

## The Use of Known False Principles in Science

Clayton James Conway

The Science Establishment adopts popular social ideas that come into vogue or high fashion, which takes dedicated women and men decades or more to overturn. The Science Establishment works hard to not change easily from ideas it has adopted. However, this resistance is nothing in comparison to the Establishment's adopted worldview that is sacrosanct with a pretense of being otherwise. Anyone that dares question the Establishment's worldview is denounced as fundamentally wrong, whipped silly, and thrown out of the church.

In Sheldrake's book "Science Delusion" (2012) he takes 10 fundamental tenets of science and by simple logic and basic analysis finds that none of them are founded on a factual basis. The Science Establishment rejects Sheldrake. However, their rejection is based on the right of Authority to reject and not on any logic or proof that Sheldrake is wrong because his analysis is correct. Basically, Authority is stating without words that tenets that cannot stand on their own are still correct when the adopted worldview holds them as consistent and or useful.

Archaeology and geology give the present Holocene epoch two very different time measurements of 10 k and 100 k for the same depth measurement. Logic requires two possibilities that one time measurement is correct and one is wrong or both are wrong. However, the Science Establishment creates a third option by default that both time measurements are correct. Of course, this defies basic logic. One depth measurement cannot represent two ages tenfold apart. However, the deliberate decision by Authority, which will not be changed, is to ignore what is unacceptable. Authority chooses to not harmonize archaeology with its known age of civilization layers and eras to the needs of geological determinations that "prove" the earth is 4.5 billion years old. Authority requires facts and inconsistencies be ignored and bow to views supportive of the adopted worldview.

Miles Mathis points out that the mathematicians "misunderstood" Newton's addition of another radius ( $r$ ) to his average distance orbital velocity equation ( $v = \pi r/T$ ). Newton did this in order to make his orbital velocity equation equal the Pythagorean value of  $2r$  just as the circumference of a circle is  $2r$ . The mathematicians hold that Newton's correction can be used as a procedure meaning that different kinds of velocity are equivalent, which in physics they are not. They call this false procedure "renormalization". However, as it is used today anytime your theory numbers get out of whack just apply the procedure as many times as needed and you are back in business. It is hard to argue with "success". All theoretical infrastructures that use the procedure fall.

Einstein's equation  $E=mc^2$  was not corrected on both sides as the rules of algebra require. Normal and strange energy was integrated together while normal and strange mass was kept separate. It is the lack of integration of strange and normal mass that makes it an incomplete theorem and why energy and mass are only numerical equivalents by it. Energy and mass are exactly the same things just in a different phase. Moreover, the square of the speed of light misdirects. Any real and large number like twice the radius of the universe would work. Light speed squared as a 4<sup>th</sup> dimension and cosmological speed limit are wrong. Gravity is at least 20 billion times faster than light. Instantaneous gravity is a basic assumption of all working models of orbital mechanics. Newton's ballistic mathematics expels orbiting planets where gravity is limited to the speed of light. The change from Maxwell waves to particles is wrong because particle groupings are the measure of a slice of the wave cycle. Smaller slices generate smaller levels of particle groupings until the equipment can no longer measure a smaller slice. Wave cycles are what quantum is.

The constant G (gravity) varies at every measurement, which is the anti-thesis of what a constant is. The Standard Model is given 4 pairs besides a God Particle and big G. However, the proper pattern is complete at 3 pairs and nothing more. It is a virtual particle. There is no matter in mass and no mass in matter. Density is referential. Vibration and charge generate resistance that we experience as solidness. The God Particle is needed by a false philosophy of materialism that deems density as what realness is. Authoritatively, it has been found more than once. However, the discovery of the Higgs boson would lead us to know the exact mass ratio of the boson to the electron. Both are still extremely uncertain. Gravity like temperature imposes itself on the atom and is not an inherent characteristic inside it. Temperature is also missing its cosmological balance. An equal minus temperature in the millions is required to balance the millions of degrees in the positive so zero Kelvin is not an end point but the mid-point cosmological average between the two extremes. Charge, magnetic alignment, and spin determines gravity interactions just as gyros have shown us and Authority willfully ignores because it challenges mass attracting mass singularity of action, which came from Aristotle's obsolete no charge model. Attraction requires charge while repelling can be both charge and a no charge mechanical dynamic. Jupiter is the primary foci and has the majority of the angular momentum of the planetary solar system because it is the largest mass body of the entire system which repels and flings the outer gaseous planets about like the Trojan asteroids. Jupiter's charge determines its distance from the sun. Stars look like pearls on invisible strings. The sun is hollow where a comet can enter and exit without disturbance while the sun is travelling 20 km per second down a twisting Birkland current string (BCS) in dark plasma mode. In 22 years the sun reverses polarity twice by 2 twists of the BCS within the length of the heliosphere (95 AU). Jupiter's interaction with the BCS creates an oppositional counter force (OCF) that grows stronger the greater the distance from the sun. At 5 billion km the OCF grows in strength to 300 earth masses pushing everything in the planetary solar system closer together while planet magnetotails repel the planets to a minimum distance away from each other. The four inner planets as a unit with the sun as their primary foci completely ignore Jupiter's attraction. The charge on the facing sides of the Earth and Moon are the same so they are repelling each other. In the adopted worldview of a dead gravity (no charge) universe there would be no gravity, which means the universe is fully charged. Light is charge.

Science adopts known false ideas and ignores inconsistencies if doing so supports the adopted worldview or other ideas that support it. What possible purpose could this be useful for? Can science still advance by holding to known false principles? The answer is yes it can. Germany during the Nazi period despite a 'Fire and Ice' cosmology came up with extremely advanced technological achievements. The question is still what advantage is gained by doing so? Journals do not want an overall solution to the problems it focuses on and reject such submissions. Journals want support and articles that increase that support. A full understanding of a subject brings about a decline of interest in it. In-depth study requires great efforts and people want to know that the field will not suddenly disappear so they can advance the subject for the expended effort. Adopting a worldview that has known false principles means it cannot be solved. Oddly, this is a source of stability. Authority has full control to accept or reject anything for two millennia on average it takes science society to process every false permutation. Moreover, a backdoor method of finding the truth by eliminating all known untruths actually works. Theories based on known false principles have in common no predictive power. The Authority holds all unexpected outcomes black or white as proof the adopted worldview is correct (confirmation bias). The purpose of the Science Establishment is to continue processing the unsolvable known false principles. Acknowledgement of these false principles is possible only after the processing has been completed which can be done in steps. Kepler replaced perfect circles with ellipses. Newton took mass attraction and gave it math. While processing continues to prove the worldview as true interest in science never completely wanes. This is facilitated by the fact that human beings as processors of information can only focus on one level of an idea at a time (Gladstones, Regan & Lee 1989) (Pashier 1994). Man can hold only one worldview at a time in his mind with great rigidity. Worldviews are simply a certain angle of perception which cannot be completely true. They are like brands that once adopted are never abandoned despite abundant inconsistencies or even a better available product (lens). However, any worldview (lens) can be used to advance science as a framework. Authority, like some individuals, views itself as what science is and any threat to the adopted worldview or supporting views as a threat to science itself. Dark ages in science have occurred so it is by no means a false threat.

Conclusion: Inconsistencies in science are tolerated. The present Holocene epoch has two official values 10 fold apart. Newton's correction of his average orbital velocity equation of  $1r$  to the Pythagorean value of  $2r$  was usurped into a false procedure for the mixing of all velocities as equivalent which riddles physics. The basic rules of algebra are not followed in Einstein's all important equation. Newton's gravity is shrouded in mystery, filed, and hidden within the atom. The Science Establishment denies active cosmic charge, which the attraction dynamic requires and also denies that gravity repels that does not require charge. It allows no challenge to the concept of mass attracting mass. The Scientific Establishment created by definition unobservable dark mass & energy (17/18) to explain why insufficient observable mass (1/18) is able to make galaxy arm motions work. An unobservable magical input of 17/18 of the total is an act of desperation to save a failed theory. Before the invention out of thin air of magical fairy dust of unobservable dark mass & energy it was authoritatively proclaimed that there was no problem with galaxy arm motions and the mass quotient of the universe. Gravity repels. There is no mass in matter. Consciousness creates and alters all things in the cosmos which responds back.

There are 8 main conclusions:

1. All worldviews inherently have known false principles.
2. Authority never questions the adopted worldview because it is used to determine facts.
3. The unconscious purpose of this false construct is to create stability to keep social interest in science alive for the long term for the completion of the back door processing.
4. Authority uses the adopted worldview to test ideas that suggest the worldview is wrong. This use of circular logic protects the worldview from being proved faulty.
5. In order to change a view one has to take over the social view first. Afterwards the old guard dies out. In extremely rare occasions a view can flip as did plate tectonics.
6. The adopted worldview curtails perceptions so strongly that individuals may be unable to observe phenomenon contrary to their beliefs or understand the full ramifications.
7. The cosmos is constantly changing while man also alters it by his mind and beliefs.
8. Authority will deny kindergarten obvious observable facts that the universe is governed by charged plasma physics.
