Abstract: A fundamental principle of nature is as follows concerning planet formation and evolution.

In stellar metamorphosis, planets and exoplanets are evolving/evolved/dead stars. A simple fundamental principle or law is stated along with the reasoning.

“A planet forms as it evolves.”

This law states quite clearly that a planet does not “form” then evolve. The process of planet formation is its process of evolution. This releases the assumption of Earth forming “as is” and then remaining relatively unchanged, when in fact the opposite is true. As the Earth was evolving from a much hotter, bigger, more energetic state, it was forming.
