

A generic formula of 2-Poulet numbers and also a method to obtain sequences of n-Poulet numbers

Abstract. In this paper I present a formula based on 2-Poulet numbers which seems to conduct always to a prime, a square of prime or a semiprime, a conjecture that this formula is generic for 2-Poulet numbers, and, in case that the conjecture doesn't hold, I present another utility for this formula, namely to generate sequences of n-Poulet numbers.

Conjecture:

Any 2-Poulet number P can be written at least in one way as $P = (q \cdot 2^a \cdot 3^b \cdot 5^c \pm 1) \cdot 2^n + 1$, where q is a prime, a square of prime or a semiprime, a, b, c are non-negative integers and n is non-null positive integer.

In other words, there always exist a number $q = ((P - 1) / 2^n \pm 1) / (2^a \cdot 3^b \cdot 5^c)$, where P is a 2-Poulet number, a, b, c are non-negative integers and n is non-null positive integer, such that q is a prime, a square of prime or a semiprime.

Note: In this paper I will consider the number 1 to be a prime (not to repeat the formulation: q is prime, square of prime, semiprime or is equal to number 1).

Verifying the conjecture:

[for the first ten 2-Poulet numbers, only for a restrictive version of the conjecture, considering just the formula $P = (q \cdot 2^a \cdot 3^b \cdot 5^c + 1) \cdot 2^n + 1$]

For $P = 341$, we have:

$$q = ((341 - 1) / 2^1 - 1) / (2^0 \cdot 3^0 \cdot 5^0) = 13^2;$$

$$q = ((341 - 1) / 2^2 - 1) / (2^2 \cdot 3^1 \cdot 5^0) = 7.$$

For $P = 1387$, we have:

$$q = ((1387 - 1) / 2^1 - 1) / (2^2 \cdot 3^0 \cdot 5^0) = 173.$$

For $P = 2047$, we have:

$$q = ((2047 - 1) / 2^1 - 1) / (2^1 \cdot 3^0 \cdot 5^0) = 7 \cdot 73.$$

For $P = 2701$, we have:

$$q = ((2701 - 1) / 2^1 - 1) / (2^0 \cdot 3^0 \cdot 5^0) = 19 \cdot 71;$$

$$q = ((2701 - 1) / 2^2 - 1) / (2^1 \cdot 3^0 \cdot 5^0) = 337.$$

For $P = 3277$, we have:

$$q = ((3277 - 1) / 2^1 - 1) / (2^0 \cdot 3^0 \cdot 5^0) = 1637;$$

$$q = ((3277 - 1) / 2^2 - 1) / (2^1 \cdot 3^0 \cdot 5^0) = 409.$$

For $P = 4033$, we have:

$$\begin{aligned}q &= ((4033 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^1) = 13 \cdot 31; \\q &= ((4033 - 1)/2^2 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 19 \cdot 53; \\q &= ((4033 - 1)/2^3 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 503; \\q &= ((4033 - 1)/2^4 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 251; \\q &= ((4033 - 1)/2^5 - 1)/(2^0 \cdot 3^0 \cdot 5^3) = 1; \\q &= ((4033 - 1)/2^6 - 1)/(2^1 \cdot 3^0 \cdot 5^0) = 31.\end{aligned}$$

For $P = 4369$, we have:

$$\begin{aligned}q &= ((4369 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 37 \cdot 59; \\q &= ((4369 - 1)/2^2 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 1091; \\q &= ((4369 - 1)/2^3 - 1)/(2^0 \cdot 3^0 \cdot 5^1) = 109; \\((4369 - 1)/2^4 - 1)/(2^0 \cdot 3^0 \cdot 5^0) &= 251;\end{aligned}$$

For $P = 4681$, we have:

$$\begin{aligned}q &= ((4681 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 2339; \\q &= ((4681 - 1)/2^2 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 7 \cdot 167; \\q &= ((4681 - 1)/2^3 - 1)/(2^3 \cdot 3^0 \cdot 5^0) = 73;\end{aligned}$$

For $P = 5461$, we have:

$$\begin{aligned}q &= ((2701 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 2729; \\q &= ((2701 - 1)/2^2 - 1)/(2^2 \cdot 3^0 \cdot 5^0) = 11 \cdot 31.\end{aligned}$$

For $P = 7957$, we have:

$$\begin{aligned}q &= ((7957 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^1) = 37 \cdot 43; \\q &= ((7957 - 1)/2^2 - 1)/(2^2 \cdot 3^0 \cdot 5^0) = 7 \cdot 71.\end{aligned}$$

Verifying the conjecture:

(for seven greater consecutive 2-Poulet numbers)

For $P = 27657600833$, we have:

$$\begin{aligned}q &= ((27657600833 - 1)/2^4 - 1)/(2^0 \cdot 3^1 \cdot 5^0) = 653 \cdot 882389; \\q &= ((27657600833 - 1)/2^1 + 1)/(2^0 \cdot 3^1 \cdot 5^0) = 22433 \cdot 205483; \\q &= ((27657600833 - 1)/2^2 + 1)/(2^0 \cdot 3^0 \cdot 5^0) = 6914400209. \\q &= ((27657600833 - 1)/2^4 + 1)/(2^0 \cdot 3^0 \cdot 5^0) = 6911 \cdot 250123. \\q &= ((27657600833 - 1)/2^6 + 1)/(2^1 \cdot 3^0 \cdot 5^0) = 8093 \cdot 26699.\end{aligned}$$

For $P = 27667059281$, we have:

$$\begin{aligned}q &= ((27667059281 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 103 \cdot 134306113; \\q &= ((27667059281 - 1)/2^4 + 1)/(2^1 \cdot 3^0 \cdot 5^0) = 864595603.\end{aligned}$$

For $P = 27675991081$, we have:

$$\begin{aligned}q &= ((27675991081 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^0) = 10169 \cdot 680401; \\q &= ((27675991081 - 1)/2^2 - 1)/(2^2 \cdot 3^0 \cdot 5^0) = 1109 \cdot 779869.\end{aligned}$$

For $P = 27681232903$, we have:

$$\begin{aligned}q &= ((27681232903 - 1)/2^1 - 1)/(2^1 \cdot 3^0 \cdot 5^2) = 276812329; \\q &= ((27681232903 - 1)/2^2 + 1)/(2^4 \cdot 3^0 \cdot 5^0) = 67 \cdot 807083.\end{aligned}$$

For $P = 27685810639$, we have:

$$q = ((27685810639 - 1)/2^1 + 1)/(2^3 \cdot 3^0 \cdot 5^1) = 4740721.$$

For $P = 27686175193$, we have:

$$\begin{aligned}q &= ((27686175193 - 1)/2^1 - 1)/(2^0 \cdot 3^0 \cdot 5^1) = 20208887; \\q &= ((27686175193 - 1)/2^1 + 1)/(2^0 \cdot 3^0 \cdot 5^0) = 2837 \cdot 4879481; \\q &= ((27686175193 - 1)/2^3 + 1)/(2^2 \cdot 3^0 \cdot 5^2) = 113 \cdot 306263.\end{aligned}$$

For $P = 27702689701$, we have:

$$\begin{aligned}q &= ((27702689701 - 1)/2^2 - 1)/(2^3 \cdot 3^0 \cdot 5^0) = 11 \cdot 78700823; \\q &= ((27702689701 - 1)/2^1 + 1)/(2^0 \cdot 3^0 \cdot 5^0) = 15971 \cdot 867281; \\q &= ((27702689701 - 1)/2^2 + 1)/(2^1 \cdot 3^0 \cdot 5^0) = 199 \cdot 17401187.\end{aligned}$$

Comment:

If the Conjecture doesn't hold, it may be considered a more premissive version: Any 2-Poulet number P can be written at least in one way as $P = (q \cdot 2^a \cdot 3^b \cdot 5^c \pm 1) \cdot 2^n + 1$, where q is a prime, a square of prime or a semiprime and a, b, c, n are non-negative integers.

In this case we have, for instance for $P = 27686175193$, $q = ((27686175193 - 1) / 2^0 - 1) / (2^0 \cdot 3^0 \cdot 5^0) = 27686175191$ which is prime.

Comment:

If the Conjecture doesn't hold, it has anyhow at least one utility: it's a method for finding sequences of Poulet numbers (not only 2-Poulet numbers).

Taking, for instance, $q = 223 \cdot r$, where r is prime, we have the sequence of Poulet numbers P defined as $P = (223 \cdot r + 1) \cdot 2^n + 1$, with the first three terms $\{41041, 10261, 52633\}$, obtained for the following values of (r, n) : $\{23, 1\}, \{23, 3\}, \{59, 2\}$.

Taking, for instance, $q = 29 \cdot r$, where r is prime, we have the sequence of Poulet numbers P defined as $P = (29 \cdot r + 1) \cdot 3^n + 1$, with the first term 2701, obtained for the following value of (r, n) : $(31, 1)$.

Taking, for instance, $q = 37 \cdot r$, where r is prime, we have the sequence of Poulet numbers P defined as $P = (37 \cdot r + 1) \cdot 5^n + 1$, with the first term 561, obtained for the following value of (r, n) : $(3, 5)$.

Taking, for instance, $q = 13^2$, we have the sequence of Poulet numbers P defined as $P = (13^2 + 1) \cdot 2^n + 1$, with the first term 341, obtained for the following value of n : 1.
