## On Prime Numbers Between kn And (k+1)n

Wing K. Yu

### Abstracts

In this paper along with three previous studies on analyzing the binomial coefficients, we will complete the proof of a theorem. The theorem states that for two positive integers  $n \ge 1$  and  $k \ge 1$ , if  $n \ge k-1$ , then there always exists at least a prime number p such that kn . The Bertrand-Chebyshev's theorem is a special case of this theorem when <math>k = 1.

## 1. Introduction

The Bertrand-Chebyshev's theorem States that for any positive integer n, there is always a prime number p such that n . It was proved by Pafnuty Chebyshev in 1850 [1]. In 2006, M. El Bachraoui [2] expanded the theorem by proving that for any positive integer <math>n, there is a prime number p such that 2n . In 2011, Andy Loo [3] expanded the theorem to prove that there is a prime number in the interval <math>(3n, 4n) when  $n \ge 2$ . It comes up with a question: Does any positive integer k make  $kn stand? If it does, in what conditions? Previously, the author partially answered these questions by analyzing the binomial coefficients <math>\binom{3n}{n}$ ,  $\binom{4n}{n}$ , and  $\binom{\lambda n}{n}$  where  $\lambda \ge 3$  is an integer [4] [5] [6]. In this paper, we will complete the work with the above methodology. In this section, we will cite some important concepts from the previous papers. Then in section 2 and section 3, we will fill up the gaps of  $\lambda$  from 5 to 25. And in section 4, we will convert  $\lambda$  to k to complete this paper.

From [4]:

For every positive integer n, there exists at least a prime number p such that 2n .From [5]:

For every integer n > 1, there exists at least a prime number p such that 3n .From [6 pp2-5]:

**Definition**:  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \}$  denotes the prime factorization operator of  $\binom{\lambda n}{n}$ . It is the product of the prime numbers in the decomposition of  $\binom{\lambda n}{n}$  in the range of  $a \ge p > b$ . In this operator, p is a prime number, a and b are real numbers, and  $\lambda n \ge a \ge p > b \ge 1$ . It has some properties: It is always true that  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \} \ge 1$ . **— (1.1)** 

If no prime number in  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \}$ , then  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \} = 1$ , or vice versa, if  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \} = 1$ , then no prime number in  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \}$ . — (1.2) For example, when  $\lambda = 5$  and n = 4,  $\Gamma_{16 \ge p > 10} \{ \binom{20}{4} \} = 13^{\circ} \cdot 11^{\circ} = 1$ . No prime number is in  $\binom{20}{4}$  in the range of  $16 \ge p > 10$ .

If there is at least one prime number in  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \}$ , then  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \} > 1$ , or vice versa, if  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \} > 1$ , then at least one prime number is in  $\Gamma_{a \ge p > b} \{ \binom{\lambda n}{n} \} = -(1.3)$ For example, when  $\lambda = 5$  and n = 4. There is  $\Lambda = 19 \cdot 17 > 1$ . Prime numbers 19

For example, when  $\lambda = 5$  and n = 4,  $\Gamma_{20 \ge p > 16} \{ \binom{20}{4} \} = 19 \cdot 17 > 1$ . Prime numbers 19 and 17 are in  $\binom{20}{4}$  in the range of  $20 \ge p > 16$ .

For 
$$n \ge 2$$
 and  $\lambda \ge 3$ ,  $\binom{\lambda n}{n} > \frac{\lambda^{\lambda n - \lambda + 1}}{n(\lambda - 1)^{(\lambda - 1)n - \lambda + 1}}$  — (1.4)  
Let  $v_p(n)$  be the *p*-adic valuation of *n*, the exponent of the highest power of *p* that divides *n*. We define  $R(p)$  by the inequalities  $p^{R(p)} \le \lambda n < p^{R(p)+1}$ , and determine the *p*-adic valuation of  $\binom{\lambda n}{n}$ . We define  $R(p)$  by the inequalities  $p^{R(p)} \le \lambda n < p^{R(p)+1}$ . If *p* divides  $\binom{\lambda n}{n}$ , then  $v_p\left(\binom{\lambda n}{n}\right) \le R(p) \le \log_p(\lambda n)$ , or  $p^{v_p\left(\binom{\lambda n}{n}\right)} \le p^{R(p)} \le \lambda n$  — (1.5)

If 
$$\lambda n \ge p > \lfloor \sqrt{\lambda n} \rfloor$$
, then  $0 \le v_p \left( {\binom{\lambda n}{n}} \right) \le R(p) \le 1$  – (1.6)  
For  $n \ge (\lambda - 2) \ge 24$ , there exists at least a prime number  $p$  such that  $(\lambda - 1)n .  
– (1.7)$ 

Let  $\pi(n)$  be the number of distinct prime numbers less than or equal to n. Among the first six consecutive natural numbers are three prime numbers 2, 3 and 5. Then, for each additional six consecutive natural numbers, at most one can add two prime numbers,  $p \equiv 1 \pmod{6}$  and  $p \equiv 5 \pmod{6}$ . Thus,  $\pi(n) \le \left|\frac{n}{3}\right| + 2 \le \frac{n}{3} + 2$ . — (1.8) When  $n > \lfloor \sqrt{\lambda n} \rfloor$ ,  $\binom{\lambda n}{n} = \Gamma_{\lambda n \ge p > n} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} \cdot \Gamma_{n \ge p > \lfloor \sqrt{\lambda n} \rfloor} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} \cdot \Gamma_{\lfloor \sqrt{\lambda n} \rfloor \ge p} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \}$ When  $n \leq \lfloor \sqrt{\lambda n} \rfloor$ ,  $\binom{\lambda n}{n} \leq \Gamma_{\lambda n \geq p > n} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} \cdot \Gamma_{\lfloor \sqrt{\lambda n} \rfloor \geq p} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \}$ Thus,  $\binom{\lambda n}{n} \leq \Gamma_{\lambda n \geq p > n} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} \cdot \Gamma_{n \geq p > \lfloor \sqrt{\lambda n} \rfloor} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} \cdot \Gamma_{\lfloor \sqrt{\lambda n} \rfloor \geq p} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \}.$ — (1.9)  $\Gamma_{\lambda n \ge p > n} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} = \Gamma_{\lambda n \ge p > n} \{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \}$  since all prime numbers in n! do not appear in the range of  $\lambda n \ge p > n$ . Referring to (1.6),  $\Gamma_{n \ge p > |\sqrt{\lambda n}|} \{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \} < \prod_{n \ge p} p$ . It has been proved [7] that for  $n \ge 3$ ,  $\prod_{n \ge p} p < 2^{2n-3}. \text{ Thus, for } n \ge 3 \text{ and } \lambda \ge 3, \ \Gamma_{n \ge p > \left|\sqrt{\lambda n}\right|} \left\{ \frac{(\lambda n)!}{n! \cdot (\lambda - 1)n!} \right\} < \prod_{n \ge p} p < 2^{2n-3}.$ Referring to (1.5) and (1.8),  $\Gamma_{\left|\sqrt{\lambda n}\right| \geq p} \left\{ \frac{(\lambda n)!}{n! \cdot ((\lambda - 1)n)!} \right\} \leq (\lambda n)^{\frac{\sqrt{\lambda n}}{3} + 2}$ Thus for  $n \ge 3$  and  $\lambda \ge 3$ ,  $\binom{\lambda n}{n} < \Gamma_{\lambda n \ge p > n} \{\frac{(\lambda n)!}{((\lambda - 1)n)!}\} \cdot 2^{2n-3} \cdot (\lambda n)^{\frac{\sqrt{\lambda n}}{3}+2}$ — (1.10) Applying (1.4) to (1.10), when  $n \ge 3$  and  $\lambda \ge 3$ , we have  $\frac{\lambda^{\lambda n-\lambda+1}}{n(\lambda-1)^{(\lambda-1)n-\lambda+1}} < {\lambda n \choose n} < \Gamma_{\lambda n \ge p>n} \{\frac{(\lambda n)!}{((\lambda-1)n)!}\} \cdot 2^{2n-3} \cdot (\lambda n)^{\frac{\sqrt{\lambda n}}{3}+2}.$ Since when  $n \ge 3$  and  $\lambda \ge 3$ ,  $2^{2n-3} > 0$  and  $(\lambda n)^{\frac{\sqrt{\lambda n}}{3}+2} > 0$ ,  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > \frac{\lambda^{\lambda n - \lambda + 1}}{(\lambda n)^{\frac{\sqrt{\lambda n}}{3} + 2} \cdot 2^{2n - 3} \cdot n(\lambda - 1)^{(\lambda - 1)n - \lambda + 1}} = \frac{2\lambda^2 \cdot \left( \left( \frac{\lambda}{4} \right) \cdot \left( \frac{\lambda}{\lambda - 1} \right)^{\lambda - 1} \right)^{(n - 1)}}{(\lambda n)^{\frac{\sqrt{\lambda n}}{2} + 3}}$  (1.11)

#### 2. A Prime Number Between $(\lambda - 1)n$ and $\lambda n$ when $5 \le \lambda \le 7$ and $n \ge \lambda - 2$

**Proposition 1**: For  $n \ge 36$  and  $5 \le \lambda \le 7$ , there exists at least a prime number p such that  $(\lambda - 1)n . (2.1)$ 

Referring to (1.11), when  $n \ge 36$  and  $5 \le \lambda \le 7$ , we have

$$\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > \frac{2\lambda^2 \cdot \left( \left( \frac{\lambda}{4} \right) \cdot \left( \frac{\lambda}{\lambda - 1} \right)^{\lambda - 1} \right)^{(n - 1)}}{(\lambda n)^{\frac{\sqrt{\lambda n}}{3} + 3}} \qquad - (2.2)$$
Let  $f_1(x) = \frac{2\lambda^2 \cdot \left( \left( \frac{\lambda}{4} \right) \cdot \left( \frac{\lambda}{\lambda - 1} \right)^{\lambda - 1} \right)^{(x - 1)}}{(\lambda x)^{\frac{\sqrt{\lambda x}}{3} + 3}}$  where x is a real number, the variable, and  $\lambda$  is a constant

at one of the 3 integers from 5 to 7.

$$f_1'(x) = f_1(x) \cdot \left( ln\left(\frac{\lambda}{4}\right) + ln\left(\frac{\lambda}{\lambda-1}\right)^{\lambda-1} - \frac{\sqrt{\lambda}\left(ln(x) + ln(\lambda) + 2\right)}{6\sqrt{x}} - \frac{3}{x}\right) = f_1(x) \cdot f_2(x) \text{ where}$$

$$f_2(x) = ln\left(\frac{\lambda}{4}\right) + ln\left(\frac{\lambda}{\lambda-1}\right)^{\lambda-1} - \frac{\sqrt{\lambda}\left(ln(x) + ln(\lambda) + 2\right)}{6\sqrt{x}} - \frac{3}{x}$$

 $f_2'(x) = \frac{\sqrt{\lambda} \ln(\lambda) + \sqrt{\lambda} \ln(x)}{12x\sqrt{x}} + \frac{3}{x^2} > 0 \text{ for } x > 1 \text{ and } \lambda > 1. \text{ Thus, } f_2(x) \text{ is a strictly increasing function.}$ 

When 
$$x = 36$$
 and  $\lambda = 5$ ,  $f_2(x) = ln\left(\frac{5}{4}\right) + ln\left(\frac{5}{5-1}\right)^{5-1} - \frac{\sqrt{5}\left(ln(36)+ln(5)+2\right)}{6\sqrt{36}} - \frac{3}{36} \approx 0.5859 > 0.$   
When  $x = 36$  and  $\lambda = 6$ ,  $f_2(x) = ln\left(\frac{6}{4}\right) + ln\left(\frac{6}{6-1}\right)^{6-1} - \frac{\sqrt{6}\left(ln(36)+ln(6)+2\right)}{6\sqrt{36}} - \frac{3}{36} \approx 0.7155 > 0.$   
When  $x = 36$  and  $\lambda = 7$ ,  $f_2(x) = ln\left(\frac{7}{4}\right) + ln\left(\frac{7}{7-1}\right)^{7-1} - \frac{\sqrt{7}\left(ln(36)+ln(7)+2\right)}{6\sqrt{36}} - \frac{3}{36} \approx 0.8522 > 0.$ 

Since  $f_2(x) > 0$  when x = 36 and  $5 \le \lambda \le 7$ , and since  $f_2(x)$  is a strictly increasing function, then when  $x \ge 36$  and  $5 \le \lambda \le 7$ , we have  $f_2(x) > 0$ . **(2.3)** 

Since when x = 36 and  $5 \le \lambda \le 7$ ,  $f_1(x) > 0$  and  $f_2(x) > 0$ , and  $f_2(x)$  is a strictly increasing function, then  $f_1'(x) = f_1(x) \cdot f_2(x) > 0$ . Thus, when  $x \ge 36$  and  $5 \le \lambda \le 7$ ,  $f_1(x)$  is a strictly increasing function.  $f_1(x + 1) > f_1(x)$ . – (2.4)

When 
$$\lambda = 5$$
 and  $x = 36$ ,  $f_1(x) = \frac{50 \cdot \left(\left(\frac{5}{4}\right) \cdot \left(\frac{5}{5-1}\right)^{5-1}\right)^{(36-1)}}{(180)^{\frac{\sqrt{180}}{3}+3}} = \frac{4.5522E+18}{7.1073E+16} > 1.$   
When  $\lambda = 6$  and  $x = 36$ ,  $f_1(x) = \frac{72 \cdot \left(\left(\frac{6}{4}\right) \cdot \left(\frac{6}{6-1}\right)^{6-1}\right)^{(36-1)}}{(216)^{\frac{\sqrt{216}}{3}+3}} = \frac{7.5378E+21}{2.7530E+18} > 1.$   
When  $\lambda = 7$  and  $x = 36$ ,  $f_1(x) = \frac{98 \cdot \left(\left(\frac{7}{4}\right) \cdot \left(\frac{7}{7-1}\right)^{7-1}\right)^{(36-1)}}{(252)^{\frac{\sqrt{252}}{3}+3}} = \frac{3.6007E+24}{8.1511E+19} > 1.$ 

Referring to (2.4), when  $x \ge 36$  and  $5 \le \lambda \le 7$ ,  $f_1(x) > 1$ .

Let x = n, then when  $n \ge 36$  and  $5 \le \lambda \le 7$ ,  $f_1(n) = \frac{2\lambda^2 \cdot \left(\left(\frac{\lambda}{4}\right) \cdot \left(\frac{\lambda}{\lambda-1}\right)^{\lambda-1}\right)^{(n-1)}}{(\lambda n)^{\frac{\sqrt{\lambda n}}{3}+3}} > 1.$ 

Thus, referring to (2.2), when  $n \ge 36$  and  $5 \le \lambda \le 7$ ,  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1.$  (2.5)

Referring to (1.3), there exists at least a prime number p such that n .

Since 
$$n > \lambda - 2$$
, in  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\}$ ,  $p \ge n + 1 = \sqrt{n^2 + 2n + 1} > \sqrt{(n + 2)n} > [\sqrt{\lambda n}]$ .  
Referring to (1.6), we have  $0 \le v_p \left( \Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) \le R(p) \le 1$ .  
 $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} = \frac{1}{\Gamma_{\lambda n \ge p > n}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \cdot \prod_{l=1}^{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\}$ . In  $\prod_{l=1}^{\lambda - 2} \left( \frac{(\lambda - 1)n}{((\lambda - 1)n)!} \right\}$ . If  $i = \lambda^{-2} \left( \Gamma_{\frac{(\lambda - 1)n}{l} \ge p > \frac{\lambda n}{l+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \cdot \prod_{l=1}^{\lambda n \ge p > \frac{\lambda n}{l+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\}$ . In  $\prod_{l=1}^{\lambda - 2} \left( \frac{(\lambda - 1)n}{((\lambda - 1)n)!} \right\}$ , for every distinct prime number  $p$  in these ranges, the numerator  $(\lambda n)$ ! has the product of  $p \cdot 2p \cdot 3p \dots ip = (i)! \cdot p^l$ . The denominator  $((\lambda - 1)n)!$  also has the same product of  $(i)! \cdot p^l$ . They cancel to each other in  $\frac{(\lambda n)!}{((\lambda - 1)n)!}$ .  
Referring to  $(1.2)$ ,  $\prod_{l=1}^{\lambda - 2} \left( \frac{\Gamma_{(\lambda - 1)n}}{((\lambda - 1)n)!} \right\} \cdot \prod_{l=1}^{l=\lambda - 2} \left( \frac{\lambda n}{(\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) = 1$ . Therefore, when  $n \ge 36$  and  $5 \le \lambda \le 7$ ,  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} = \Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right\} = 1$  and  $\prod_{l=1}^{l=\lambda - 2} \left( \frac{\Gamma_{\lambda n}}{(\lambda - 1)n!} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) > 1$ .  $-(2.6)$   
From  $(1.1)$ ,  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \ge 1$  and  $\prod_{l=1}^{l=\lambda - 2} \left( \frac{\Gamma_{\lambda n}}{(\lambda - 1)n!} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) \ge 1$ , and in  $(2.6)$  at least one of these two parts is greater than 1.  
When  $n \ge 36$  and  $5 \le \lambda \le 7$ , if  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} = 1$ , then  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ .  $-(2.7)$   
If  $\prod_{l=1}^{l=\lambda - 2} \left( \frac{\Gamma_{\lambda n}}{(\lambda + 1)} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) = 1$ , then  $\Lambda_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ .  
When the factor  $\Gamma_{\lambda n} \frac{(\lambda - 1)n}{(\lambda + 1)} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , then at least one factor  $\Gamma_{\lambda n} \frac{(\lambda - 1)n}{(\lambda + 1)!} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ .  
When the factor  $\Gamma_{\lambda n} \frac{(\lambda -$ 

$$\begin{split} &\Gamma_{\lambda y_{i+1} \geq p > (\lambda-1)y_{i+1}}\{\frac{(\lambda n)!}{((\lambda-1)n)!}\} > 1. \text{ Thus, when } y_{i+1} \geq \frac{36}{i+1} \text{, there exists at least a prime number } p \text{ such that } (\lambda-1) \cdot y_{i+1}$$

Since  $n > y_{i+1} \ge \frac{36}{i+1}$ , there exists at least a prime number p such that  $(\lambda - 1)n .$ 

Thus, If 
$$\prod_{i=1}^{i=\lambda-2} \left( \Gamma_{\underline{\lambda n}\atop i+1} \ge p > \frac{(\lambda-1)n}{i+1} \left\{ \frac{(\lambda n)!}{((\lambda-1)n)!} \right\} \right) > 1$$
, then  $\Gamma_{\underline{\lambda n} \ge p > (\lambda-1)n} \left\{ \frac{(\lambda n)!}{((\lambda-1)n)!} \right\} > 1$ . (2.9)

From (2.8) and (2.9), no mater  $\prod_{i=1}^{i=\lambda-2} \left( \prod_{\substack{\lambda n \\ i+1} \geq p > \frac{(\lambda-1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda-1)n)!} \right\} \right)$  equal to 1 or greater than 1,

it is always true that  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \} > 1$ . Thus when  $n \ge 36$  and  $5 \le \lambda \le 7$ , referring to (1.3), there exists at least a prime number p such that  $(\lambda - 1)n . – (2.10)$ 

In conclusion from **(2.5)**, **(2.7)**, **(2.10)**, when  $n \ge 36$  and  $5 \le \lambda \le 7$ , then  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ . When  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , then  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , and there exists at least a prime

number *p* such that  $(\lambda - 1)n . Thus,$ **Proposition 1**is proven.

**Proposition 2**: For  $35 \ge n \ge \lambda - 2$  and  $5 \le \lambda \le 7$ , there exists at least a prime number p such that  $(\lambda - 1)n . (2.11)$ 

We use tables to prove (2.11). Table 1, Table 2, and Table 3 show that when  $\lambda$  = 5, 6, and 7, **Proposition 2** is correct. Thus, (2.11) is valid.

Combining (2.1) and (2.11), we have proven that when  $5 \le \lambda \le 7$  and  $n \ge \lambda -2$ , there exists at least a prime number p such that  $(\lambda -1)n . (2.12)$ 

### **3.** A Prime Number Between $(\lambda - 1)n$ and $\lambda n$ when $8 \le \lambda \le 25$ and $n \ge \lambda - 2$

**Proposition 3**: For  $n \ge 24$  and  $8 \le \lambda \le 25$ , there exists at least a prime number p such that  $(\lambda - 1)n . (3.1)$ 

Referring to (1.11), when  $n \ge 24$  and  $8 \le \lambda \le 25$ , we have

one of the 18 integers from 8 to 25.

$$f_{3}'(x) = f_{3}(x) \cdot \left( ln\left(\frac{\lambda}{4}\right) + ln\left(\frac{\lambda}{\lambda-1}\right)^{\lambda-1} - \frac{\sqrt{\lambda}\left(ln(x) + ln(\lambda) + 2\right)}{6\sqrt{x}} - \frac{3}{x} \right) = f_{3}(x) \cdot f_{4}(x) \text{ where}$$

$$f_{4}(x) = ln\left(\frac{\lambda}{4}\right) + ln\left(\frac{\lambda}{\lambda-1}\right)^{\lambda-1} - \frac{\sqrt{\lambda}\left(ln(x) + ln(\lambda) + 2\right)}{6\sqrt{x}} - \frac{3}{x}$$

$$f_{4}'(x) = \frac{\sqrt{\lambda}\ln(\lambda) + \sqrt{\lambda}\ln(x)}{12x\sqrt{x}} + \frac{3}{x^{2}} > 0 \text{ for } x > 1 \text{ and } \lambda > 1. \text{ Thus, } f_{4}(x) \text{ is a strictly increasing function.}$$

We now calculate the  $f_4(x)$  values and list them in **Table 4** for x = 24 and  $\lambda = 8, 9, 10, \dots 25$ . **Table 4.** When x = 24 and  $\lambda$  from 8 to 25,  $f_4(x) > 0$ 

λ	8	9	10	11	12	13	14	15	16
$f_4(x)$	0.805	0.876	0.935	0.985	1.028	1.064	1.096	1.124	1.148
2	17	10	19	20	21	22	23	24	25
λ	17	18	19	20	21	22	25	24	25
$f_4(x)$	1.168	1.186	1.202	1.215	1.227	1.237	1.246	1.253	1.259

**Table 4** shows that when x = 24 and  $\lambda$  from 8 to 25,  $f_4(x) > 0$ . Since  $f_3(x) > 0$  and  $f_4(x) > 0$ , and  $f_4(x)$  is a strictly increasing function, when  $x \ge 24$  and  $8 \le \lambda \le 25$ ,  $f_3'(x) = f_3(x) \cdot f_4(x) > 0$ . Thus, under these conditions,  $f_3(x)$  is a strictly increasing function, and  $f_3(x + 1) > f_3(x)$ . - (3.3)

We now calculate the  $f_3(x)$  values and list them in **Table 5** for x = 24 and  $\lambda = 8, 9, 10, \dots 25$ . **Table 5.** When x = 24 and  $\lambda$  from 8 to 25,  $f_3(x) > 1$ 

λ	8	9	10	11	12	13	14	15	16
$f_5(x)$	9.366	19.132	31.150	42.517	50.475	53.571	51.866	46.527	39.386
λ	17	18	19	20	21	22	23	24	25
$f_5(x)$	31.212	23.760	17.383	12.287	8.421	5.633	3.679	2.536	1.481

**Table 5** shows when x = 24 and  $\lambda$  from 8 to 25,  $f_3(x) > 1$ . Since  $f_3(x + 1) > f_3(x)$ , when

  $x \ge 24$  and  $8 \le \lambda \le 25$ ,  $f_3(x) > 1$ .

Let x = n, then when  $n \ge 24$  and  $8 \le \lambda \le 25$ ,  $f_3(n) = \frac{2\lambda^2 \cdot \left(\left(\frac{\lambda}{4}\right) \cdot \left(\frac{\lambda}{\lambda-1}\right)^{\lambda-1}\right)^{(n-1)}}{(\lambda n)^{\frac{\sqrt{\lambda n}}{3}+3}} > 1.$ 

Thus, referring to (3.2), when  $n \ge 24$  and  $8 \le \lambda \le 25$ ,  $\Gamma_{\lambda n \ge p>n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1.$  (3.5) Referring to (1.3), there exists at least a prime number p such that n .

Since 
$$n > \lambda - 2$$
, in  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\}$ ,  $p \ge n + 1 = \sqrt{n^2 + 2n + 1} > \sqrt{(n + 2)n} > [\sqrt{\lambda n}]$ .  
Referring to (1.6), we have  $0 \le v_p \left( \Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) \le R(p) \le 1$ .  
 $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} = \prod_{i=1}^{(\lambda n) \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \cdot \prod_{i=1}^{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \cdot \prod_{i=1}^{i=\lambda - 2} \left( \Gamma_{\frac{(\lambda - 1)n}{i} \ge p > \frac{\lambda n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right)$ , for every distinct prime number  $p$  in these ranges, the numerator  $(\lambda n)!$  has the product of  $p \cdot 2p \cdot 3p \dots ip = (i)! \cdot p^i$ . The denominator  $((\lambda - 1)n)!$  also has the same product of  $(i)! \cdot p^i$ . They cancel to each other in  $\frac{(\lambda n)!}{((\lambda - 1)n)!}$ .  
Referring to (1.2),  $\prod_{i=1}^{\lambda - 2} \left( \Gamma_{\frac{(\lambda - 1)n}{i} \ge p > \frac{\lambda n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) = 1$ . Therefore, when  $n \ge 24$  and  $8 \le \lambda \le 25$ ,  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} = \Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \cdot \prod_{i=1}^{i=\lambda - 2} \left( \Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) \ge 1$ .  $- (3.6)$   
From (1.1),  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \ge 1$  and  $\prod_{i=1}^{i=\lambda - 2} \left( \Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) \ge 1$ , then referring to (1.3), there exists at least a prime number  $p$  such that  $(\lambda - 1)n .  $- (3.7)$   
If  $\prod_{i=1}^{i=\lambda - 2} \left( \Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} \right) > 1$ , then at least one factor  $\Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ .  $- (3.8)$   
If  $\prod_{i=1}^{i=\lambda - 2} \left( \Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , then  $t = tore \Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ .  $- (3.8)$   
If  $\prod_{i=1}^{i=\lambda - 2} \left( \Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , then at least one factor  $\Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda - 1)n}{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ . When the factor  $\Gamma_{\frac{\lambda n}{i+1} \ge p > \frac{(\lambda$$ 

$$\begin{split} & \Gamma_{\lambda \cdot y_{i+1} \geq p > (\lambda - 1) \cdot y_{i+1}} \{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \} > 1. \text{ Thus, when } y_{i+1} \geq \frac{24}{i+1} \text{, there exists at least a prime number} \\ & p \text{ such that } (\lambda - 1) \cdot y_{i+1}$$

Since  $n > y_{i+1} \ge \frac{24}{i+1}$ , there exists at least a prime number p such that  $(\lambda - 1)n .$ 

Thus, If 
$$\prod_{i=1}^{i=\lambda-2} \left( \Gamma_{\underline{\lambda}n}_{\underline{i+1}} \ge p > \frac{(\lambda-1)n}{\underline{i+1}} \left\{ \frac{(\lambda n)!}{((\lambda-1)n)!} \right\} \right) > 1$$
, then  $\Gamma_{\underline{\lambda}n \ge p > (\lambda-1)n} \left\{ \frac{(\lambda n)!}{((\lambda-1)n)!} \right\} > 1$ . (3.9)

Referring to (3.8) and (3.9), when  $n \ge 24$  and  $8 \le \lambda \le 25$ , if  $\prod_{i=1}^{i=\lambda-2} \left( \prod_{\substack{\lambda n \\ i+1}} \sum_{j=1}^{(\lambda-1)n} \left\{ \frac{(\lambda n)!}{((\lambda-1)n)!} \right\} \right) \ge 1$ ,

then  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \} > 1$ . Thus, referring to **(1.3)**, there exists at least a prime number p such that  $(\lambda - 1)n . (3.10)$ 

In conclusion from (3.5), (3.7), (3.10), when  $n \ge 24$  and  $8 \le \lambda \le 25$ , then  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ . When  $\Gamma_{\lambda n \ge p > n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , then  $\Gamma_{\lambda n \ge p > (\lambda - 1)n} \left\{ \frac{(\lambda n)!}{((\lambda - 1)n)!} \right\} > 1$ , and there exists at least a prime number p such that  $(\lambda - 1)n . Thus,$ **Proposition 3**is proven.

**Proposition 4**: For  $23 \ge n \ge \lambda - 2$  and  $8 \le \lambda \le 25$ , there exists at least a prime number p such that  $(\lambda - 1)n . (3.11)$ 

We use tables to prove (3.11). Table 6, Table 7, and Table 8 show that when  $8 \le \lambda \le 25$ , **Proposition 4** is correct. Thus, (3.11) is valid.

Combining (3.1) and (3.11), we have proven that when  $8 \le \lambda \le 25$  and  $n \ge \lambda - 2$ , there exists at least a prime number p such that  $(\lambda - 1)n . (3.12)$ 

## 4. A Prime Number Between kn and (k+1)n

From [2] [4], for every positive integer n, there exists at least a prime number p such that 2n . (4.1)

From [3] [5], for every integer n > 1, there exists at least a prime number p such that

3n .

— (4.2)

From (2.12), when  $5 \le \lambda \le 7$  and  $n \ge \lambda - 2$ , there exists at least a prime number p such that  $(\lambda - 1)n .$ 

From (3.12), when  $8 \le \lambda \le 25$  and  $n \ge \lambda - 2$ , there exists at least a prime number p such that  $(\lambda - 1)n .$ 

From (1.7), for  $n \ge (\lambda - 2) \ge 24$ , there exists at least a prime number p such that  $(\lambda - 1)n .$ 

Combining (4.1), (4.2), (2.12), (3.12), and (1.7), we show that for  $n \ge \lambda - 2 \ge 1$ , there exists at least a prime number p such that  $(\lambda - 1)n . (4.3)$ 

Let  $k = \lambda - 1$ , (4.3) becomes that for  $n \ge k - 1 \ge 1$ , there exists at least a prime number p such that kn . (4.4)

Since the Bertrand-Chebyshev's theorem states that for any positive integer n, there is always a prime number p such that n , we can derive the**Theorem (4.5)**: For two positive $integers <math>n \ge 1$  and  $k \ge 1$ , if  $n \ge k - 1$ , then there always exists at least a prime number p such that kn . The Bertrand-Chebyshev's theorem is a special case of**Theorem (4.5)** when <math>k = 1.
