

Global Policy and the Scientific Age in the Modern Era

By

Miguel A. Sanchez-Rey

President Barack Obama's policy decisions is indicative of a failed policy era. In particular, his response to U.S. climate change, trade, and welfare spending has not produce the kind of response that much of the world, including in the developing world, has implemented, in order, to achieve a lasting shift that invigorates the public to achieve an overwhelming vote that gives a unanimous control of the House of Congress to the Democratic Party. The ineffectiveness of the House of Congress has also been ominous. But even if the Democrats were to take control of the House no drastic changes to political consciousness surmounts only that previous policy decisions are to be protected so as not to incite private interests.

As President Barack Obama has resorted to the executive order to implement popular policy sidestepping the stipulation of Checks and Balances that has been the staple of the American Constitution. Unleashing a little, then notice, constitutional crisis in the modern era.

The party Democrats, including the current U.S. presidential candidate Hillary Rodham Clinton, has restated equal policy choices that are as centrists as, "Barack," and yet, essential, but ineffective in guiding policy toward normalized relations of economic necessity or geopolitical concerns.

Markets are motivated by short-term interests. Government exist to protect the public from the ravishes of the private sector. Current climate policy must, inevitably, if either/or Donald Trump or Hillary Clinton were to take the Executive Office, comply with private interests

if it is to be enacted. And those interest means that short-term profits come first than the welfare of the public in general.

Sustainability is a promising endeavor and catastrophe. One only hopes that technological advances in solar energy, windmills, electric cars, and et., could, in the long-term, bring an end to rising ocean temperatures and slow-down the rate in which warmer climates has surmounted.

Even then much of the world population depends on a minimal resource of food, products, and services. Those minimal resources are shorting by the constant depletion of minerals in which there is, at the time, no resolution to the crisis and contradictory nature of using ITER [International Thermonuclear Experimental Reactor] to achieve a utilitarian society. A utilitarian society that controls and civilizes its own population with clean-energy.

Its ever more obvious, that to use ITER efficiently, requires mass-production. But its drawbacks are that mass cooperation must ensue but mineral depletion becomes inevitable. So its resolution, in the Scientific Age, is to fully implement PHPR [The Physicalist Program] as a resolution to a foreseeable catastrophic scenario in the form of a task. The First Task of PHPR is how to achieve a terraformic reaction. But to even consider doing so requires a serene planet in which the First Task of PHPR is to have a 40-year window to complete 60 percent and another 60 years to reach full completion. Those 40-years must also pursue a stand-down of all military hostilities, at a world-wide scale, that results in a quiet and serene state, in which, a

global decline is to be of little notice and in which completion of the First Task achieves a vibrant society similar to 90's era that came before the dawn of the Scientific Age.

It makes little difference if the Presidential office is to be held by either a Democrat or Republican. The executive order, that has been use to bypass Congressional deadlock, has become the norm of national policy. Either/or the executive order will continue to frame policy decisions that the House of Congress is to continue to be an ineffective and debating body in which deadlock is to continue for the foreseeable future. That said U.S. national defense will continue to remain an independent entity and rising terrorism will continue to plague world-affairs as long as globalist policies continue.

How to establish ITER is a controversial riddle that issues of genocide become the lime-light. If the world-population is to use ITER mineral resources must be ration. If that's the case, to meet rising population growth and rising demand, ITER, essential to controlling and mitigating climate change, is to be restricted. If restriction is necessary than the population is to be minimally deprive though economic growth is to expand.

Much of the population is then to obey Western interests since those interests are known to be more stable and progressive. Violence, though declining in the modern era, is to be enacted as much of the remaining population becomes resistant to powerful private interests. Where the commons become ever more threaten by rising scarcity and the fruition of a stable democratic order in the Scientific Age.

How to relate military interests to PHPR requires consideration of national policy. The unstable political process of the modern era renders PHPR top-secret. Where advances in the First Task is to be kept classified until completion is in the near horizon as a scientific dictatorship is evident. A scientific dictatorship that uses the executive order to implement popular policy and in which the House of Congress debates popular policy. Policies that are popular to market forces and cognizant to mineral restrictions. That said the Executive Office and the House of Congress, which also implies that state-capitalist sector, is to be permanently shut-out and in which the utmost secrecy must be kept to prevent a fall-out due to metaspaces and war-crime.

An international effort must also be of consideration. To pursue an international effort national laboratories must pull their research repositories from public knowledge and a lock-down of all scientific advances relevant to PHPR, and the Scientific Age, is to follow until full-disclosure becomes relevant to the scientific process.

Control of public opinion, in order to prevent havoc to short-term and long-term strategic interests, is to pacify the world-population through mass economic growth and free education that puts heavy restrictions to scientific participation. A sacrifice in which the pay-offs are limitless and in which its duration is to be minimal.

Policy is an efficient means to meet standards and tranquility. The policies of the modern era require openness to policy efficiency and productiveness. Mass-production of ITER must, as well, be a productive and efficient endeavor. Depravity is the current reality of U.S. national interests and of concern to the intergovernmental establishment. Decline becomes true but, nevertheless, social and natural tranquility is determined to be the norm.
