

## Supervision inside an electronic couponing system.

Author: Ivo van der Rijt

23APR2023

Abstract: This paper describes various ways of supervision inside (and of) a economic system that is not derived on a debt based money system.

As a creator of a system i can not have an opinion who controls a economic system or who excercises power through that sytem. You can put an a.i. in charge, government or a selection of representatives of various fields of expertise. How to check upon that power also resides within the population. A kabinet, a parlement, unions, tribe head(s) or representatives thereof.

Tracking:

A electronic couponing sytem just as in a central bank digital currency system makes it far easier to track what, how and when people are doing things. To tracking there are positive and negative things to mention. If a system knows when a women has here period, it can make sure sanitary napkin is available on the right time even when a person is forgotten to alocate salary to it. From a efficiency point of view excellent but where is the freedom in dealling with an unwanted situation. Unwanted and sometimes undesired situations can lead to new discoveries and subsequently help society forward. As an example the discovery of Penicillin by Alexander Fleming.

Wealth Capping:

In my original work i described the reach of a wealth cap inside a couponing system. In order to alleviate the pressure on a society or on nature in general a wealth cap may be introduced so a person can no longer change salary into certain (hard asset, stock) coupons. Upon reaching a wealth cap (individual is covered for the remaining of its lifespan) different perks (powers) may become available to that person. Co-determine the heading of society, development, Technology, Direction/ supervision of the coupon system itself, Animal welfare, (Interstellar)travel, Culture etc. etc.
