*Abstract: According to 21<sup>st</sup> century physics the Higgs Boson does not emit or reflect electromagnetism. This means the Higgs Boson is not matter and therefore does not exist.*

The definition of matter:

*Anything that emits or reflects electromagnetism.*

The definition of matter according to Wikipedia thought police and censors:

*Matter is a poorly-defined term and is commonly known as anything that has mass and volume.*

Since the Higgs Boson does not emit or reflect electromagnetism, it can be safely disregarded as being real according to the actual definition of matter. It is a fantasy. The reason why mathematicians keep it as "matter" is because it has "mass", which brings an irrational issue attached. How does something have mass when it supposedly gives mass? This just means they have contradicted themselves. The Higgs Boson will never receive the Nobel Prize because it is a complete farce. The problem is brought to light:

**The Higgs Boson is a red herring. The actual problem is how we define matter itself, not what causes mass!**
