**Author:** Yahya Awad Sharif Mohammed

**Article:**

Matter consists infinitely of pieces of matter there is not an atom nor its components, in chemical interactions it interacts infinitely , electrons are an infinite flow of energy light as well is an infinite flow of energy.matter is infinite and has its characteristics infinitely , compounds consist of two elements infinitely , a compound to have its own completely different characteristics it should consist of two elements infinitely.

A photo of Gold atoms :

[https://en.wikipedia.org/wiki/Atom#/media/File:Atomic\\_resolution\\_Au100.JPG](https://en.wikipedia.org/wiki/Atom#/media/File:Atomic_resolution_Au100.JPG)

in the same section:

<https://en.wikipedia.org/wiki/Atom#Identification>

These are in fact protrusions on the surface of a gold bar , gold protrusions according to my theory are ultimately tiny balls of gold itself , Atomic number of gold is 79 it easy to see it consists of only 79 protons so why cant I see protons , neutrons and even electrons ? they are just dots without particle composition nor electrons they are just golden protrusions in a microscopic level and the gaps are just holes.

in some surfaces you can see the protrusions I'm referring to by naked eyes

according to my understanding , matter is matter whether it is solid liquid or gas , iron water and hydrogen are all matter , gold has protrusions and melted gold has protrusions as well , water has protrusions and hydrogen also, the surface of water seems smooth but it is in fact full of protrusions , hydrogen gas also has protrusions on his surface , you may ask why I am able to move my hand through gasses as well as liquids because yo simply cut them you won't feel gas on your hand because it is soft.

those balls or protrusion do not melt because matter is in fact infinite and it melts infinitely -liquid and gas- the protrusions are just a collection of this soft-infinitely melted - matter.

for infinite matter to satisfy absolute smooth surface should not exist , i.e there always should be protrusions on every surface- moving your hand through gas or liquid is just cutting that gas or liquid with your hand-

we have drops of water, drop a drop of water on a surface , you would see a part of sphere , protrusions do not need to be perfect balls , and things are different in terms of microscopic levels, for example a surface of gold bar seems smooth when seen by naked eye but at microscopic levels it is not , melting gold also seems to be more smooth but it is not , they are just "liquid" protrusions. gases also have protrusions at microscopic levels , when gases spreads they have some kind of form with particular volume, protrusions are these forms at microscopic levels.
