M – theory

Chonnam National University, Name: Min-Young Yun  
e-mail: ymy008@naver.com, Phone: 010-6462-4125. 
Department: Mechanical Engineering system

Abstract

The behavior of smallest unit that creating from superstring and quark is indeterminate, but can be described as one equation according to macroscopic-rules.

So, it is easy to understand in all ages and countries, at any times and places. Newborns speak out the easiest word 'Mom' at the first time they speaking, which Decided the title of the theory.¹)

¹) 2000 Mathematics Subject Classification  
00A69 (Applied Mathematics, General applied mathematics For physics)

Key words and phrases:  
Superstring, Bernoulli number, Riemann \( \zeta \) function

1. Introduction

1. Quantum hypothesis

Planck's law of black-body radiation

\[ u = \int_0^\infty u(\nu) d\nu = \int_0^\infty \frac{8\pi h\nu^3}{c^3} \cdot \frac{1}{e^{\frac{h\nu}{kT}} - 1} d\nu \]

\[ \int_0^\infty \frac{\nu^3}{e^{\frac{h\nu}{kT}} - 1} d\nu = \int_0^\infty \frac{x^3}{e^x - 1} dx = \Gamma(4) \zeta(4) = \frac{\pi^4}{15} \]

\[ = \frac{8\pi^5 k^4}{15 c^3 h^3} T^4 = \sigma T^4 \]

Bose–Einstein statistics: \( n_i = \frac{g_i}{e^{(e-\mu)/kT} - 1} \)

Fermi–Dirac statistics: \( n_i = \frac{g_i}{e^{(E-E_F)/kT} + 1} \)
2. Quantum field theory

- Riemann - Riemann geometry - General Relativity

Einstein field equation

\[ R_{ik} - \frac{g_{ik} R}{2} + \Lambda g_{ik} = \frac{8\pi G}{c^4} T_{ik}, \quad \Lambda = \frac{8\pi G}{3c^2} \rho \]

- Bernoulli - Probability - Uncertainty principle

Uncertainty principle

\[ \Delta x \Delta p \geq \frac{\hbar}{2\pi}, \quad \hbar = 6.62606896 \times 10^{-34} \text{ kg} \cdot \text{m}^2/\text{s} \]

\[ (E = mc^2) + (i \hbar \frac{\partial \psi}{\partial t}) = -\frac{\hbar^2}{2m} \nabla^2 \psi + V\psi = (\nabla^2 - \frac{1}{c^2 \partial t^2}) \psi = \frac{m^2 c^2}{\hbar} \psi \]
3. Superstring theory

The deepest problem in theoretical physics is harmonizing the theory of general relativity, which describes gravitation and applies to large-scale structures (stars, galaxies, super clusters), with quantum mechanics, which describes the other three fundamental forces acting on the atomic scale.

Solved Superstring theory is an attempt to explain all of the particles and fundamental forces of nature in one theory by modelling them as vibrations of tiny supersymmetric strings.

Numerical Dimension 2nd Unit \( C(\mathbb{R},i) \)

\[ x_1 \neq x_2 \neq x_3 \neq \cdots \neq x_n \]

\[
\lim_{n \to \infty} x_1 + x_2 + \cdots + x_n = x_1 + x_2 + \cdots 1 + 2 + 3 + \cdots + x_n \\
= 1 + 2 + 3 + \cdots + x_1 + x_2 + \cdots + n \\
\therefore x_1 + x_2 + \cdots + x_n = \sum_{k=1}^{n} k
\]

Ordinary Differential Equation
2. Rules of the universe – the universe equations

1. Derivation of Space equation

Through the natural process of emerging rules

Cosmic dust, grains of one, two each gathered a set of mathematical expressions in the rules. \(1 + 1 + 1 + \cdots = n\) is a set of grains of dust \(n\) the one character you can switch to algebra.

\[
\sum_{k=1}^{n} k = 1 + 2 + 3 + 4 + \cdots + n = \frac{1}{2}n^2 + \frac{1}{2}n
\]

For example, \(\frac{1}{2}n^2 + \frac{1}{2}n\) \(n = 3\) the assignment \(\frac{9}{2} + \frac{3}{2} = 6\)

\(1 - 3\) is the sum of those numbers.

\[
\sum_{k=1}^{n} k^2 = 1^2 + 2^2 + 3^2 + 4^2 + \cdots + n^2 = \frac{1}{3}n^3 + \frac{1}{2}n^2 + \frac{1}{6}n
\]

\[
\sum_{k=1}^{n} k^3 = 1^3 + 2^3 + 3^3 + 4^3 + \cdots + n^3 = \frac{1}{4}n^4 + \frac{1}{2}n^3 + \frac{1}{4}n^2 + 0 \cdot n
\]

\[
\sum_{k=1}^{n} k^4 = \frac{1}{5}n^5 + \frac{1}{2}n^4 + \frac{1}{3}n^3 + 0 \cdot n^2 - \frac{1}{30}n
\]

\[
\sum_{k=1}^{n} k^5 = \frac{1}{6}n^6 + \frac{1}{2}n^5 + \frac{5}{12}n^4 + 0 \cdot n^3 - \frac{1}{12}n^2 + 0 \cdot n
\]

\[
\sum_{k=1}^{n} k^6 = \frac{1}{7}n^7 + \frac{1}{2}n^6 + \frac{1}{2}n^5 + 0 \cdot n^4 - \frac{1}{6}n^3 + 0 \cdot n^2 + \frac{1}{42}n
\]

\[\vdots\]

\[
\sum_{k=1}^{n} k^x\]

represents the inductive.
\[
\sum_{k=1}^{n} k^x = \frac{1}{x+1} n^{x+1} + \frac{1}{2} n^x + x P_1 \frac{1}{12} n^{x-1} - x P_3 \frac{1}{720} n^{x-3} \\
+ x P_5 \frac{1}{30240} n^{x-5} - x P_7 \frac{1}{1209600} n^{x-7} + \ldots \\
+ x \frac{P_{2s-1}}{(2s)!} 4 \sqrt{\pi s} \left( \frac{s}{\pi e} \right)^{2s} n^{x-2s+1}
\]

The program using a complex formula \( \sum_{k=1}^{n} k^x \) rank, \( a_{x,s} = f(x,s) \) was represented as a graph.

\[
\sum_{k=1}^{n} k \sim \sum_{k=1}^{n} k^{10}
\]

Represented by three-dimensional graphs (Excel file attached)
\[\sum_{k=1}^{n} k^{11} \sim \sum_{k=1}^{n} k^{25}\]

Represented by three-dimensional graphs (Excel file attached)

\[\sum_{k=1}^{n} k^{26} \sim \sum_{k=1}^{n} k^{50}\]
Because the value is too large relative to 0–35 parts linear (laminar), but expanded to look at all the cigarette smoke (turbulent flow) of the same patterns are intended.

\[

\[
\sum_{k=1}^{n} k^{25}
\]

Graphs (Excel file attached)

\[
\sum_{k=1}^{n} k^{50}
\]

Graphs (Excel file attached)
Each of the universe exists at least one ranked number (molecules – Atomic – particles (quark, string) – ?2) and all particles are affect each other number represented by the power.

The random is entered as a chaos($\frac{1}{x+1} n^{x+1}, n^x, \frac{xn^{x-1}}, x(x-1)(x-2)n^{x-3}$)

(indeterminate behavior, similar to the concept of human free will)

where ($\frac{1}{2}, \frac{1}{12}, \frac{1}{720}, \frac{1}{30240}, \frac{1}{1209600} \cdots$)3) is any random number devide cosmic rules. (The probability that the regulatory nature of substance)

ex: any number divided by two others (0, 1) 2, any number divided by 12 others (0, 1, 2 ⋯, 11) 12 there

Chaos (the random input) and
Cosmos (with all the random sharing rule)
that the Harmony

Universe has indeterminate and macroscopic rules.

---

2) The smallest Exist(?) is Timespace $(m,s)$

3) ($\frac{1}{2} + \frac{1}{12} - \frac{1}{720} + \frac{1}{30240} - \frac{1}{1209600} + \cdots$) = 1 The sum of the numbers 1
Under the final $\sum_{k=1}^{n}k^x$ 3 expression is same expression.

The first representation

$$(\pi, e \text{ is universal language})$$

$$\sum_{k=1}^{n}k^x = \frac{1}{x+1} n^{x+1} + \frac{1}{2} n^x + x P_1 \frac{1}{12} n^{x-1} - x P_3 \frac{1}{720} n^{x-3} + x P_5 \frac{1}{30240} n^{x-5} - x P_7 \frac{1}{1209600} n^{x-7} + x P_9 \frac{1}{47900160} n^{x-9} - x P_{11} \frac{691}{1307674368000} n^{x-11} + x P_{13} \frac{1}{74724249600} n^{x-13} \ldots$$

$$- x P_{s-1} \frac{2 \sqrt{2\pi s} \left(\frac{s}{2\pi i e}\right)^s \zeta(s) (1 + \frac{1}{12s} + \frac{1}{288s^2} - \cdots) n^{x-s+1} \text{ for } s \geq 4} \frac{1}{s!}$$

\[\star\text{Stirling formula}\]

$$n! = \sqrt{2\pi n} \left(\frac{n}{e}\right)^n (1 + \frac{1}{12n} + \frac{1}{288n^2} - \frac{139}{51840n^3} - \cdots) \approx \sqrt{2\pi n} \left(\frac{n}{e}\right)^n$$

$$e^n = \sqrt{2\pi n} \frac{n^n}{n!} (1 + \frac{1}{12n} + \frac{1}{288n^2} - \frac{139}{51840n^3} - \cdots)$$

$$\frac{1}{\sqrt{2\pi n}} \left(\frac{e}{n}\right)^n n! = (1 + \frac{1}{12n} + \frac{1}{288n^2} - \frac{139}{51840n^3} - \cdots)$$
Second representation

The first organized expression, let the number of Bernoulli with Bernoulli's representation.

\[ \sum_{k=1}^{n} k^x = \frac{1}{x+1} n^{x+1} + \frac{1}{2} n^x + \frac{x C_1}{6} n^{x-1} - \frac{x C_3}{30} n^{x-3} + \frac{x C_5}{6} \frac{1}{42} n^{x-5} - \frac{x C_7}{8} \frac{1}{30} n^{x-7} + \frac{x C_9}{10} \frac{5}{66} n^{x-9} - \frac{x C_{11}}{12} \frac{691}{2730} n^{x-11} + \frac{x C_{13}}{14} \frac{7}{6} n^{x-13} - \frac{x C_{15}}{16} \frac{3617}{510} n^{x-15} + \frac{x C_{17}}{18} \frac{43867}{978} n^{x-17} - \ldots + \frac{x C_{2s-1}}{2s} B_s n^{x-2s+1} \]

5) \( \bullet B_n \) Bernoulli number

\[
\begin{align*}
B_1 &= \frac{1}{6} \\
B_2 &= \frac{1}{30} \\
B_3 &= \frac{1}{42} \\
B_4 &= \frac{1}{30} \\
B_5 &= \frac{5}{66} \\

B_{18} &= \frac{26,315,271,553,053,477,373}{1,919,190} \\
B_{19} &= \frac{2,929,993,913,841,559}{6} \\
B_{20} &= \frac{261,082,718,496,449,122,051}{135,30}
\end{align*}
\]
Third representation

Riemann zeta function $\zeta(2n)$ use is expressed as $2\pi$.
Disc-shaped space is most useful to understand the feeling.

Through $2\pi$ then 12, 720, 30240 \ldots are
Periodically, Geometric mean will contain.

$$\sum_{k=1}^{n} k^x = \frac{1}{x + 1} n^{x+1} + \frac{1}{2} n^x + xP_1 \frac{\pi^2}{6} n^{x-1} - xP_3 \frac{2}{(2\pi)^4} \frac{\pi^4}{90} n^{x-3}$$
$$+ xP_5 \frac{2}{(2\pi)^6} \frac{\pi^6}{945} n^{x-5} - xP_7 \frac{2}{(2\pi)^8} \frac{\pi^8}{9450} n^{x-7}$$
$$+ xP_9 \frac{2}{(2\pi)^{10}} \frac{\pi^{10}}{93555} n^{x-9} - xP_{11} \frac{2}{(2\pi)^{12}} \frac{691\pi^{12}}{638512875} n^{x-11}$$
$$+ \ldots + xP_{2s-1} \frac{2}{(2\pi)^{2s}} \zeta(2s) \cdot n^{x-2s+1}_{65)}$$

6) $\star (2n)$ Riemann zeta function

$$\zeta(n) = \prod_{p} \frac{1}{1-p^{-n}}, \zeta(n) = \sum_{k=1}^{n} \frac{1}{k^n} = 1 + \frac{1}{2^n} + \frac{1}{3^n} + \frac{1}{4^n} \ldots$$

$\zeta(1) = \sum_{k=1}^{\infty} \frac{1}{k} = 1 + \frac{1}{2} + \frac{1}{3} + \ldots = \infty$ Harmonic-s $\zeta(2) = \sum_{k=1}^{\infty} \frac{1}{k^2} = 1 + \frac{1}{2^2} + \frac{1}{3^2} + \ldots = \frac{\pi^2}{6}$

$\zeta(3) = \sum_{k=1}^{\infty} \frac{1}{k^3} = 1 + \frac{1}{2^3} + \frac{1}{3^3} + \ldots = 1.202 \ldots$ $\zeta(4) = \sum_{k=1}^{\infty} \frac{1}{k^4} = 1 + \frac{1}{2^4} + \frac{1}{3^4} + \ldots = \frac{\pi^4}{90}$

$\zeta(5) = \sum_{k=1}^{\infty} \frac{1}{k^5} = 1 + \frac{1}{2^5} + \frac{1}{3^5} + \ldots = 1.036 \ldots$ $\zeta(6) = \sum_{k=1}^{\infty} \frac{1}{k^6} = 1 + \frac{1}{2^6} + \frac{1}{3^6} + \ldots = \frac{\pi^6}{945}$

$\zeta(7) = \sum_{k=1}^{\infty} \frac{1}{k^7} = 1 + \frac{1}{2^7} + \frac{1}{3^7} + \ldots = 1.0083 \ldots$ $\zeta(8) = \sum_{k=1}^{\infty} \frac{1}{k^8} = 1 + \frac{1}{2^8} + \frac{1}{3^8} + \ldots = \frac{\pi^8}{9450}$

$\zeta(9) = \sum_{k=1}^{\infty} \frac{1}{k^9} = 1 + \frac{1}{2^9} + \frac{1}{3^9} + \ldots = 1.0020 \ldots$ $\zeta(10) = \sum_{k=1}^{\infty} \frac{1}{k^{10}} = 1 + \frac{1}{2^{10}} + \ldots = \frac{\pi^{10}}{93555}$

$\zeta(11) = \sum_{k=1}^{\infty} \frac{1}{k^{11}} = 1 + \frac{1}{2^{11}} + \ldots = 1.0004 \ldots$ $\zeta(12) = \sum_{k=1}^{\infty} \frac{1}{k^{12}} = 1 + \frac{1}{2^{12}} + \ldots = \frac{691\pi^{12}}{638512875}$
The final expression

Complex area, expand the ultimate appearance.
Imaginary area $i$ is 0 odd term was represented in complex space.

$$\sum_{k=1}^{n} k^x = \frac{1}{x+1} n^x + \frac{1}{2} n^x - x P_1 \frac{2}{(2\pi i)^2} \frac{(2\pi)^2}{24} n^{x-1}$$

Understanding of the Imaginary number \( i \)

\[ e^{i\pi} + 1 = 0 \] Euler's equation. \( e^{i\pi} = -1 \), To take root on both sides

\[ e^{\frac{\pi}{2}i} = i \]. If you take the reciprocal \( e^{-\frac{\pi}{2}i} = \frac{1}{i} = -i \)

\[ -\frac{\pi}{2}i = \infty = \zeta(1) = 1 + \frac{1}{2} + \frac{1}{3} + \ldots = -\frac{\pi}{2}i \]

\[ 0 = \frac{1}{2}n^x - xP_1\frac{2}{(2\pi i)^2} \cdot \frac{(2\pi)^2}{24}n^{x-1} \]

\[ \quad - xP_2\frac{2}{(2\pi i)^3} \cdot \zeta(3)n^{x-2} - xP_3\frac{2}{(2\pi i)^4} \cdot \frac{(2\pi)^4}{1440}n^{x-3} - \ldots \]

\[ \quad - xP_{s-1} \cdot \frac{2}{(2\pi i)^s} \cdot \zeta(s) \cdot n^{x-s+1} \]

\[ 0 = -xP_0\frac{2}{(2\pi i)^1} \zeta(1)n^x - xP_1\frac{2}{(2\pi i)^2} \cdot \frac{(2\pi)^2}{24}n^{x-1} \]

\[ \quad - xP_2\frac{2}{(2\pi i)^3} \cdot \zeta(3)n^{x-2} - xP_3\frac{2}{(2\pi i)^4} \cdot \frac{(2\pi)^4}{1440}n^{x-3} - \ldots \]

\[ \quad - xP_{s-1} \cdot \frac{2}{(2\pi i)^s} \cdot \zeta(s) \cdot n^{x-s+1} \]

Quantum mechanics and the imaginary number :

\[ i\hbar \frac{\partial \psi}{\partial t} = -\frac{\hbar^2}{2m} \nabla^2 \psi + V\psi \quad \text{Schrodinger equation} \]

Fractal and imaginary number :

\[ z_{n+1} = z_n^2 + c \quad (c \text{ is Complex}) \quad \text{Mandelbrot set} \]

Bernoulli number and Fractal :

\[ \frac{1}{n} \Delta B_k(x) = B_{k-1}(x) \]

\[ B_{2n}(x) = B_n(x)^2 + c \]
2. Numerical analysis of the Space equation

The first representation is easy to understand and examine the representation of numbers

\[
\sum_{k=1}^{n} k^x = \frac{1}{x+1} n^{x+1} + \frac{1}{2} n^x + \frac{x}{12} n^{x-1} - \frac{x(x-1)(x-2)}{720} n^{x-3} \\
+ \frac{x(x-1)(x-2)(x-3)(x-4)}{30240} n^{x-5} \\
- \frac{x(x-1) \cdots (x-6)}{1209600} n^{x-7} + \cdots \\
+ \frac{x P_{s-1}}{s!} 2 \sqrt{\pi} s \left( \frac{s}{2 \pi i e} \right)^s n^{x-s+1} \\
= x P_{s-1} \cdot \frac{2}{(2 \pi i)^s} \cdot \zeta(s) \cdot n^{x-s+1}
\]

Appears natural constants

\[
2, 12, 720, 30240, 1209600 \cdots \frac{s!}{2 \sqrt{2 \pi} s \left( \frac{s}{2 \pi i e} \right)^s} \cdots \frac{(2s)!}{4 \sqrt{\pi} s \left( \frac{s}{\pi i e} \right)^{2s}}
\]
Mathematical constant (the natural constants)
\[
2, 12, 720, 30240, 1209600 \cdots \frac{(2s)!}{4 \sqrt{\pi s} \left( \frac{s}{\pi e} \right)^{2s}}
\]

Look forward in the feature space 2, 12, 720, e, \( \pi \).
12, 720 are listed as represented by the Riemann zeta function and the periodic nature of \( 2\pi \)

\[ 2 \] Super string, Double helix, All atoms (+, -), Vibrational properties of all materials, Males and females (all creatures)

\[ 12 \] Complete harmony, the symbol of the life cycle of the universe, (source: http://ko.wikipedia.org/wiki/12)
Face-centered cubic lattice (FCC), Any life that included the \( C_{12} \), Any sound can be represented by 12rule\(^7\), 12 kinds of human activity patterns Astrology Category\(^8\)

\[
\text{string mass moment of inertia} = \frac{1}{12} ML^2
\]
12 types of quark particles (6 quark and 6 antiquark), 12month
\[
\sum_{n=1}^{\infty} n = 1 + 2 + 3 + \cdots = -\frac{1}{12} \quad \text{Ramanujan's theorem}
\]
Human synthetic 12 amino acid types by Double helix

\[ 720 \] \( C_{60} \) Fullerenes, 360 days \( \cong 1 \) years, Mesopotamia 60 base, the sexagenary cycle, Angle of a circle\( 360^\circ \)

\(^8\) Western Palace 12 zodiacal constellations, East 12cycle
Mathematical statistics applied

1. **Normal distribution**

\[
f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-m)^2}{2\sigma^2}} N(m,\sigma^2)
\]

Normal distribution of height, weight, longevity, intelligence, and rainfall, and various physical values, sales of certain products, etc. All the standard normal distribution follows the distribution of

ex: 1. South Korea Men's average height 173cm, 180cm is 12% of the distribution

2. The average human IQ is 100. IQ 148 than 2%

2. **Poisson distribution**

\[
f(x) = \frac{e^{-\lambda} \lambda^x}{x!} (\lambda > 0, x = 0,1,2,\ldots)
\]

Poisson distribution is very frequently used in mathematical statistics

- What caused the page to complete a single incidence of typo.

ex: Which one page paper will occur on average five times a typo.

On page 8 is a single typo is a probability that

\[
P(X=8) = \frac{e^{-5.58}}{8!} = 0.0652 = 6.5%
\]

- The number of persons born during the day caused

- What specific amount of radiation exposure to DNA mutations that occur when the number of

3. **Gamma distribution**

\[
f(x) = \frac{1}{\Gamma(\alpha)} \lambda^\alpha x^{\alpha-1} e^{-\lambda x}
\]

\(\alpha = \) The number of times a particular event occurs, \(\lambda = \) Average hours per case to occur the number of

ex: global game of starcraft average number of connections per second, six people. 4 people have access to more than 1 second to wait until the odds?

\[
P(X \geq 1) = \int_1^\infty \frac{1}{\Gamma(4)} 6^4 x^3 e^{-6x} dx = 0.1512 = 15.1%
\]

All three kinds of distributions are transformed with the principle of normal distribution.
\[ \sum_{k=1}^{n} k^x \quad \text{Derivation of the standard normal distribution} \]

Principle: Bernoulli binomial distribution were induced to take limit. (Gauss)

\[
\frac{s!}{2 \sqrt{2\pi s} \left( \frac{s}{2\pi i e} \right)^s} = \frac{s!}{2 \sqrt{2\pi s} \left( \frac{2\pi i e}{s} \right)^s} = \frac{(2\pi i)^s}{2 \cdot \zeta(s)}
\]

\[
= \frac{(2\pi i)^s}{2} = \frac{s!}{2} \left( \frac{2\pi i}{s} \right)^s \frac{1}{\sqrt{2\pi s}} e^s
\]

Normal distribution \( f(x) = \frac{1}{\sqrt{2\pi \sigma^2}} e^{-\frac{(x-m)^2}{2\sigma^2}} N(m, \sigma^2) \)

Physical application

Molecular speed: Maxwell – Boltzmann distribution

\[
f(v) = 4\pi \left( \frac{m}{2\pi k T} \right)^{\frac{3}{2}} v^2 e^{-\frac{mv^2}{2kT}} \quad \Rightarrow \quad \epsilon = \frac{1}{2} mv^2
\]

\[
f(v) = \frac{8\pi}{m} \left( \frac{m}{2\pi k T} \right)^{\frac{3}{2}} \epsilon \cdot e^{-\frac{\epsilon}{2kT}} = \frac{2\epsilon}{kT} \sqrt{\left( \frac{\epsilon}{2\pi k T} \right)} e^{-\frac{\epsilon}{2kT}}
\]

\[ \lim_{n \to \infty} \zeta(n) = 1 \]
The boundaries of life and material
(source: Wikipedia http://ko.wikipedia.org/wiki/%EC%83%9D%EB%AA%85)

Total Current Biology in 2009 the definition of life
Biological view, the following attributes of life but is not as rigid.

Based on the metabolism definition
1. Grow
2. To metabolism
3. Adaptation
4. Reproduction
5. Response to stimuli

If the above criteria, strictly applied the following problems occur.
1. The fire can be alive.
2. Mules, so that fertility can not be alive.
3. The virus does not grow outside the host cell can reproduce, so that you can not really alive.

Biologists to study life on Earth a living creature that showed the following symptoms

Living the life of carbohydrates, lipids, nucleic acids, proteins, and possess the same ingredients.
To survive, living organisms require both energy and materials.
The living organisms are made up of one or more cells.
Should always maintain a living creature.
Species of living organisms to evolve.
Consisting of all life on Earth as an organism is comprised of carbon.
Some people are all creatures of the universe in all of these points would see things that others, the symptoms 'carbon chauvinism' is called.

If there are boundaries of material life and the universe, biological equations to express the esophagus, the substance is to create a separate equation.
However, the boundaries of life and matter are not clear.
3. Cosmology

1. Applying a mathematical proof of the Riemann hypothesis
   1. Using Bernoulli number

\[
\sum_{k=1}^{n} k^x = \frac{1}{x+1} n^{x+1} + \frac{1}{2} n^x + \frac{x C_1}{2} \frac{1}{6} n^{x-1} - \frac{x C_3}{4} \frac{1}{30} n^{x-3} + \cdots \\
+ \frac{x C_{n-1}}{n} B_n n^{x-n+1}, \quad -x P_{n-1} \frac{2}{(2\pi i)^n} \zeta(n) n^{x-n+1}
\]

1. \( \zeta(n) = 1 + \frac{1}{2^n} + \cdots = 0, \quad f(x) = 1 + x^{-\log^2} + \cdots = 0 \) Non–constant polynomial with real coefficients equation have conjugate complex roots

\( f(\alpha) = 0, \quad f(\bar{\alpha}) = 0 \) \( \alpha = a + bi \ (b \neq 0), \quad \bar{\alpha} = a - bi. \) (Gauss)

2. **Fundamental theorem of algebra**: every non–constant single–variable polynomial with complex coefficients has at least one complex root

\[
\frac{n}{\pi^2} \Gamma\left(\frac{n}{2}\right)
\]

3. The surface area of the \((n-1)\)sphere of radius 1 is \( 2 \cdot \frac{n}{\pi} \Gamma\left(\frac{n}{2}\right) \) (scalar)

The volume of the \(n\) sphere of radius \(r\) is \( \frac{n}{\pi} r^n \Gamma\left(\frac{n}{2} + 1\right) \) (scalar)

4. **Riemannzeta Bernoulli number**

\[
B_n = -n \cdot \zeta(1-n) \quad (n \geq 1), \quad \zeta(n) = \frac{1}{2} \frac{(2\pi i)^n}{n!} B_n \quad (n \geq 2)
\]

\[
\zeta(n) - \frac{1}{2} \frac{(2\pi i)^n}{n!} \cdot n \cdot \zeta(1-n) = 0 \quad (n \geq 2) \quad \Gamma(n) = (n-1)!
\]
\[
\zeta(n) - \frac{1}{2} \cdot \frac{(2\pi i)^n}{\Gamma(n)} \cdot \zeta(1 - n) = 0 \quad (n \geq 2)
\]

\[
\zeta(n) - \frac{(2\pi i)^n}{2 \cdot \Gamma(n)} \cdot \zeta(1 - n) = 0 \quad (n \geq 2)
\]

**Fundamental theorem of algebra** root \( n = a + bi \)

\[
\zeta(a + bi) - \frac{(2\pi i)^{a+bi}}{2 \cdot \Gamma(a + bi)} \cdot \zeta(1 - a - bi) = 0
\]

\[
a \neq 0, \quad b \neq 0^{10) \quad \frac{(2\pi i)^{a+bi}}{2 \cdot \Gamma(a + bi)} \neq 0
\]

Then \( \zeta(a + bi) = 0, \quad \zeta(1 - a - bi) = 0 \) \( \alpha = a + bi \) \( b \neq 0 \), \( \bar{\alpha} = a - bi \)

\( \zeta(a + bi), \quad \zeta(1 - a - bi) \) \( \ldots \quad (1) \)

\( \zeta(a - bi), \quad \zeta(1 - a + bi) \) \( \ldots \quad (2) \)

\( \zeta(a \pm bi), \quad \zeta(1 - a \mp bi) \ldots \) \( \ldots \) \( \ldots \) \( \ldots \) \( \ldots \) \( \ldots \)

\( 1 - a = a \quad 2a = 1 \)

\[
\therefore a = \frac{1}{2}
\]

If \( a = \frac{1}{3} \) then \( \zeta \left( \frac{1}{3} \pm bi \right) \), \( \zeta \left( \frac{2}{3} \mp bi \right), \) \( \frac{1}{3} \pm bi \neq \frac{2}{3} \mp bi \)

\[
\therefore \text{all non–trivial zeros of the Riemann zeta function have real part } \frac{1}{2}
\]

\( \zeta \left( \frac{1}{2} \pm bi \right) = 0 \)

---

10) If \( n = a + bi = 0 \) \( \zeta(0) = \infty \neq 0 \)

If \( b = 0 \) then \( a = -2, -4, -6 \ldots \) \( \zeta(n) \) These are called the trivial zeros

11) \( b = 14.135, 21.022, 25.011 \ldots \)

If \( n = \frac{1}{2} + bi \ b = 0 \) then \( \zeta \left( \frac{1}{2} \right) = -1.4603545 \ldots \)
2. Using Jacobi theta function

\[
\theta(\tau) = \sum_{n=-\infty}^{\infty} e^{\pi i n^2 \tau} \int_0^\infty e^{-\pi n^2 t} \frac{s}{2} \frac{dt}{t} = \pi^{-\frac{s}{2}} \Gamma\left(\frac{s}{2}\right) \frac{1}{n^s}
\]

\[
\xi(s) = \pi^{-\frac{s}{2}} \Gamma\left(\frac{s}{2}\right) \zeta(s) = \int_0^\infty \left(\theta(it) - \frac{1}{2}\right) t^{\frac{s}{2}} \frac{dt}{t}
\]

\[
\xi(s) = \frac{1}{s-1} - \frac{1}{s} + \frac{1}{2} \int_0^1 \left(\theta(it) - \frac{1}{\sqrt{t}}\right) t^{\frac{s}{2}} \frac{dt}{t} + \frac{1}{2} \int_1^\infty \left(\theta(it) - 1\right) t^{\frac{s}{2}} \frac{dt}{t}
\]

\[
\theta\left(-\frac{1}{\tau}\right) = \sqrt{\frac{\tau}{i}} \theta(\tau)
\]

\[
\xi(s) = \xi(1-s)
\]

\[
\xi(s) = \pi^{-\frac{s}{2}} \Gamma\left(\frac{s}{2}\right) \zeta(s), \quad \xi(1-s) = \pi^{-\frac{(1-s)}{2}} \Gamma\left(\frac{1-s}{2}\right) \zeta(1-s)
\]

\[
\pi^{-\frac{s}{2}} \Gamma\left(\frac{s}{2}\right) \zeta(s) = \pi^{-\frac{1-s}{2}} \Gamma\left(\frac{1-s}{2}\right) \zeta(1-s)
\]

\[
\left[\frac{-s + 1-s}{\pi^2} \Gamma\left(\frac{s}{2}\right) / \Gamma\left(\frac{1-s}{2}\right)\right] \zeta(s) = \zeta(1-s)
\]

\[
\left[\frac{1}{\pi^2} \Gamma\left(\frac{s}{2}\right) / \Gamma\left(\frac{1-s}{2}\right)\right] \zeta(s) = \zeta(1-s)
\]

\[
\left[\frac{1}{\pi^2} \Gamma\left(\frac{s}{2}\right) / \Gamma\left(\frac{1-s}{2}\right)\right] \zeta(s) - \zeta(1-s) = 0
\]

 Fundamental theorem of algebra root \( s = a + bi \)

\[
\zeta(s), \quad s = a + bi
\]
\[
\left[ \frac{1}{2} - a - bi \right] \frac{\Gamma \left( \frac{a + bi}{2} \right)}{\Gamma \left( \frac{1 - a - bi}{2} \right)} \zeta(a + bi) - \zeta(1 - a - bi) = 0
\]

\[\Gamma(\bar{z}) = \Gamma(\bar{z}) \quad \text{if} \quad a = \frac{1}{2}\]

\[
\frac{1}{2} + bi \quad \Gamma\left(\frac{1}{2}\right) = C + Di, \quad \Gamma\left(\frac{1}{2} - bi\right) = C - Di
\]

\[C \neq 0, \ D \neq 0\]

\[
\frac{C + Di}{C - Di} = \frac{C^2 - D^2 + 2CDi}{C^2 + D^2} \neq 0 \left[ -bi \frac{\Gamma\left(\frac{a + bi}{2}\right)}{\Gamma\left(\frac{1 - a - bi}{2}\right)} \right] \neq 0
\]

Then \(\zeta(a + bi) = 0\), \(\zeta(1 - a - bi) = 0\)

\[
\zeta(\alpha) = 0 \quad \alpha = a + bi, \quad \bar{\alpha} = a - bi,^{12} \quad (b \neq 0)
\]

\[
\zeta(a + bi), \quad \zeta(1 - a - bi) \quad ... \quad 1
\]

\[
\zeta(a - bi), \quad \zeta(1 - a + bi) \quad ... \quad 2
\]

\[
\zeta(a \pm bi), \quad \zeta(1 - a \mp bi) \quad ... \quad 1, 2
\]

\[
a = 1 - a \quad 2a = 1
\]

\[\therefore a = \frac{1}{2}\]

If \(a = \frac{1}{3}\) then \(\zeta\left(\frac{1}{3} \pm bi\right) \quad \zeta\left(\frac{2}{3} \mp bi\right) \quad \frac{1}{3} \pm bi \neq \frac{2}{3} \mp bi\)

\[\therefore \quad \text{all non-trivial zeros of the Riemann zeta function have real part} \quad \frac{1}{2}\]

\[
\zeta\left(\frac{1}{2} \pm bi\right) = 0
\]

\[^{12}b = 14.135, 21.022, 25.011 \cdots\]

If \(n = \frac{1}{2} + bi \quad b=0\) then \(\zeta(\frac{1}{2}) = -1.4603545 \cdots\)
2. \[ \sum_{k=1}^{n} k^x \] Apply human activity

Configuration of water molecules, the position and momentum of a particle is indeterminate. But the chance of the attributes of the water molecule is deterministic. (Boiling point of water, molecules combined angle, specific heat, etc.)

Of the freedom of individual human being is contingent, but the majority of their activity pattern is confirmed as a probability.

6 of 6 pairs of quarks and the energy conversion antiquarks conflict
Sound 6 is the disagreement music chords (ex, Do & Fa #, Le & Sol #⋯)
Sound 4 is the most harmonious music chords (ex, Do & Mi, Le & Fa#⋯)
East fortune is the worst couple the difference in the 6-year-old
East fortune is the best couple the difference in the 4-year-old

Western and oriental ancient civilization, without identifying the vast data accumulated from the generalization of Astrology 2 (Male, female distinction), 12, 720 through the periodic nature of scientific evidence will prove. Uncertainty principle applied, to the moment you find out your fortune, change your fortune.

Until now, only a probability measure due to the speculation was becoming regarded as being unscientific, but as countless cases have maintained for thousands of years of existence.
Representation of human free will to use nuclear weapons on the planet to change the rules of the cycle will look even more insignificant in the results of macro–galactic scale, but man do such a thing as the solar system, the probability that the behavior is indeterminate.

Power of ten by Philip Morrison, Phylis Morrison, Office of Charles & Ray Eames
3. Apply engineering

1) **Kepler’s hypothesis**

How can a ball of the same size could be the most densely concentrated? Orange or apple fruiterer empirically if anyone will answer.

First, a single line of fruit, fruit and arrange next to it when he arranged vertically side by side without an array of fruit in between the recesses between the two sets. So they arranged the floor filled with the fruit after defeat, the row of 3 that make fruits and put the fruit on the way home pile. This one fruit, the fruit is located around 12.

Cubic face centered structure of atoms FCC, 74% Charge percentage (space efficiency), 74% dark energy

But mathematicians seriously worried. Genius of the German mathematician and astronomer Johannes Kepler, who (1571–1630) abandoned. Newton, Lagrange, Gauss called mathematics the emperor, Axel Thue, Laszlo Fejes-Toth, David Hilbert and guess ultimately proved Thomas Hales (1998), ranging from the Fermat’s last theorem did not work with mathematics, up to the longest attempt of conundrum continued.

Apples to oranges in town merchant to the empirical fact that everyone knows the probability of a genius many years invested a whopping 387 years and 250 side to bring up a large computer files containing evidence. Abstract of the evidence came up.

dimensional analysis through a simple interpretation \[ \sum_{k=1}^{n} k^x \]

\[
\frac{1}{2!} B_2 = \frac{1}{2} \cdot \frac{1}{6} = \frac{2}{(2\pi)^2} \zeta(2) = \frac{2}{(2\pi)^2} \frac{\pi^2}{6} = \frac{1}{12}
\]
2) $C_{60}^\text{Fullerene}^{10}$

$C_{60}$ Molecular structure found Curl, Kroto, Smalley received a Nobel Prize in 1996. Carbon nanotubes and superconductors are listed $C_{60}$ long, flat panel display, a 2 car batteries and hydrogen storage, super-capacities (capacitors), high-density memory devices, biotechnology and possess a wide range of economic value. $C_{60}$ a diameter of 0.4nm (0.4 × 10⁻⁹m) of space, and higher fullerenes, because the larger space, the introduction of alkali metal fullerene metal than the conventional organic superconductors, high temperature superconductivity in the castle has been shown to take a interest.

 Fullerene molecules consisting of carbon allotropies, so the mass spectrometer if the peak value of 720, 60 Fullerene molecule is composed of carbon. Going to the mass of carbon 12, about six nuclear Neutrons and Protons, the combined value of 6 is defined will.

$C_{60} = \frac{2}{(2\pi)^4} \frac{(2\pi)^4}{1440} = \frac{1}{720}$

Circle and the ball shaped $C_{60} \times 42$

to be distributed on the surface of the ball
Space equation and the superconducting

Because no electrical resistance in superconducting superconductors made from one circuit, the power loss in the current begins to flow forever, current flows do not occur at all. According to the current in the superconductor experiment, at least 100,000 years of its life is over.

Theoretically calculated value of $10^{1000000}$ seconds

Age of the universe ($137 \times 100$ million years, $4 \times 10^{17}$s) can not compare more than long enough. Superconducting cable, so you create a very strong electromagnetic field can get.

Photon mass in a superconductor could not get the process and particles interact with the Higgs particle mass to obtain essentially the same process. And in order to achieve this, both gauge symmetry must be destroyed. Superconducting behavior with the principles of particle mass in the universe that we get is essentially the same principle.

So we live in a universe that We'll be one giant superconductor would be comparable.

Electron ready to make one of two Cooper pairs move as particles having a remarkable effect. In a separate e could not see any kind of 'orientation' is to happen. If so, all Cooper pairs behave as if they were one lump. Cooper pairs with the same direction and they go down quite a bit of obstacles continue to maintain that status. As a result, the electrical resistance completely disappears.

Conclusion, universe is below the critical temperature, betide Cooper–pair state symmetry is broken. As a result of small particles and particles created by the mass of the world and everything will be obtained.

1, based on the mass of the proton

Through the neutrino experiments (neutrino) mass of an accurate way to know yet

"Each particle families in the order of the array with the rules of some sort Sounds. One or two points the whole, is questionable."

Brian R. Greene, the elegant universe, *31* (1999)

If the point of Superstring theory black holes as particles in a very small area, put a very large mass to infinity, but points out the value of the string to replace the microscopic theory of relativity and quantum mechanics can
be integrated in the area, and Euler's beta function through the experimental
Very Superstring theory and the exact value, but,

Why is string, why Euler's Beta function is consistent with experimental
values, 6 quarks and 6 antiquarks what has been done, all of those
questions, questions is Superstring.\textsuperscript{14)}

Gamma function\textsuperscript{15)} \( \Gamma(z) = \int_0^\infty t^{z-1}e^{-t}dt \)

Euler Beta function\textsuperscript{16)} \( B(x,y) = \int_0^1 t^{x-1}(1-t)^{y-1}dt \)

\[ nC_k = \binom{n}{k} = \frac{1}{(n+1)B(n-k+1,k+1)} \] Euler Beta function can be expressed as a generalization of the binomial coefficients can be expressed as in \( \sum_{k=1}^{n} k^x \).

The Superstring theory 'The universe is a symphony and the like.'

All material is the basic unit of the string is vibrating like strings

Einstein to express the universe, so was looking for equations
Superstring scholars find the equations to unify four kinds of strength
That is the equation.
4) Zero Zone theory

July 2007 South Korea Yang dong-bong standard theory of anti-quantum physics researchers zero zone Superior units, all units of the International Time (s) has been integrated.

The theory of the $299,792,458m = 1s$ as the length of time to convert the extremely accurate experimental and theoretical values was obtained.

### Zero Zone theory

5) \( \sum_{k=1}^{n} k^x \) with a constant speed of light derivation

Unrelated to the relative velocity of a light source, 299792458 m/s at the speed of light (m, s) 2 unit is a relative concept, so 1.2 seconds to 1 second, 1.4m and 1m to be able to decide the speed of light through a simple count in itself does not make sense to encourage is.

However, the human unit of length (m), time (s) rather than arbitrary units Radius of the Earth, operate with planets was attributed to an absolute standard. (Ancient Civilizations of the calendar)

Astro station using one year cycle was calculated as 12, 60. Space rotation to follow the \( \sum_{k=1}^{n} k^x \) nature constant, and the mathematical constant absolute time reference unit (m), (s) are available through the link.

1 years 360 days set the physical constants (the number of Earth's rotation), the mathematical constant \( (360 = 2\pi) \) of the switch to turn the sun and the earth rotates 360 times when a unit of math is a physical unit conversions.

\[
\sum_{k=1}^{n} k^x = \frac{1}{x+1} n^{x+1} + \frac{1}{2} n^x + \frac{1}{12} P_1 n^{x-1} + 0 \cdot n^{x-2} \\
- \frac{1}{720} P_3 n^{x-3} + 0 \cdot n^{x-4} + \frac{1}{30240} P_5 n^{x-5} + 0 \cdot n^{x-6} \\
- \frac{1}{1209600} P_7 n^{x-7} + 0 \cdot n^{x-8} + \frac{1}{47900160} P_9 n^{x-9} + 0 \cdot n^{x-10} \\
- \frac{691}{1307674368000} P_{11} n^{x-11} + \ldots
\]
and put on 11 to \( n, \frac{(2\pi)^s}{2\zeta(s)} \frac{(2\pi)^{11}}{2\zeta(11)} = 301116106 \) And the difference
between the speed of light \( \frac{299792458}{301116106} \cdot 100\% = 99.56\% \)

Mathematical constant speed of light and 1 seconds based on physical constants \( 360 \text{ days} = 31104000 \), based on the Julian calendar is based on
the speed of light \( 365 \text{ days} 6 \text{ hours} = 31557600 \text{ s} \)

\[
\frac{C_{\text{math}} \times 360 \text{ days}}{C_{\text{physics}} \times 365 \text{ days}} = \frac{301116106 \times 31104000}{299792458 \times 31557600} \times 100\% = 99.01\% 
\]

Derivation equation, the speed of light through space, the Julian calendar

\[
\frac{C_{\text{math}} \times 360 \text{ days}}{365 \text{ days}} = \frac{301116106 \times 31104000}{31557600} = 296,787,948 \text{ m/s} 
\]

1 m from the North Pole to the equator around the earth and 1 / 10 million
defined in the 1 m

\[
\frac{1}{2} \pi r_{\text{RadiusEarth}} \times \frac{1}{10,000,000} = 1 \text{ m}. \text{ From } \frac{1}{2} \pi r \text{ to } 2\pi r. \text{ From } 60 \text{ s}, 60 \text{ min} \text{ to } 120 \text{ s}, 120 \text{ min} \text{ the conversion to Based on the length, time value multiplied by each of the 4}

\[
\frac{R_{\text{physics}}/t_{\text{physics}}}{R_{\text{Math}}/t_{\text{Math}}} = \frac{\left[ \frac{1}{2} \pi r \right] \text{ m/60sec} \times 60 \text{ min} \times 24 \text{ hour} \times 360 \text{ day}}{\left[ 2\pi r \right] \text{ m/120sec} \times 120 \text{ min} \times 12 \text{ hour} \times 720 \text{ day}} = 1 
\]
The Earth is ellipsoid. Earth’s average radius defined by the IUGG in $6,371.0072\, km$ assumes a complete circle around the earth to obtain the polar–equator and the length of $10,007,554\, m$ divided by $10^7$ to $1\, m$ in $7,554\, m$ as the base line of the longer distances are listed as the criterion measure than before numbers are small. Should be calibrated is the value. Small amount of measured increases.

\[
\frac{C_{\text{math}} \times 360 \text{ day}_{\text{math}}}{C_{\text{physics}} \times 365 \text{ day}_{\text{physics}}} \times \frac{10000000}{10007554} = \frac{301116106 \times 31104000}{299792458 \times 31557600} \times 99.9246\%
\]

The speed of light can be like $1,079,252,848\, km/h$ value of all the $2\pi$ multiples of light speed and nature constant means, such as Planck’s constant. (Excel file attached)

\[
\frac{C_{\text{math}} \times 360 \text{ day}_{\text{math}}}{365 \text{ day}_{\text{physics}}} \times 99.9246\% = 296787948 \times 0.999246
\]

\[= 296,564,170\, m/s \text{ (C of } 98.9232\% \text{ 1.08\% error)}\]

Error of 1.08\% : Earth’s rotation, the orbital speed bumps, and in fact one year the figures reduction has been 27 years revealed 22 seconds. Earth is 4.5 billion years old, when considering the

\[360 \text{ days} = 31104000, \quad 365 \text{ days 6 hours} = 31557600, \quad \frac{31104000}{31557600} \times 100 = 98.56\%
\]

If 1 years is $361 \text{ days 7 hours 36 minutes} 28\text{ seconds}$, to measure the speed of light is 100\% consistent with the human.

In other words, the light of the error rate of the Earth 4.5 billion years orbiting the time rate of change of less than 1 times.
Bernoulli number and geometry of the connection speed of light

"All objects in space–time the speed of light moves." –Albert Einstein

The object is to follow Einstein’s thinking about the speed of light ($c$) with a radius that is moving in a circle around.

$$a^2 + b^2 = c^2 \quad (c \text{ is speed of light: } m/s)$$

$$\frac{d\theta}{dx} = 1 \quad (0,1), (-c,0), (0,-1), (c,0)$$

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \cdots = \frac{b}{a}$$

Infinite series representation $\tan x = \sum_{n=1}^{\infty} \frac{(-1)^{n-1}2^{2n}(2^{2n}-1)B_{2n}}{(2n)!} x^{2n-1}$

$$\tan x = \sum_{n=1}^{\infty} \frac{2^{n+1}(2^n-1)}{(2\pi i)^n \zeta(n)} \left(1 + \frac{1}{12n} + \frac{1}{288n^2} + \cdots\right) x^{n-1}$$

Understanding of geometry and sequence

Geometric representation of the Fibonacci sequence

$$r = a\theta \quad f(x,y) = \tan^{-1} \frac{y}{x}$$

$$F(n) = \frac{\varphi^n - (1-\varphi)^n}{\sqrt{5}} \quad \varphi = \frac{1 + \sqrt{5}}{2}$$
- The minimum number of 4
1. Lagrange's four-square theorem: All natural numbers at least four of the sum can be expressed as a sum $x_1^2 + x_2^2 + x_3^2 + x_4^2 = n$
2. To recognize the human dimension: $x_1^2 + x_2^2 + x_3^2 + x_4^2 \leq r^2$

4-Dimensional space-time

3. Four color problem: To distinguish between the two neighboring countries on a map, the minimum required in four colors
4. To distinguish at least four kinds of the kinds of forces: gravity, weak interaction, electromagnetic force, strong interaction
5. DNA, RNA Each of the four kinds of bases
6. length, time, energy, mass

Prime number and quantum mechanics
Heisenberg uncertainty principle and the sequence of prime number links

$$\Delta x \Delta p \geq \frac{\hbar}{2\pi} : \text{Location}(\Delta x) \text{and Momentum}(\Delta p) \text{ both do not know exactly.}$$

- Prime number of the sequences: $N$ Smaller than the number of prime number approaches $rac{N}{\ln N}$.

However, the exact value of the Prime number of the larger value of the sequence $(n \to \infty)$, If do not know the value $f(n-1)$ then, $f(n)$ is unknown.
5. The new cosmology
1) Error of Big Bang\(^{18}\)

1. Based on the Hubble constant, one big bang, expanding universe, according to
the age of the universe is 15 billion years to about 10 billion years. First
galaxies rotate as it takes approximately 200 million years, the universe
since the birth of galaxies will be rotating about 50 times or so. The shape
and the rotation speed of the galaxies that look for a very small number.

http://en.wikipedia.org/wiki/Big_Bang

If the universe follow expression

\[
0 = -x P_0 \frac{2}{(2\pi i)^1} \zeta(1)n^x - x P_1 \frac{2}{(2\pi i)^2} \frac{(2\pi)^2}{24} n^{x-1} \\
- x P_2 \frac{2}{(2\pi i)^3} \zeta(3)n^{x-2} - x P_3 \frac{2}{(2\pi i)^4} \frac{(2\pi)^4}{1440} n^{x-3} - \cdots \\
- x P_{s-1} \frac{2}{(2\pi i)^s} \zeta(s) \cdot n^{x-s+1}
\]

that is the age of the universe \(\infty\)
The time of the universe 15 billion years is only part of the fractal.

Nothing and existence is one.
2) Fractal cosmology

For fractal objects can greatly expand even keep the original appearance of this phenomenon is the bands self-similarity. Mandelbrot set in a statistical self-similarity has expanded his own whenever he appears in two variations. (Ex, coastlines, clouds, turbulence, mountain, lightning, cells, leaves, life pattern \ldots.)

\[
0 = -x P_0 \frac{2}{2\pi i} \zeta(1) n^x - x P_1 \frac{2}{(2\pi i)^2} \zeta(2) n^{x-1} - x P_2 \frac{2}{(2\pi i)^3} \zeta(3) n^{x-2} - x P_4 \frac{2}{(2\pi i)^5} \zeta(4) n^{x-3} - x P_5 \frac{2}{(2\pi i)^6} \zeta(5) n^{x-4} - \ldots
\]

\[-x P_{s-1} \frac{2}{(2\pi i)^s} \zeta(s) n^{x-s+1} \ldots => \text{section=>whole=>section=>} \ldots\]

3) **Dark energy, Dark mass**\(^{20}\) of identity

Nuclei cubic face centered (FCC) of the charge percentage \(74\% = \frac{\pi}{\sqrt{18}} \times 100\%\)

\[\text{= Dark energy } 74\%\]

Fractal cosmology, the universe is the galaxy nucleus and nucleus-like structure.

74\% of the universe is dark energy that fills the center of the Milky Way galaxy is distributed in the nucleus Spherical galactic nuclei, filled with dark energy the universe is 74\% of the charging rate Our galaxy is filled with dark energy is 26\% between the Galactic Center Space is located.

(Cosmic background radiation observations **Space is a 12 Tetrahedron**
4. Understanding Appendix

1. Natural Constants $\pi$. Algebra, geometry, probability of a meaningful integration.

**1. Geometry and Algebra**

- Area formula:
  
  $A = 4r^2$

- Circumference formula:
  
  $S = \pi r^2 = \frac{\pi A}{4}$

- Pi formula:
  
  $\pi = \frac{1}{2n} \left( \frac{e}{n} \right)^{2n} (n!)^2$

- Area and circumference relationship:

  $$S = \frac{1}{2n} \left( \frac{e}{n} \right)^{2n} (n!)^2 A = \frac{2r}{n} \left( \frac{e}{n} \right)^{2n} (n!)^2$$

2. Probability and geometry (needles of Buffon, Monte Carlo techniques)

When the needle dropped on the center of the circle

- Probability of the end of the needle enters the circle

  $A = 4r^2$

  $S = \pi r^2 = \frac{\pi A}{4}$

- Circle area relationship:

  $$\frac{S}{A} = \frac{\pi r^2}{4r^2} = \frac{\pi}{4}$$

10000 times drop the needle within 1% error range

\[
\int_{-\infty}^{\infty} e^{-x^2} dx = \sqrt{\pi}, \quad \prod_{n=1}^{\infty} n = \sqrt{2\pi}, \quad \text{Entropy } \ln\left(\sigma \sqrt{2\pi e}\right)
\]

---

14) Stirling formula $n! = \sqrt{2\pi n} \left( \frac{n}{e} \right)^n \left( 1 + \frac{1}{12n} + \frac{1}{288n^2} - \frac{139}{51840n^3} - \ldots \right)$

15) the relative error tolerance is proportional to the $1/\sqrt{N}$ number 10000 times ship to grab a sample of $1/100$, which is the range of error of 1%.
2. Understanding of infinite series

Maclaurin series (Taylor series)

\[ f(x) = f(0) + x f'(0) + \frac{x^2}{2!} f''(0) + \frac{x^3}{3!} f'''(0) + \cdots \]

\[
\begin{array}{|c|c|c|}
\hline
\sum_{k=1}^{n} \frac{1}{k} & B_n = -n \zeta(1-n) & \zeta(1) = -\frac{\pi}{2i} \\
\hline
\sum_{k=1}^{n} k & B_2 = -2 \zeta(-1) = \frac{1}{6} = -2 \sum_{k=1}^{n} k & \zeta(-1) = -\frac{1}{12} \\
\hline
\sum_{k=1}^{n} k^3 & B_4 = -4 \zeta(-3) = \frac{1}{30} = -4 \sum_{k=1}^{n} k^3 & \zeta(-3) = -\frac{1}{120} \\
\hline
\sum_{k=1}^{n} k^5 & B_6 = -6 \zeta(-5) = \frac{1}{42} = -6 \sum_{k=1}^{n} k^5 & \zeta(-5) = -\frac{1}{252} \\
\hline
\sum_{k=1}^{n} k^7 & B_8 = -8 \zeta(-7) = \frac{1}{30} = -8 \sum_{k=1}^{n} k^7 & \zeta(-7) = -\frac{1}{240} \\
\hline
\sum_{k=1}^{n} k^9 & B_{10} = -10 \zeta(-9) = \frac{5}{66} = -10 \sum_{k=1}^{n} k^9 & \zeta(-9) = -\frac{1}{132} \\
\hline
\sum_{k=1}^{n} k^{11} & B_{12} = -12 \zeta(-11) = \frac{691}{2730} = -12 \sum_{k=1}^{n} k^{11} & \zeta(-11) = \frac{691}{32760} \\
\hline
\sum_{k=1}^{n} k^{13} & B_{14} = -14 \zeta(-13) = \frac{7}{6} = -14 \sum_{k=1}^{n} k^{13} & \zeta(-13) = -\frac{1}{12} \\
\hline
\sum_{k=1}^{n} k^{15} & B_{16} = -16 \zeta(-15) = \frac{3617}{510} = -16 \sum_{k=1}^{n} k^{15} & \zeta(-15) = \frac{3617}{6120} \\
\hline
\sum_{k=1}^{n} k^{17} & B_{18} = -18 \zeta(-17) = \frac{43867}{798} = -18 \sum_{k=1}^{n} k^{17} & \zeta(-17) = \frac{43867}{14364} \\
\hline
\vdots & \vdots & \vdots \\
\hline
\end{array}
\]

\[ 0 = \frac{1}{2} n^x - x C_1 \zeta(-1) \cdot n^{x-1} + x C_3 \zeta(-3) \cdot n^{x-3} - x C_5 \zeta(-5) n^{x-5} + x C_7 \zeta(-7) \cdot n^{x-7} - x C_9 \zeta(-9) \cdot n^{x-9} + \cdots + x C_s \zeta(-s) n^{x-s+1} \]
Laurent series

In mathematics, the Laurent series of a complex function \( f(z) \) is a representation of that function as a power series which includes terms of negative degree. It may be used to express complex functions in cases where a Taylor series expansion cannot be applied.

The Laurent series for a complex function \( f(z) \) about a point \( c \) is given by:

\[
f(z) = \sum_{n=-\infty}^{\infty} a_n (z - z_0)^n
\]

where the \( a_n \) are constants, defined by a line integral which is a generalization of Cauchy's integral formula:

\[
a_n = \frac{1}{2\pi i} \oint_{\gamma} \frac{f(z)dz}{(z-c)^{n+1}}
\]

which traces out the unit circle, and then the path integral \( \oint_C \frac{dk}{k} = 2\pi i \)

\[
0 = -xP_0 \frac{2}{(2\pi i)^1} \zeta(1)n^x - xP_1 \frac{2}{(2\pi i)^2} \frac{(2\pi)^2}{24} n^{x-1} - \ldots
\]

\[
- xP_{s-1} \cdot \frac{2}{(2\pi i)^s} \zeta(s) \cdot n^{x-s+1}
\]

\[
0 = -xP_0 \left( \oint_C \frac{dk}{k} \right)^1 \zeta(1)n^x - xP_1 \left( \oint_C \frac{dk}{k} \right)^2 \frac{2}{(2\pi)^2} \frac{(2\pi)^2}{24} n^{x-1} - \ldots
\]

\[
- xP_{s-1} \cdot \left( \oint_C \frac{dk}{k} \right)^s \sum_{k=1}^{\infty} \frac{1}{k^s} \cdot n^{x-s+1}
\]
3. Numerical of Dimension

\[ \sum_{k=1}^{n} k^2 \]

Understanding of the geometry (the Riemann hypothesis, assuming the solution Poincaré)

4. Properties of Bernoulli numbers and Prime number

\[ B_m = \frac{N_m}{D_m} \quad (N_m, D_m \text{ disjoint}) \]

\[ D_m = p - 1 \mid m \text{To satisfy all the prime factorization.} \]

\[ D_4 = 30 = 2 \times 3 \times 5 \]
\[ D_{10} = 66 = 2 \times 3 \times 11 \]
\[ D_{12} = 2730 = 2 \times 3 \times 5 \times 7 \times 13 \]

\[ \frac{te^xt}{e^t - 1} = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!} \]

\[ \triangle B_n(x) = nx^{n-1} \quad \frac{1}{n} \triangle B_k(x) = B_{k-1}(x) \]

\[ B_0 = 1 \]

\[ B_1(x) = x + \frac{1}{2} \]

\[ B_2(x) = x^2 + x + \frac{1}{6} \]

\[ B_3(x) = x^3 + \frac{3}{2} x^2 + \frac{1}{2} x \]

\[ B_4(x) = x^4 + 2x^3 + x^2 - \frac{1}{30} \]

\[ B_5(x) = x^5 + \frac{5}{2} x^4 + \frac{5}{3} x^3 - \frac{1}{6} x \]
△5. Kissing Number problem

Minkowski–Hlawka Theorem: There exist lattices in \( n \) dimensions having hypersphere packing densities satisfying \( \eta \geq \frac{\zeta(n)}{2^{n-1}} \)
