

The Definition of Matter

Jeffrey J Wolynski

Jeffrey.wolynski@yahoo.com

Abstract: It is hypothesized an Ockham's Razor definition of matter so that science can be saved from mathematical fantasies and the collective insanity of those who teach that math is the language of some invisible being in the sky that created all matter via Big Bang.

Matter (n.): anything that emits or reflects electromagnetism

According to this definition of matter, dark matter and dark energy become mathematical fantasies, as well as other fantasy particles that are not affected by it including but not limited to quarks, neutrinos, anti-matter, etc. Anything that does not emit or reflect electromagnetism can be regarded as arbitrary and thrown in the trash similar to the epi-cycle model for Geocentrism.
