

Specific Function of Prime Numbers

Abde-laziz Ben Ideiss

Abstract

This paper discusses a function of infinite formulas in determining prime numbers directly and in order.

This function consists of three steps:

1-Step (the first) is a formula that produces prime numbers and multiples of prime numbers (disbursed) from the list of numbers, and it depends on some of the constants that will never change, such as: 10 and 1 as for the variable constants in the formula are: 12 and 18 its variable depends on an increase 30 Every step.

$$\mathbf{10+1+12-1-10}$$

$$23=10+13=1+12-1=11-10=1$$

$$\mathbf{12+30=42}$$

$$53=10+43=1+42-1=41-10=31$$

$$\mathbf{42+30=72}$$

$$83=10+73=1+72-1=71-10=61$$

$$\mathbf{72+30=102}$$

$$113=10+103=1+102-1=101-10=\underline{91}$$

$$102+30=132$$

$$\mathbf{10+1+18-1-10}$$

$$29=10+19=1+18-1=17-10=7$$

$$\mathbf{18+30=48}$$

$$59=10+\underline{49}=1+48-1=47-10=37$$

$$\mathbf{48+30=78}$$

$$89=10+79=1+78-1=\underline{77}-10=67$$

$$\mathbf{78+30=108}$$

$$119=10+109=1+108-1=107-10=97$$

$$108+30=138$$

∞

3-Step (the third) is clear as (the first step) in use, and results in the numbers of multiples of prime numbers, and these numbers must be crossed out in the list of numbers (first step), and the result is ordinarily initial numbers.
