Abstract. In this paper I conjecture that for any pair of twin primes $p$ and $p + 2$ there exist an odd positive integer $n$ such that the value of Smarandache function for $n$ is equal to $p$ and the value of MC function for $n$ is equal to $p + 2$.

Conjecture:

For any pair of twin primes $p$ and $p + 2$, where $p \geq 5$, there exist a positive integer $n$ of the form $15k + 18$ such that the value of Smarandache function for $n$ is equal to $p$ and the value of MC function for $n$ is equal to $p + 2$.

Verifying the conjecture:
(for the first 11 pairs of twin primes)

: For $n = 15$ the value of Smarandache function is equal to 5 and the value of MC function is equal to 7;
: For $n = 33$ the value of Smarandache function is equal to 11 and the value of MC function is equal to 13;
: For $n = 51$ the value of Smarandache function is equal to 17 and the value of MC function is equal to 19;
: For $n = 87$ the value of Smarandache function is equal to 29 and the value of MC function is equal to 31;
: For $n = 123$ the value of Smarandache function is equal to 41 and the value of MC function is equal to 43;
: For $n = 177$ the value of Smarandache function is equal to 59 and the value of MC function is equal to 61;
: For $n = 213$ the value of Smarandache function is equal to 71 and the value of MC function is equal to 73;
: For $n = 303$ the value of Smarandache function is equal to 101 and the value of MC function is equal to 103;
: For $n = 321$ the value of Smarandache function is equal to 107 and the value of MC function is equal to 109;
: For $n = 411$ the value of Smarandache function is equal to 137 and the value of MC function is equal to 139;
: For $n = 447$ the value of Smarandache function is equal to 149 and the value of MC function is equal to 151.
