

Bayes rule from: cs.cornell.edu/home/kleinber/networks-book/networks-book-ch16.pdf,
information cascades

Section 1. We ask:

"Can we validate Bayes rule as defined in the captioned textbook link?"

We assume the notation of Meth8 and Pr[...] from the text as Probability of [...], which is ignored for our purposes here because Pr[...] precedes each term of the formulas of the text.

We assume the apparatus of Meth8 modal logic model checker, implementing our resuscitation of the Łukasiewicz four-valued logic as system variant VL4. The 16-valued truth tables are horizontal.

LET: $p \ q \ [A \ B, \text{ from the text}], \ (q \> p) \ [A|B], \ (p \> q) \ [B|A]$
 vt Validated tautology, nvt Not validated tautology,
 Designated truth value: T Tautology (F Contradiction)

The text defines A given B, that is, if B then A:

$$(q \> p) = ((p \& q) \setminus q) ; nvt ; \quad T T F F \ T T F F \ T T F F \ T T F F \quad (1)$$

Because Eq 1 is not vt, as expected from the text, we test the main connective for $\>$ Imply instead of $=$ Equivalent.

$$(q \> p) \> ((p \& q) \setminus q) ; nvt ; \quad T T T F \ T T T F \ T T T F \ T T T F \quad (1.1)$$

The text defines B given A, that is, if A then B:

$$(p \> q) = ((q \& p) \setminus p) ; nvt ; \quad T F T F \ T F T F \ T F T F \ T F T F \quad (2)$$

Because Eq 2 is not vt, as expected from the textbook, we test the main connective for $\>$ Imply instead of $=$ Equivalent.

$$(p \> q) \> ((q \& p) \setminus p) ; nvt ; \quad T T T F \ T T T F \ T T T F \ T T T F \quad (2.1)$$

Eq 1 and Eq 2 are supposed to be vt but are not. We note that Eq 1.1 is equivalent to Eq 2.1 where the respective main connectives are $\>$ Imply, not $=$ Equivalent.

$$((q \> p) \> ((p \& q) \setminus q)) = ((p \> q) \> ((q \& p) \setminus p)) ; vt ; \quad T T T T \ T T T T \ T T T T \ T T T T \quad (3)$$

Because Eqs 1 and 2 are nvt, we could terminate validation at this point.

Section 2. We ask:

"Can the argument from the text be resuscitated in the process of continuing to evaluate it?"

The text rewrites Eqs 1 and 2 by multiplying both sides of the formula by the denominator in the

respective consequent. In Eqs 1 and 2 the respective multiplier terms are q and p. The idea is to clear the denominator in the respective consequents.

$$((q>p)\&q) = (((p\&q)\q)\&q) ; nvt ; \quad \text{TTFE TTFE TTFE TTFE} \quad (4)$$

$$((p>q)\&p) = (((q\&p)\p)\&p) ; nvt ; \quad \text{TFTF TFTF TFTF TFTF} \quad (5)$$

We test the main connective in Eqs 4 and 5 for > Imply instead of = Equivalent, with the same result as in Eqs 1.1,2.1, and 3.

Because $(p\&q) = (q\&p)$, the text rewrites Eq 5 but Eq 4 is carried over as unchanged.

$$((q>p)\&q) = (((p\&q)\q)\&q) ; nvt ; \quad \text{TTFE TTFE TTFE TTFE} \quad (6)$$

$$((p>q)\&p) = (((p\&q)\p)\&p) ; nvt ; \quad \text{TFTF TFTF TFTF TFTF} \quad (7)$$

The text rewrites Eqs 6 and 7 by simplifying the consequents.

$$((q>p)\&q) = (p\&q) ; vt ; \quad \text{TTTT TTTT TTTT TTTT} \quad (8)$$

$$((p>q)\&p) = (p\&q) ; vt ; \quad \text{TTTT TTTT TTTT TTTT} \quad (9)$$

The text sets Eq 8 equal to Eq 9.

$$((q>p)\&q) = ((p>q)\&p) ; vt ; \quad \text{TTTT TTTT TTTT TTTT} \quad (10)$$

For Eq 10 the text divides both antecedent and consequent by the term q to reduce the antecedent then rewrites.

$$(q>p) = (((p>q)\&p)\q) ; nvt ; \quad \text{TTFE TTFE TTFE TTFE} \quad (11)$$

This produces the intended definition of the text for the expression $\text{Pr}[A|B]$ (16.4) as Bayes rule.

Bayes rule as Eq 11 is nvt. We note the text begins with Eqs 1 and 2, both nvt.

This leads us to consider Eq 3 vt as the basis from which to obtain Bayes rule.

$$((q>p)>((p\&q)\q)) = ((p>q)>((q\&p)\p)) ; vt ; \quad \text{TTTT TTTT TTTT TTTT} \quad (3)$$

From Eq 3, we seek to find the definition of $(q>p)$, or as an alternative approach of $(p>q)$.

In the case of the term $(q>p)$ we seek to remove from the antecedent in Eq 3 the term $((p\&q)\q)$. The procedure is to apply the expression $<((p\&q)\q)$ to the antecedent and consequent.

$$(((q>p)>((p\&q)\q))<((p\&q)\q)) = (((p>q)>((q\&p)\p))<((p\&q)\q)) ; vt ; \quad \text{TTTT TTTT TTTT TTTT} \quad (12)$$

We simplify and rewrite Eq 12.

$$(q>p) = (((p>q)>((q\&p)\p))<((p\&q)\q)) ; nvt ; \quad \text{FFTF FFTF FFTF FFTF} \quad (13)$$

In the case of the term $(p > q)$ we seek to remove from the consequent in Eq 3 the term $((q \& p) \setminus p)$. The procedure is to apply the expression $<((q \& p) \setminus p)$ to the consequent and antecedent.

$$(((q > p) > ((p \& q) \setminus q)) < ((q \& p) \setminus p)) = (((p > q) > ((q \& p) \setminus p)) < ((q \& p) \setminus p)) ; vt ;$$

TTTT TTTT TTTT TTTT (14)

We simplify and rewrite Eq 14.

$$(p > q) = (((q > p) > ((p \& q) \setminus q)) < ((q \& p) \setminus p)) ; nvt ;$$

FTFF FTFF FTFF FTFF (15)

The textbook definitions of Bayes rule are not validated as tautologous and cannot be resuscitated from the textbook.

Section 3. As an experiment, we ask:

"Are the definitions of Bayes rule derivable from Eq 3, the only expression tautologous, from Section 1; in other words, can Meth8 produce a correct Bayes rule because Section 1 failed to do so?"

We reiterate Eq 3 from above and rename it for this section as Eq 3'.

$$((q > p) > ((p \& q) \setminus q)) = ((p > q) > ((q \& p) \setminus p)) ; vt$$

(3')

LET $r = ((p \& q) \setminus q)$, $s = ((q \& p) \setminus p)$ and rewrite Eq 3' with those definitions by substitution.

$$((r = ((p \& q) \setminus q)) \& (s = ((q \& p) \setminus p))) > (((q > p) > r) - s) = (((p > q) > s) - r) ; vt$$

(4')

Our approach is to manipulate the term $((q > p) > r) - s$ so that $(q > p)$ is the antecedent of an equality.

This means finding the correct method to represent $(q > p)$ as a separate term in $((q > p) > r) - s$, or as an alternative approach to represent $(p > q)$ as a separate term in $((p > q) > s) - r$, or both.

We use the template $A > B = \sim A + B$ where A is $(q > p)$ and B is r, so $((q > p) > r) - s$ becomes $(\sim(q > p) + r) - s$.

$$((r = ((p \& q) \setminus q)) \& (s = ((q \& p) \setminus p))) > (((\sim(q > p) + r) - s) = (((p > q) > s) - r) ; vt$$

(5')

This successfully removed from the antecedent term of interest the second $>$ Imply connective to leave connectives + Or and - Not Or.

We use the same template as $C > D = \sim C + D$ where C is $(p > q)$ and D is s, so that $((p > q) > s) - r$ becomes $(\sim(p > q) + s) - r$.

$$((r = ((p \& q) \setminus q)) \& (s = ((q \& p) \setminus p))) > (((\sim(q > p) + r) - s) = ((\sim(p > q) + s) - r)) ; vt$$

(6')

This successfully removed from the consequent term of interest the second $>$ Imply connective to leave connectives + Or and - Not Or.

We cannot extract either $(q > p)$ or $(p > q)$ as separate terms from Eq. 6'. Therefore we abandon seeking these terms as those claimed for $\Pr[A|B]$ or $\Pr[B|A]$ in the text for Bayes rule.
