Analysis of the Matrix $X_{jk} = [x_{jk}] \in \mathbb{C}$ where $x_{jk} = x(j, k) = \delta + \omega(\alpha + \beta)^{jk}$

Pedro Caceres
Longmeadow, MA, 2018

1. Abstract
The function $x(j, k) = x_{jk} = \delta + \omega(\alpha + \beta)^{jk}$ in $\mathbb{C} \rightarrow \mathbb{C}$ is a generalization of the power function $y(\alpha) = \alpha^k$ in $\mathbb{R} \rightarrow \mathbb{R}$ and the exponential function $y(k) = e^{\alpha k}$ in $\mathbb{R} \rightarrow \mathbb{R}$. In this paper we are going to calculate the values of infinite and partial sums and products involving elements of the matrix $X_{jk} = [x_{jk}] \in \mathbb{C}$

$$X_{jk} = \begin{bmatrix} \delta + w(\alpha + \beta)^{\eta} & \delta + w(\alpha + \beta)^{2\eta} & \cdots & \delta + w(\alpha + \beta)^{m\eta} \\ \delta + w(\alpha + 2\beta)^{\eta} & \delta + w(\alpha + 2\beta)^{2\eta} & \cdots & \delta + w(\alpha + 2\beta)^{m\eta} \\ \vdots & \vdots & \ddots & \vdots \\ \delta + w(\alpha + n\beta)^{\eta} & \delta + w(\alpha + n\beta)^{2\eta} & \cdots & \delta + w(\alpha + n\beta)^{m\eta} \end{bmatrix}$$

As a result, several new representations will be made for some infinite series, including the Riemann Zeta Function in $\mathbb{C}$.

2. Definition of $C$-Transformation
The $C$-Transformation (Caceres Transformation) of a function $f(k): \mathbb{R} \rightarrow \mathbb{R}$ is given by:

$$C[f(x)] = \lim_{m \rightarrow \infty} \left( \sum_{k=1}^{m} f(k) - \int f(m) \, dm \right)$$

We will call $C$-values of a function $f(x)$ the results of the $C$-transformation applied to the function $f(x)$.

3. Functions used in the paper
3.1. Riemann Zeta function $\zeta(k)$:

$$\zeta(k) = \sum_{j=1}^{\infty} j^{-k} \text{ converges for } k \neq 1$$

Figure 1. Riemann Zeta function in $\mathbb{R}$
This is one of the best studied functions in mathematics. Some of the most important connections of the Riemann Zeta function and Number Theory are:

a. Euler Product Formula that ties $\zeta(k)$ with the distribution of prime numbers
\[ \zeta(s) = \sum_{j=1}^{\infty} j^{-s} = \prod_{p \text{ prime}} \frac{1}{1-p^{-s}} \]

Example for \( k=2 \)

\[ \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \cdots = \frac{1}{1-2^{-2}} \cdot \frac{1}{1-3^{-2}} \cdot \frac{1}{1-5^{-2}} \cdot \frac{1}{1-7^{-2}} \cdot \ldots \]

b. Integral definition:

\[ \zeta(s) = \sum_{j=1}^{\infty} j^{-s} = \frac{1}{\Gamma(s)} \int_{1}^{\infty} \frac{1}{e^x - 1} x^{s} \, dx \]

Where \( \Gamma(s) \) is the Gamma function (described in 4.4)

c. Analytical continuation for:

\( \text{Re}(s) > 0 \) [Dirichlet]

\[ \zeta(s) = \frac{1}{s-1} \sum_{k=1}^{\infty} \frac{n}{(n+1)^{s}} - \frac{n-s}{n^{s}} \]

\( 0 < \text{Re}(s) < 1 \):

\[ \zeta(s) = \frac{1}{1-2^{1-s}} \sum_{k=1}^{\infty} \frac{(-1)^{k-1}}{k^{s}} \]

\( -k < \text{Re}(s) \) [Kopp, Konrad. 1945]:

\[ \zeta(s) = \frac{1}{s-1} \sum_{k=1}^{\infty} \frac{k(k+1)}{2} \left( \frac{2k+3+s}{(k+1)^{s+2}} - \frac{2k-1-s}{k^{s+2}} \right) \]

d. Laurent series at \( s=1 \):

\[ \zeta(s) = \frac{1}{s-1} + \sum_{k=1}^{\infty} \frac{(-1)^{k} \gamma_{n}}{k!} (s-1)^{k} \]

where \( \gamma_{n} \) are the Stieltjes constants, defined in 4.3.

e. Caceres approximation for \( \zeta(s) \) [Caceres, Pedro. 2017]:

\[ \zeta(s)^{\text{approx}} = \frac{1}{1-\pi^{-s-2}} \]

</tbody>
</table>

Table 1

3.2. Hurwitz function \( \zeta(k, z) \):

\[ \zeta(k, z) = \sum_{j=0}^{\infty} (j + z)^{-k} = \sum_{j=z}^{\infty} j^{-k} \quad \text{converges for } k > 1 \]

3.3. Generalized Harmonic Function \( H_{n}^{(k)} \):
\[ H_n^{(k)} = \sum_{j=1}^{n} j^{-k} = \left( \frac{1}{1^k} + \frac{1}{2^k} + \cdots + \frac{1}{n^k} \right) \text{ converges for } k > 1 \]

3.4. Gamma Function \( \Gamma(n + 1) \):

\[ \Gamma(n + 1) = n! \]

\[ \Gamma\left(1 + \frac{1}{n}\right) = \frac{1}{n} \Gamma(n) \]

\[ \Gamma(z) = \frac{1}{z} \prod_{n=1}^{\infty} \frac{(1 + \frac{1}{n})^z}{1 + \frac{z}{n}} \]

\[ \Gamma(z) \Gamma(1 - z) = \frac{\pi}{\sin(\pi z)} \]

If \( z \) is positive even integer, then:

\[ \Gamma\left(n + \frac{1}{2}\right) = \frac{(2n)!}{4^n n!} \sqrt{\pi} \]

Integral representation:

\[ \Gamma(z) = \int_0^\infty e^{-x} x^{z-1} dx \]

The derivative of the Gamma function can be given by:

\[ \Gamma'(n + 1) = n! \left( -\gamma + \sum_{k=1}^{n} \frac{1}{k} \right) \]

Where \( \gamma \) is the Euler-Mascheroni constant.

3.5. K function \( K(n) \):

\[ K(n) = \prod_{j=1}^{n-1} j = 1^1 \times 2^2 \times \ldots \times 1(n - 1)^{(n-1)} \]

3.6. Hyperfactorial function \( H_n \):
\[ H_n = K(n + 1) \]

3.7. Digamma function \( \psi^{(0)}(z) \):
\[
\psi^{(0)}(z) = \frac{d}{dz} \ln(\Gamma(z)) = \frac{\Gamma'(z)}{\Gamma(z)}
\]

For integers \( n \):
\[
\psi^{(0)}(n) = -\gamma + H_{n-1} \quad \text{where} \quad \gamma \text{ is the Euler-Mascheroni constant}
\]

3.8. Polygamma function \( \psi^{(m)}(z) \):
\[
\psi^{(m)}(z) = (-1)^{m+1} m! \zeta(1 + m, z)
\]

3.9. Pochhammer symbol:
\[
(x)_n = \frac{\Gamma(x + n)}{\Gamma(x)} = x(x + 1) \cdots (x + n - 1)
\]

3.10. Hypergeometric function:
\[
\sum_{n=0}^{\infty} \frac{(a)_n(b)_n}{(c)_n} \frac{z^n}{n!} = 1 + \frac{ab}{1!} z + \frac{a(a+1)b(b+1)}{2!} \frac{z^2}{(c+1)!} + \cdots
\]

Where \((a)_n\) is a Pochhammer symbol. The solution exists if \( c \) is not a negative integer (1) for all of \(|z|<1\) and (2) on the unit circle \(|z|=1\) if \( \text{Re}(c-a-b)>0 \).
This function is related to the Hypergeometric Differential equation:

\[ z(1 - z)y'' + [c - (a + b + 1)z] y' - aby = 0 \]

Some particular values:

\[
\begin{align*}
_2F_1(1,1;1;z) &= \frac{1}{1 - z} \\
_2F_1(1,1;2;z) &= -\frac{\ln(1 - z)}{z} \\
_2F_1(1,2;1;z) &= \frac{1}{(1 - z)^2} \\
_2F_1(1,2;2;z) &= \frac{1}{1 - z}
\end{align*}
\]

3.11. Polylogarithm \( Li_s(z) \) defined by a power series in \( z \), which is also a Dirichlet series in \( s \):

\[
Li_s(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^s}
\]

converges for \( s > 1 \) and \( |z| < 1 \)

Particular values:

<table>
<thead>
<tr>
<th>( Li_1(z) )</th>
<th>( Li_0(z) )</th>
<th>( Li_1(1/2) )</th>
<th>( Li_2(1/2) )</th>

</tr>
</tbody>
</table>

Table 2

![Figure 5. Polylogarithm function in R](image)

Where:

\[
\eta(s) = \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^s} \quad \text{is the } \eta \text{ (eta) Dirichlet function}
\]

\[
\beta(s) = \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n + 1)^s} \quad \text{is the } \beta \text{ (beta) Dirichlet function}
\]

3.12. The Lerch Transcendent function \( \Phi(z, s, q) \):

\[
\Phi(z, s, q) = \sum_{k=0}^{\infty} \frac{z^k}{(k + q)^s}
\]
4. Constants used in this paper

4.1. Glaisher-Kinkelin constant

\[ A = e^{1/12} \Gamma'(-1) = 1.28242712 \ldots \]

4.2. Euler-Mascheroni constant:

\[ \gamma = \lim_{m \to \infty} \left( \sum_{k=1}^{m} \frac{1}{k} - \int \frac{dm}{m} \right) = \lim_{m \to \infty} \left( \sum_{k=1}^{m} \frac{1}{k} - \ln(m) \right) = 0.57721566490 \ldots \]

\[ \gamma \text{ is also the } C\text{-value of } f(k) = \frac{1}{k} \]

4.3. Stieltjes constants:

\[ \gamma_n = \lim_{m \to \infty} \left( \sum_{k=1}^{m} \frac{(\ln k)^n}{k} - \int \frac{(\ln m)^n}{m} \, dk \right) = \lim_{m \to \infty} \left( \sum_{k=1}^{m} \frac{(\ln k)^n}{k} - \frac{(\ln m)^{n+1}}{n+1} \right) \]

Table 3

\[ \gamma_n \text{ are also the } C\text{-values of } f(k) = \frac{(\ln k)^n}{k} \]

4.4. Constants involving \( \zeta(s) \):

Lemma 1:

\[ \sum_{j=2}^{\infty} \sum_{k=2}^{\infty} j^{-k} = 1 \]

Proof:

\[ \sum_{j=2}^{\infty} \sum_{k=2}^{\infty} j^{-k} = \lim_{n,m \to \infty} \sum_{j=2}^{n} \sum_{k=2}^{m} j^{-k} = \]

\[ = \lim_{n,m \to \infty} \sum_{j=2}^{n} \frac{j^{m-1}(j^m - j)}{j - 1} = \lim_{n \to \infty} \sum_{j=2}^{n} \frac{j^{-1}}{j - 1} = \lim_{n \to \infty} \left( 1 - \frac{1}{n} \right) = 1 \]

Lemma 2:

\[ \sum_{j=2}^{\infty} (\zeta(j) - 1) = 1 \]

Proof:

\[ \sum_{j=2}^{\infty} (\zeta(j) - 1) = \sum_{j=2}^{\infty} \left( \sum_{k=1}^{j} j^{-k} - 1 \right) = \sum_{j=2}^{\infty} \sum_{k=2}^{j} j^{-k} = 1 \]

Per lemma 1
Lemma 3:

\[
\lim_{k \to \infty} \zeta(k) = 1
\]

Proof:

\[
\zeta(k) = \sum_{j=1}^{\infty} j^{-k} = 1 + \frac{1}{2^k} + \frac{1}{3^k} + \frac{1}{4^k} + \frac{1}{5^k} + \cdots
\]

\[
\lim_{k \to \infty} \zeta(k) = \lim_{k \to \infty} 1 + \frac{1}{2^k} + \frac{1}{3^k} + \frac{1}{4^k} + \frac{1}{5^k} + \cdots = 1
\]

Theorem 1.0: The infinite sums \(\sum_{j=1}^{\infty} [\zeta(u \pm k \pm n) - \zeta(v \pm k \pm m)]\) converge to a value in the interval (-1, 1) for all \(u \geq 1, v \geq 1, n, m \in N\) such that \((u \pm k \pm n) > 1\) and \((v \pm k \pm m) > 1\) for all \(j \in N\)

Proof:

\[
\sum_{j=1}^{\infty} [\zeta(u \pm n) - \zeta(v \pm m)] = \\
= \zeta(u \pm n) - \zeta(v \pm m) + \zeta(2u \pm n) - \zeta(2v \pm m) + \cdots \\
= \sum_{j=1}^{\infty} \sum_{k=1}^{\infty} (\frac{1}{juk \pm n} - \frac{1}{jvk \pm m})
\]

The largest differences in value between the parameters \(uk \pm n\) and \(vk \pm m\) occurs when \(u = 1, n = 1, v = \text{infinity}\).

\[
\sum_{j=1}^{\infty} \sum_{k=1}^{\infty} (\frac{1}{juk \pm n} - \frac{1}{jvk \pm m}) \leq \sum_{j=1}^{\infty} \left(\sum_{k=1}^{\infty} \frac{1}{j^{k+1}}\right) - 1 = \\
= \sum_{j=2}^{\infty} \sum_{k=1}^{\infty} \frac{1}{j^{k+1}} = \sum_{j=2}^{\infty} \sum_{k=2}^{\infty} \frac{1}{j^k} = 1
\]

As per lemmas 1,2,3.

Following the same logic, we can also say that:

\[
\sum_{j=1}^{\infty} \sum_{k=1}^{\infty} (\frac{1}{juk \pm n} - \frac{1}{jvk \pm m}) \geq -1
\]

Therefore, the infinite sums \(\sum_{j=1}^{\infty} [\zeta(uk \pm n) - \zeta(vk \pm m)]\) converge to a value in the interval (-1, 1) for all \(u, v, n, m \in N\) such that \((u \pm k \pm n) > 1\) and \((v \pm k \pm m) > 1\) for all \(j \in N\)
Similarly, we can propose and formulate the following Theorem.

**Theorem 2.0:** The infinite sums \( \sum_{j=1}^{\infty} [\zeta(u \cdot k \pm n) - \zeta(v \cdot k \pm m)] \) converge to a value in the interval \((-\infty, \infty)\) for all \( u \geq 1, v \geq 1, n, m \in \mathbb{R} \) such that \((u \cdot k \pm n) > 1\) and \((v \cdot k \pm m) > 1\) for all \( j \in \mathbb{N} \).

Example:

\[
\sum_{j=1}^{\infty} [\zeta((1.1) \cdot j + 2) - \zeta((1.2) \cdot j + 0.1)] = -3.14132 \ldots
\]

\[
\sum_{j=1}^{\infty} [\zeta(1.001 \cdot j) - \zeta(1.1 \cdot j + 1)] = 999.733 \ldots
\]

These theorems let us define a set of infinite constants of the type:

\[
CZ_{u,v,n,m}^{(q)} = \sum_{j=1}^{\infty} [\zeta(uj \pm n) - \zeta(vj \pm m)] = \text{constant}
\]

(By default, \( q=1 \) will not be written)

Some of the \( CZ \) constants we will use through the paper are:

\[
CZ_{2,0,1,2} = \sum_{j=1}^{\infty} [\zeta(2j) - \zeta(2j + 1)] = 0.5
\]

\[
CZ_{4,0,4,-2} = \sum_{j=1}^{\infty} [\zeta(4j) - \zeta(4j - 2)] = -0.5766744746 \ldots
\]

\[
CZ_{4,1,4,-1} = \sum_{j=1}^{\infty} [\zeta(4j + 1) - \zeta(4j - 1)] = -0.17186598552 \ldots
\]

These constants will be used to calculate the value of values of the Matrix \( X_{ij} = [x_{jk}] \) in \( C \) complex plane.

The following matrix shows some values of the \( CZ_{u,v,1,0} \) constants:

5. The Matrix $X_{ij} = [x_{jk}] \in \mathbb{R}^{l \times k}$ where $x_{jk} = \delta + \omega(\alpha + \beta j)^{\varphi k}, \alpha, \beta, \omega, \delta, \varphi \in \mathbb{R}$

$$X_{jk} = [\delta + w(\alpha + \beta j)^{\varphi k}] = \begin{bmatrix} [\delta + w(\alpha + \beta)^{\varphi}] & [\delta + w(\alpha + \beta)^{2\varphi}] & \cdots & [\delta + w(\alpha + \beta)^{m\varphi}] \\ [\delta + w(\alpha + 2\beta)^{\varphi}] & [\delta + w(\alpha + 2\beta)^{2\varphi}] & \cdots & [\delta + w(\alpha + 2\beta)^{m\varphi}] \\ \vdots & \vdots & \ddots & \vdots \\ [\delta + w(\alpha + n\beta)^{\varphi}] & [\delta + w(\alpha + n\beta)^{2\varphi}] & \cdots & [\delta + w(\alpha + n\beta)^{m\varphi}] \end{bmatrix}$$

5.1 Elements of the matrix $X_{ij}$

$x_{jk} = \delta + \omega(\alpha + \beta j)^{\varphi k}$

5.2 Rows of the matrix $X_{ij}$

$RX_{jk} = \delta + \omega(\alpha + \beta j)^{\varphi k}$ for $k = 1..m$

5.3 Columns of the matrix $X_{ij}$

$CX_{jk} = \delta + \omega(\alpha + \beta j)^{\varphi k}$ for $j = 1..n$

5.4. Some examples of $X_{ij}$ based on values of $\alpha, \beta, \omega, \delta, \varphi$ in $\mathbb{R}$:

a. If $\alpha = 0, \beta = 1, \omega = 1, \delta = 0, \varphi = -1$ then $x_{jk} = j^{-k}$

$$X_{ij} = \begin{bmatrix} 1^{-1} & \cdots & 1^{-k} \\ \vdots & \ddots & \vdots \\ 1^{-1} & \cdots & 1^{-k} \end{bmatrix}$$

b. If $\alpha = 0, \beta = 1, \omega = 1, \delta = 0$ then $x_{jk} = j^{-\varphi k}$

$$X_{ij} = \begin{bmatrix} 1^{-\varphi} & \cdots & 1^{-\varphi k} \\ \vdots & \ddots & \vdots \\ 1^{-\varphi} & \cdots & 1^{-\varphi k} \end{bmatrix}$$

c. If $\alpha = 0, \beta = 1, \omega = 1, \delta = 1, \varphi = -1$ then $x_{jk} = (1 + j^{-k})$

$$X_{ij} = \begin{bmatrix} (1 + 1^{-1}) & \cdots & (1 + 1^{-k}) \\ \vdots & \ddots & \vdots \\ (1 + 1^{-1}) & \cdots & (1 + 1^{-k}) \end{bmatrix}$$

d. If $\alpha = 1, \beta = -1, \omega = 1, \delta = 1, \varphi = -1$ then $x_{jk} = (1 - j^{-k})$

$$X_{ij} = \begin{bmatrix} (1 - 1^{-1}) & \cdots & (1 - 1^{-k}) \\ \vdots & \ddots & \vdots \\ (1 - 1^{-1}) & \cdots & (1 - 1^{-k}) \end{bmatrix}$$

e. If $\alpha = 1, \beta = 1, \omega = 1, \delta = 0, \varphi = -1$ then $x_{jk} = (1 + j)^{-k}$

$$X_{ij} = \begin{bmatrix} (1 + 1)^{-1} & \cdots & (1 + 1)^{-k} \\ \vdots & \ddots & \vdots \\ (1 + 1)^{-1} & \cdots & (1 + 1)^{-k} \end{bmatrix}$$

f. If $\alpha = 0, \beta = 1, \omega = 1, \delta = 0, \varphi = -1$, and $j = re^{i\theta}$ then $x_{jk} = (re^{i\theta})^{-k}$

$$X_{ij} = \begin{bmatrix} (e^{i\theta})^{-1} & \cdots & (e^{i\theta})^{-k} \\ \vdots & \ddots & \vdots \\ (re^{i\theta})^{-1} & \cdots & (re^{i\theta})^{-k} \end{bmatrix}$$

6. Elements $x_{jk} = \delta + \omega(\alpha + \beta j)^{\varphi k}$ with $\alpha, \omega, \beta, \delta, \varphi \in \mathbb{R}$

6.1 A general expression for $x_{jk}$ as a power series is given by the binomial expression:

$$x_{jk} = \delta + w(\alpha + \beta j)^{\varphi k} = \delta + w \sum_{p=0}^{\varphi k} \binom{\varphi k}{p} \alpha^{\varphi k-p} (\beta j)^p$$
6.2 For $\delta = 0, \omega = 1, \alpha = 0, \beta = 1, \varphi = 1 \rightarrow x_{jk} = j^k$ can also be expressed as series of the form:

$$x_{jk} = j^k = (q + (j - q))^k = \sum_{p=0}^{k} \binom{k}{p} q^{k-p}(j - q)^p$$

For $q=1$:

$$x_{jk} = j^k = (1 + (j - 1))^k = \sum_{p=0}^{k} \binom{k}{p} (j - 1)^p$$

Example: $3^4 = \binom{4}{0}2^4 + \binom{4}{1}2^3 + \binom{4}{2}2^2 + \binom{4}{3}2^1 + \binom{4}{4}2^0 = 81$

$x_{jk} = j^k$ can also be expressed using the exponential function:

$$x_{jk} = \sum_{p=0}^{k} \binom{k}{p} e^p \ln(j-1)$$

6.3 For $\delta = 0, \omega = 1, \alpha = 0, \beta = 1, \varphi = -1, k = j \rightarrow y(j,k) = j^{-l}$. Series expansion at $j=0$:

$$x_{ij} = j^{-l} = 1 - j \log(j) + \frac{1}{2} j^2 \log^2(j) - \frac{1}{6} j^3 \log^3(j) + \cdots = \sum_{p=0}^{\infty} \frac{(-1)^p}{p!} j^p \log^p(j)$$

Table 5

7. General expressions for the sums of the rows and columns of Matrix $X_{jk} = [x_{jk}] \in \mathbb{R}^{1 \times k}$ where $x_{jk} = \delta + \omega (\alpha + \beta j)^{\varphi k}$ with $\alpha, \beta, \omega, \delta, \varphi \in \mathbb{R}$

7.1. Sum of Columns, over $(j)$:

A general expression for $\sum x_{jk}$ over $j$ using the Hurwitz function:

$$\sum_{j=1}^{n} \delta + w(\alpha + \beta j)^{\varphi k} = \delta n - w \beta^{\varphi k} \left( -\varphi k, \frac{\alpha + \beta}{\beta} + n \right) + w \beta^{\varphi k} \ z \left( -\varphi k, \frac{\alpha + \beta}{\beta} \right)$$

7.2. Sum of Rows, over $(k)$:

A general expression for $\sum x_{jk}$ over $k$ using the formula for the sum of geometric progressions when $|(\alpha + \beta)| < 1$:

$$\sum_{k=1}^{n} \delta + w(\alpha + \beta j)^{\varphi k} = \delta n + \frac{w (\alpha + \beta)^{\varphi} ((\alpha + \beta)^{\varphi n} - 1)}{((\alpha + \beta)^{\varphi} - 1)}$$

8. Case 1: Matrix $X_{ij} = [x_{jk}] \in \mathbb{R}^{l \times k}$ where $x_{jk} = j^{-k}$

8.1. Sum of terms of the rows of $X_{jk} = [j^{-k}]$:

$$\sum_{k=1}^{\infty} j^{-k} = \lim_{m \to \infty} \left( \frac{1}{1} + \frac{1}{j^2} + \cdots + \frac{1}{j^m} \right) = \frac{1}{j - 1} \quad \text{if } j > 1$$
\[ \sum_{k=1}^{n} j^{-k} = n \quad \text{if } j = 1 \text{ and } \sum_{k=1}^{\infty} j^{-k} \text{ is Divergent} \]

\[ \sum_{k=1}^{m} j^{-k} = \frac{j^{-k}(j^k - 1)}{j - 1} \quad \text{if } j > 1 \]

$\Pi \text{ rows} X_{jk} = \Pi [j^{-k}]$

Table 10

8.3. Sum of terms of the columns of $X_{jk} = [j^{-k}]$:

$$\sum_{j=1}^{\infty} j^{-k} = \lim_{n \to \infty} \left( \frac{1}{1^k} + \frac{1}{2^k} + \cdots + \frac{1}{n^k} \right) = \zeta(k)$$

This is the Riemann-Zeta function.

$$\sum_{j=1}^{n} j^{-1} = H_n = \zeta(1) \text{ is Divergent}$$

$$\sum_{j=1}^{n} j^{-k} = \left( \frac{1}{1^k} + \frac{1}{2^k} + \cdots + \frac{1}{n^k} \right) = H_n^{(k)}$$

Where $H_n^{(k)}$, is the generalized Harmonic function.

<td>$H_4^{(2)} = \frac{205}{144}$</td>
</tr>
</tbody>
</table>

Table 12

We can also express this partial sum using the Hurwitz function as:

$$\sum_{j=1}^{n} j^{-k} = \left( \frac{1}{1^k} + \frac{1}{2^k} + \cdots + \frac{1}{n^k} \right) = \zeta(k) - \zeta(k, n + 1)$$

$$\sum_{j=1}^{\infty} j^{-k} = \lim_{n \to \infty} \left( \frac{1}{1^k} + \frac{1}{2^k} + \cdots + \frac{1}{n^k} \right) = \zeta(k, z)$$

$$\sum_{j=p}^{n} j^{-k} = \zeta(k, p) - \zeta(k, n + 1)$$

Value Table for column k=3, and n=∞
Other interesting expressions:

\[
\sum_{j=1}^{\infty} j^{-k} \left( 1 - \frac{1}{\sum_{p=0}^{\infty} \frac{(k/p)^p}{p!}} \right) = 1 \quad \text{for Re}(k) > 1
\]

This expression gives the factor \( A(k) \) such that \( \sum_{j=1}^{\infty} \frac{A(k)}{j^s} = 1 \) for all \( k \).

\[
\sum_{j=1}^{\infty} j^{-k} = \sum_{j=1}^{\infty} \frac{(-k)^p}{p!} (\log(j))^p \quad \text{for Re}(k) > 1
\]

\[
\sum_{j=1}^{n} j^{-k} = \sum_{j=1}^{n} \frac{(-k)^p}{p!} (\log(j))^p = H_n^{(k)} = \zeta(k) + \frac{\psi^{(k-1)}(n+1)}{k-1} \quad \text{for Re}(k) > 1
\]

A similar series:

\[
\sum_{j=1}^{\infty} \frac{k^p}{p!} \cdot j \cdot (-\log(j))^p = H_n^{(k-1)} - \frac{1}{2} n(n+1) \quad \text{for Re}(k) > 1
\]

Using the power series for \( \pi^k \):

\[
\pi^k = \sum_{p=0}^{\infty} \frac{k^p}{p!} (\log(\pi))^p
\]

And we can write \( \zeta(k) \) as a function of \( \pi^k \). Example for \( k=2 \) for example:

\[
\frac{\zeta(2)}{\pi^2} = \frac{\sum_{j=1}^{\infty} \sum_{p=0}^{\infty} \frac{(-2)^p}{p!} (\log(j))^p}{\sum_{p=0}^{\infty} \frac{(-2)^p}{p!} (\log(\pi))^p}
\]

We know that these expressions give us rational numbers when \( k \) = even:

\[
\frac{\zeta(2)}{\pi^2} = \frac{1}{6}
\]

\[
\frac{\zeta(4)}{\pi^4} = \frac{1}{90}
\]

\[
\frac{\zeta(6)}{\pi^6} = \frac{1}{945}
\]

\[
\frac{\zeta(8)}{\pi^8} = \frac{1}{9450}
\]

We also know that there is not a defined expression when \( k \) is odd. We are proposing the following expression as a very close approximation for \( \frac{\zeta(s)}{\pi^s} \) for \( s \)=odd positive integer:
\[ \frac{\zeta(s)}{\pi^s} = \frac{1}{K(s)} \] where \( K(s) = \text{Floor} \left( \frac{(2^s-1)\pi^s}{2s} \right) - 1 \) for \( s > 1 \)

*Table 14*

This approximation leads to the following approximate formulation for \( \zeta(s) \)

\[ \zeta(s) = \frac{1}{1 - \pi^{-s} - 2^{-s}} \]

Graphically:

*Figure 6. Caceres' approximation for the Riemann Zeta function in R*

8.4. Product of terms of the columns of \( X_{jk} = [j^{-k}] \):

\[
\prod_{j=1}^{\infty} j^{-k} = \lim_{n \to \infty} \left( \frac{1}{1^k} \times \frac{1}{2^k} \times \ldots \times \frac{1}{n^k} \right) = 0
\]

\[
\prod_{j=1}^{n} j^{-k} = \left( \frac{1}{1^k} \times \frac{1}{2^k} \times \ldots \times \frac{1}{n^k} \right) = n!^{-k} = \Gamma(n+1)^{-k}
\]

Where \( \Gamma \) is the Gamma function.

Table 16

8.5. Sum of terms of the Main Diagonal of $X_{jk} = [j^{-1}]$:

$$\sum_{j=1}^{\infty} j^{-1} = \sum_{j=1}^{\infty} \sum_{p=0}^{j} \binom{j}{p} (j-1)^p = \frac{1}{1^1} + \frac{1}{2^2} + \frac{1}{3^3} + \frac{1}{4^4} ...$$

This infinite sum converges rapidly to:

$$\sum_{j=1}^{\infty} j^{-1} = 1 + \frac{1}{2^2} + \frac{1}{3^3} + \frac{1}{4^4} ... = 1.29129 ...$$

Other relevant expressions for $y = j^{-1}$

$$\frac{d}{dj} j^{-1} = j^{-1} (\log(j) + 1)$$

$$\int j^{-1} \, dj = \int \sum_{p=0}^{\infty} (-1)^p j^p \log^p(j) \, dj = \sum_{p=1}^{\infty} \frac{1}{A_p} \sum_{q=1}^{p} \frac{p!}{(q-1)!} \log^{q-1}(j)$$

The last expression is accurate for $p=1,2,3,4,6,8$ and all even, and approximate for $p=5,7$ and greater odd integers. The terms $A_p$ coincide with the terms of OEIS A055774 of positive numbers that are the least common multiple of $n!$ and $n^p$.

And it can be calculated that:

$$\int_0^{\infty} j^{-1} \, dj = 1.99545595750014 ...$$

$$\int_1^{\infty} j^{-1} \, dj = 0.70416996043747 ...$$

$$\int_2^{\infty} j^{-1} \, dj = 0.131821 ...$$

$$\int_0^{\infty} j^{-1} \, dj - \sum_{j=1}^{\infty} j^{-1} = 0.587116 ...$$

8.6. Product of terms of the Main Diagonal of $X_{jk} = [j^{-1}]$:

$$\prod_{j=1}^{\infty} j^{-1} = 0$$
\[
\prod_{j=n}^{j} \frac{1}{j} = \frac{1}{H(n)}
\]

Where \(H(n)\) is the Hyperfactorial function.

<td>0</td>
<td>0.46875</td>
<td>0.716367</td>
</tr>
</tbody>
</table>

| Table 23 |

Let’s remember that:

\( H_{n}^{(m)} = \zeta(m) - \zeta(m, n + 1) \)

8.9.2 \( S_{2 \infty} \)

\( S_{2 \infty} = \sum_{j=2}^{\infty} \sum_{k=2}^{\infty} j-k \)

\( S_{2 \infty} = \lim_{n,m\rightarrow\infty} \sum_{j=2}^{n} \sum_{k=2}^{m} j-k = \lim_{n,m\rightarrow\infty} \sum_{j=2}^{m} (H_{n}^{(j)} - 1) = \lim_{n\rightarrow\infty} \left( 1 - \frac{1}{n} \right) = 1 \)

Which is equivalent to the next expression.

8.9.3 \( S_{2 \infty} \)

\( \sum_{j=2}^{\infty} \left[ \zeta(j) - 1 \right] = S_{2 \infty} = 1 \)

8.9.4 \( S_{2 m} \)

\( S_{2 m} = \sum_{j=2}^{\infty} \sum_{k=m}^{\infty} j-k = (m - 1) - \sum_{q=2}^{q-1} \zeta(q) \)

8.9.5 \( S_{2 m} \)

\( S_{2 m} = \sum_{j=2}^{\infty} \sum_{k=m}^{\infty} j-k = S_{22} - \sum_{q=2}^{q-1} (\zeta(q) - 1) = 1 - \sum_{q=2}^{q-1} (\zeta(q) - 1) \)

8.9.6 \( S_{2 \infty} \)

If \( C_{m} = \text{Sum of elements of the column } k=m \), and \( R_{n} = \text{Sum of elements of the row } j=n \), then:
\[ S_{n}^{m} = \sum_{j=2}^{\infty} \sum_{k=2}^{m} j^{-k} - \sum_{p=2}^{m-1} C_{p} - \sum_{q=2}^{n-1} R_{q} + \sum_{r=2}^{n-1} \sum_{s=2}^{m-1} r^{-s} \]

Where:

\[ \sum_{j=2}^{\infty} \sum_{k=2}^{\infty} j^{-k} = 1 \]

\[ \sum_{p=2}^{m-1} C_{p} = \sum_{p=2}^{m-1} (\zeta(p) - 1) \]

\[ \sum_{q=2}^{n-1} R_{q} = \sum_{q=2}^{n-1} \frac{1}{q(q - 1)} \]

and we can rewrite

\[ S_{n}^{m} = 1 - \sum_{p=2}^{m-1} (\zeta(p) - 1) - \sum_{q=2}^{n-1} \frac{1}{q(q - 1)} + \sum_{r=2}^{n-1} \sum_{s=2}^{m-1} r^{-s} \]

Example:

\[ S_{3}^{4} = 1 - \sum_{p=2}^{3} (\zeta(p) - 1) - \sum_{q=2}^{2} \frac{1}{q(q - 1)} + \sum_{r=2}^{2} \sum_{s=2}^{3} r^{-s} \]

\[ S_{3}^{4} = 1 - \zeta(2) - 1 - \zeta(3) - 1 - \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} \]

\[ S_{3}^{4} = \frac{23}{8} - \zeta(2) - \zeta(3) \]

This is the same value shown in the previous table.

8.9.7. Other infinite sums involving \( \zeta(s) \) (In parenthesis using \( CZ_{n} \) nomenclature)

\[ \sum_{j=2}^{\infty} [\zeta(j) - 1] = 1 = CZ_{1,0,\infty,0}^{(2)} \]

\[ \sum_{j=2}^{\infty} [2 \zeta(j) - 1] = \frac{3}{4} = CZ_{2,0,\infty,0}^{(2)} \]

\[ \sum_{j=2}^{\infty} [\zeta(2j) - 1] = \frac{1}{4} = CZ_{2,-1,\infty,0}^{(2)} \]

\[ \sum_{j=2}^{\infty} \frac{\zeta(j - 1)}{j} = 1 - \gamma = 0.422784 \ldots \]

\[ \sum_{j=2}^{\infty} \frac{\zeta(j - 1)}{e^j} = -\frac{1}{e} \left( \frac{1}{(e - 1)} + \gamma + \psi^{(0)} \left( \frac{e - 1}{e} \right) \right) = 0.099151 \ldots \]
8.10. C-values for \(X_{ij} = \frac{1}{k^n}; n>1\)

\[ C_n(f(n) = \frac{1}{k^n}) = \lim_{m \to \infty} \left( \frac{1}{k^n} \sum_{k=1}^{m} dm \right) = \lim_{m \to \infty} \left( \frac{1}{k^n} \sum_{k=1}^{m} \frac{m^{1-n}}{(n-1)} \right) = \zeta(n) \]

<table>

Table 24

9. Case 2: Matrix \(X_{ij} = [x_{jk}] \in \mathbb{R}^{i \times k}\) where \(x_{jk} = j^k\)

9.1. Sum of terms of the columns of \(X_{jk} = [j^k] \):

\[ \sum_{j=1}^{n} j^k = 1^k + 2^k + 3^k + \cdots + n^k = \sum_{j=1}^{\infty} \sum_{p=0}^{\infty} \frac{k^p}{p!} (\log(j))^p \]

\[ \sum_{j=1}^{n} j^k = 1^k + 2^k + 3^k + \cdots + n^k = H_n^{(-k)} \]

\[ \sum_{j=1}^{n} j^k = 1^k + 2^k + 3^k + \cdots + n^k = \zeta(-k) - \zeta(-k, n + 1) \]

\[ \sum_{j=1}^{n} j^k = 1^k + 2^k + 3^k + \cdots = \frac{1}{k+1} \sum_{p=0}^{n} \binom{k+1}{p} B_k^+ n^{k+1-p} \]

Where \(B_k^+\) are the Bernoulli (k) numbers.

Example for \(k=2\) using Bernoulli’s numbers:

\[ \sum_{j=1}^{n} j^2 = \frac{1}{3} (B_0 n^3 + 3B_1^+ n^2 + 3B_2 n^1) = \frac{n^3}{3} + \frac{n^2}{2} + \frac{n^1}{6} \]

Values for several \(k\):

<table>
<thead>
<tr>
<th>(k=3)</th>
<th>(k=4)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\sum_{j=1}^{n} j^3 = \frac{n^4}{4} + \frac{n^3}{2} + \frac{n^2}{4} )</td>
<td>(\sum_{j=1}^{n} j^4 = \frac{n^5}{5} + \frac{n^4}{2} + \frac{n^3}{3} - \frac{31n}{30} )</td>
</tr>
</tbody>
</table>

Table 25

A similar series:

\[ \sum_{j=2}^{n} \sum_{p=1}^{\infty} \frac{(k-1)^p}{p!} j * (\log(j))^p = -\left( \frac{n}{2} \right) - \left( n^k - 1 \right) + \cdots + (2^{k-1} - 1) = H_n^{(-k)} - \frac{1}{2} n(n + 1) \]

Example for \(n=4, k=3\):

\[ \sum_{j=2}^{4} \sum_{p=1}^{\infty} \frac{2^p}{p!} j * (\log(j))^p = -\left( \frac{4}{2} \right) + (4^3 - 1) + (3^3 - 1) + (2^3 - 1) = 90 \]
9.2. Sum of terms of the rows of $X_{jk} = [j^k]$:

$$\sum_{k=1}^{m} j^k = j^1 + j^2 + j^3 + \ldots + j^k = \frac{j(j^m - 1)}{j - 1}$$

9.3. Product of terms of the columns of $X_{jk} = [j^k]$:

$$\prod_{j=1}^{n} j^k = (n!)^k$$

9.4. Product of terms of the columns of $X_{jk} = [j^k]$:

$$\prod_{k=1}^{n} j^k = j^{\left(\frac{1}{2}\right)n(n+1)}$$

10. **Case 3: Matrix** $X_{ij} = [x_{jk}] \in \mathbb{R}^{j \times k}$ where $x_{jk} = \frac{\ln(j)}{j^k}$

10.1. Sum of terms of the columns of $X_{jk} = [\frac{\ln(j)}{j^k}]$:

$$\sum_{j=1}^{\infty} \frac{\ln(j)}{j^k} = \zeta^{(1,0)}(k, n + 1) - \zeta(k)$$

$$\sum_{j=1}^{\infty} \frac{\ln(j)}{j^k} = - \zeta'(k)$$

<table>

Table 33

15.4. Sum of terms of the matrix of $X_{ij}$:

$$\sum_{j=1}^{n} \sum_{k=1}^{\infty} (\alpha + j)^{-k} = \psi^{(0)}(\alpha + n) - \psi^{(0)}(\alpha)$$

The equation simplifies for initial values of $j,k=2$

$$\sum_{j=1}^{\infty} \sum_{k=2}^{\infty} (\alpha + j)^{-k} = \frac{1}{\alpha + 1} = \sum_{p=0}^{\infty} (-1)^{p} a^{p} = \sum_{p=0}^{\infty} (\alpha + \alpha)^{p} (-1)^{p} 2^{-(n+1)}$$

$$\sum_{j=2}^{n} \sum_{k=2}^{\infty} (\alpha + j)^{-k} = \frac{1}{\alpha + 1} - \frac{1}{\alpha + n}$$

$$\sum_{j=1}^{r} \sum_{k=1}^{s} (\alpha + j)^{-k} = \sum_{p=1}^{r} \sum_{q=0}^{t} (\alpha + p)^{q}$$
Example:

\[
\sum_{j=1}^{2} \sum_{k=1}^{3} (\alpha + j)^{-k} = \frac{(\alpha + 1)^2 + (\alpha + 1) + 1}{(\alpha + 1)^3} + \frac{(\alpha + 2)^2 + (\alpha + 2) + 1}{(\alpha + 2)^3}
\]

For \(\alpha = 2, \beta = 4\) →

\[
\sum_{j=1}^{2} \sum_{k=1}^{3} (2 + 4j)^{-k} = 0.31007...
\]

15.5. \(C\)-values for \(X_{ij}\) = \(\frac{1}{(1-k)^n}\)

\[
C_n \left\{ f(n) = \frac{1}{(1-k)^n} \right\} = \lim_{m \to \infty} \left( \sum_{k=2}^{m} \frac{1}{(1-k)^n} - \int \frac{dm}{(1-m)^n} \right)
\]

\[
= \lim_{m \to \infty} \left( \sum_{k=2}^{m} \frac{1}{(1-k)^n} - \frac{(1-m)^{1-n}}{1-n} \right) = \sum_{k=2}^{\infty} \frac{1}{(1-k)^n} + \frac{1}{n-1}
\]

\end{tabular}

Table 36

\begin{figure}
\centering
\includegraphics[width=0.5\textwidth]{figure10.png}
\caption{C-values for \(x_{jk} = \frac{1}{(1+k)^n}\)}
\end{figure}

17. **Case 10:** Matrix \(X_{ij} = [x_{jk}] \in \mathbb{R}^{r \times k}\) where \(x_{jk} = 1 + (\alpha + \beta)^{-k}\)

17.1. Sum of terms of the matrix of \(X_{ij} = [x_{jk}] \in \mathbb{R}^{r \times k}\) where \(x_{jk} = 1 + (\alpha + \beta)^{-k}\):

\[
\sum_{j=1}^{r} \sum_{k=1}^{s} [1 + (\alpha + \beta)^{-k}] = \sum_{j=1}^{r} \sum_{k=1}^{s} \frac{1}{(\alpha + \beta)^{p}} + \sum_{p=2}^{s} \sum_{q=1}^{r} \frac{1}{(\alpha + p\beta)^{s}}
\]

Example:

\[
\sum_{j=1}^{2} \sum_{k=1}^{3} [1 + (\alpha + \beta)^{-k}] = \frac{1}{(\alpha + 2\beta)} + \frac{1}{(\alpha + 2\beta)^2} + \frac{1}{(\alpha + \beta)} + \frac{1}{(\alpha + \beta)^2} + 4
\]

For \(\alpha=2, \beta = 4 \rightarrow \sum_{j=1}^{2} \sum_{k=1}^{3} [1 + (2 + 4j)^{-k}] = 6.31007\)
17.2. Product of terms of the matrix of $X_{jk} = [x_{jk}] \in R^{1\times k}$ where $x_{jk} = 1 + \left(\alpha + \beta\right)^{-k}$

Table 38
18. Case 11: Matrix \( X_{ij} = [x_{jk}] = [x_{jk}] \in \mathbb{R}^{i \times k} \) where \( x_{jk} = 1 + \left( \frac{z}{j^k} \right) \) and \( x_{jk} = 1 + \left( \frac{z}{2j-1} \right)^k \).

**Euler-Ramanujan Infinite Products.**

18.1. If \( k \) is EVEN: Given \( z \in \mathbb{R} \) and \( q \in \mathbb{N} \) and \( k = 2q \), the following expressions are true:

\[
\prod_{j=1}^{\infty} \left( 1 - \left( \frac{z}{j^k} \right) \right) = i^{q+1} \left( \frac{-1}{\pi z} \right)^q \prod_{j=0}^{q-1} \sin \left( \pi z^* e^{i j/q} \right)
\]

\[
\prod_{j=1}^{\infty} \left( 1 + \left( \frac{z}{j^k} \right) \right) = -i^q \left( \frac{-1}{\pi z} \right)^q \prod_{j=0}^{q-1} \sin \left( i \pi z^* e^{i j/q} \right)
\]

18.2. If \( k \) is EVEN: Given \( z \in \mathbb{R} \) and \( q \in \mathbb{N} \) and \( k = 2q \), the following expressions are true:

\[
\prod_{j=1}^{\infty} \left( 1 - \left( \frac{z}{2j-1} \right)^k \right) = \prod_{j=0}^{q-1} \cos \left( \frac{\pi z}{2} e^{i j/q} \right)
\]

\[
\prod_{j=1}^{\infty} \left( 1 + \left( \frac{z}{2j-1} \right)^k \right) = \prod_{j=0}^{q-1} \cos \left( \frac{i \pi z}{2} e^{i j/q} \right)
\]

18.3. If \( k \) is ODD: Given \( z \in \mathbb{R} \) and \( q \in \mathbb{N} \), the following expressions are true:

\[
\prod_{j=1}^{\infty} \left( 1 - \left( \frac{z}{j^k} \right) \right) = 1/ \prod_{j=0}^{k-1} \Gamma \left( 1 - z^* (-1)^j i^{2j} \right)
\]

\[
\prod_{j=1}^{\infty} \left( 1 + \left( \frac{z}{j^k} \right) \right) = 1/ \prod_{j=0}^{k-1} \Gamma \left( 1 + z^* (-1)^j i^{2j} \right)
\]

19. Case 12: Matrix \( X_{ij} = [x_{jk}] \in \mathbb{R}^{i \times k} \) where \( x_{jk} = (1 + j^{-k}) \)

19.1. Sum of Rows (diverges)

\[
\sum_{k=1}^{m} (1 + j^{-k}) = \frac{-j^{-m} + jm - m + 1}{1 - j}
\]

19.2. Sum of Columns (diverges)

\[
\sum_{j=1}^{n} (1 + j^{-k}) = n + H_{n}^{(k)} = n + \zeta(k)
\]

19.3. Sum of Diagonal (diverges)

\[
\sum_{j=1}^{n} (1 + j^{-1}) = n + \sum_{j=1}^{n} \frac{1}{j}
\]
19.4. Product of columns (From Euler-Ramanujan products in section 17)

If $k=2q$ even

$$\prod_{j=1}^{\infty} (1 + j^{-k}) = \prod_{j=1}^{\infty} (1 + j^{-2}) = -j^q \left( \frac{-1}{\pi} \right)^q \prod_{j=0}^{q-1} \sin \left( i \pi e^{i j \frac{q}{2}} \right)$$

If $k$ is odd

$$\prod_{j=1}^{\infty} (1 + j^{-k}) = \prod_{j=1}^{\infty} (1 + j^{-1}) = 1/\prod_{j=0}^{k-1} \Gamma(1 + (-1)^j i \pi)$$

We can also verify that:

$$\prod_{j=1}^{\infty} (1 + j^{-k}) = \prod_{j=1}^{\infty} (1 + j^{-2}) = 1/\prod_{j=0}^{k-1} \Gamma(1 + (-1)^j i \pi)$$

19.5. Product of Rows (converges). Using Pochhammer’s notation:

$$\prod_{k=1}^{\infty} (1 + j^{-k}) = \frac{1}{2} (-1; \frac{1}{j})_\infty$$

We can also express it with:

$$\sum_{j=1}^{m} \sum_{k=1}^{n} (1 + j^{-k}) = \sum_{j=1}^{m} \sum_{k=1}^{n} 1 + \sum_{k=1}^{m} j^{-k} = \sum_{j=1}^{m} (m + \frac{j^m (j^m - 1)}{j - 1}) = nm + \sum_{j=1}^{m} \frac{j^m (j^m - 1)}{j - 1}$$

Example:

$$\sum_{j=1}^{2} \sum_{k=1}^{3} (1 + j^{-k}) = \frac{79}{8}$$

19.6. Sum (Main Diagonal)

$$\sum_{j=1}^{m} (1 + j^{-1}) = n + \sum_{j=1}^{n} j^{-1}$$

19.7. Product (Main Diagonal)

$$\lim_{n \to \infty} \prod_{j=2}^{n} (1 + j^{-1}) = 1.30180595229 \ldots$$

19.8. $C_n \{ f(n) = 1 + k^{-n} \}$:

$$C_n \{ f(n) = 1 + k^{-n} \} = \lim_{m \to \infty} \sum_{k=1}^{m} (1 + k^{-n}) - \int (1 + m^{-n}) \, dm$$

$$= \lim_{m \to \infty} \left( \sum_{k=1}^{m} (1 + k^{-n}) - m + \frac{m^{1-n}}{(1-n)} \right)$$

$$= \lim_{m \to \infty} \left( \sum_{k=1}^{m} k^{-n} + m - m + \frac{m^{1-n}}{(1-n)} \right) = \zeta(n)$$
\( CP_n \{f(n) = 1 + k^{-n}\} = \zeta(n) \)

20. Case 13: Matrix \( X_{ij} = [x_{jk}] \in \mathbb{R}^{i \times k} \) where \( x_{jk} = (1 - j^{-k}) \)

20.1. Sum of Rows (diverges)
\[
\sum_{k=1}^{m} (1 - j^{-k}) = \sum_{k=1}^{m} \left( \frac{j^{-m}(m j^{m+1} - mj - j^{m} + 1)}{j - 1} \right)
\]

20.2. Sum of Columns (diverges)
\[
\sum_{j=1}^{n} (1 - j^{-k}) = n - H_n^{(k)} = n - \zeta(k)
\]

20.3. Sum of Diagonal (diverges)
\[
\sum_{j=1}^{n} (1 - j^{-j}) = n - \sum_{j=1}^{n} \frac{1}{j}
\]

20.4. Product of columns (From Euler-Ramanujan products in section 17)
If \( k=2q \) even
\[
\prod_{j=1}^{\infty} (1 - j^{-k}) = \prod_{j=1}^{\infty} (1 - j^{-1})^{q+1} \left( \frac{-1}{\pi} \right)^q \prod_{j=0}^{\infty} \sin \left( \pi^*e^{i \pi j} \right)
\]
If \( k \) is odd
\[
\prod_{j=1}^{\infty} (1 - j^{-k}) = \prod_{j=1}^{\infty} (1 - j^{-1})^{q+1} = 1/ \prod_{j=0}^{k-1} \Gamma(1 - (-1)^j \cdot \frac{2j}{\pi})
\]

20.5. Product of Rows (converges). Using Pochhammer’s notation:
\[
\prod_{k=1}^{\infty} (1 - j^{-k}) = \left( \frac{1}{1-j} \right)_{\infty}
\]
We also can express it with:
\[
\sum_{j=1}^{n} \sum_{k=1}^{m} (1 - j^{-k}) = \sum_{j=1}^{n} \left( \sum_{k=1}^{m} 1 - \sum_{k=1}^{m} j^{-k} \right) = \sum_{j=1}^{n} \left( m - \frac{j^{-m}(m j^{m+1} - mj - j^{m} + 1)}{j - 1} \right)
\]
\[
= nm - \sum_{j=1}^{n} \frac{j^{-m}(m j^{m+1} - mj - j^{m} + 1)}{j - 1}
\]
Example:
\[
\sum_{j=1}^{2} \sum_{k=1}^{3} (1 - j^{-k}) = -11
\]

20.6. Sum (Main Diagonal)
\[ \sum_{j=1}^{m} (1 - j^{-l}) = n - \sum_{j=1}^{n} j^{-l} \]

20.7. Product (Main Diagonal) converges

\[ \lim_{n \to \infty} \prod_{j=2}^{n} (1 - j^{-1}) = 0.71915450096 \ldots \]

20.8. The following relationship linking is quite interesting:

\[ 2 \sum_{n=p}^{\infty} j^{-l} = \prod_{j=p}^{\infty} (1 + j^{-l}) - \prod_{j=p}^{\infty} (1 - j^{-l}) + O(p^4) \]

With \( \lim_{p \to \infty} O(p^4) = 0 \)

Examples:

Table 39

20.9. \( C \)-values for \( X_{ij} = 1 - k^{-n} \):

\[ C_n\{f(n) = 1 - k^{-n}\} = \lim_{m \to \infty} \left( \sum_{k=1}^{m} (1 - k^{-n}) - \int (1 - m^{-n}) \, dm \right) \]

\[ = \lim_{m \to \infty} \left( \sum_{k=1}^{m} (1 - k^{-n}) - \frac{m(m^{-n} + (n - 1))}{n - 1} \right) \]

\[ = \lim_{m \to \infty} \left( - \sum_{k=1}^{m} k^{-n} + m - m - \frac{m^{1-n}}{(1-n)} \right) = -\zeta(n) \]

\[ C_n\{f(n) = 1 + k^{-n}\} = -\zeta(n) \]

21. Case 14: Matrix \( X_{ij} = [x_{jk}] \in \mathbb{R}^{n \times k} \) where \( x_{jk} = e^{i-k} \)

Table 46

25.2. Sum of rows:
\[ \sum_{k=1}^{n} \frac{1}{k} (j^{-k}) = \left( \frac{1}{j} \right)^{n+1} \left( -\Phi \left( \frac{1}{j}, 1, n + 1 \right) \right) - \ln \left( \frac{(j-1)}{j} \right) \]

Where \( \Phi(z, s, q) \), is the Lerch Transcendent function:
Example: \[ \sum_{k=1}^{n} \frac{1}{k} (2^{-k}) = \left( \frac{1}{2} \right)^{n+1} \left( -\Phi \left( \frac{1}{2}, 1, n + 1 \right) \right) + \ln(2) \]
25.3. Sum of rows:
\[
\sum_{k=1}^{\infty} \frac{1}{k} (j^{-k}) = \frac{\zeta(k)}{k}
\]

25.4. Sum of diagonal converges:
\[
\sum_{j=1}^{\infty} \frac{1}{j^{-j}} = \sum_{j=1}^{\infty} j^{-j-1} = 1.13839 \ldots
\]

26. Case 19: Matrix \( X_{ij} = [x_{jk}] \in \mathbb{C} \) where \( x_{jk} = j^{-k} \) with \( j = re^{i\theta} = r(\cos \theta + i \sin \theta) \)

26.1. Sum of terms of the rows of \( X_{jk} \):
\[
R_j = \sum_{k=1}^{\infty} j^{-k} = \sum_{k=1}^{\infty} [r(\cos \theta + i \sin \theta)]^{-k} = \frac{(re^{i\theta})^{-n} (-1 + (re^{i\theta})^n)}{-1 + re^{i\theta}}
\]

Example for \( j=4 \):

Table 52

26.3. Sum of terms of the matrix $X_{ij}$:

$$
\sum_{r=1}^{\infty} \sum_{k=1}^{\infty} [re^{i\theta}]^{-k} = \lim_{n \to \infty} \left[ -e^{-it} \left( \psi^{(0)}(1 - e^{-i\theta}) - \psi^{(0)}(n + 1 - e^{-i\theta}) \right) \right]
$$

This sum does not converge.

We will calculate the infinite sums starting on $r=2$, $k=2$: 
\[
\sum_{r=2}^{\infty} \sum_{k=2}^{\infty} [\text{re}^{i\theta}]^{-k} = \lim_{n \to \infty} \frac{(\psi^{(0)}(n + 1 - e^{-i\theta}) - \psi^{(0)}(n + 1) - \psi^{(0)}(2 - e^{-i\theta}) - \gamma + 1)}{\text{e}^{i\theta}}
\]

In 4.4, we defined a set of new constants:

\[CZ_{2,0,2} = \sum_{j=1}^{\infty} [\zeta(2j) - \zeta(2j + 1)] = 0.5\]

\[CZ_{4,0,4,-2} = \sum_{j=1}^{\infty} [-\zeta(4j - 2)) + \zeta(4j)] = -0.576674746...\]

\[CZ_{4,1,4,-1} = \sum_{j=1}^{\infty} [-\zeta(4j - 1)) + \zeta(4j + 1)] = -0.17186598524...\]

Values for some \(\theta\):

</tbody>
</table>

Table 59
29. Case 22: Matrix $X_{ij} = [x_{jk}] \in C$ where $x_{jk} = j^{-z}$ with $z \in C$

29.1 Let’s define $z = \alpha + \beta i$, then:

$$x_{jk} = j^{-z} = j^{\alpha + \beta i} = j^\alpha (\cos(\beta \ln(j)) + i \sin(\beta \ln(j)))$$

The C-Transformation of $x_{jk}$ is given by:

$$C_n\{f(z) = j^{-z}\} = \lim_{n \to \infty} \left( \sum_{k=1}^{n} f(z) - \int f(n) \, dn \right)$$

and

$$\int f(n) \, dn = \int n^{-\alpha} \, dn = \frac{1}{(1-\alpha) - i\beta} n^{(1-\alpha) - \beta i}$$

That we can write:

$$\int f(n) \, dn = [n^{(1-\alpha)} \cos(\beta \ln(n)) - i \sin(\beta \ln(n))] * \frac{[(1-\alpha) + i\beta]}{[(1-\alpha)^2 + \beta^2]}$$

We can then write the real and imaginary part of $C_n\{f(z) = j^{-z}\}$:

(a) $Re[C_n\{f(z) = j^{-z}\}] = \sum_{k=1}^{n} k^{-\alpha} \cos(\beta \ln(k)) - n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} [(1-\alpha) \cos(\beta \ln(n)) + \beta \sin(\beta \ln(n))]$

(b) $Im[C_n\{f(z) = j^{-z}\}] = \sum_{k=1}^{n} k^{-\alpha} \sin(\beta \ln(k)) + n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} [\beta \cos(\beta \ln(n)) - (1-\alpha) \sin(\beta \ln(n))]$

We can calculate the following table:

<table>
<thead>
<tr>
<th>$z = \alpha + i \beta$</th>
<th>$\lim_{n \to \infty} C_n{f(z) = j^{-z}}$</th>
<th>$\zeta(z)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2,0)</td>
<td>1.644934 + i*0</td>
<td>$\zeta(2,0)$</td>
</tr>
<tr>
<td>(3,0)</td>
<td>1.202075 + i*0</td>
<td>$\zeta(3,0)$</td>
</tr>
<tr>
<td>(1,1)</td>
<td>0.582096 + i*0.9269</td>
<td>$\zeta(1,1)$</td>
</tr>
<tr>
<td>(1/2, 14.134725...)</td>
<td>0 + i*0</td>
<td>Zero of the $\zeta$ function</td>
</tr>
</tbody>
</table>

Table 60. Values of $C_n\{f(z) = j^{-z}\}$
We can see that if \( z = \alpha + i\beta \in \mathcal{C} \) with \( \alpha > 0 \), then \( \lim_{m \to \infty} \mathcal{C}_m \{ f(z) = j^{-z} \} = \zeta(z) \) when \( \text{Re}(z) = \alpha \geq 0 \).

29.2. Let's define four functions derived from \( \mathcal{C}_n \{ f(z) = j^{-z} \} \):

\[
\begin{align*}
f_1(z) &= \sum_{k=1}^{n} k^{-\alpha} \cos(\beta \cdot \ln(k)) \\
f_2(z) &= [n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} \{ (1-\alpha) \cdot \cos(\beta \cdot \ln(n)) + \beta \cdot \sin(\beta \cdot \ln(n)) \}] \\
f_3(z) &= \sum_{k=1}^{n} k^{-\alpha} \sin(\beta \cdot \ln(k)) \\
f_4(z) &= -n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} \{ \beta \cdot \cos(\beta \cdot \ln(n)) - (1-\alpha) \cdot \sin(\beta \cdot \ln(n)) \}
\end{align*}
\]

And let's call:

\[
\begin{align*}
X(z) &= f_1(z) + i \cdot f_3(z) \\
Y(z) &= f_2(z) + i \cdot f_4(z)
\end{align*}
\]

In general, we can now express that any solution in \( Z \) of \( \zeta(z) \) as:

\[
\zeta(z) = \lim_{n \to \infty} [f_1(z) - f_2(z)] + i \cdot [f_3(z) - f_4(z)]
\]

Or

\[
\zeta(z) = \lim_{n \to \infty} [X(z) - Y(z)]
\]

Where:

\[
\begin{align*}
X(z) &= \sum_{k=1}^{n} k^{-\alpha} \cos(\beta \cdot \ln(k)) + i \cdot \sum_{k=1}^{n} k^{-\alpha} \sin(\beta \cdot \ln(k)) \\
Y(z) &= \left[ n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} \{ (1-\alpha) \cdot \cos(\beta \cdot \ln(n)) + \beta \cdot \sin(\beta \cdot \ln(n)) \} \right] \\
&\quad + i \left( n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} \{ \beta \cdot \cos(\beta \cdot \ln(n)) - (1-\alpha) \cdot \sin(\beta \cdot \ln(n)) \} \right)
\end{align*}
\]

Let's observe that if \( z^* = \alpha + i\beta \) as a non-trivial zero of \( \zeta(z) \), then:

\[
\begin{align*}
X(z) &= Y(z) \\
f_1(z) &= f_2(z) \text{ and } f_3(z) = f_4(z)
\end{align*}
\]

and

\[
\begin{align*}
\text{Re}(\zeta(z^*)) &= 0 \text{ and } \text{Im}(\zeta(z^*)) = 0 \text{ implies:} \\
\sum_{k=1}^{n} k^{-\alpha} \cos(\beta \cdot \ln(k)) &= n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} \{ (1-\alpha) \cdot \cos(\beta \cdot \ln(n)) + \beta \cdot \sin(\beta \cdot \ln(n)) \} \\
\sum_{k=1}^{n} k^{-\alpha} \sin(\beta \cdot \ln(k)) &= -n^{(1-\alpha)} \frac{1}{[(1-\alpha)^2 + \beta^2]} \{ \beta \cdot \cos(\beta \cdot \ln(n)) - (1-\alpha) \cdot \sin(\beta \cdot \ln(n)) \}
\end{align*}
\]

Let's represent graphically the following four wave functions \( f_1(z), -f_2(z), f_1(z), -f_2(z) \) when \( n \to \infty \) for different values of \( z = \alpha + i\beta \):
Figure 12:  \( z = \frac{1}{2} + i \cdot 5 \)

Figure 13:  \( z = 1 + 2i \)
The observations that can be drawn from these charts for multiple iterations over $\alpha, \beta$ are:

- The waves evolve around $x=0$ if $\text{Re}(z) = \alpha < 1$
- The graphs, as wave functions, evolve around the $x$ axis if $\alpha = 1/2$ as all four partial functions are of the type $f(x) = f(\sqrt{n})$:
  \[ f(n) = A\sqrt{n} \left( B \cos(\ln(Cn)) \pm D \sin(\ln(Cn)) \right) \text{ with } A, B, C, D = \text{constant} \]
- If $z^*$ is a known non-trivial zero of $\zeta(z)$, such as $\Re(1) = 1/2 + i*14.134725...$ the 4 graphs collapse into 2, as in figure 4. We just checked the obvious evidence that for $z^*$ non-trivial zeros of $\zeta(z)$ the following obvious equalities happen:
  \[ f_1(z) = -f_2(z) \text{ and } f_3(z) = -f_4(z) \]

29.3. Modulus of $X(z)$ and $Y(z)$

Let's calculate and plot the distance of $\zeta(z)$ to the origin given by its modulus defined for $z = a + ib$ as:

\[ |z|^2 = x^2 + b^2 \]

The modulus is the distance of $z$ to the origin.
The modulus of $\zeta(z)$ will be given by:

$$|\zeta(z)|^2 = |f_1(z) - f_2(z)|^2 + |(f_3(z) - f_4(z)|^2$$

This modulus must be zero when $z = z^*$ a zero of $\zeta(z)$.

Figure 16: $z = \frac{1}{2} + i*5 \quad |\zeta(z)|^2 > 0.7005...$ for $n > 5000$ and growing as $n \to \infty$

Figure 17: $z = 1 + i*2 \quad |\zeta(z)|^2 > 0.5981...$ for $n > 5000$ $n \to \infty$
The function $Y(z)$ and its modulus $|Y(z)|^2$

We defined

$$Y(z) = \left[ n^{1-\alpha} \frac{1}{[1-\alpha]^2 + \beta^2} \left[ (1-\alpha) \cos(\beta*\ln(n)) + \beta \sin(\beta*\ln(n)) \right] \right] + i \left[ n^{1-\alpha} \frac{1}{[1-\alpha]^2 + \beta^2} \left[ \beta \cos(\beta*\ln(n)) - (1-\alpha) \sin(\beta*\ln(n)) \right] \right]$$

the value of $|Y(z)|^2$ is therefore:

$$|Y(z)|^2 = \left[ n^{1-\alpha} \frac{1}{[1-\alpha]^2 + \beta^2} \left[ (1-\alpha) \cos(\beta*\ln(n)) + \beta \sin(\beta*\ln(n)) \right] \right]^2 + \left[ n^{1-\alpha} \frac{1}{[1-\alpha]^2 + \beta^2} \left[ \beta \cos(\beta*\ln(n)) - (1-\alpha) \sin(\beta*\ln(n)) \right] \right]^2$$

Simplifying, we obtain a very important formula for $|y(z)|$:

$$|Y(z)|^2 = n^{2(1-\alpha)} \frac{1}{[\beta^2 + (1-\alpha)^2]} \rightarrow |y(z)|^2$$

is a polynomial function.

29.5 Lemma xx: $|Y(z)|^2$ is a line for $\alpha=1/2$

The slope for any $|Y(z)|^2$ with respect to $n$ is given by:

$$slope(|y(z)|^2) = d(|Y(z)|^2)/dn$$

Which equals to:

$$slope(|Y(z)|^2) = 2(1-\alpha) n^{1-2\alpha} \frac{1}{[\beta^2 + (1-\alpha)^2]}$$

$|Y(z)|^2$ is a line when the slope is constant, which can only happen if and only if
When \( \alpha = \frac{1}{2} \), the slope of \( |y(z)|^2 \) is:

\[
\text{slope } |y(z)|^2 = \frac{1}{i} \frac{1}{\beta + 1/4} \text{ for } \alpha = 1/2 \quad \text{with } z = \alpha + i\beta
\]

29.5. The function \( X(z) \) and its modulus \( |x(z)|^2 \)

We have defined:

\[
X(z) = \sum_{k=1}^{N} k^{-\alpha} \left( \cos(\beta \ln(k)) + i \sin(\beta \ln(k)) \right)
\]

The modulus of \( x(z) \) will be calculated by:

\[
|x(z)|^2 = \left( \sum_{k=1}^{N} k^{-\alpha} \cos(\beta \ln(n)) \right)^2 + \left( \sum_{k=1}^{N} \sum_{m \neq n} k^{-\alpha} \sin(\beta \ln(n)) \right)^2
\]

The square of an infinite series will need some algebraic manipulation. We will simplify this calculation using the following expressions:

a) \( \left( \sum_{n=1}^{N} a_n \right) \left( \sum_{n=1}^{N} b_n \right) = \sum_{n=1}^{N} a_n b_n + \sum_{n=1}^{N} \sum_{m \neq n} a_n * b_n \)

b) \( \cos(\beta \ln(k)) \cos(\beta \ln(j)) + \sin(\beta \ln(k)) \sin(\beta \ln(j)) = \cos(\beta(\ln(k) - \ln(j))) = \cos(\beta \ln(\frac{k}{j})) \)

to obtain a workable expression for \( |x(z)| \):

\[
|x(z)|^2 = \sum_{k=1}^{N} k^{-2\alpha} + \sum_{k=1}^{N} \sum_{j \neq k} k^{-\alpha} j^{-\alpha} \cos \left( \beta \ln \left( \frac{k}{j} \right) \right)
\]

If we change the indices of the sums we have to deduct the main diagonal:
\[ |x(z)|^2 = \sum_{k=1}^{n} k^{-2\alpha} + \sum_{k=1}^{n} \sum_{j=1}^{n} k^{-\alpha} \cdot j^{-\alpha} \cdot \cos\beta \ln \left( \frac{k}{j} \right) - \sum_{k=1}^{n} k^{-2\alpha} \cos(\beta \ln(1)) \]

\[ |x(z)|^2 = \sum_{k=1}^{n} k^{-2\alpha} + \sum_{k=1}^{n} \sum_{j=1}^{n} k^{-\alpha} \cdot j^{-\alpha} \cdot \cos\beta \ln \left( \frac{k}{j} \right) - \sum_{k=1}^{n} k^{-2\alpha} \]

And:

\[ |x(z)|^2 = \sum_{k=1}^{n} \sum_{j=1}^{n} k^{-\alpha} \cdot j^{-\alpha} \cdot \cos\beta \ln \left( \frac{k}{j} \right) \]

Examples:

| \(\alpha\) | \(\beta\) | \(\lim_{n \to \infty} |x(z)|^2\) | \(|\zeta(\alpha, z)|^2\) |
|-------|------|------------------------|------------------------|
| 2.0   | 7    | 1.074756               | 1.074756               |
| 3.0   | 2    | 0.968687               | 0.968687               |

We can see that:

\[ \lim_{n \to \infty} |x(z)|^2 = \left| \zeta(\alpha, z) \right|^2 = \zeta(\alpha + \beta i) \cdot \zeta(\alpha - \beta i) \quad \text{for } \alpha > 1 \]

\[ |x(n)|^2 \text{ converges when } n \to \infty \text{ and } \alpha > 1 \]

The graphs for \(\alpha = 1\) do not converge while all other graphs for \(\alpha > 1\) they all converge to a constant value \(\zeta(\alpha, \beta)\) as horizontal straight line with slope equal to zero. This observation can be used to prove that there are no zero values of \(\zeta(z)\) for \(z\) with \(\Re(z) = \alpha > 1\) based on the following Lemma where we prove that if \(\alpha + \beta i\) is a zero of \(\zeta(z)\) then \(|x(z)|^2\) tends to a straight line with slope not equal to zero.

**29.6 Lemma xx:** \(|X(z)|^2\) is a line for \(\alpha = 1/2\)

The proposition says that the following limit exists only for \(\Re(z) = 1/2\)
\[
\lim_{n \to \infty} \frac{|X(n)|^2}{n} = S
\]

We have already formulated the expression:

\[
\lim_{n \to \infty} \left( \frac{|x(z)|^2}{n} \right) = \lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} k^{-2\alpha} + \sum_{k=j \neq k}^{n} k^{-\alpha} \cdot j^{-\alpha} \cdot \cos \left( \beta \left( \frac{k}{j} \right) \right) \right)
\]

### 29.6.1. For \( \alpha > 1/2 \), \( \lim_{n \to \infty} \frac{|X(n)|^2}{n} = 0 \)

\[
\lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} k^{-2\alpha} \right) = 0 \quad \text{because } 2\alpha > 1 \text{ and the series is convergent}
\]

\[
\lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=j \neq k}^{n} k^{-\alpha} \cdot j^{-\alpha} \cdot \cos \left( \beta \left( \frac{k}{j} \right) \right) \right) < \lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} \sum_{j \neq k} \left( k^{-\alpha} \cdot j^{-\alpha} \right) \right)
\]

So:

\[
\lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} k^{-2\alpha} \right) = 0
\]

### 29.6.2. For \( \alpha < 1/2 \), \( \lim_{n \to \infty} \frac{|X(n)|^2}{n} = \infty \)

\[
\lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} k^{-2\alpha} \right) < \lim_{n \to \infty} \frac{1}{n} \left( n \cdot \frac{1}{n} \right) = \lim_{n \to \infty} \frac{1}{n} = 0
\]

And:

\[
\lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=j \neq k}^{n} k^{-\alpha} \cdot j^{-\alpha} \cdot \cos \left( \beta \left( \frac{k}{j} \right) \right) \right) > \lim_{n \to \infty} \left( \frac{1}{n} \cdot n^2 \cdot \frac{1}{n^2} \right) = \infty
\]

Where we replaced the summations by the number of elements in the matrix (\( n \times n \)) times the smallest value in each row (\( 1/n \)) and \( 1 > (2-1-2\alpha) > 0 \) when \( \alpha < 1/2 \)

### 29.6.3. \( \lim_{n \to \infty} \frac{|X(n)|^2}{n} \) exists when \( \alpha = 1/2 \).

Before calculating this limit, let's see graphically that the limit actually exists for certain \( z = z^* \) (in the graph \( \beta = R(1) = 14.134725... \)) with \( \alpha = 1/2 \):
When $\alpha=1/2$, we can express $(|x(z)|^2/n)$ as:

$$
\lim_{n \to \infty} \frac{|x(z)|^2}{n} = \lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} k^{-1} + \sum_{j \neq k}^{n} j^{-1/2} \cdot k^{-1/2} \cdot j^{-1/2} \cdot \cos \left( \beta \left( \ln \left( \frac{k}{j} \right) \right) \right) \right) =
$$

$$
= 0 + \lim_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{n} j^{-1/2} \cdot k^{-1/2} \cdot \cos \left( \beta \left( \ln \left( \frac{k}{j} \right) \right) \right) \right) =
$$

$$
= \lim_{n \to \infty} 2 \sum_{j=1}^{n} j^{-1/2} \cdot \cos \left( \beta \left( \ln \left( \frac{n}{j} \right) \right) \right) =
$$

Using the integral approximation of the infinite series

$$
= 2 \cdot \lim_{n \to \infty} \frac{2 + \sqrt{n} \cdot \cos \left( \beta \cdot \ln \left( \frac{n}{4} \right) \right) - 2 + \sqrt{\ln(n/4)} \cdot \beta \cdot n^{-1/2}}{4 + \beta^2 + 1} =
$$

$$
= 2 \cdot \frac{2 + \sqrt{n} \cdot \cos \left( \beta \cdot \ln \left( \frac{n}{4} \right) \right) - 2 + \sqrt{\ln(n/4)} \cdot \beta \cdot n^{-1/2}}{4 + \beta^2 + 1} =
$$

So, if $\lim_{n \to \infty} (|x(z)|^2/n)$ exists will be equal to:

$$
\lim_{n \to \infty} \frac{|X(n)|^2}{n} = \frac{1}{\beta^2 + \frac{1}{4}} \text{ if } z = \frac{1}{2} + i\beta
$$

The fact that:
\[ \zeta(z) = X(z) - Y(z) \]

\[ |(X(z)|^2 \text{ collapses to a line with slope } \frac{1}{\beta^2 + \frac{1}{4}} \text{ when } \alpha = 1/2 \text{ and } n \to \infty \]

\[ |(Y(z)|^2 \text{ collapses to a line with slope } \frac{1}{\beta^2 + \frac{1}{4}} \text{ when } \alpha = 1/2 \text{ and } n \to \infty \]

\[ |(X(z)|^2 \text{ and } |(Y(z)|^2 \text{ have only same form representation as a straight line when } \alpha = 1/2 \]

are the basic elements of the proposed proof by the author of the Riemann Hypothesis (Caceres, 2017)
