# Cousin Primes Conjecture

## Toshiro Takami<sup>\*</sup> mmm82889@yahoo.co.jp

#### Abstract

Cousin Primes Conjecture were performed using WolframAlpha and Wolfram cloud from the beginning this time, as in the case of the twin primes that we did the other day.

Cousin Primes and Twin Primes have exactly the same dynamics.

All Cousin Primes are executed in hexagonal circulation. It does not change in a huge number (forever huge number).

In the hexagon, Cousin Primes are generated only at (6n+1)(6n+5). [n is a positive integer]

When the number grows to the limit, the denominator of the expression becomes very large, and primes occur very rarely, but since Cousin Primes are 4/3 times the square of the distribution of primes, the frequency of occurrence of Cousin Primes is very equal to 0.

However, it is not 0. Therefore, Cousin Primes continue to be generated.

That is, Cousin Primes exist forever.

#### key words

Hexagonal circulation, Cousin primes, 4/3 times the square of the probability of the primes

### Introduction

First, say 6n+5=6n-1.

The Cousin Primes is represented as (6n+1) or (6n-1). And, n is positive integer.

All Cousin Primes are combination of (6n+1) and (6n-1). That is, all Cousin Primes are a combination of 1th-angle and 5th-angle.

<sup>\*47-8</sup> kuyamadai, Isahaya-shi, Nagasaki-prefecture, 854-0067 Japan

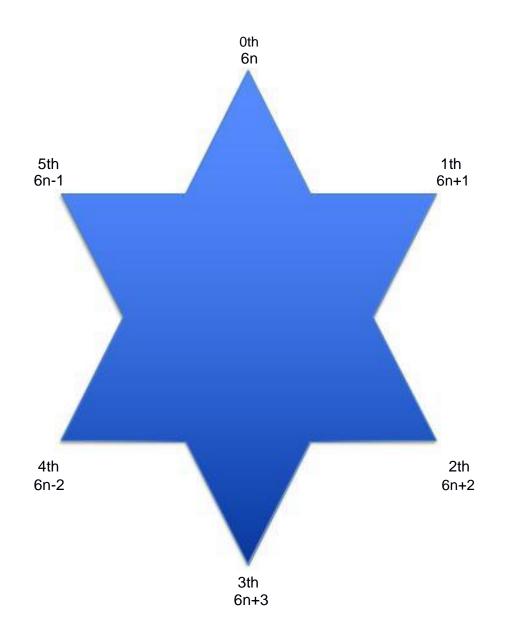

1th-angle is (6n+1). 5th-angle is (6n - 1). (6n - 2), (6n), (6n+2) in are even numbers. (6n+1), (6n+3), (6n - 1) are odd numbers. The Cousin Primes are (6n+1) and (6n - 1). The following is a Cousin Primes. There are no prime numbers that are not (6n - 1) or (6n+1). 7 — 6n+1 (Cousin primes) 11 — 6n -1 13 — 6n+1 (Cousin primes) 17 — 6n -1 19 — 6n+1 (Cousin primes) 23 — 6n -1 ......

I wrote below the distribution of Cousin Primes.

There are 1215 cousin primes from 5 to  $1 \times 10^5 = 99996$ . Probability is  $\frac{9589}{99996}$ . In this, there are 1222 Cousin Primes. Probability is  $\frac{1222}{99996} = 0.0122204888...$ and  $[\frac{9590}{99996}]^2 \times \frac{4}{3} = 0.0122633943...$ 

There are 5761450 primes from 5 to  $1 \times 10^8 = 99999996$ . Probability is  $\frac{5761450}{99999996}$ . In this, there are 440257 Cousin Primes. Probability is  $\frac{440257}{99999996} = 0.00440257017610...$  and  $[\frac{5761451}{99999996}]^2 \times \frac{4}{3} = 0.004425909052127...$ 

As in the case of Twin Primes, constant = 4/3 even in Cousin Primes.

### Discussion

Although not found in the literature, cousin primes and twin primes have exactly the same dynamics.

This means that if twin primes are infinite, cousin primes are infinite.

The probability that cousin prime will occur 4/3 times the square of the probability that a prime will occur in a huge number, where the probability that a prime will occur is low from the equation (1).

While a prime number is generated, cousin primes be generated.

And, as can be seen from the equation below, even if the number becomes large, the degree of occurrence of primes only decreases little by little.

$$\pi(x) \sim \frac{x}{\log x} \quad (x \to \infty) \tag{1}$$

(Expected to be larger than  $\log(10^{200000})$ )

As x in  $\log(x)$  grows to the limit, the denominator of the equation also grows extremely large. Even if primes are generated, the frequency of occurrence is extremely low. The generation of Cousin Primes is approximately the square of the generation frequency of primes, and the generation frequency is extremely low.

However, as long as primes are generated, Cousin Primes are generated with a very low frequency.

When the number grows to the limit, the denominator of the expression becomes very large, and primes occur very rarely, but since Cousin Primes are 4/3 times the square of the distribution of Primes, the frequency of occurrence of Cousin Primes is very equal to 0.

However, it is not 0. Therefore, Cousin Primes continue to be generated.

However, when the number grows to the limit, the probability of the Cousin Primes appearing is almost 0 because it is 4/3 times the square of the probability of the appearance of the Prime. It is a subtle place to say that almost 0 appears.

Use a contradiction method. If Cousin Primes is finite, the Primes is finite. This is contradictory. Because there are an infinite of Primes.

That is, Cousin Primes exist forever.

Proof end.
