

Not generating the universe from scratch

A recent abstract under quantum physics at vixra..org, stated:

The creator created the universe from scratch, and after that instant, the creator left his creatures alone. The observers under these creatures can read the historic part of the read-only repository in which the creator archived the universe.

We flagged this as an example of making outlandish assumptions about the universe.

1. The universe is created (the "from scratch" is repetitious because creation implies ex nihilo, something from nothing) in an instant, implying a time scale was present.
2. The creator left the creatures alone, that is, became subsequently absent, implying the creator was an indifferent machine.
3. Additionally, the creator was not a personal spirit with a proper name which implies a mechanism indifferent to what was surely vicariously created.
