

Syracuse Conjecture Quadrature

Rolando Zucchini

Independent math researcher

ABSTRACT

After circa 2300 years (*Circle Quadrature*; Archimèdès, Syracuse 287 – 212 BC) the history of mathematics repeats itself in a different problem.

The conjecture of Syracuse, or Collatz conjecture, is approached from a completely dissimilar point of view than many previous attempts. One of its features suggests a process that leads to Theorem $2n+1$, whose demonstration subdivided the set of odd numbers in seven subsets which have different behaviors applying algorithm of Collatz. It allows us to replace the Collatz cycles with the cycles of links, transforming their oscillating sequences in monotone decreasing sequences. By Theorem of Independence we can manage cycles of links as we like, also to reach very high horizons and when we decide go back to lower horizons. In this article it's proved that Collatz conjecture is not fully demonstrable. In fact, if we consider the banal link $n < 2n$, there are eight cycles which connect each other in an endless of possible links. It is a type of *Circle Quadrature*, but its statement is confirmed. In other words: BIG CRUNCH (go back to 1) is always possible, but BIG BANG (to move on) has no End.

INTRODUCTION

This paper shows the true nature of Syracuse Conjecture (or Collatz Conjecture), in fact it's proved that it is a kind of the squaring of the circle or *Circle Quadrature*. In addition to the important result are reported many properties and peculiarities of this conjecture. It hides the magical harmony of odd numbers, and maybe a type of law on the expansion of Cosmos based on the powers of 2, as prophesied by Plato in some of his writings. In this paper is used only arithmetic calculus, elementary number theory and binomial algebraic inequalities. In spite of its simple enunciation, Syracuse conjecture is a difficult topic, therefore this article needs patience in reading for a well-understanding. A variety of applications and examples were needed for better explain the work. "*Syracuse conjecture: a wolf disguised in a lamb*". (Maddmaths, web 2011).

Remark : This article is an exhaustive synthesized makeover of the book (110 pages plus 30 tables of links odd numbers 5 – 2999, A4 format) self-published on Amazon [1].

CONCISE PRESENTATION OF CONTENTS

The famous Syracuse Conjecture (SC), better known as the Collatz Conjecture (CC), it's approached by a completely dissimilar point of view than many previous attempts, highlighting some of its features. One of them suggests a process that leads to Theorem $2n+1$ whose proof subdivided the set of odd numbers in seven subsets which have different behaviors applying algorithm of Collatz. It allows us to replace the Collatz cycles with the cycles of links, transforming their oscillating sequences in monotone decreasing sequences, which, after a finite number of steps (very low), fall down to 1 always respecting the final cycles $\{10; 5; 4; 2; 1\}$ or $\{7; 5; 4; 2; 1\}$. The

General List of binomial inequalities until a number of steps $N(s) \leq 21$ cover *circa* 96% of \mathbb{N} . By Theorem of Independence we can cover the remaining 4% managing the cycles of links as we like, also to reach very high main horizons $\Theta(m)$ and, when we decide, go back to the lower horizon $\Theta(l) < \Theta(m)$. In this article it is proved that CC is not entirely demonstrable. In fact, if we consider the cycle of even numbers, there are eight cycles which connect each other in an endless of links. The unique feasible procedure for its demonstration is to prove that any sequence obtained by Collatz algorithm contains a value lesser than the starting number (or *generating number*). Given that the even numbers $2n$ go to $n < 2n$, we can consider only odd numbers. For every biggest horizon we are able to cover by binomial inequality after $N(s)$ steps, there is an upper horizon that needs a greater number of steps to become lower than itself. So it's proved that SC is a sort of *Circle Quadrature*. In other words: BIG CRUNCH (go back to 1) is always possible, but BIG BANG (to move on) has no End. Therefore we can claim that its initial statement is true.

“The numbers reign on the Universe” (Pythagoras)

“ONE and DIADE are generators of Cosmos” (Plato)

Remark : At the end three appendices were added to be used for a desirable teaching of CC in High Schools.

1. The conjecture of Syracuse

The conjecture of Syracuse states: *If at any natural integer n , non-zero, we apply the algorithm $3n+1$ if n is odd, $n/2$ if n is even, the sequence of the values obtained, precipitates to 1 after a finite number of steps, always in compliance with the final cycle $\{4; 2; 1\}$.*

$$\text{For every } n \in \mathbb{N} : n \neq 0 \rightarrow \begin{cases} 3n + 1 & \text{if } n \text{ is odd} \\ \frac{n}{2} & \text{if } n \text{ is even} \end{cases}$$

Chosen $n = 12$ (even), applying the algorithm of Collatz we obtain the following sequence:

$n = 12 \rightarrow S(12) = \{12; 6; 3; 10; 5; 16; 8; 4; 2; 1\}$ the number 12 falls down to 1 in nine steps.

The sequence (or succession) generated by the number 12 is oscillating (neither increasing nor decreasing) and can be represented with a graph on a Cartesian plane having its origin in $(0,1)$. The number 1 can be understood as the minimum level or the sea level. The steps are shown on the horizontal axis and the generating number on the vertical axis. The graph of fluctuation of the sequence $S(12)$ is represented in figure. The horizontal line parallel to the abscissa axis (steps) is the horizon of the number 12 (indicated with the Greek letter ϑ). The number 12, during the oscillation of the sequence $S(12)$, exceeds its horizon once, exactly in step 5, in correspondence of which reaches a peak 16.

It is to be noted that if we choose as starting number an odd number, the first element of the sequence is always an even number, since the product of 3 for another odd number still gives an odd number, which becomes even with the addition of 1. This happens for all the successors of an odd number contained in the sequence. An even number, instead, may be followed by an odd number or by one or more even numbers: $n = 48 \rightarrow S(48) = \{48; 24; 12; 6; 3; 10; 5; 16; 8; 4; 2; 1\}$. If you choose an even number power of 2, $n = 2^p = 2; 4; 8; 16; 32; 64; 128; 256; 512; 1024; \dots$, it reaches 1 after a cycle of p applications of the algorithm. The same observation also applies to the odd numbers when $3n+1 = 2^p \rightarrow n = (2^p-1)/3 : p \in E \subset \mathbb{N}$; hence $n = (4^p-1)/3$. In this case the corresponding sequence $S(n)$ contains $p+2$ values and it reaches 1 in $p+1$ steps.

If we choose the number 25 we will have the following sequence:

25 → 76 → 38 → **19** → 58 → 29 → 88 → 44 → 22 → **11** → 34 → 17 → 52 → 26 → 13 → 40 → 20 → **10** → **5** → 16 → 8 → **4** → **2** → **1**

It consists of 24 values, 23 steps. We observe that the sequence of values does not contain two same numbers, but they are all different from each other. In short, the sequences obtained through algorithm of Collatz precipitate to 1 taking different values between them. This is obvious. In fact, if in a succession two numbers were the same, from one of them onwards we would have the same sequence, giving rise to a vicious circle (*loop*), and this is impossible (clearly with the exclusion of 1 which generates the final cycle).

Again with reference to the number 25, but this reasoning is valid for any other number, another *important observation* is that when the value of the sequence falls below 25, in this case 19, its succession from here on becomes perfectly equal to that of this number. In this way the sequence of number 25 is linked to the succession of number 19. In short, the endless sequences generated by the algorithm give rise to a kind of interaction, in which each sequence is linked to a previous one whose generating number is smaller. For 25 we have the following chain of links:

25 → **19** → **11** → **10** → **5** → **4** → **2** → **1**

In this way we can associate a specific procedure to the Collatz sequences.

If we take 49 as generating number, we have:

49 → 148 → 74 → **37** < 49

37 → 112 → 56 → **28** < 37

28 → **14** < 28

14 → **7** < 14

7 → 22 → 11 → 34 → 17 → 52 → 26 → 13 → 40 → 20 → 10 → **5** < 7

5 → 16 → 8 → **4** < 5

4 → **2** → **1** final cycle.

49 → **37** → **28** → **14** → **7** → **5** → **4** → **2** → **1**

If we take 204 as generating number, applying the algorithm, we obtain:

204 → **102** < 204

102 → **51** < 102

51 → 154 → 77 → 232 → 116 → 58 → **29** < 51

29 → 88 → 44 → **22** < 29

22 → **11** < 22

11 → 34 → 17 → 52 → 26 → 13 → 40 → 20 → **10** < 11

10 → **5** < 10

5 → 16 → 8 → **4** < 5

4 → **2** → **1** final cycle.

204 → **102** → **51** → **29** → **22** → **11** → **10** → **5** → **4** → **2** → **1**

Such a proceeding is applicable for every $n \in \mathbb{N}$: $n \neq 0$ and $n \neq 1$.

In brief, the endless sequences can be imagined as a maze in which the numbered rooms are connected to each other in a descending order in accordance with the rules imposed by the algorithm, up to the final cycle $4 \rightarrow 2 \rightarrow 1$ finding the exit. SC would be proved if we could demonstrate that any sequence contains a value lesser than the starting number (generating number). Because if this happens it hooks to this, which in turn hooks to another lesser than it, and so on, up

to precipitate necessarily to 1 (exit of the maze). Or, as they say, the main horizon of generating number descends to the next lower horizons until it reaches the sea level. This can be stated with certainty for even numbers $n \in E : n = 2^p$ and for odd numbers $n \in O : n = (4^p - 1)/3$. For all other numbers there is uncertainty.

1.1. Theorem $2n+1$

We have seen that the Collatz sequences are oscillating, excluding those whose generating number is power of 2. These are decreasing monotonic and fall down to 1 after a number of steps previously calculated. For the oscillating sequences we found that they certainly fall down to 1 if a term of the sequence, generated by a generic number n , assumes a smaller value of n , i.e. below the horizon of n that we can mark with $\Theta(n)$. Marking with n_i this value ($n_i < n$; $\Theta(n_i)$ lower of $\Theta(n)$), the sequence generated by n is linked to that generated by n_i , which, in turn, is linked to that of $n_j < n_i$ ($\Theta(n_j)$ lower of $\Theta(n_i)$), which ... and so it precipitates to 1, exiting from the labyrinth, or, how to say, reaches the sea level. We wonder: does this happens in all sequences? In any succession there is always an element whose value is less than the generator? This is certainly true for the even starting numbers. For them, the first element of the sequence is $n/2$, and $n/2 < n$. If, instead, the generating number is odd, the first element is $3n+1$, which, as we have seen, it's certainly even and therefore divisible by 2. That is: $3n+1 \rightarrow (3n+1)/2$. Unless it is of the type $(3n+1)/2 = 2^p$ or $(3n+1)/2 = (4^p - 1)/3$ ($n \in O$), it turns out to be $(3n+1)/2 > n$. But if $3n+1$ were doubly even (twice divisible by 2, or divisible by 4), triply even (three times divisible by 2, or divisible by 8), then $(3n+1)/4 < n$ and $(3n+1)/8 < n$ they would definitely be true.

We denote the generic odd number with $2n+1$.

Statement: There are iterative cycles obtained by the algorithm of Collatz applied to odd numbers $2n+1$ which contain terms a_n lesser than their generators.

Demonstration: Bearing in mind that in the sequences generated by the algorithm of Collatz any odd number has as its successor an even number, we will have:

$$2n+1 \rightarrow 3(2n+1)+1 = 6n+4 \rightarrow 3n+2.$$

$3n+2$ can be even or odd.

a) If $3n+2$ is even, then $3n+2 \rightarrow (3n+2)/2 < 2n+1$ ($3n+2 < 4n+2$, from which $n > 0$, always true).

But $3n+2$ is even if $n \in E = \{2; 4; 6; 8; 10; 12; 14; 16; \dots; 2n\}$.

It follows that $2n+1$ is in $O_1 = \{5; 9; 13; 17; 21; 25; 29; 33; \dots; 4n+1\}$ [$n > 0$]

b) If $3n+2$ is odd, then: $3n+2 \rightarrow 3(3n+2)+1 = 9n+7$, which being even in virtue of algorithm, then $9n+7 \rightarrow (9n+7)/2$, which can be even or odd.

b1) If $(9n+7)/2$ is even, then $(9n+7)/2 \rightarrow (9n+7)/4 < 4n+2 = 2(2n+1) \rightarrow (9n+7)/8 < 2n+1$. And this happens if $(9n+7)/2$ is at least doubly even (divisible by 4). So: $(9n+7)/2 \rightarrow (9n+7)/4 \rightarrow (9n+7)/8 < 2n+1$. But $(9n+7)/2$ is even for $n \in O_1 = \{1; 5; 9; 13; 17; 21; 25; 29; \dots; 4n+1\}$.

It follows that $2n+1$ is in $O_2 = \{3; 11; 19; 27; 35; 43; 51; 59; \dots; 8n+3\}$ [$n \geq 0$]

b2) If $(9n+7)/2$ is odd, then $(9n+7)/2 \rightarrow 3((9n+7)/2)+1 = (27n+21)/2+1 = (27n+23)/2$, which being even in virtue of the algorithm: $(27n+23)/2 \rightarrow (27n+23)/4 < 8n+4 = 4(2n+1) \rightarrow (27n+23)/16 < 2n+1$. And this happens if $(27n+23)/2$ is at least triply even (divisible by 8). So: $(27n+23)/2 \rightarrow (27n+23)/4 \rightarrow (27n+23)/8 \rightarrow (27n+23)/16 < 2n+1$.

But $(27n+23)/2$ is even for $n \in O_4 = \{3; 7; 11; 15; 19; 23; 27; 31; \dots; 4n-1; 4n+3\}$.

But $(9n+7)/2$ is odd for $n \in O_4 = \{3; 7; 11, 15; 19; 23; 27; 31; \dots; 4n-1; 4n+3\}$.

It follows that $2n+1$ is in $O_3 = \{7; 15; 23; 31; 39; 47; 55; 63; \dots; 8n-1; 8n+7\} [n > 0]$

If we denote with $S(2n+1)$ any sequence obtained applying Collatz algorithm starting from a generic odd generating number $2n+1$; we have identified three subsets in whose iterative cycles there are term $a_n \in S(2n+1)$ such that $a_n < 2n+1$. They are:

$$O_1 = \{5; 9; 13; 17; 21; 25; 29; 33; \dots; 4n+1\}$$

$$O_2 = \{3; 11; 19; 27; 35; 43; 51; 59; \dots; 8n+3\}$$

$$O_3 = \{7; 15; 23; 31; 39; 47; 55; 63; \dots; 8n-1; 8n+7\}$$

$O_1 \cup O_2 \cup O_3 = \{3; 5; 7; 9; 11; 13; 15; 17; 19; 21; 23; 25; 27; 29; 31; \dots; 2n+1; 2n+3\} = O - \{1\}$, with 1 generator of the end cycle.

1.2. Addition to the theorem $2n+1$

Note: Bold font is used in this article for highlighting substitutions. As we will see in the following paragraphs there are so many substitutions that are not sufficient the letters of a whole alphabet.

a) $2n+1 \in O_1$

$3n+2$ is even if $n \in E = \{0; 2; 4; 6; 8; \dots; 2n\} [n \geq 0]$

It is simply even if $n \in E' = \{0; 4; 8; 12; 16; \dots; 4n\}$

$$n = 4n : 2n+1 = 2(4n)+1 = 8n+1; 3n+2 = 3(4n)+2 = 12n+2 \rightarrow 6n+1 < 8n+1 \ O_1$$

It is doubly even if $n \in E'' = \{6; 14; 22; 30; 38; \dots; 8n+6\}$

$$n = 8n+6 : 2n+1 = 2(8n+6)+1 = 16n+13; 3n+2 = 3(8n+6)+2 = 24n+20 \rightarrow 12n+10 < 16n+13 \ O_1$$

It is at least triply even if $n \in E''' = \{2; 10; 18; 26; 34; \dots; 8n+2\}$

$$n = 8n+2 : 2n+1 = 2(8n+2)+1 = 16n+5; 3n+2 = 3(8n+2)+2 = 24n+8 \rightarrow 12n+4 < 16n+5 \ O_1$$

$E' \cup E'' \cup E''' = E \rightarrow$ for every $n \in E : (3n+2)/2 < 2n+1 \in O_1$

$$n = 2n : 2n+1 = 2(2n)+1 = 4n+1; (3n+2)/2 = (3(2n)+2)/2 = 3n+1 < 4n+1 \in O_1$$

b1) $2n+1 \in O_2$

$(9n+7)/2$ is even if $n \in O_1 = \{1; 5; 9; 13; \dots; 4n+1\} [n \geq 0]$

It is doubly even if $n \in O_1' = \{9; 25; 41; 57; 73; \dots; 16n+9\}$

$$n = 16n+9 \rightarrow 2n+1 = 2(16n+9)+1 = 32n+19; (9n+7)/2 = [9(16n+9)+7]/2 = 72n+44 \rightarrow 36n+22 \rightarrow 18n+11 < 32n+19$$

It is at least triply even if $n \in O_1'' = \{1; 17; 33; 49; \dots; 16n+1\}$
 $n = 16n+1 \rightarrow 2n+1 = 2(16n+1)+1 = 32n+3; (9n+7)/2 = [9(16n+1)+7]/2 = 72n+8 \rightarrow 36n+4 \rightarrow 18n+2 < 32n+3$
 $O_1' \cup O_1'' = O_1''' = \{1; 9; 17; 25; \dots; 8n+1\} \subset O_1 \rightarrow$ for every $n \in O_1''' : (9n+7)/8 < 2n+1 \in O_2$
 $n = 8n+1 : 2n+1 = 2(8n+1)+1 = 16n+3; (9(8n+1)+7)/8 = 9n+2 < 16n+3 \in O_2$

b2) $2n+1 \in O_3$

$(27n+23)/2$ is even if $n \in O_4 = \{3; 7; 11; 15; \dots; 4n+3\} [n \geq 0]$
It is at least triply even if $n \in O_4' = \{11; 27; 43; 59; \dots; 16n+11\}$
 $n = 16n+11 \rightarrow 2n+1 = 2(16n+11)+1 = 32n+23; (27n+23)/2 = [27(16n+11)+23]/2 = 216n+160 \rightarrow 108n+80 \rightarrow 54n+40 \rightarrow 27n+20 < 32n+23$
 $O_4' \subset O_4 \rightarrow$ for every $n \in O_4' : (27n+23)/16 < 2n+1 \in O_3$
 $n = 16n+11 : 2n+1 = 2(16n+11)+1 = 32n+23; (27(16n+11)+23)/16 = 27n+20 < 32n+23 \in O_3$

1.2.1. Summary

a)
 $2n+1 \in O_1 \rightarrow 6n+4 \rightarrow 3n+2 \rightarrow (3n+2)/2 < 2n+1 = 3n+1 < 4n+1$ O_1 : an odd number in O_1 assumes a value less than itself after three applications of Collatz algorithm (3 steps). This always happens.

b1)
 $2n+1 \in O_2 \rightarrow 6n+4 \rightarrow 3n+2 \rightarrow 9n+7 \rightarrow (9n+7)/2 \rightarrow (9n+7)/4 \rightarrow (9n+7)/8 < 2n+1 = 9n+2 < 16n+3$
 O_2 : an odd number in O_2 assumes a value less than itself after six applications of Collatz algorithm (6 steps). If this does not happen it is transformed into an odd number or in O_1 or in O_2 or in O_3 .

b2)
 $2n+1 \in O_3 \rightarrow 6n+4 \rightarrow 3n+2 \rightarrow 9n+7 \rightarrow (9n+7)/2 \rightarrow (27n+23)/2 \rightarrow (27n+23)/4 \rightarrow (27n+23)/8 \rightarrow (27n+23)/16 < 2n+1 = 27n+20 < 32n+23$ O_3 : an odd number in O_3 assumes a value less than itself after eight applications of Collatz algorithm (8 steps). If this does not happen it is transformed into an odd number or in O_1 or in O_2 or in O_3 .

1.2.2. Corollaries

Every sequence obtained by application of Collatz algorithm do not contain (never) odd numbers divisible by 3. In fact : $(2n+1) \in O \rightarrow 3(2n+1)+1 = 6n+4 \rightarrow 3n+2$ can be even or odd and it is not divisible by 3 for every $n \in \mathbb{N}$. We can therefore state the following corollaries.

Corollary 1: *In the cycles of links no odd number connects to an odd number divisible by 3.*

Corollary 2: *In the cycles of links no odd number connects to an even number divisible by 3.*

Corollary 3: *If the sequences obtained by applying the algorithm of Collatz start from an odd generating number, then the odd numbers divisible by 3 are present only as generating numbers.*

Corollary 4: *If a sequence obtained by applying the algorithm of Collatz starts from an odd generating number, then in it are not presents even numbers divisible by 3.*

2. Explanatory notes and odd numbers subsets

Syracuse conjecture plan Theorem $2n+1$

$$\begin{aligned}
2n+1 \text{ O} \rightarrow 6n+4 \text{ E} \rightarrow 3n+2 \text{ O} \vee \text{E} \rightarrow (3n+2)/2 \text{ O}_1 : 3 \text{ steps} \\
\downarrow \\
9n+7 \text{ E} \rightarrow (9n+7)/2 \text{ O} \vee \text{E} \rightarrow (9n+7)/4 \text{ O}_2 : 5 \text{ steps} \\
\downarrow \\
(27n+23)/2 \text{ E} \rightarrow (27n+23)/4 \text{ O}_3 : 6 \text{ steps}
\end{aligned}$$

Notes

a) Definition: A cycle of link is the number of steps required for to arrive from the main horizon of a generating number (Start) to the lower horizon of its link (End).

We point: $\Theta(m)$: main horizon
 $\Theta(l)$: lower horizon
 $N(s)$: number of steps

b) Definition: Two cycles of links, c_1, c_2 , are equivalent if contain the same number of steps, i.e. : $c_1 \sim c_2 \leftrightarrow N(s)[c_1] = N(s)[c_2]$.

c) $O_1 = \{5; 9; 13; 17; 21; 25; 29; 33; \dots; 4n+1\} [n > 0]$
 $O_2 = \{11; 19; 27; 35; 43; 51; 59; 67; \dots; 8n+3\} [n > 0]$
 $O_3 = \{7; 15; 23; 31; 39; 47; 55; 63; \dots; 8n-1\} [n > 0]$

A number n is in O_1 if $n-1$ is divisible by 4 :
We pose : $u = (n-1)/4$; $x = 2u = (n-1)/2 \rightarrow f(x) = (3x+2)/2$ after $N(s) = 3$
A number n is in O_2 if $n-3$ is divisible by 8 :
We pose : $v = (n-3)/8$; $y = 4v+1 = (n-1)/2 \rightarrow f(y) = (9y+7)/4$ after $N(s) = 5$
A number n is in O_3 if $n+1$ is divisible by 8 :
We pose : $w = (n+1)/8$; $z = 4w-1 = (n-1)/2 \rightarrow f(z) = (27z+23)/4$ after $N(s) = 6$

d) Important remark

We use binomials of 4 types:

- 1) (even number)· n + (even number) \rightarrow divisible by 2
- 2) (odd number)· n + (even number) : it can be Odd or Even. Is Odd if $n = 2n+1$; is Even if $n = 2n$
- 3) (odd number)· n + (odd number): it can be Odd or Even. Is Odd if $n = 2n$; is Even if $n = 2n+1$
- 4) (even number)· n + (odd number): it can be in O_1 or in O_2 or in O_3 :
 - 4a) It's in O_1 if $n = 2n$ or if $n = 2n+1$.
 - 4b) It's in O_2 if $n = 4n+1$ or if $n = 4n+3$; if $n = 4n$ or if $n = 4n+2$
 - 4c) It's in O_3 if $n = 4n+3$ or if $n = 4n+1$; if $n = 4n+2$ or if $n = 4n$

e) If it is written E; O; O_1 ; O_2 ; O_3 it is an obligation; instead [E]; [O]; [O_1]; [O_2]; [O_3] it is a choice

2.1. O_1 ; O_2 ; O_3

O_1

$$4n+1 \text{ O}_1 : x = 2n \rightarrow f(x) = 3n+1 < 4n+1 \text{ O}_1 : N(s) = 3$$

O_2

$$8n+3 \text{ O}_2 : y = 4n+1 \rightarrow f(y) = 9n+4 \text{ [E]} : n = 2n$$

$$8n+3 O_2 \rightarrow 8(2n)+3 = 16n+3 O_2^*$$

$$9n+4 \rightarrow 9(2n)+4 = 18n+4 \rightarrow 9n+2 < 16n+3 O_2^* = \{19; 35; \dots\} \subset O_2 : N(s) = 6$$

For generating odd numbers $O_2 - O_2^* = 16n+11 O_{2a} = \{11; 27; \dots\}$ we have:

$$16n+11 O_{2a} : y = 8n+5 \rightarrow f(y) = 18n+13 O_1 \vee O_2 \vee O_3 \text{ after 5 steps}$$

O₃

$$8n-1 O_3 : z = 4n-1 \rightarrow f(z) = 27n-1 [E] : n = 2n+1$$

$$8n-1 O_3 \rightarrow 8(2n+1)-1 = 16n+7 O_3$$

$$27n-1 \rightarrow 27(2n+1)-1 = 54n+26 \rightarrow 27n+13 [E] : n = 2n+1$$

$$16n+7 O_3 \rightarrow 16(2n+1)+7 = 32n+23 O_3^*$$

$$27n+13 \rightarrow 27(2n+1)+13 = 54n+40 \rightarrow 27n+20 < 32n+23 O_3^* = \{23; 55; \dots\} \subset O_3 : N(s) = 8$$

For generating odd numbers $O_3 - O_3^*$ of type:

$$32n-1 O_{3a} = \{31; 63; 95; \dots\} [n > 0]$$

$$32n+7 O_{3b} = \{7; 39; 71; \dots\} [n \geq 0]$$

$$32n+15 O_{3c} = \{15; 47; 79; \dots\} [n \geq 0]$$

we have:

$$32n-1 O_{3a} : z = 16n-1 \rightarrow f(z) = 108n-1 O_2 \vee O_3 \text{ after 6 steps}$$

$$32n+7 O_{3b} : z = 16n+3 \rightarrow f(z) = 108n+26 \rightarrow 54n+13 O_1 \vee O_2 \vee O_3 \text{ after 7 steps}$$

$$32n+15 O_{3c} : z = 16n+7 \rightarrow f(z) = 108n+53 O_1 : x = 54n+26 \rightarrow f(x) = 81n+40 E \vee O \text{ after 9 steps}$$

Keep in mind that: $32n-9 O_3^* \sim 32n+23 O_3^*$; $32n-1 O_{3a} \sim 32n+31 O_{3a}$.

Summarizing :

$$O = O_1 \cup O_2 \cup O_3$$

$$O_2 = O_2^* \cup O_{2a}$$

$$O_3 = O_3^* \cup O_{3a} \cup O_{3b} \cup O_{3c}$$

2.2. Further analysis O₂

$$16n+11 O_{2a} : y = 8n+5 \rightarrow f(y) = 18n+13 O_1 \vee O_2 \vee O_3$$

$$6561n+4178 \rightarrow 6561(2n)+4178 = 13122n+4178 \rightarrow 6561n+2089 < 8192n+2607 O_{3c}$$

Check:

$$8192n+2607 O_{3c} : z = 4096n+1303 \rightarrow f(z) = 27648n+8801 O_1 : x = 13824n+4400 \rightarrow$$

$$f(x) = 20736n+6601 O_1 : x = 10368n+3300 \rightarrow f(x) = 15552n+4951 O_3^* : z = 7776n+2475 \rightarrow$$

$$f(z) = 52488n+16712 \rightarrow 26244n+8356 \rightarrow 13122n+4178 \rightarrow 6561n+2089 < 8192n+2607 O_{3c} =$$

$$\{2607; \dots\} \subset O_3 : N(s) = 21$$

... ..
... ..

By the procedure previously illustrated, appropriately choosing the connections between the eight cycles, applying the formulas obtained from Theorem 2n+1, using Theorem of Independence explained later (§ 3.2.); we arrive to the following list binomial inequalities $N(s) \leq 21$.

2.4. General List binomial inequalities $N(s) \leq 21$

$$N(s) = 3$$

$$3n+1 < 4n+1 O_1 = 3n+1 < 2^2 \cdot n+1 O_1$$

$$N(s) = 6$$

$$9n+2 < 16n+3 O_2^* = 3^2 \cdot n+2 < 2^4 \cdot n+3 O_2^*$$

$$N(s) = 8$$

$$27n+10 < 32n+11 O_{2a} = 3^3 \cdot n+10 < 2^5 \cdot n+11 O_{2a}$$

$$27n+20 < 32n+23 O_3^* = 3^3 \cdot n+20 < 2^5 \cdot n+23 O_3^*$$

$$N(s) = 11$$

$$81n+5 < 128n+7 O_{3b} = 3^4 \cdot n+5 < 2^7 \cdot n+7 O_{3b}$$

$$81n+10 < 128n+15 O_{3c} = 3^4 \cdot n+10 < 2^7 \cdot n+15 O_{3c}$$

$$81n+38 < 128n+59 O_{2a} = 3^4 \cdot n+38 < 2^7 \cdot n+59 O_{2a}$$

$$N(s) = 13$$

$$243n+38 < 256n+39 O_{3b} = 3^5 \cdot n+38 < 2^8 \cdot n+39 O_{3b}$$

$$243n+76 < 256n+79 O_{3c} = 3^5 \cdot n+76 < 2^8 \cdot n+79 O_{3c}$$

\end{aligned}$$

The binomial inequalities are of type:

$$3^h \cdot n + q < 2^k \cdot n + p$$

- p is the well-know term of the binomial main horizons; q is the corresponding well-know term of the binomial lower horizons : $q < p$.
- $h + k =$ number of steps $N(s)$: $N(s)$ increment = 2 or 3
- Increase of k 1 or 2 : 1 if $N(s)$ increment = 2 ; 2 if $N(s)$ increment = 3
- Increase of h always 1

Remark

To compile the above list, in some cases of the same $N(s)$, the following method was used. If $\Theta(m1) < \Theta(m2)$ ($p_1 < p_2$) are two consecutive main horizons and p is a generic well-know term, such that $p_1 < p < p_2$, then: $p = \{p_2 \text{ mod } 4 - p \in O_2^* \cup p \in O_3^* \cup p \sim N(s) \text{ previously calculated}\}$ (§ 3.3.3.).

2.4.1. Percentages

From the list above we have the following percentages:

N(s) = 1 E : 2n → n	50
N(s) = 3 O ₁ : 4n+1 → 3n + 1	25
N(s) = 6 O ₂ * : 16n+3 → 9n+2	6.25
N(s) = 8 O _{2a} ; O ₃ *	6.25
N(s) = 11 : 0.78125 x 3	2.344
N(s) = 13 : 0.39062... x 7	2.734
N(s) = 16 : 0.09765... x 12	1.172
N(s) = 19 : 0.02441... x 31	0.757
N(s) = 21 : 0.01221... x 86	1.050
≈ 96 %	

The remaining 4% is covered by the binomial inequalities of the infinite cycles of links. By apposite calculation tools it is possible to reach close by 100% of \mathbb{N} , but it's not possible to arrive 100% coverage of \mathbb{N} . As it will be proved, for every biggest horizon we are able to cover by a binomial inequality after $N(s)$ steps, there is an upper horizon that needs a greater number of steps $N(s)$ to become lower than itself. So we can affirm that SC is a sort of *Circle Quadrature*.

3. SC Quadrature

3.1. Theorem of duplication

Statement

If a binomial inequality is valid for the horizon $2^\alpha \cdot n + p$ then it also applies to the horizon $2 \cdot 2^\alpha \cdot n + p$, i.e.: $2^{\alpha+1} \cdot n + p$.

Demonstration

$O_1 : 2^{\alpha+1} \cdot n + 1 \quad O_1 : x = 2^\alpha \cdot n \rightarrow f(x) = 3 \cdot 2^{\alpha-1} \cdot n + 1 < 2^{\alpha+1} \cdot n + 1 \quad O_1 : [\alpha \geq 1]$
 $\alpha = 1 \rightarrow 3n + 1 < 4n + 1 \quad O_1$ principal inequality

In O_2 we take into consideration just O_{2a} (O_2^* is perfectly similar)

$O_{2a} : 2^{\alpha+1} \cdot n + 11 \quad O_{2a} : y = 2^\alpha \cdot n + 5 \rightarrow f(y) = 3^2 \cdot 2^{\alpha-2} \cdot n + 13 \quad O_1 : x = 3^2 \cdot 2^{\alpha-3} \cdot n + 6 \rightarrow$
 $f(x) = 3^3 \cdot 2^{\alpha-4} \cdot n + 10 < 2^{\alpha+1} \cdot n + 11 \quad O_{2a} : [\alpha \geq 4]$
 $\alpha = 4 \rightarrow 27n + 10 < 32n + 11 \quad O_{2a}$ principal inequality

In O_3 we take into consideration just O_{3c} (O_{3a} , O_{3b} and O_{3c} are perfectly similar).

$$O_{3c} : 2^{\alpha+1} \cdot n + 15 \quad O_{3c} : z = 2^{\alpha} \cdot n + 7 \rightarrow f(z) = 3^3 \cdot 2^{\alpha-2} \cdot n + 53 \quad O_1 : x = 3^3 \cdot 2^{\alpha-3} \cdot n + 26 \rightarrow f(x) = 3^4 \cdot 2^{\alpha-4} \cdot n + 40 \\ \rightarrow 3^4 \cdot 2^{\alpha-5} \cdot n + 20 \rightarrow 3^4 \cdot 2^{\alpha-6} \cdot n + 10 < 2^{\alpha+1} \cdot n + 15 \quad O_{3c} : [\alpha \geq 6]$$

$$\alpha = 6 \rightarrow 81n + 10 < 128n + 15 \quad O_{3c} \text{ principal inequality}$$

... ..

3.1.1. Corollary

If a binomial inequality is valid for the horizon $2^{\alpha} \cdot n + p$ then it's valid for the horizon $2^{\alpha+i} \cdot n + p$ for every $i \in \mathbb{N}$

We use the principle of induction :

- (1) $i = 1 \rightarrow 2^{\alpha+1} \cdot n + p$ is true for Theorem of duplication
- (2) Supposed true $2^{\alpha+i} \cdot n + p$
- (3) $2^{\alpha+i+1} \cdot n + p = 2 \cdot (2^{\alpha+i} \cdot n + p) \sim 2^{\alpha+i} \cdot n + p$ (1) $\rightarrow 2^{\alpha+i} \cdot n + p$ is true (2) \rightarrow QED

3.2. Theorem of Independence

Statement

In every horizon $2^{\alpha} \cdot n + p$ the well-know term of the principal binomial inequality is independent of the term parametric from an appropriate exponent α onwards.

Demonstration

$$O_1 : 4k+1 \quad O_1 : k = \{1; 2; 3; \dots\} \\ 2^{\alpha} \cdot n + 4k + 1 \quad O_1 : x = 2^{\alpha-1} \cdot n + 2k \rightarrow f(x) = 3 \cdot 2^{\alpha-2} \cdot n + 3k + 1 < 2^{\alpha} \cdot n + 4k + 1 \quad O_1 : [\alpha \geq 2]$$

$$\alpha = 2 \rightarrow 3n + 3k + 1 < 4n + 4k + 1 \rightarrow 3(n+k) + 1 < 4(n+k) + 1 \quad O_1 \\ n = 0 \rightarrow 3k + 1 < 4k + 1 \quad O_1 \text{ principal inequality : } N(s) = 3$$

$$O_2^* : 16k+3 \quad O_2^* : k = \{1; 2; 3; \dots\} \\ 2^{\alpha} \cdot n + 16k + 3 \quad O_2^* : y = 2^{\alpha-1} \cdot n + 8k + 1 \rightarrow f(y) = 3^2 \cdot 2^{\alpha-3} \cdot n + 18k + 4 \rightarrow \\ 3^2 \cdot 2^{\alpha-4} \cdot n + 9k + 2 < 2^{\alpha} \cdot n + 16k + 3 \quad O_2^* : [\alpha \geq 4]$$

$$\alpha = 4 \rightarrow 9n + 9k + 2 < 16n + 16k + 3 \rightarrow 9(n+k) + 2 < 16(n+k) + 3 \quad O_2^* \\ n = 0 \rightarrow 9k + 2 < 16k + 3 \quad O_2^* \text{ principal inequality : } N(s) = 6$$

$$O_3^* : 32k-9 \sim 32k+23 \quad O_3^* : k = \{0; 1; 2; \dots\} \\ 2^{\alpha} \cdot n + 32k + 23 \quad O_3^* : z = 2^{\alpha-1} \cdot n + 16k + 11 \rightarrow f(z) = 3^3 \cdot 2^{\alpha-3} \cdot n + 108k + 80 \rightarrow 3^3 \cdot 2^{\alpha-4} \cdot n + 54k + 40 \rightarrow \\ 3^3 \cdot 2^{\alpha-5} \cdot n + 27k + 20 < 2^{\alpha} \cdot n + 32k + 23 \quad O_3^* : [\alpha \geq 5]$$

$$\alpha = 5 \rightarrow 27n + 27k + 20 < 32n + 32k + 23 \rightarrow 27(n+k) + 20 < 32(n+k) + 23 \quad O_3^* \\ n = 0 \rightarrow 27k + 20 < 32k + 23 \quad O_3^* \text{ principal inequality : } N(s) = 8$$

If $2k+1 \in O_{2a} \vee O_{3a} \vee O_{3b} \vee O_{3c}$ now we prove the theorem of independence for the most favorable cycles with the fewest number of steps. As it will be proved it's applicable to all other cycles.

$O_{2a} : 16k+11$ $O_{2a} : k = \{0; 1; 2; \dots\}$

$2^a \cdot n + 16k + 11$ $O_{2a} : y = 2^{a-1} \cdot n + 8k + 5 \rightarrow f(y) = 3^2 \cdot 2^{a-3} \cdot n + 18k + 13$ $[O_1] : k = 2k$

$2^a \cdot n + 16k + 11 \rightarrow 2^a \cdot n + 16(2k) + 11 = 2^a \cdot n + 32k + 11$ O_{2a}
 $3^2 \cdot 2^{a-3} \cdot n + 18k + 13 \rightarrow 3^2 \cdot 2^{a-3} \cdot n + 18(2k) + 13 = 3^2 \cdot 2^{a-3} \cdot n + 36k + 13$ $O_1 : x = 3^2 \cdot 2^{a-4} \cdot n + 18k + 6 \rightarrow$
 $f(x) = 3^3 \cdot 2^{a-5} \cdot n + 27k + 10 < 2^a \cdot n + 32k + 11$ $O_{2a} : [\alpha \geq 5]$

$\alpha = 5 \rightarrow 27n + 27k + 10 < 32n + 32k + 11 \rightarrow 27(n + k) + 10 < 32(n + k) + 11$ O_{2a}

 $x = 3^5 \cdot 2^{\alpha-7} \cdot n + 486k + 296 \rightarrow f(x) = 3^6 \cdot 2^{\alpha-8} \cdot n + 729k + 445$ [O] : $k = 2k$

$2^a \cdot n + 256k + 155$ $O_{2a} \rightarrow 2^a \cdot n + 256(2k) + 155 = 2^a \cdot n + 512k + 155$ O_{2a}
 $3^6 \cdot 2^{\alpha-8} \cdot n + 729k + 445 \rightarrow 3^6 \cdot 2^{\alpha-8} \cdot n + 729(2k) + 445 = 3^6 \cdot 2^{\alpha-8} \cdot n + 1458k + 445$ [O_1] : $k = 2k$

$2^a \cdot n + 512k + 155$ $O_{2a} \rightarrow 2^a \cdot n + 512(2k) + 155 = 2^a \cdot n + 1024k + 155$ O_{2a}
 $3^6 \cdot 2^{\alpha-8} \cdot n + 1458k + 445 \rightarrow 3^6 \cdot 2^{\alpha-8} \cdot n + 1458(2k) + 445 = 3^6 \cdot 2^{\alpha-8} \cdot n + 2916k + 445$ O_1 :
 $x = 3^6 \cdot 2^{\alpha-9} \cdot n + 1458k + 222 \rightarrow f(x) = 3^7 \cdot 2^{\alpha-10} \cdot n + 2187k + 334$ [O] : $k = 2k+1$

$2^a \cdot n + 1024k + 155$ $O_{2a} \rightarrow 2^a \cdot n + 1024(2k+1) + 155 = 2^a \cdot n + 2048k + 1179$ O_{2a}
 $3^7 \cdot 2^{\alpha-10} \cdot n + 2187k + 334 \rightarrow 3^7 \cdot 2^{\alpha-10} \cdot n + 2187(2k+1) + 334 = 3^7 \cdot 2^{\alpha-10} \cdot n + 4374k + 2521$ [O_1] : $k = 2k$

$2^a \cdot n + 2048k + 1179$ $O_{2a} \rightarrow 2^a \cdot n + 2048(2k) + 1179 = 2^a \cdot n + 4096k + 1179$ O_{2a}
 $3^7 \cdot 2^{\alpha-10} \cdot n + 4374k + 2521 \rightarrow 3^7 \cdot 2^{\alpha-10} \cdot n + 4374(2k) + 2521 = 3^7 \cdot 2^{\alpha-10} \cdot n + 8748k + 2521$ O_1 :
 $x = 3^7 \cdot 2^{\alpha-11} \cdot n + 4374k + 1260 \rightarrow f(x) = 3^8 \cdot 2^{\alpha-12} \cdot n + 6561k + 1891$ [O] : $k = 2k$ here we stop.

We could continue to go on for an infinity of steps, where O_1 is always presents, but its value doesn't becomes (never) less than that of O_{2a} . Only if we decide to go back is this possible; and is this possible if we choose [E] and not [O]. In fact:

$f(x) = 3^8 \cdot 2^{\alpha-12} \cdot n + 6561k + 1891$ [E] : $k = 2k+1$

$2^a \cdot n + 4096k + 1179$ $O_{2a} \rightarrow 2^a \cdot n + 4096(2k+1) + 1179 = 2^a \cdot n + 8192k + 5275$ O_{2a}
 $3^8 \cdot 2^{\alpha-12} \cdot n + 6561k + 1891 \rightarrow 3^8 \cdot 2^{\alpha-12} \cdot n + 6561(2k+1) + 1891 = 3^8 \cdot 2^{\alpha-12} \cdot n + 13122k + 8452 \rightarrow$
 $3^8 \cdot 2^{\alpha-13} \cdot n + 6561k + 4226 < 2^a \cdot n + 8192k + 5275$ O_{2a} [$\alpha \geq 13$]

$\alpha = 13 \rightarrow 3^8 \cdot n + 3^8 \cdot k + 4226 < 2^{13} \cdot n + 2^{13} \cdot k + 5275$ $O_{2a} \rightarrow 3^8 \cdot (n+k) + 4226 < 2^{13} \cdot (n+k) + 5275$ O_{2a}
 $n = 0 \rightarrow 3^8 \cdot k + 4226 < 2^{13} \cdot k + 5275$ O_{2a} principal inequality : $N(s) = 21$
 $n = k = 0 \rightarrow 4226 < 5275$ O_{2a} nude number.

Another cycle of link with an infinite number of steps managed in this way:

$$O_{3b} \rightarrow E \rightarrow O_3 \rightarrow O_1 \rightarrow O_3 \rightarrow O_1 \rightarrow \dots \dots \rightarrow E \rightarrow \dots \dots$$

$$2^a \cdot n + 32k + 7 \text{ } O_{3b} : z = 2^{\alpha-1} \cdot n + 16k + 3 \rightarrow f(z) = 3^3 \cdot 2^{\alpha-3} \cdot n + 108k + 26 \rightarrow 3^3 \cdot 2^{\alpha-4} \cdot n + 54k + 13 \text{ } [O_3] : k = 4k + 3$$

$$2^a \cdot n + 32k + 7 \text{ } O_{3b} \rightarrow 2^a \cdot n + 32(4k + 3) + 7 = 2^a \cdot n + 128k + 103 \text{ } O_{3b} \\ 3^3 \cdot 2^{\alpha-4} \cdot n + 54k + 13 \rightarrow 3^3 \cdot 2^{\alpha-4} \cdot n + 54(4k + 3) + 13 = 3^3 \cdot 2^{\alpha-4} \cdot n + 216k + 175 \text{ } O_3 : z = 3^3 \cdot 2^{\alpha-5} \cdot n + 108k + 87 \rightarrow \\ f(z) = 3^6 \cdot 2^{\alpha-7} \cdot n + 729k + 593 \text{ } [O] : k = 2k$$

$$2^a \cdot n + 128k + 103 \text{ } O_{3b} \rightarrow 2^a \cdot n + 128(2k) + 103 = 2^a \cdot n + 256k + 103 \text{ } O_{3b} \\ 3^6 \cdot 2^{\alpha-7} \cdot n + 729k + 593 \rightarrow 3^6 \cdot 2^{\alpha-7} \cdot n + 729(2k) + 593 = 3^6 \cdot 2^{\alpha-7} \cdot n + 1458k + 593 \text{ } [O_1] : k = 2k$$

It is clear and evident that there are an infinity of possible combinations of connections in the cycles of links which could contain an infinite number of steps. So, by the procedure applied above, it's proved that Collatz Conjecture is a sort of *Circle Quadrature*, and Independence Theorem allows us to manage the cycles of links as we like. So, chosen an odd number $p \in \mathbb{O}$ we can associate the horizon $2^k \cdot n + p$ to it. By formulas plan of Theorem 2n+1 we can calculate $3^h \cdot n + q < 2^k \cdot n + p$ and the number of steps needed to move from the main horizon $2^k \cdot n + p$ to its lower horizon $3^h \cdot n + q$: $N(s) = h + k$.

Test of some binomial inequalities in General List by Theorem of Independence

$$N(s) = 8 : 27n + 20 < 32n + 23 \text{ O}_{3^*}$$

$$2^k \cdot n + 23 \text{ O}_{3^*} : z = 2^{k-1} \cdot n + 11 \rightarrow f(z) = 3^3 \cdot 2^{k-3} \cdot n + 80 \rightarrow 3^3 \cdot 2^{k-4} \cdot n + 40 \rightarrow$$

Of course in the cycle of link of 27 we could apply Independence Theorem and formulas plan Theorem $2n+1$, but in this case we would have lost some of the internal binomial inequalities.

3.3.2. Applications Independence Theorem

We apply Theorem of Independence to odd numbers in O_{2a} ; O_{3a} ; O_{3b} ; O_{3c} . We don't take into consideration O_1 ; O_2^* ; O_3^* because they are completely covered by their own respective binomial inequalities.

$$\text{Remembering : } \begin{cases} x = \frac{n-1}{2} \rightarrow f(x) = \frac{3x+2}{2} : N(s) = 3 \\ y = \frac{n-1}{2} \rightarrow f(y) = \frac{9y+7}{4} : N(s) = 5 \\ z = \frac{n-1}{2} \rightarrow f(z) = \frac{27z+23}{4} : N(s) = 6 \end{cases}$$

$n = 2407$

16n+11 = 38523 O_{2a}

3.4. Big Bang and Big Crunch

Maybe the cycles of the links of the SC (CC) represents a possible kind of law on expansion of Cosmos called BIG BANG. Starting from 1 we reach very high and very large horizons. As we saw BIG CRUNCH is always possible, but BIG BANG has no End.

BIG BANG :

$$1 \rightarrow 2 \rightarrow 4 \rightarrow 16 \rightarrow 32 \rightarrow 128 \rightarrow 256 \rightarrow 1024 \rightarrow 4096 \rightarrow 8192 \rightarrow 2^{15} \rightarrow 2^{16} \rightarrow 2^{18} \rightarrow \dots \rightarrow 2^{21} \rightarrow 2^{23} \rightarrow 2^{24} \rightarrow \dots \rightarrow 2^{27} \rightarrow 2^{29} \rightarrow 2^{31} \rightarrow \dots \rightarrow 2^{35} \rightarrow \dots \rightarrow 2^{40} \rightarrow 2^{42} \rightarrow \dots \rightarrow 2^{45} \rightarrow \dots \rightarrow 2^{51} \rightarrow \dots \rightarrow 2^{54} \rightarrow 2^{56} \rightarrow \dots \rightarrow 2^{59} \rightarrow \dots \rightarrow 2^{77} \rightarrow \dots \rightarrow 2^{89} \rightarrow \dots \rightarrow 2^k \rightarrow \dots \rightarrow \infty$$

Where ... are occupied by 2^k of the cycles of links to us still unknown.
Increment of $k = 1$ or 2 .

BIG CRUNCH :

$$3^h \rightarrow 3^{h-1} \rightarrow 3^{h-2} \rightarrow 3^{h-3} \rightarrow \dots \rightarrow 3^{37} \rightarrow 3^{36} \rightarrow 3^{35} \rightarrow 3^{34} \rightarrow 3^{33} \rightarrow \dots \rightarrow 3^{20} \rightarrow 3^{19} \rightarrow 3^{18} \rightarrow \dots \rightarrow 3^{12} \rightarrow 3^{11} \rightarrow 3^{10} \rightarrow 3^9 \rightarrow 6561 \rightarrow 2187 \rightarrow 729 \rightarrow 243 \rightarrow 81 \rightarrow 27 \rightarrow 9 \rightarrow 3 \rightarrow 1$$

Decrease of h always 1 .

3.5. Final Proof

We have seen that SC is a sort of *Circle Quadrature*, and this paper proves that is not possible to arrive 100% coverage of \mathbb{N} by binomial inequalities. So, CC is not completely demonstrable, but we can claim that its initial statement is true, in fact:

$$\text{For any } \Theta(m) = 2^k \cdot n + p ; \text{ there is } \Theta(l) = 3^h \cdot n + q : \begin{cases} h < k \\ q < p \end{cases} : \Theta(l) < \Theta(m)$$

This is guaranteed from Theorem $2n+1$ and its addition as well as Theorem of Independence.

Hence there exists $a_n \in S(2n+1) : a_n < 2n+1$ after $N(s) = h + k$ steps.

Since exists $a_n \in S(2n) : a_n < 2n$ after $N(s) = \text{one step} : 2n \rightarrow n$. Being $E \cup O = \mathbb{N}$.

So every $n \in \mathbb{N}$ falls down to 1 !!! \rightarrow QED

3.6. Conclusion

Odd generating numbers in O_1 becomes less than itself after one application of Theorem $2n+1$. So also it is for odd generating numbers in O_2^* of type $16n+3$. So also it is for odd generating numbers in O_3^* of type $32n-9 \sim 32n+23$. For the others odd generating numbers in $O_2 - O_2^*$ of type $16n+11$ O_{2a} and in $O_3 - O_3^*$ of type $32n-1 \sim 32n+31$ O_{3a} ; $32n+7$ O_{3b} ; $32n+15$ O_{3c} ; Theorem $2n+1$ must be iterated two, three, or more times, or very many times, until the odd generating number becomes lesser than itself. In this way the blanks in the following pattern they fill more and more with grey almost to complete the set \mathbb{N} .

4. Appendices

The following appendices are added because Collatz Conjecture could be taught in High Schools successfully and student interest.

4.1. The labyrinth of Syracuse

We have seen how the endless successions generated by algorithm of Collatz are an inextricable labyrinth of numbered rooms, in which it seems impossible to find the exit; but the applications of Theorem $2n+1$ and Independence Theorem allow us to find always the exit, standing in any room of this maze that we will call: Labyrinth of Syracuse.

Strategy to exit labyrinth of Syracuse as we stand in room number 99.

Strategy to exit labyrinth of Syracuse as we stand in room number 1947.

Main observations

In all cycles of links, the final cycle (last five elements = four steps) to exit from labyrinth of Syracuse is: $\{10; 5; 4; 2; 1\}$; or $\{7; 5; 4; 2; 1\}$; unless in the cycle appears an even number like that

of kind 2^p , or an odd number of type $(4^p-1)/3$. In this case the subsequent steps are evaluable *a priori*, and the last five element are: $16 \rightarrow 8 \rightarrow 4 \rightarrow 2 \rightarrow 1 = \{16; 8; 4; 2; 1\}$.

Another final cycle in cycles of links is $\{12; 6; 3; 2; 1\}$. This cycle is anomalous, since it appears only if the generating numbers are of type $n = 3 \cdot 2^p \in I(3) = \{3; 6; 12; 24; 48; 96; 192; \dots; 3 \cdot 2^p\}$. The $n \in I(3)$ do not appear in any other iterative cycle. Not in those generated by even numbers, in fact: if $n \in E$, then $n \rightarrow n/2$, if $n/2 = 3 \cdot 2^p : n = 2 \cdot 3 \cdot 2^p = 3 \cdot 2^{p+1} \in I(3)$. Not in those generated by odd numbers; in fact if $n \in O$ then $n \rightarrow 3n+1$, if $3n+1 = 3 \cdot 2^p : n = (3 \cdot 2^p - 1)/3 = 2^p - 1/3$ which is impossible. The only odd number in $I(3)$ is 3, which generates the sequence: $3 \rightarrow 10 \rightarrow 5 \rightarrow 16 \rightarrow 8 \rightarrow 4 \rightarrow 2 < 3$. In the labyrinth of Syracuse this anomalous cycle, up value 3, can be considered as an infinite sequence of even rooms, numbered one double of the other, aligned in a long hallway perfectly straight that is not connected to any other room of the maze. In the metaphor of the descent to the sea described in the following paragraph, instead, it can be interpreted in such a river that flows into the sea without having any tributaries or being affluent. For $n \geq 3$ all sequences generated by $n = 3 \cdot 2^p \in I(3)$ are monotone decreasing such that $a_n = a_{n-1}/2$. If, for example, the generating number is $n = 3 \cdot 2^{10} = 3072$ we have $S(3072) = \{3072; 1536; 768; 384; 192; 96; 48; 24; 12; 6; 3\}$.

4.2. Descent to the sea

Instead of using the metaphor of the labyrinth, we use that of the descent to the sea, the examples are translated into graphs. It should be borne in mind that the final cycle $\{10; 5; 4; 2; 1\}$ is done in 6 steps, since $\Theta(5)$ passes to $\Theta(4)$ in three steps, while the final cycle $\{7; 5; 4; 2; 1\}$ is accomplished in 16 steps, since $\Theta(7)$ passes to $\Theta(5)$ in 11 steps and, as we already said, $\Theta(5)$ passes to $\Theta(4)$ in three steps. For convenience these end cycles are represented by a single line section, one step.

Graph of the descent to the sea from the main horizon $\Theta(m) = 101$. This arrives at the sea in 6 steps instead of 25.

In this way we can arrive at the sea level from highest heights, greatly reducing the number of steps and remaining always below the main horizon.

4.3. The skyscraper

If we wanted to get off on the first floor of a very high skyscraper finding ourselves on the 63rd floor, we should follow a clear strategy in pressing the buttons of the elevator, otherwise we will

continue to go down and climb up again until to reach the 9232rd floor. Instead, using the method of the cycles of links, we know that we have to press the button 61 of the lift control panel. And then the button 46. And then the button 23. Since we already know the cycle of the links of number 23, we will get off on the first floor (1) with ease and from there, with the stairs, we will reach the ground floor. If we do not follow this strategy we would be forced to stay locked in the elevator, going up and down, for 107 floors. This is the summarized strategy.
