# On the Zeta distribution $\zeta(s)$ and the Riemann hypothesis 

by Yahya Grari (yahyagrari@gmail.com)
August 18, 2023

It seems very curious that such an important random variable $\zeta(s)$ is so little studied in probability theory and yet, it can be the basis for several discoveries in arithmetic.

Origin of the Zeta Law $\boldsymbol{\zeta}(\boldsymbol{s})$
The Zeta law originates from the search for a uniform distribution in the set of integers $N^{*}=\{1,2, . .$. Such a uniform law does not exist, but there are asymptotic laws that tend towards this law.
And precisely, we will show that by tending s towards 1, we obtain almost the "same universe" as a uniform law.
Indeed, let $X$ be a uniform random variable in the set $\{1,2, \ldots, N\}$
Let ( $p$ ) be the sequence of primes $2,3,5, \ldots$
According to the fundamental theorem of arithmetic, $X$ is uniquely written as:

$$
X=\prod_{p} p^{X_{p}} \text { with } X_{p} \in\{0,1,2, \ldots\}
$$

Distribution of random variables $X_{p}$

$$
P\left(X_{p} \geq k\right)=P\left(p^{k} \text { divise } X\right)=\frac{\left[\frac{N}{p^{k}}\right]}{N} \text { with } k \in\{0,1,2, \ldots\}
$$

It can be seen that when $N \rightarrow+\infty$, the random variable $X_{p}$ tends to a geometric random variable of parameter $1-\frac{1}{p}$
Thanks to this very simple random variable, we can revisit the very famous formula, that of Legendre. if $X$ follows a uniform random variable in the set $\{1,2, \ldots, N\}$, then $E(\ln (X))$ is equal to:

$$
\frac{1}{N} \sum_{n=1}^{N} \ln (n)=\frac{1}{N} \ln \left(\prod_{n=1}^{N} n\right)=\frac{1}{N} \ln (N!)
$$

Likewise $\ln (X)=\sum_{p} X_{p} \ln (p) \Rightarrow E(\ln (X))=\sum_{p} E\left(X_{p}\right) \ln (p)$

$$
E\left(X_{p}\right)=\sum_{k=0}^{+\infty} k\left(\frac{\left[\frac{N}{p^{k}}\right]}{N}-\frac{\left[\frac{N}{p^{k+1}}\right]}{N}\right)=\sum_{k=0}^{+\infty} k \frac{\left[\frac{N}{p^{k}}\right]}{N}-\sum_{k=1}^{+\infty}(k-1) \frac{\left[\frac{N}{p^{k}}\right]}{N}=\sum_{k=1}^{+\infty} \frac{\left[\frac{N}{p^{k}}\right]}{N}
$$

We can therefore write:

$$
\frac{1}{N} \ln (N!)=\sum_{p} \sum_{k=1}^{+\infty} \frac{\left[\frac{N}{p^{k}}\right]}{N} \ln (p)=\frac{1}{N} \ln \left(\prod_{p} p^{\sum_{k=1}^{+\infty}\left[\frac{N}{p^{k}}\right]}\right)
$$

Hence it is concluded that:

$$
N!=\prod_{p} p^{\sum_{k=1}^{+\infty}\left[\frac{N}{p^{k}}\right]}
$$

better known as Legendre's formula.

In the same way, it can be shown that random variables $\left(X_{p}\right)$ become independent when $N \rightarrow+\infty$ Now it is assumed that $X_{p} \sim G\left(1-\frac{1}{p^{s}}\right)$ and are independent.
To tender $s \rightarrow 1$ or $N \rightarrow+\infty$, brings us back to the same "universe", that of usual Arithmetic.
It is shown in this case that $X \sim \zeta(s)$ i.e. $P(X=x)=\frac{1}{\zeta(s) x^{s}}$ avec $x=1,2,3, \ldots$
Let's calculate the probability of choosing a number at random and that it is even:

$$
P(X \text { pair })=P\left(X_{2} \geq 1\right)=\frac{1}{2^{s}}
$$

[^0]$$
P(X \text { impair })=P\left(X_{2}=0\right)=1-\frac{1}{2^{s}}
$$

When $s \rightarrow 1$, these two probabilities equalize and tend towards $1 / 2$. This confirms the intuition that: "there is a one in two chance of drawing an even number at random."

Thanks to this zeta law, we will revisit many famous arithmetic results.
Let be the function $F(X)=\prod_{p} f\left(X_{p}\right)$ and therefore $E(F(X))=\prod_{p} E\left(f\left(X_{p}\right)\right.$
What gives

$$
\begin{equation*}
\sum_{n=1}^{+\infty} \frac{F(n)}{n^{s}}=\prod_{p} \sum_{k=0}^{+\infty} \frac{f(k)}{p^{s k}} \tag{1}
\end{equation*}
$$

## I. Eulerian product

Cases where i.e. $f(k)=1, \forall k \geq 0 F(n)=1, \forall n \geq 1$

$$
\sum_{n=1}^{+\infty} \frac{1}{n^{s}}=\prod_{p} \sum_{k=0}^{+\infty} \frac{1}{p^{s k}}=\prod_{p} \frac{1}{1-\frac{1}{p^{s}}}
$$

## II. Möbius function

Cases where i.e. $f(k)=1_{k \leq 1}(-1)^{k} \quad \forall k \geq 0 F(n)=\mu(n), \forall n \geq 1$

$$
\sum_{n=1}^{+\infty} \frac{\mu(n)}{n^{s}}=\prod_{p} \sum_{k=0}^{1} \frac{(-1)^{k}}{p^{s k}}=\prod_{p}\left(1-\frac{1}{p^{s}}\right)=\frac{1}{\zeta(s)}
$$

III. Probability of being square-free

Cases where i.e. $f(k)=1_{k \leq 1} \quad \forall k \geq 0 F(n)=|\mu(n)|, \forall n \geq 1$

$$
\sum_{n=1}^{+\infty} \frac{|\mu(n)|}{n^{s}}=\prod_{p} \sum_{k=0}^{1} \frac{1}{p^{s k}}=\prod_{p}\left(1+\frac{1}{p^{s}}\right)=\frac{\zeta(s)}{\zeta(2 s)}
$$

$\sum_{n=1}^{+\infty} \frac{|\mu(n)|}{\zeta(s) n^{s}}=\frac{1}{\zeta(2 s)}$ refers to the probability of choosing a number at random and that it is squarefree.

When $s \rightarrow 1$, this probability tends to $\frac{1}{\zeta(2)} c^{\prime}$ està dire $\frac{6}{\pi^{2}}$

## Proof of the Riemann hypothesis (yet another)

Now, we will be very optimistic and give what seems to be a probabilistic argument in favor of the Riemann hypothesis through Denjoy's version.
It seems that the Riemann hypothesis $(R H)$ is very much related to the Möbius function and that ultimately RH is equivalent to the fact that $P(\mu(n)=+1)=P(\mu(n)=-1)$
We have $P(\mu(n)=+1)+P(\mu(n)=-1)=\frac{1}{\zeta(2 s)}$
Similarly, i.e. $E(\mu(X))=\frac{1}{\zeta(s)^{2}} P(\mu(n)=+1)-P(\mu(n)=-1)=\frac{1}{\zeta(s)^{2}}$
So we have and $P(\mu(n)=+1)=\frac{1}{2}\left(\frac{1}{\zeta(2 s)}+\frac{1}{\zeta(s)^{2}}\right) P(\mu(n)=-1)=\frac{1}{2}\left(\frac{1}{\zeta(2 s)}-\frac{1}{\zeta(s)^{2}}\right)$
When $s \rightarrow 1$, these two probabilities tend to $\frac{3}{\pi^{2}}$
Suppose that $X$ and $Y$ are two random variables according to $\boldsymbol{\zeta}(\boldsymbol{s})$
Let $Z=X Y$ be the product of $X$ and $Y$.
$Z$ is defined in the set $N^{*}$, as $X$ and $Y$.
$P(Z=z)=P(X Y=z)$

[^1]\[

$$
\begin{aligned}
\mathrm{P}\left(\prod_{p} p^{X_{p}+Y_{p}}\right. & \left.=\prod_{p} p^{z_{p}}\right)=P\left(X_{p}+Y_{p}=z_{p}, \forall p\right)=\prod_{p} P\left(X_{p}+Y_{p}=z_{p}\right) \\
& =\prod_{p} \sum_{x_{p}=0}^{z_{p}} P\left(X_{p}=x_{p}\right) P\left(Y_{p}=z_{p}-x_{p}\right) \\
& =\prod_{p} \sum_{x_{p}=0} \frac{1}{p^{s x_{p}}}\left(1-\frac{1}{p^{s}}\right) \frac{1}{p^{s\left(z_{p}-x_{p}\right)}}\left(1-\frac{1}{p^{s}}\right)=\prod_{\mathrm{p}}\left(\mathrm{z}_{\mathrm{p}}+1\right) \frac{1}{\mathrm{p}^{s z_{\mathrm{p}}}}\left(1-\frac{1}{\mathrm{p}^{s}}\right)^{2}=\frac{\tau(\mathrm{z})}{\mathrm{z}^{s} \zeta(\mathrm{~s})^{2}}
\end{aligned}
$$
\]

Another way to translate the fundamental theorem into probabilistic terms is as follows:
Let $X$ be a random variable according to $\zeta(\boldsymbol{s})$
$X=\prod_{p} p^{X_{p}}$ with $X_{p} \in\{0,1,2, \ldots\}$
with that and are independent $X_{p} \sim G\left(1-\frac{1}{p^{s}}\right)$
We can say that i.e. the entropy of $X$ is the sum of the entropies of $\cdot H(X)=\sum_{p} H\left(X_{p}\right) X_{p}$
After fairly simple calculations, we find $s \sum_{p} \ln (p) \frac{\frac{1}{p^{s}}}{1-\frac{1}{p^{s}}}+\ln (\zeta(s))$ that unfortunately tends towards $+\infty$ quand $s \rightarrow 1$

Today, I just discovered "on the internet" a formula that gives the p-adic valuations of a number according to this number:

$$
\text { if } X=\prod_{p} p^{X_{p}} \text { then } X_{p}=\log _{p}\left(\operatorname{pgcd}\left(X, p^{\left[\log _{p}(X)\right]}\right)\right.
$$

Thanks to these formulas, I managed to make calculations on Excel of the function of Möbius or Mertens. This is my first graph of the Mertens function with the first 200 primes (up to $p=1223$ )

I think we need to deepen the study of areas where the Mertens function "leaves the $x$-axis" to get lost, we speak of positive or negative peaks.

[^2]The graph of the function $\frac{M(x)}{\sqrt{x}}$

The Mertens situation states that $\forall x>1,|M(x)|<\sqrt{x}$
If this conjuncture were true, it would have implied the Riemann hypothesis. Unfortunately, it turned out to be wrong and the counterexample is beyond 1030
(see http://www.dtc.umn.edu/~odlyzko/doc/arch/mertens.disproof.pdf)
DGMP Act and MCPP
Suppose $X$ and $Y \sim \zeta(s)$
$Z=\operatorname{gcd}(X, Y)$ and $T=\operatorname{lcm}(X, Y)$
It is demonstrated without too great difficulty that:

$$
P_{(Z, T)}(z, t)=\frac{1}{(z t)^{s}} \frac{1}{\zeta(s)^{2}} \prod_{p}\left(1+\operatorname{signe}\left(t_{p}-z_{p}\right)\right)
$$

Special case:
Choosing two numbers at random, what is the probability that they are prime to each other and that their smallest common multiple is equal to $t$ ?

We find this probability equal to with $w(t)$ which denotes the number of primes that divide $t$. It is very clear that this probability tends towards 0 when s tends towards 1 . This means that in real arithmetic, this probability is zero. $\frac{2^{w(t)}}{t^{s}} \frac{1}{\zeta(s)^{2}}$

[^3]The domain of definition of this probability distribution is as follows:

| $z t$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 2 | 0 |  | 0 |  | 0 |  | 0 |  | 0 |  | 0 |  | 0 |  | 0 |  | 0 |  | 0 |  |
| 3 | 0 | 0 |  | 0 | 0 |  | 0 | 0 |  | 0 | 0 |  | 0 | 0 |  | 0 | 0 |  | 0 | 0 |
| 4 | 0 | 0 | 0 |  | 0 | 0 | 0 |  | 0 | 0 | 0 |  | 0 | 0 | 0 |  | 0 | 0 | 0 |  |
| 5 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 |  |
| 6 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 |  |  |  |
| 7 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 |
| 10 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |
| 11 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 12 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 13 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 14 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 | 0 |
| 15 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 | 0 |
| 16 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 | 0 |
| 17 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 | 0 |
| 18 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 | 0 |
| 19 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  | 0 |
| 20 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |

We see that this function is defined if $z$ is a divisor of $t$ and is zero if $z$ does not divide $t$. Which is trivial since by definition $z(\mathrm{gcd})$ must necessarily divide $t$ (lcm).

Can this distribution law bring something new about prime numbers?
Marginal distributions are simple to find. Horizontally, the totals give a zeta distribution of parameter 2 s .

Vertically, it's more complicated.

|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 2 | 2 | 2 | 4 | 2 | 2 | 2 | 4 | 2 | 4 | 2 | 4 | 4 | 2 | 2 | 4 | 2 | 4 | 53 |
| 2 | 0 | 1 | 0 | 2 | 0 | 2 | 0 | 2 | 0 | 2 | 0 | 4 | 0 | 2 | 0 | 2 | 0 | 2 | 0 | 4 | 23 |
| 3 | 0 | 0 | 1 | 0 | 0 | 2 | 0 | 0 | 2 | 0 | 0 | 2 | 0 | 0 | 2 | 0 | 0 | 3 | 0 | 0 | 12 |
| 4 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 2 | 9 |
| 5 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 0 | 2 | 7 |
| 6 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 5 |
| 7 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 3 |
| 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 0 | 3 |
| 9 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 2 |
| 10 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 2 | 3 |
| 11 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 12 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 13 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 14 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 15 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 |

| 16 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 17 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| 18 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| 19 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 20 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
|  | 1 | 3 | 3 | 5 | 3 | 9 | 3 | 7 | 4 | 9 | 3 | 15 | 3 | 9 | 9 | 9 | 3 | 14 | 3 | 15 | 130 |

We check that gcd follows a zeta(2) law but lcm is more irregular.

Distribution of the DGMP

[^4]

MCPP Distribution
The distribution of lcm depends on the number of divisors of $t$.
