

Introduction to The Natural Force Of The Universe

Luo Zhengda

There is one truth only, it is not existed in the concept of the single "gravity", also not in the single "repulsion", and certainly not in the "gravity and repulsion" taking the same mass substance as the carrier, but in the external force and the repulsive force.

The opposite direction crisscross, friction and confrontation of two forces of background field natural external force (contraction state gather-jet-stream) and celestial field natural repulsive force (expansion state radiation-jet-stream), to establish the mutual conversion for mass substance and energy substance of the universe, and impel the universal perpetual motion. The relationship between background field natural external force (contraction state gather-jet-stream) and celestial field natural repulsive force (expansion state radiation-jet-stream): the sum (superposition) of my celestial field natural repulsive force (expansion state radiation-jet-stream) and their celestial field natural repulsive force (expansion state radiation-jet-stream), is for your any point's background field natural external force (contraction

state gather-jet-stream) — the first cause of the universe. While, the sum (superposition) of your celestial field natural repulsive force (expansion state radiation-jet-stream) and their celestial field natural repulsive force (expansion state radiation-jet-stream), is for my any point's background field natural external force (contraction state gather-jet-stream) — the first cause of the universe.

The natural external force is the force of contraction and aggregation, and the natural repulsive force is the force of expansion and exclusion; the natural external force is taking space energy substance as the carrier, and the natural repulsive force is taking celestial mass substance as the carrier; thus constitutes a real contradiction, so the natural external force and natural repulsive force are the real forces of the universe.

Newton's "gravity" is the force of contraction, and the single gravity cannot explain the expansion of the universe, so gravity is not the real force of the universe; The "repulsion" derived by Hubble according to the galaxies' mutual far away is the force of expansion, and the single repulsion cannot explain the mutual aggregation between celestial bodies, so repulsion is not the real force of the universe; Einstein's "gravity and repulsion" (the cosmological constant is equivalent to repulsion) are the forces taking the same celestial mass substance as the carrier, and

"gravity and repulsion" are the fake contradiction, so Einstein's "gravity and repulsion" are not the real forces of the universe too.
