系数是CG系数，实际计算结果也表明确实就是对应的CG系数。从而也提供了一种规范、统一、直观和完整的计算CG系数新方法。

$$= h \lambda_{\underbrace{A_\zeta \otimes \cdots \otimes B_\zeta \otimes C_\zeta}_{2s}}(\hat{p}, h), -s \leq h \leq s \quad \square$$

$$\text{定理4.3.2.} \quad \Omega^2(s) \lambda_{\underbrace{A_\zeta \otimes \cdots \otimes B_\zeta \otimes C_\zeta}_{2s}}(\hat{p}, h) = s(s+1) \lambda_{\underbrace{A_\zeta \otimes \cdots \otimes B_\zeta \otimes C_\zeta}_{2s}}(\hat{p}, h), -s \leq h \leq s$$

以上定理可以用全对称的表象变换方法可以很容易得到证明。由上可知 $\lambda_{\underbrace{A_\zeta \cdots B_\zeta C_\zeta}_{2s}}(\hat{p}, h)$ 是自旋本征态，所以展开系数是CG系数，实际计算结果也表明确实就是对应的CG系数。从而也提供了一种规范、统一、直观和完整的计算CG系数新方法。

证明: 采用数学归纳法证明此定理。

第一步:  $s' = \frac{1}{2}, 1$ 时成立:

$$\lambda_{A_{s'}} (\hat{p}, h) = \frac{1}{1!} \lambda_{A_{s'}} (\hat{p}, h), -\frac{1}{2} \leq h \leq \frac{1}{2}; \lambda_{A_{s'} B_{s'}} (\hat{p}, h) = \frac{1}{2!} \lambda_{\{A_{s'} B_{s'}\}} (\hat{p}, h), -1 \leq h \leq 1$$

第二步: 假设  $s' = s - \frac{1}{2}$ 时成立:

$$\underbrace{\lambda_{A_{s'} \dots B_{s'}}}_{2s-1} (\hat{p}, h) = \frac{1}{(2s-1)!} \lambda_{\{A_{s'} \dots B_{s'}\}} (\hat{p}, h), -s + \frac{1}{2} \leq h \leq s - \frac{1}{2}$$

第三步:  $1 \leq s' = s$ 时:  $-s \leq h \leq s, \lambda_{A_{s'} \dots B_{s'} C_{s'}} (\hat{p}, h)$

$$= \sum_{h'=1/2}^{-1/2} \frac{\sqrt{C_{s+h}^{1/2+h'} C_{s-h}^{1/2-h'}}}{\sqrt{C_{2s}^1}} \underbrace{\lambda_{A_{s'} \dots B_{s'}}}_{2s-1} (\hat{p}, h-h') \lambda_{C_{s'}} (\hat{p}, h') = \sum_{h'=1}^{-1} \frac{\sqrt{C_{s+h}^{1+h'} C_{s-h}^{1-h'}}}{\sqrt{C_{2s}^2}} \underbrace{\lambda_{A_{s'} \dots B_{s'}}}_{2(s-1)} (\hat{p}, h-h') \lambda_{B_{s'} C_{s'}} (\hat{p}, h')$$

$$\Rightarrow \underbrace{\lambda_{A_{s'} \dots B_{s'} C_{s'}}}_{2s} (\hat{p}, h) = \frac{1}{(2s-1)!} \lambda_{\{A_{s'} \dots B_{s'}\}} (\hat{p}, h), \lambda_{A_{s'} \dots B_{s'} C_{s'}} (\hat{p}, h) = \lambda_{A_{s'} \dots C_{s'} B_{s'}} (\hat{p}, h), -s \leq h \leq s$$

$$\Leftrightarrow \underbrace{\lambda_{A_{s'} \dots B_{s'} C_{s'}}}_{2s} (\hat{p}, h) = \frac{1}{(2s)!} \lambda_{\{A_{s'} \dots C_{s'} B_{s'}\}} (\hat{p}, h), -s \leq h \leq s$$

此步证明了  $s' = s$  时命题成立。

第四步: 根据以上归纳法推理, 命题成立, 定理得证。 □

## 5 自旋方程自旋基的重新梳理分析

### 5.1 定义-自旋基分解: $s = (s - \frac{1}{2}) \oplus \frac{1}{2}$

定义5.1.1.  $-s \leq h \leq s$

$$\lambda_{k_\zeta}(\hat{p}, h; s) = \Gamma_{k_\zeta}^{A_\zeta \cdots B_\zeta} \Gamma_{A_\zeta}^{l_\zeta} \cdot \underbrace{\Gamma_{A_\zeta}^{l_\zeta}}_{2s} \cdot \left[ \frac{\sqrt{s+h}}{\sqrt{2s}} \lambda_{l_\zeta}(\hat{p}, h - \frac{1}{2}; s - \frac{1}{2}) \lambda_{B_\zeta}(\hat{p}, \frac{1}{2}) + \frac{\sqrt{s-h}}{\sqrt{2s}} \lambda_{l_\zeta}(\hat{p}, h + \frac{1}{2}; s - \frac{1}{2}) \lambda_{B_\zeta}(\hat{p}, -\frac{1}{2}) \right]$$

$$\text{推论5.1.1. } \lambda(\hat{p}, h; s) = \Gamma_{k_\zeta}^{A_\zeta \cdots B_\zeta} \Gamma_{A_\zeta}^{l_\zeta} \cdot \underbrace{\Gamma_{A_\zeta}^{l_\zeta}}_{2s} \cdot \sum_{h'=1/2}^{-1/2} \frac{\sqrt{C_{s+h}^{1/2+h'} C_{s-h}^{1/2-h'}}}{\sqrt{C_{2s}^1}} \lambda(\hat{p}, h - h'; s - \frac{1}{2}) \lambda_{B_\zeta}(\hat{p}, h'), -s \leq h \leq s$$

$$\text{推论5.1.2. } \lambda(\hat{p}, h; s) = N^{A_\zeta}(s) \sum_{h'=1/2}^{-1/2} \frac{\sqrt{C_{s+h}^{1/2+h'} C_{s-h}^{1/2-h'}}}{\sqrt{C_{2s}^1}} \lambda(\hat{p}, h - h'; s - \frac{1}{2}) \lambda_{A_\zeta}(\hat{p}, h'), -s \leq h \leq s$$

### 5.2 推论- $\lambda(\hat{p}, h; s)$ 是自旋本征态

定理5.2.1.  $[\sigma(s) \cdot \hat{p}] \lambda(\hat{p}, h; s) = h \lambda(\hat{p}, h; s), -s \leq h \leq s$

定理5.2.2.  $\sigma^2(s) \lambda(\hat{p}, h; s) = s(s+1) \lambda(\hat{p}, h; s), -s \leq h \leq s$

### 7.4 自我评述

以上各种自旋基是对应的等动量情形通过么正变换而得来的，除了全对称性破缺之外，其余性质仍全部满足。事实上其全对称性也仍然存在，只是通过么正变换后被隐藏起来了而已。本质上仍满足全对称性，只是表面上破缺而已。以上自旋基也可以通过反变换回到等动量情形（特别是z-轴方向），所以这也表明多粒子系统总自旋与各个粒子速度无关，完全由粒子内部自由度决定。么正变换后只有几率是不变、真实的，但物理图像不一定是真实的，比如动量被改变了；也可以换种观点等价认为动量不变，表象改变了，但这样不直观、不自然。我更倾向于前者，更自然更符合物理直观，可以认为此时表达式中动量就是物理、真实的动量，所以此时的自旋基也是物理、真实的自旋基，这些物理自旋基是接下来纠缠态分析的一个有力的数学工具。以上章节的自旋变换关系表达了如下的一个物理系统：多个不同自旋粒子复合成最大总自旋的物理体系，如果局域在足够小的空间，那么它们完全等价于一个高自旋粒子。反之就是纠缠多粒子系统，故纠缠系统是处于完全自由系统和完全束缚系统中间的一个状态，也许各种基本粒子就是通过量子纠缠合成的。这样的自旋基已不再满足原来的方程，而满足新的方程，但新的方程是什么样子的呢？可以进一步研究，也许隐含新的物理内容。

以上的证明开始主要通过头脑思考和具体验证解决的，排列组合的东西有的时候虽然可以想明白，但很难清清楚楚，明明白白地写出来。后来找到了以上比较严格的方法证明了它。

## 9.2 特殊情形下多个角动量耦合的CG系数公式

多个角动量耦合的CG系数原则上可以通过Racah公式的反复使用得到吗？好像只有特殊的单粒子情形下才可行。最一般的情形Racah和Wigner早已经解决了，数学上属于中等难度，只是繁复而已，公式很复杂，物理上使用起来很不方便，所以有些情况下重新获得便利的表述方式还是很有必要的。

**定义9.2.1.**  $j_{k+1} = n_1 + \dots + n_k + n_{k+1}$ ,  $j_k = n_2 + \dots + n_k + n_{k+1}$ ,  $\dots$ ,  $j_2 = n_k + n_{k+1}$ ,  $j_1 = n_{k+1}$ ,

**引理9.2.1.**

$$\langle (j_{k-1}, m_{k-1}); (n_2, l_2) | j_{k-1}, n_2; (j_k, m_k) \rangle = \delta(m_{k-1} + l_k - m_k) \left\{ \frac{(2j_{k-1})!(2n_2)!(j_k+m_k)!(j_k-m_k)!}{(2j_k)!(j_{k-1}+m_{k-1})!(j_{k-1}-m_{k-1})!(n_2+l_2)!(n_2-l_2)!} \right\}^{1/2}$$

**定理9.2.1.**  $|j_1, n_k, \dots, n_2, n_1; (j, m)\rangle = |j_k, n_1; (j, m)\rangle = |(j, m)\rangle$

### 3.2 自旋-n粒子Klein-Gordon方程投影算子的定义表述

以上这些定理是我本人通过归纳试探提出来的，并已经在前面章节严格证明了它们。

### 3.3 自旋-n粒子Klein-Gordon方程投影算子的重要猜想

猜想3.3.1.  $\sum_{r=0}^{[n/2]} (-1)^r \frac{n!n!}{(2n)!} \frac{(2n-2r)!}{r!(n-r)!(n-2r)!}$   
 $\{ [C_{\{a_1\}} C_{a_2} - A_{\{a_1\}} B_{a_2} - B_{\{a_1\}} A_{a_2}] [C_{\{b_1\}} C_{b_2} - A_{\{b_1\}} B_{b_2} - B_{\{b_1\}} A_{b_2}] \cdot$

$$\begin{aligned}
& [C_{a_{2r-1}}C_{a_{2r}} - A_{a_{2r-1}}B_{a_{2r}} - B_{a_{2r-1}}A_{a_{2r}}][C_{b_{2r-1}}C_{b_{2r}} - A_{b_{2r-1}}B_{b_{2r}} - B_{b_{2r-1}}A_{b_{2r}}] \\
& [C_{a_{2r+1}}C_{b_{2r+1}} - A_{a_{2r+1}}B_{b_{2r+1}} - B_{a_{2r+1}}A_{b_{2r+1}}] \cdot [C_{a_n}C_{b_n} - A_{a_n}B_{b_n} - B_{a_n}A_{b_n}] \\
& = \sum_{k=0}^n \frac{(-1)^n}{C_{2n}^{2k}} \sum_{i,j=0}^{k|(n-k)} \frac{2^{i+j}n!n!}{(n-k-i)!(n-k-j)!(k-i)!(k-j)!(2i)!(2j)!} \\
& \{[A_{\{a_1 \cdots A_{a_{n-k-i}}\}}][B_{a_{n+1-k-i}} \cdots B_{a_{n-2i}}][C_{a_{n+1-2i}} \cdots C_{a_n}]\} \{[B_{\{b_1 \cdots B_{b_{n-k-j}}\}}][A_{b_{n+1-k-j}} \cdots A_{b_{n-2j}}][C_{b_{n+1-2j}} \cdots C_{b_n}]\} \\
& - \sum_{k=0}^{n-1} \frac{(-1)^n}{C_{2n}^{2k+1}} \sum_{i,j=0}^{k|(n-1-k)} \frac{2^{i+j+1}n!n!}{(n-k-i-1)!(n-k-j-1)!(k-i)!(k-j)!(2i+1)!(2j+1)!} \\
& \{[A_{\{a_1 \cdots A_{a_{n-k-i-1}}\}}][B_{a_{n-k-i}} \cdots B_{a_{n-2i-1}}][C_{a_{n-2i}} \cdots C_{a_n}]\} \{[B_{\{b_1 \cdots B_{b_{n-k-j-1}}\}}][A_{b_{n-k-j}} \cdots A_{b_{n-2j-1}}][C_{b_{n-2j}} \cdots C_{b_n}]\}
\end{aligned}$$

以上猜想是从Behrends和Fronsdal构造出来的公式(猜想)<sup>[52, 53]</sup>和我本人上节提出的定理相结合而得到的,它是后面很多重要结论的前提条件,很多情形下验证都是正确的,目前还没遇到反例。但如果要严格证明它,却需要先证明Behrends和Fronsdal构造出来的公式,目前我还做不到这一点。当然如果此猜想通过其他方法得到证明,那么Behrends和Fronsdal构造出来的公式就可以得到严格的证明。

## 4 从物理到数学抽象: 投影算子猜想

本节A,B,C不再特指,泛指一般对易变量。

### 4.1 从自旋-n粒子Klein-Gordon方程投影算子引出的数学猜想

& - \sum_{k=0}^{n-1} \frac{1}{C_{2n}^{2k+1}} \sum_{i,j=0}^{k|(n-1-k)} \frac{(-2)^{i+j+1}n!n!}{(n-k-i-1)!(n-k-j-1)!(k-i)!(k-j)!(2i+1)!(2j+1)!} \\
& \{[A_{\{a_1 \cdots A_{a_{n-k-i-1}}\}}][B_{a_{n-k-i}} \cdots B_{a_{n-2i-1}}][C_{a_{n-2i}} \cdots C_{a_n}]\} \{[B_{\{b_1 \cdots B_{b_{n-k-i-1}}\}}][A_{b_{n-k-i}} \cdots A_{b_{n-2i-1}}][C_{b_{n-2i}} \cdots C_{b_n}]\}

以上是更一般的猜想,如果它成立,则上节的猜想自然成立。

& [A_{a_{2r+1}}B_{b_{2r+1}} + B_{a_{2r+1}}A_{b_{2r+1}}] \cdot [A_{a_n}B_{b_n} + B_{a_n}A_{b_n}]\} \\
& = \sum_{k=0}^n \frac{(2k)!}{k!k!} \frac{(2n-2k)!}{(n-k)!(n-k)!} [A_{\{a_1 \cdots A_{a_{n-k}} B_{a_{n+1-k}} \cdots B_{a_n}\}}][B_{\{b_1 \cdots B_{b_{n-k}} A_{b_{n+1-k}} \cdots A_{b_n}\}}]

# 第三十一章 有质量矢量粒子的协变量子化方案

自我评述：对于Bargmann-Wigner方程描述的粒子，一般来说既可以描述带荷的复粒子，也可以描述不带荷的马约拉纳粒子。两种情形的主对易规则形式一致，但其余对易或反对易括号，对带荷的复粒子一般为零；对不带荷的马约拉纳粒子，其余对易或反对易括号由主对易规则和马约拉纳条件自然得到，一般不为零。在本章节既讨论了复粒子情形，也讨论了马约拉纳粒子情形，完整给出了两种情形下的全部对易规则。但以后章节一般不再求全，一般只讨论复粒子情形和主对易规则，不再专门讨论马约拉纳粒子情形，若要得到马约拉纳粒子情形的量子场论，只需在复粒子情形加上马约拉纳条件即可自然得到。

从上面可以看出，在 $m \rightarrow 0$ 时， $A_a, F_{ab} \rightarrow \infty$ 变得没意义，但 $\psi_{\alpha_\zeta}$ 仍然有意义，可以自然过渡，重新写在下面。当然严格的做法仍要采用无质量粒子的方法，这里只是形式的推导。

### 3 有质量矢量场对易规则两种表述等价性的直观证明方法

自我评述：简单巧妙的解析证法前一章已经给出，那为什么还要给出其它的证法呢？原因有三个：一是我最先按这复杂直观的方法证明的；二是在这个复杂的证明过程中，可以顺便得到有质量矢量场分解的全部对易规则；三是可以得到一批有用的恒等式。我已经多次遇到这样类似的情况，不同证法往往需要完全不同的数学技巧。有些抽象证明很简洁，但看不清细节，有的时候明明证出来了，总有些怀疑，因为不直观、太抽象；而构造性的证明，有时简洁，有时很繁琐，但每一步都可以看得清清楚楚。

## 5 有质量Majorana矢量场(取 $\theta = 0$ )

### 5.1 有质量Majorana矢量场与有质量矢量场的对比

本章有质量矢量场的以上结论对于有质量Majorana矢量场一样相应成立，但要加上下面的附加条件。

$$\text{定理5.1.1. } \psi = \gamma_2 \otimes \gamma_2 \psi^*, A_a = A_a^+, \eta_a^{a'} (F_{ab} = F_{a'b}^+, \eta_a^{a'} \eta_b^{b'}), b^+(\vec{p}, h) = (-1)^{s+h} a^+(\vec{p}, -h)$$

下面就有质量Majorana矢量场与有质量复矢量场不一样的情形进行详细对比讨论。

# 第三十二章 有质量引力微子的协变量子化方案

自我评述：对于Bargmann-Wigner方程描述的粒子，一般来说既可以描述带荷的复粒子，也可以描述不带荷的马约拉纳粒子。两种情形的主对易规则形式一致，但其余对易或反对易括号，对带荷的复粒子一般为零；对不带荷的马约拉纳粒子，其余对易或反对易括号由主对易规则和马约拉纳条件自然得到，一般不为零。在本章只讨论复粒子情形，一般也只给出主对易规则，不再专门讨论马约拉纳粒子情形，若要得到马约拉纳粒子情形的量子场论，只需在复粒子情形加上马约拉纳条件即可自然得到。

# 第三十三章 有质量引力子的协变量子化方案

自我评述：对于Bargmann-Wigner方程描述的粒子，一般来说既可以描述带荷的复粒子，也可以描述不带荷的马约拉纳粒子。两种情形的主对易规则形式一致，但其余对易或反对易括号，对带荷的复粒子一般为零；对不带荷的马约拉纳粒子，其余对易或反对易括号由主对易规则和马约拉纳条件自然得到，一般不为零。在本章只讨论复粒子情形，一般也只给出主对易规则，不再专门讨论马约拉纳粒子情形，若要得到马约拉纳粒子情形的量子场论，只需在复粒子情形加上马约拉纳条件即可自然得到。
