Abstract: A simple principle is provided so that future scientists can understand the universe.

Since the big bang is false due to quasars being shown to be ejected from host galaxies, it is clear that the universe is eternal. It grows inside out of itself in a timeless fashion.

*"The universe is eternal."*

This principle should help future scientists guard against false creationist theories such as Young Earth Creationism and Big Bang Creationism. There is no difference conceptually between everything coming into existence magically from 6000 years ago or 13.7 billion years ago. Even if you push it back to 60 quadrillion quadrillion quadrillion years, it still has the universe just coming into existence without any mechanism. I cannot be responsible for young minds who are told to sacrifice their good sense to be indoctrinated into absurdities.
