# On the Number of Twin Primes less than a Given Quantity: An Alternative Form of Hardy-Littlewood Conjecture 

Junho Choi

#### Abstract

I found an alternative form of Hardy-Littlewood Conjecture using Mertens' $3^{\text {rd }}$ theorem. This new form has a theoretical background and coincides with prime number theorem. It is expected to provide an easier way to prove the conjecture.

## 1. Introduction

Though it is not proved yet if there are infinitely many twin primes, here is a proposition stating what the number of twin primes would be.

Proposition 1. (Hardy-Littlewood Conjecture) Let $\pi_{2}(x)$ denote the number of prime numbers $p$ less than or equal to x such that $\mathrm{p}+2$ is also a prime number. Then, this satisfies

$$
\begin{equation*}
\pi_{2}(\mathrm{x}) \sim 2 C_{2} \frac{x}{(\log x)^{2}} \tag{1}
\end{equation*}
$$

where $C_{2}=\prod_{p \geq 3}\left(1-\frac{1}{(p-1)^{2}}\right)=0.66016 \ldots$ is the twin prime constant.
To make an alternative form of this similarity, the following theorem would be used.

Theorem 1. (Mertens' $3^{\text {rd }}$ Theorem) Let p be prime numbers, then,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \log n \prod_{p<n}\left(1-\frac{1}{p}\right)=e^{-\gamma} \tag{2}
\end{equation*}
$$

where $\gamma$ is Euler-Mascheroni constant.

## 2. Estimating the Number of Twin Primes

All prime numbers except 2 and 3 are of form $6 \mathrm{k}-1$ or $6 \mathrm{k}+1$, so all twin primes except $(3,5)$ are of form $(6 k-1,6 k+1)$. Tables below consist of numbers of the form $6 k-1,6 k$, and $6 k+1$ with multiples of each prime numbers starting from 5 highlighted with blue.

| 5 | 11 | 17 | 23 | 29 | 35 | 41 | 47 | 53 | 59 | 65 | 71 | 77 | 83 | 89 | 95 | 101 | 107 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 6 | 12 | 18 | 24 | 30 | 36 | 42 | 48 | 54 | 60 | 66 | 72 | 78 | 84 | 90 | 96 | 102 | 108 |
| 7 | 13 | 19 | 25 | 31 | 37 | 43 | 49 | 55 | 61 | 67 | 73 | 79 | 85 | 91 | 97 | 103 | 109 |

| 5 | 11 | 17 | 23 | 29 | 35 | 41 | 47 | 53 | 59 | 65 | 71 | 77 | 83 | 89 | 95 | 101 | 107 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 6 | 12 | 18 | 24 | 30 | 36 | 42 | 48 | 54 | 60 | 66 | 72 | 78 | 84 | 90 | 96 | 102 | 108 |
| 7 | 13 | 19 | 25 | 31 | 37 | 43 | 49 | 55 | 61 | 67 | 73 | 79 | 85 | 91 | 97 | 103 | 109 |

| 47 | 53 | 59 | 65 | 71 | 77 | 83 | 89 | 95 | 101 | 107 | 113 | 119 | 125 | 131 | 137 | 143 | 149 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 48 | 54 | 60 | 66 | 72 | 78 | 84 | 90 | 96 | 102 | 108 | 114 | 120 | 126 | 132 | 138 | 144 | 150 |
| 49 | 55 | 61 | 67 | 73 | 79 | 85 | 91 | 97 | 103 | 109 | 115 | 121 | 127 | 133 | 139 | 145 | 151 |

| 65 | 71 | 77 | 83 | 89 | 95 | 101 | 107 | 113 | 119 | 125 | 131 | 137 | 143 | 149 | 155 | 161 | 167 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 66 | 72 | 78 | 84 | 90 | 96 | 102 | 108 | 114 | 120 | 126 | 132 | 138 | 144 | 150 | 156 | 162 | 168 |
| 67 | 73 | 79 | 85 | 91 | 97 | 103 | 109 | 115 | 121 | 127 | 133 | 139 | 145 | 151 | 157 | 163 | 169 |

There exists a pattern where composition numbers appear. This can be examined in two cases.
Case $1: \mathrm{p}$ is a prime number of form $6 \mathrm{k}-1$

| $\ldots$ | $6(m p-k)-1$ | $\ldots$ | $6 m p-1$ | $\ldots$ | $6(m p+k)-1=(6 m+1) p$ | $\ldots$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ldots$ | $6(m p-k)$ | $\ldots$ | $6 m p$ | $\cdots$ | $6(m p+k)$ | $\ldots$ |
| $\ldots$ | $6(m p-k)+1=(6 m-1) p$ | $\cdots$ | $6 m p+1$ | $\cdots$ | $6(m p+k)+1$ | $\ldots$ |

Case $2: \mathrm{p}$ is a prime number of form $6 \mathrm{k}+1$

| $\ldots$ | $6(\mathrm{mp}-\mathrm{k})-1=(6 \mathrm{~m}-1) \mathrm{p}$ | $\ldots$ | $6 \mathrm{mp}-1$ | $\ldots$ | $6(\mathrm{mp}+\mathrm{k})-1$ | $\ldots$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ldots$ | $6(\mathrm{mp}-\mathrm{k})$ | $\ldots$ | 6 mp | $\ldots$ | $6(\mathrm{mp}+\mathrm{k})$ | $\ldots$ |
| $\ldots$ | $6(\mathrm{mp}-\mathrm{k})+1$ | $\ldots$ | $6 \mathrm{mp}+1$ | $\ldots$ | $6(\mathrm{mp}+\mathrm{k})+1=(6 \mathrm{~m}+1) \mathrm{p}$ | $\ldots$ |

Here, $m$ is an arbitrary natural number. Both cases give same conclusion.

Theorem 2. $\forall \mathrm{z} \in \mathrm{N}$, a pair of two numbers $6 \mathrm{z}-1$ and $6 \mathrm{z}+1$ are not twin primes if and only if $\mathrm{z}=\mathrm{mp} \pm \mathrm{k}$ for some $\mathrm{m} \in \mathrm{N}$ and prime number p . (k is determined by p as $\mathrm{p}=6 \mathrm{k} \pm 1$ )

Regarding the tables above, the number of columns under a given quantity $z$ is $\frac{z}{6}$ and for all prime number $\mathrm{p}>3$ (since multiples of 2 and 3 are already excluded as considering only numbers of form $6 z \pm 1$ ), the column with no twin primes appears twice every consecutive $p$ columns. Since this property is independent for two arbitrary prime numbers and it is enough to consider prime numbers less than the square root of $x$, the number of twin primes under a given quantity $x$ can be estimated by

$$
\frac{x}{6} \prod_{p=5}^{p<\sqrt{x}}\left(1-\frac{2}{p}\right)
$$

## 3. An Alternative Form of Hardy-Littlewood Conjecture

Comparing Hardy-Littlewood conjecture and the formula (3), we have following.

$$
\begin{aligned}
& \lim _{x \rightarrow \infty} \frac{2 C_{2} \frac{x}{(\log x)^{2}}}{\frac{x}{6} \prod_{p=5}^{p<\sqrt{x}}\left(1-\frac{2}{p}\right)}=12 C_{2} \lim _{x \rightarrow \infty} \frac{1}{(\log x)^{2} \times 3 \prod_{p=3}^{p<\sqrt{x}}\left(1-\frac{2}{p}\right)} \\
& =4 \prod_{p \geq 3}\left(1-\frac{1}{(p-1)^{2}}\right) \lim _{x \rightarrow \infty} \frac{1}{\left(\log x^{2}\right)^{2} \times \prod_{p=3}^{p<x}\left(1-\frac{2}{p}\right)} \\
& =4 \lim _{n \rightarrow \infty} \prod_{p=3}^{p<n}\left(1-\frac{1}{(p-1)^{2}}\right) \lim _{x \rightarrow \infty} \frac{1}{4(\log x)^{2} \times \prod_{p=3}^{p<x}\left(1-\frac{2}{p}\right)}
\end{aligned}
$$

$$
\begin{aligned}
& =\lim _{x \rightarrow \infty} \frac{1}{(\log x)^{2}} \prod_{p=3}^{p<x} \frac{p(p-2)}{(p-1)^{2}} \frac{1}{\frac{p-2}{p}} \\
& =\lim _{x \rightarrow \infty} \frac{1}{(\log x)^{2} \times \prod_{p=3}^{p<x}\left(1-\frac{1}{p}\right)^{2}} \\
& =\lim _{x \rightarrow \infty}\left(\log x \times 2 \prod_{p=2}^{p<x}\left(1-\frac{1}{p}\right)\right)^{-2} \\
& =\left(2 e^{-\gamma}\right)^{-2}=\left(\frac{e^{\gamma}}{2}\right)^{2}
\end{aligned}
$$

Note that their ratio is a constant. This gives an alternative form of Hardy-Littlewood conjecture:

$$
\pi_{2}(\mathrm{x}) \sim 2 C_{2} \frac{x}{(\log x)^{2}} \sim\left(\frac{e^{\gamma}}{2}\right)^{2} \frac{x}{6} \prod_{p=5}^{p<\sqrt{x}}\left(1-\frac{2}{p}\right)
$$

## 4. Significance of the Alternating Form

If we apply similar method to estimate the number of primes under a given number $x$, we would have

$$
x \prod_{p<\sqrt{x}}\left(1-\frac{1}{p}\right)
$$

Then, by Mertens' $3^{\text {rd }}$ Theorem, the prime number theorem also has an alternative form:

$$
\begin{equation*}
\pi(\mathrm{x}) \sim \frac{x}{\log x} \sim \frac{e^{\gamma}}{2} x \prod_{p<\sqrt{x}}\left(1-\frac{1}{p}\right) \tag{6}
\end{equation*}
$$

which is a constant multiple of formula (5).

The fact that $\frac{e^{\gamma}}{2}$ appears without square is noticeable and this coincidence between (4) and (6) provides another circumstantial evidence that Hardy-Littlewood conjecture is true.

## 5. Conclusion

Here, I suggest a new conjecture stating the number of twin primes less than a given quantity which is equivalent to Hardy-Littlewood Conjecture but more intuitive and convincing. It is expected that finding the meaning of the constant $\frac{e^{\gamma}}{2}$ might guides to a proof of this conjecture.
