Abstract: showing a viewpoint with regard to the neutrino oscillations

## Main viewpoints and conclusions:

A lepton (or called a meson) refers to the composite particle that constituted of a number of electrons and a plurality of neutrinos;<sup>[1]</sup> that is

$$A \text{ lepton (a meson)} = m \cdot \nu + n \cdot e; \quad m, n \text{ are positive integers.}$$

Neutrino oscillations is the processes and phenomenon that a lepton (a meson) evolves into other types of leptons (mesons) through obtaining or releasing of neutrinos.

The neutrino oscillation is one kind of Weak interaction processes.<sup>[2][3]</sup>
