

## The Near Abortion of Gravistrong

sgm, 2018/JUL/31

After 40 years of being ignored and dismissed by convention, and erroneously thinking I had failed in unifying gravitation and the strong-nuclear force, yesterday, I was Totally ready to give it up .. But .. instead of chronicling the logic-chain, please allow me to explain in simplest terms, the idea.

Forget gluons and gravitons; just think about curvature, specifically unidimensional temporal curvature, TC. *Matter*, by its presence, creates **convex** TC; *antimatter*, **concave** TC. So every annihilation/creation event has **balanced** curvature. Matter nucleons/stellar-objects are surrounded by convex TC; antimatter nucleons/stellar-objects, concave TC. Further, convex-convex attracts; concave-concave attracts; and, **convex-concave repels**.

One final point before we move toward validation: convex TC corresponds with **time-dilation**; concave TC, **time-compression**; **convex↔time-slows**; **concave↔time-quickens**.

The framework above implies anti-<sup>8</sup>Be should decay **faster** than <sup>8</sup>Be. *And*, we should observe some strange behavior in the direction of the Dipole Repeler (C-nu-B anisotropy).\*

Thank goodness 40 years were an investment rather than a squandering.

\*Hawking-evaporation should make PABHs evaporate more quickly than PBHs BUT dark energy dominates the cosmos because PABHs *dominate* PBHs one-on-one; they're **faster**.
