ABSTRACT

Something has created the universe and we already know what it is, what we see as God is similar to something in our body.

INTRODUCTION

If God has created the universe, then logic dictates that God was not in the universe when it was created. When you create something, then you cannot be a part of what you have created. The universe can only be created around that God, so if there is a God then the universe must have emerged from that God. God must be some kind of source, so we need to look at the structure of the universe in order to find that God source.

The structure of the universe;

The structure of the universe might seem a mystery but it's not, my Vixra paper 1803.0165 explains that our visible universe is a growing ether bubble in an endless absolute vacuum. That ether bubble grows in the zero dimension, and the three known dimensions are based on that zero dimension. The third dimension is based on the first and the second dimension plus a third dimension, that third dimension is depth and the third dimension and everything in it has a size. The second dimension is based on the first dimension plus a second dimension, that second dimension is width and the second dimension and everything in it has a size. But the second and the third dimension are also based on another dimension, a dimension that we cannot see. That dimension is the zero dimension and its existence and what it is reveals itself, because the first dimension must be based on a previous dimension as well. So the first dimension is based on the zero dimension plus a second dimension, that second dimension is length and the first dimension and everything in it has a size.

But what can we say about that zero dimension?, logic dictates that it doesn't contain anything because everything in our visible universe is made of one, two or three dimensions. And if a dimension doesn't contain something with a dimension, then logic dictates that it cannot have a size.

So the zero dimension is a dimension where length, width and depth don't apply, size doesn't apply to that zero dimension. Something without a size can be nothing or endless, so logic dictates that the zero dimension is an endless void of nothingness. The zero dimension can be seen as a state where nothing is present, where nothing exists. The zero dimension surrounds the other dimensions but those dimensions cannot exist in it, the next dimensions are only based on that zero dimension. And that brings us back to our visible universe, because everything in our visible universe is based on that zero dimension. And that tells us that our visible expanding universe is surrounded by an endless void of nothingness, that endless void is an absolute vacuum (it's space without particles).

Our growing visible universe;

The visible properties of galaxies also tell us how the universe works, and it tells us something about that God source as well. We can easily determine that galaxies are dragged outwards by ether streams, their structure tells us why. When you look at an image of a whirlpool in water, a whirlpool in air and a spiral galaxy (from above) then you will see that they have the same whirlpool structure, and that tells us that galaxies are invisible whirlpools. That is why each galaxy has several of the following whirlpool properties, you can see an eye (black hole), jets (visible or invisible), spiral arms (waves), differential orbital speeds of the stars, and the stars move up and down in their orbit (a wave-like motion). Those properties are unique whirlpool properties and they can only be found in a whirlpool, and a whirlpool always requires a medium that is made of loose particles (so space consists of ether particles). So it's obvious that each galaxy is an invisible whirlpool in ether, the stars are dragged along in that ether whirlpool and that is another clue.

Those ether whirlpools tell us that matter continuously absorbs and uses ether, why?, because the weightless stars can only be dragged along in that frictionless ether whirlpool if they continuously absorb and use the surrounding ether. That continuous absorption creates a continuous grip on the surrounding ether, that is why the stars cannot be thrown away at those high orbital speeds (they are stuck). And because those stars continuously require ether, we can also conclude that there is no matter in that absolute vacuum (it's space without particles). And we can also conclude that matter cannot exist without ether, matter continuously needs ether to maintain itself. But what does this say about that God source?, it tells us that something in our universe must continuously create ether and matter. And because matter cannot exist without ether, means that matter and ether must be created simultaneously. And that continuous process is still happening, because matter still exist and because the ether bubble is still growing. So there must be some kind of God source in the center of our visible universe, it has created the universe around itself.

The God source in the center of our visible universe;

If ether is continuously absorbed and used by matter, then logic dictates that something must also produce ether at a higher rate than it's absorbed. And because matter cannot exist without ether, they must be created simultaneously but not in the same amount. That is what happens in the center of our visible universe and that is why the ether bubble grows, astronomers cannot see beyond a certain point when they look back in time because they see that God source. They see some kind of source that continuously produces ether and particles (matter) at a very high rate, and that results in turbulent ether streams and ether whirlpools (galaxies). Those ether whirlpools (galaxies) are formed by those turbulent ether streams and they are dragged along outwards in those ether streams, and that results in the dispersion of the galaxies. That God source has created an ether bubble and it's been growing since that God source emerged, and another clue that tells us what that source is.

There is something in nature that looks like those ether particles, they look like the blood cells that transfer oxygen to other cells. And that gives us another clue, that ether producing source looks like the stem cells in bone marrow and that cannot be a coincidence. The stem cells in that bone marrow produce those blood cells at a very high rate as well, and stem cells are also able to transform themselves in all other cells. That source in the universe also produce ether at a very high rate and it also transforms its particles to energy/matter, so our visible universe is created by some kind of sub-atomic stem particles. That might sound strange but it's not, it's as strange as the stem cells in our body. Each cell in our body is created by stem cells, those stem cells create life and that is an important clue. Humanity is looking for a God that has created everything in nature (including life), those stem cells tell us that God must be something like those stem cells. And that makes sense, God has created humanity in his own image and a stem cell does the same thing. A sub-atomic stem particle would be able to transform itself in the required sub-atomic particles, and it would be able to transform itself at a very high rate.

We know that nature uses that stem cell mechanism to create life, so why would there be another mechanism on a sub-atomic level? Logic dictates that all sub-atomic particles must have been created by sub-atomic stem particles as well, those stem particles have created life on a sub-atomic level. And a clue in nature tells me that I'm right, my Vixra paper 1601.0163 explains why. Nobody noticed that sub-atomic particles have the same properties as the cells in nature, that cannot be a coincidence. Sub-atomic particles are there for a reason, they are there to maintain everything in the universe. Those sub-atomic particles are described in the Standard Model, it describes the sub-atomic particles that we know but it's incomplete. If the cells in our body would be described in a Standard Model as well, then it would include a stem cell. A stem cell is the foundation of all cells in our body, so logic dictates that sub-atomic particles must be created by sub-atomic stem particles as well.

Everything is made of sub-atomic particles, so that also tells us that we need to look for God on a sub-atomic level. And because we can determine that matter continuously absorbs and uses ether, we can conclude that the God source cannot be made of matter because it continuously expels ether. I don't know what has created those sub-atomic stem particles, but stem cells are capable of dividing and renewing themselves and that looks like the totipotent stem cells in our body. Totipotent stem cells are cells that have the capacity to self-renew themselves, by dividing and to develop into themselves into any cell. So it would make sense if that God source started as one primordial sub-atomic stem particle, and it has replicated itself since then.

My Vixra paper 1508.0191 explains that time is a process whereby atoms continuously absorb and use ether, so time doesn't apply to that God source because it continuously expels ether. That God source is an eternal source, that ether bubble will continue to grow and that God source and our visible growing universe will exist forever (the universe has no age).

CONCLUSION

Humanity is looking for something that they already know, God is similar to the stem cells in our body. We are created by stem cells and everything in our visible universe is created by sub-atomic stem particles, those sub-atomic stem particles can be seen as God.
