Higgs as Primitive Idempotents

by Frank Dodd (Tony) Smith Jr.

Abstract:

By identifying the Higgs with Primitive Idempotents of the Cl(8) real Clifford algebra, the Higgs is not seen as a simple-minded fundamental scalar particle, but rather the Higgs is seen as a quantum process that creates a fermionic condensate with which it interacts to make the fermions appear massive. The Primitive Idempotent Higgs is part of my E8 Physics model in terms of which the Primitive Idempotent Higgs is seen to do all the nice things that the fundamental scalar particle Higgs needs to do, and to be effectively a Higgs-Tquark system with 3 mass states (i.e., the LHC should see events that look like 3 standard model Higgs mass states at around 140 GeV and 200 GeV and 250 GeV with the total standard model cross section being divided up among those three states. In particular, the LHC should see a Higgs around 140 GeV but with a lower cross section than expected.)

Standard Model Higgs compared to E8 Physics Higgs

The conventional Standard Model has structure:
spacetime is a base manifold;
particles are representations of gauge groups
  gauge bosons are in the adjoint representation
  fermions are in other representations (analogous to spinor)
Higgs boson is in scalar representation.

E8 Physics (see vixra 1108.0027 and tony5m17h.net) has structure
(from 248-dim E8 = 120-dim adjoint D8 + 128-dim half-spinor D8):
spacetime is in the adjoint D8 part of E8 (64 of 120 D8 adjoints)
gauge bosons are in the adjoint D8 part of E8 (56 of the 120 D8 adjoints)
fermions are in the half-spinor D8 part of E8 (64+64 of the 128 D8 half-spinors).

There is no room for a fundamental Higgs in the E8 of E8 Physics. However,
for E8 Physics to include the observed results of the Standard Model
it must have something that acts like the Standard Model Higgs
even though it will NOT be a fundamental particle.

To see how the E8 Physics Higgs works,
embed E8 into the 256-dimensional real Clifford algebra Cl(8):

\[
\begin{align*}
\text{Cl}(8) & = 256 = 1 + 8 + 28 + 56 + 70 + 56 + 28 + 8 + 1 \\
\text{Primitive} & = 16 = 1 + 6 + 1 \\
\text{Idempotent} & = 8 \\
\text{E8 Root Vectors} & = 240 = 8 + 28 + 56 + 56 + 56 + 28 + 8
\end{align*}
\]

The Cl(8) Primitive Idempotent is 16-dimensional and can be decomposed
into two 8-dimensional half-spinor parts each of which is related by Triality
to 8-dimensional spacetime and has Octonionic structure. In that decomposition:
the 1+6+1 = (1+3)+(3+1) is related to two copies of
a 4-dimensional Associative Quaternionic subspace of the Octonionic structure
and
the 8 = 4+4 is related to two copies of
a 4-dimensional Co-Associative subspace of the Octonionic structure
(see the book “Spinors and Calibrations” by F. Reese Harvey)
The $8 = 4+4$ Co-Associative part of the Cl(8) Primitive Idempotent when combined with the 240 E8 Root Vectors forms the full 248-dimensional E8. It represents a Cartan subalgebra of the E8 Lie algebra.

The (1+3)+(3+1) Associative part of the Cl(8) Primitive Idempotent is the Higgs of E8 Physics.

The half-spinors generated by the E8 Higgs part of the Cl(8) Primitive Idempotent represent:
- neutrino; red, green, blue down quarks; red, green, blue up quarks; electron
so the E8 Higgs effectively creates/annihilates the fundamental fermions and
**the E8 Higgs is effectively a condensate of fundamental fermions.**

In E8 Physics the high-energy 8-dimensional Octonionic spacetime reduces, by freezing out a preferred 4-dim Associative Quaternionic subspace, to a 4+4 -dimensional Batakis Kaluza-Klein of the form M4 x CP2 with 4-dim M4 physical spacetime.

Since the (1+3)+(3+1) part of the Cl(8) Primitive Idempotent includes the Cl(8) grade-0 scalar 1 and $3+3 = 6$ of the Cl(8) grade-4 which act as pseudoscalars for 4-dim spacetime and the Cl(8) grade-8 pseudoscalar 1
**the E8 Higgs transforms with respect to 4-dim spacetime as a scalar (or pseudoscalar) and in that respect is similar to Standard Model Higgs.**

Not only does the E8 Higgs fermion condensate transform with respect to 4-dim physical spacetime like the Standard Model Higgs but **the geometry of the reduction from 8-dim Octonionic spacetime to 4+4 -dimensional Batakis Kaluza-Klein, by the Mayer mechanism, gives E8 Higgs the ElectroWeak Symmetry-Breaking Ginzburg-Landau structure.**

Since the second and third fermion generations emerge dynamically from the reduction from 8-dim to 4+4 -dim Kaluza-Klein, they are also created/annihilated by the Primitive Idempotent E8 Higgs and are present in the fermion condensate. Since the Truth Quark is so much more massive that the other fermions,** the E8 Higgs is effectively a Truth Quark condensate.**
When Triviality and Vacuum Stability are taken into account,** the E8 Higgs and Truth Quark system has 3 mass states.**
