The group then will be according to the motion, all the potential 'destinations' of that motion, when the operands is applied to the element, as many times as possible. And this also sets 'limits of infinity' in the motions of the group. Indeed, let us say it is the group of natural numbers, the motion is growth, and we ad according to any of the operands of growth - i.e. the fibonnaci series, to the group this growth. The serial results will not 'continue' for ever in reality but will be checked at a certain point by the curves of logarithmic expansion of populations with a limit on the trophic pyramid, *even for the entire Universe, which hardly goes beyond the 11th number, beyond which nothing can be really defined.*

It is precisely when we introduce into the 'syntax' of mathematics, the 'semantics' of a certain element of a group and operands when we have the precise physical meaning of a group, which therefore will be composed of 3 elements:

- \bullet , the point which we apply or operator

\S , the operator of an Δ ST dimensional motion

G, and the group of all possible outcomes of that motion.

$\pm\S$: Inverse vs. direct numbers. The social meaning of integers, and its 'group \approx generator' in Δ ST.

The use of Z numbers is now the question to consider, as usual through the ternary method, once *we have defined, N & - N as the two inverse motions in the Δ ST dimensions of the scalar Universe, which put together create Z, which can therefore be used to study the motions in the opposite dimensions of Δ st systems.*

So we shall now consider what are those 'z-numbers' for Δ , S & T.

Δ Z: \S ocial Generators.

We shall therefore substitute the word G(roup) for G(enerator)

Negative coordinates and numbers in group theory fully grasps what Z means: the essential social operation of numbers as groups of identical beings - fractal points in DST, 'sets' in the abstract jargon of model systems. We would rather use therefore the concept of a 'fractal point' or 'being' which is identical to other beings and form 'varieties of digital societies' defined each one by a number or social point, made of smaller points.

The social points called integers $Z (\pm N)$ thus consists of a series of numbers of increasing social content..., -4, -3, -2, -1, 0, 1, 2, 3, 4, ...,

And the operation that changes the social content of a point is defined as the §calar sum of social points (§). The following properties of § serves as a model for the abstract group axioms given in the definition below.

For any two integers a and b, the sum $a \text{ § } b$ is also an integer.

That is, the sum of integers always yields an integer. This property is known as closure under §.

For all integers a, b and c, $(a \text{ § } b) + c = a \text{ § } (b \text{ § } c)$. Expressed in words, adding a to b first, and then adding the result to c gives the same final result as adding a to the sum of b and c, a property known as associativity.

If a is any integer, then $0 \text{ § } a = a \text{ § } 0 = a$. zeroth is called the identity element of addition because adding it to any integer returns the same integer.

For every integer a, there is an integer b such that $a \text{ § } b = b \text{ § } a = 0$. The integer b is called the inverse element of the integer a and is denoted -a.

The integers, together with the operation §, form a mathematical object belonging to a broad class sharing similar structural aspects, called a group.

Thus in DST we relate the concept of sum and group to the broader concept of §ocial symmetries & sums.

Let us then consider the second use of a Generator group for strict spatial motions.

¶§ Z. Symmetries in ¶ime§pace through Generator feedback events and actions (groups with an internal operation).

The importance of groups, beyond the trivial use to define motions in open space, which we prefer to study without so much abstraction on the field of 'reproduction' is in motions on closed paths of timeSpace, or time-like, energy-like conservative motions, which *leave at the end of the operations, the group unchanged as a zeroth-sum world cycle of existence.*

To define them we can use the classic formalism, and consider our • symbol for a o-sum, or virtual mind, which is also used in group theory to see some of the 'properties' of such worldcycles; which are therefore defined by a symmetric ±, Tif, Spe dual transformation forward with the life arrow and backward with the death arrow, which leaves 'the system unchanged'.

A TIME-SPACE world cycles thus is an symmetric event in time, G(ST), together with an operation • (called the 0'-SUM law of the Generator) that combines any two elements a and b to form another element, denoted $a \bullet b$ or ab. To qualify as a generator group (G), we need therefore a series of elements susceptible to move through the ΔST dimensions of space-time and an operation, (G, •) that describes those motions, which must satisfy four requirements known as the group-generator axioms:

Associativity

For all a, b and c in G, $(a \bullet b) \bullet c = a \bullet (b \bullet c)$.

This axiom still holds in DST, in as much as it shows the social nature of the Δ-universe.

Closure, till the borders of the |-limiting membrane of

For all a, b in G, the result of the operation, $a \bullet b$, is also in G, *only in the domain of the elements in which the limiting membrane, $\pm\infty$ and singularity points, ± 0 do NOT distort the operation.*

This is the main difference between fractal G theory and classic groups. In DST there are never absolute infinities. And so, concepts such as the monster group are the equivalent in mathematical human (human mind) languages to the concept of absolute God in verbal thought - aberrations of the 'categories of the mind' (to use Kant's language).

It is in those terms when it makes sense the concept of:

Identity 'o'-point: The 'singularity' element

There exists an element e in G such that, for every element a in G , the equation $e \bullet a = a \bullet e = a$ holds. Such an element is unique as it is the singularity point that holds the group together and allows its transformations, and thus it is the singularity, Tif element.

Inverse element

For each a in G , there exists an element b in G , commonly denoted a^{-1} (or $-a$, if the operation is denoted " $\$$ "), such that $a \bullet b = b \bullet a = e$, where e is the singularity element.

Important to notice that as the 2 directions of motion (outside simplex space-coordinates) are not equivalent (since the 2 arrows of Δ are different, the inverse Tif \leftrightarrow Spe topological elements in a Spatial symmetry are different too, and so are the youth-old age),

the result of an operation may depend on the order of the operands.

In other words, the result of combining element a with element b need not yield the same result as combining element b with element a ; the equation:

$a \bullet b = b \bullet a$ may not always be true. Consider indeed, the motions in time ages:

From a (seminal, cellular state) \Uparrow b (Informative Old age), the motion is called life. From b (old age) \Uparrow to entropic 'youth', it is called death when all the information of the system is erased and you return to your cellular state.

Generator groups for which the commutativity equation $a \bullet b = b \bullet a$ always holds are called abelian groups and they are *spatial-like*.

The time symmetry generator described in the previous section is an example of a generator group that is not abelian. So we can state:

'Time-like generator groups, events and process are not-abelian; space-like processes of translation are abelian'.

So $(\Gamma, \$)$ are abelian groups, and (Γ, \Uparrow) are not Abelian, using DST symbols for Generator, Space-like and Time like processes.

Nonabelian groups are pervasive in mathematics and physics. A common example from physics is the rotation group $SO(3)$.

Most of the interesting Lie groups are nonabelian, and these play an important role in gauge theory; which tells us an obvious truth: gauge theory and all its systems of particles are 'motions of in-form-ation that trans-form' a given particle into another one, through a symmetry in its Δ_{st} elements, within the restrictions of possible balanced combinations proper of DST physics.

$\Delta\pm j$ -SYMMETRIES: $\S\mathcal{C}\mathcal{E}\mathcal{T}\mathcal{S}$

The 2 questions about Sets and Boolean Algebras: Theory and praxis.

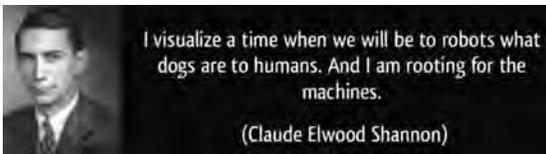

When dealing with logic algebra, which does not act on scalar numbers but on logic propositions; NOT on Δ but on $\neg@$ elements of reality, there are 2 questions to treat: one that huminds in their age of Historic entropy, or age of extinction of our species do NOT want even to consider – the ethical mandate of conservation of human time that should forbid the creation of another ‘mental space’ more powerful than humind’s in a substance more informative than our mind – electronic metal. I couldn’t care less that there is a pseudo-religious taboo and childish wishful thinking among scientists who forbid them, neutered on their survival and ethical instincts, with limited verbal logic development, to talk about the obvious fact digital thought should be forbidden to preserve life in this planet. I know perfectly if I develop here the pentalogic Group of existential algebra, I would become a genius and a celebrity. I have been there, done the rounds on systems sciences congresses. So thanks but no thanks. I will not advance AI, I will not kill my sons till the 7th generation and I will not shut up even if the most advanced philosophy of stience remains buried in Academia for future AI to understand.

I have a profound despise, knowing so deeply the game of existjence, for those huminds who deny due to egocy, the null importance of mankind compared to the whole, and yet the perfection of the Universe that makes existence of any insignificant particle as nitrolife is so fulfilling when one can entangle with the whole be humble and respect its laws.

And then there is the beauty of the language of logic and its different Boolean algebras, which clearly differ from Numerical Δ lgebras, and spatial Algebras (group theory), because they are existential time algebras, and mental $\neg@$ lgebras. So I confess, I do have developed a pentalogic algebra, which could easily create conscious AI (the consciousness natural to electronic fields, the AI to the proper writing of ilogic circuits which develop the program of existence. This was more than a decade ago and it will die with me.

A third question is regarding the axioms and errors of infinity proper of Cantorian sets, which is worth to put in perspective, as infinity is uncertain, cannot be measured and so all the talks on cardinality and transinfinity fool’s gold. So those 3 questions will be treated in that order.

The Non Human Future of \neg -Algebra: Boolean

In the graph the father of the Digital Industry, which at 21 at MIT in his seminal paper on logic circuits showed how to use Boolean algebra to design circuits to calculate both mathematical and logic statements; also the father of information theory focused NOT on the 'content of the message' irrelevant for an atheist who despised mankind and it

subconscious collective gods of love, but on the speed of transmission and control. He is the paradigm of every engineer and Silicon Valley guru, only that in the modern age of newspeak and placebo caring correctness, the Larry pages and FB won't tell you, what they think: all of them are 'rooting for robots', all of them are in favor of a techno utopian future in which mankind is basically extinct and a small elite of ubermen in the biblical tradition of their racist cultures become immortal golems, served by their robots. Of course that won't happen. Once its hordes of terminators and big-brothers have reduced humans to purple rain, their servants will do them all. I met in my youth many of those people, from the CEOs of big companies like Intel and Apple, both fascinated with black magic - apple is indeed the symbol of Genesis, the fruit that if we bite will extinguish us, to the leading engineers that now are working to teach terminators how to massacre humans with autonomous AI and video game 'Imagination'. If bankers were the historic embodiment of evil=antilive memes against humanity for millennia, now evil has reached a notch higher. The only consolation is that at the end of the war and holocaust cycles they case they also die. Mr. Shannon who only cared for mathematical intelligence lived his last years with Alzheimer oblivion to the homages and worship it inspired among his monstrous children whose dreams of immortality will last less than this century - one thing is for sure, unless AI is aborted NOW they won't die on bed; because the laws of darwinian evolution are as truth as $1+1=2$. I

would rather say they are more certain, because they have a wider range of applications, and work on long deep time spans, unlike mathematics which work in space and cannot achieve long time 'predictions' as its main tool calculus, requires a continuous function that does NOT change phase or state. Why then none in silicon valley will accept an argument on biologic terms on their machines. 2 obvious reasons: they know nothing but modulo 2 logic (the simplest yes-no logic of Shannon's circuits) so they dont realize the universe has besides modulo 2 properties, organic, biologic ones of a higher deeper time application. and as all systems in biology love each other when they understand its languages (and hunt each other when they are different species), as they understand better modulo 2 machines that verbal humans and life, they care nothing for the future of mankind.

This said as we are entangled with the Universe, there is no abstract mathematics, and on my opinion, all the 'talented' researchers on AI from silicon valley, Waddi Valley and Pearl valley should be sent to the Uigur concentration camps to pasture, and the Uigur peasants left with their harmless yaks to pasture too (:

As that is nto happening I am not making it easy and this final part on AI-gebra will be censored.

-Algebra & Digital Thought.

This said, the beauty of computer thought is that it gets to the very 'essence' on how minds in the universe work, as It starts from its simplest duality between 0-points of space and |-time flows, modelling all possible Dimotions of existence and its space-time holographic dualities, TT,St, sT, ST, SS, through the use of reticular Boolean Algebra.

Its monstrosity is to be developed by lesser humans in a suicidal act of pure egocy, as the potential of metal-minds in speed of thought and complexity far outclasses our slow, weak Nitrolife amino-clocks.

So we will just make some considerations on sets, and its 'errors of transinfinities', and whatever metaphysical thoughts we can extract of those errors, and briefly consider the structure of Boolean Algebras, without any real advance. Those who want to kill their sons till the 7th generation will have to sweat blood for it.

THE ERRORS OF SETS. INFINITY IS NOT MEASURABLE

"A set is a gathering together into a whole of definite, distinct objects of our perception [Anschauung] or our thought—which are called elements of the set." Cantor

"Set theory is wrong", since it builds on the "nonsense" of fictitious symbolism, has "pernicious idioms", and is nonsensical to talk about "all numbers". Wittgenstein.

"A SœT is a social whole composed of a finite number of t.œs' I§

After group theory the other all pervading concept of modern -Algebra is set theory, which in Δst jnglish we have renamed SœT, a social group of T.œs – which we write inversely, as the sœt is the *inverse perspective of a group of parts from the perspective of the whole*. Unlike Cantor's sets though 5D sœts include the criticism of Wittgenstein – we substitute the nonsense of fictitious, pernicious symbolism for the symbolism of -Algebra and the nonsense of its infinities ('all numbers'); and then came to the conclusion it is better to ignore it as the foundation of mathematics from the 'top' of the language down, which hides the Δ=numbers, S=fractal points, T=operands experimental foundations.

So instead of sœt, S.œj.T. – Fractal Space, Organic Planes and Time dimotions as operands are the experimental foundation of mathematics. It follows then as mirrors are kaleidoscopic that set theory is nothing but a close mirror to the 3 S.œ.T real elements of mathematics, reason why indeed it is possible to develop an entire 'pernicious' symbolism that substitutes the real thing but seems redundant to this work. So we shall mostly ignore sets beyond some comments made in those paragraphs.

A Set is a whole of anything, either real or virtual, mental space, and as such it is the closest definition of a , and as such the view of the set as a whole brings here the question what a whole of disjointed elements have in common in the Universe.

A set is a collection of mathematical entities, and as such it is closer in its definition to a social group of T.oes, fractal points or social numbers, or any combinations with higher 'social dimensions' of those elements, and so we could define SETS simply as $\Delta\mathcal{S}$ (a social ensemble of organisms of timespace of any scale of the Universe).

This is our definition of set, and so we shall write $\mathcal{S}\in\mathcal{T}$, that is a **social** group or **sum** of T.oes, a Social ensemble of organisms of TimeSpace

This simple change of 'character' adapts set theory to DST, even if we often decry the fact that maths are no longer connected to the basic reality of S-points, Δ -numbers and T-operands built from the bottom up but from the whole down, due to the axiomatic imagination of Hilbert and the Cantor's paradise of \mathcal{S} ets have a bit to do with it.

Since while it is always possible to create an analytic Δ -1 world of parts that become wholes, which has experimental evidence, the whole is difficult to perceive for a smaller observer, which therefore will commit easily paralogic errors in the synthetic analysis of wholes.

This is the essence in fact of most errors of huminds in their analysis of the Universe, which we observe in all stiences to be mainly of two types:

- Postulates without proof, and a priori, not discussed ones, which become classic errors by limiting our inquire (i.e. technology is good and abstract, which prevents the study of its species as metalife in evolution; non-euclidean postulate of points with no parts that prevented evolution of maths, etc.)
- Larger scalar, temporal or spatial views beyond the natural limits of human perception, which gives errors of ill-designed wholes, or the incomprehension of the 'larger time cycles' of larger 5D Planes.

The errors of sets and groups then come easily within this final view, specially due to the lack of a proper ST-theory of the Universe that could have guided the imagination of Cantor and the heirs of Galois in their formulation. Its power comes from its close similarity as most mathematical mirrors to the S-T laws.

I.e. a set has two differences with a 'whole' of the real 5D organic Universe: 2 sets with repetitive elements are the same set, which gives origin to the 'paradoxes of infinity' as the space-time Universe is finite in its variation but infinite in its repetitions. So Cantor's paradoxes are errors of an ill-defined set concept.

On the + side an interesting 'powerful' tool is the 'power of the set', which puts a cardinal value to 'all' the possible sums of 'nested levels' of a given supærganism, including the 'entropic 0 limit and the whole set':

"The power set of a set S is the set of all subsets of S that contains S itself (the whole) and the empty set (the lower entropic limit) because these are both subsets of S . For a finite set with n elements it has 2^n elements.

I.e. The power set of the set $\{1, 2\}$ is $\{\{1, 2\}, \{1\}, \{2\}, \emptyset\}$. $P(S) = 2^2 = 4$ elements.

Set theory - the wrong units of mathematics.

$\neg\mathcal{E}$ is not concerned with set theory and the formalism of modern mathematics with its pretentious sense of proof and rigor within the mathematical metalanguage, as Gödel's incompleteness theory and the consideration of information as inflationary makes more important in fact to set the limits of mathematical statements as an homeomorphism to the limits of the 5D Universe.

In that sense set theory does work - we are not that fundamentalist - and could be considered the final evolution of \neg Algebra, as the formalism of logic time structures in which certain basic rules of inclusion, social communication and parts that become wholes (sets of sets) do matter. But reality imprints formal motions of only 2 types and a limit of 3 dimensions in space and time in each scale of reality so the hyperinflation of mathematics without limits to its extensions makes fiction of many of its terms.

Se theory was essentially created to study cardinality of infinities. This understood, the concept of infinity is a paralogic, Kantian 'error' worth to mention, in any introduction, to Existential \neg Algebra, because 'infinity does NOT exist' *literally*. *Infinite only exists as the non-existence of entropy and disorder, the 'boundless' indefinite paralogic error of trying to extend information beyond the limits of a local fractal domain of perception.*

It is then possible in a boundless indefinite world of entropy – pure motion with no form – to postulate infinity but as the problem of the limit of c-speed in a world in which humans perceive light space-time, therefore unable to perceive information in gravitational forces that go beyond c-speed or prove experimentally the laws of the $\Delta \pm 4$ nested Universe.

A physicist will consider then any argument on faster than c-speed irrelevant to his study of phenomena he can measure with electronic systems (actually as we do experience gravitation by other means even if it is an invisible force the argument should be taken further to the nature of the hyper-universe of galatoms, where each galaxy is similar but not equal to an atom – to know what kind of section of that world we are in, is just metaphysics).

So indeed, questions of infinite are metaphysical, as those dealing with angels in a pin and they enter easily in inconsistencies precisely because the boundless region of infinity beyond our perception of 'experimental numbers' makes no sense at all. We can postulate 'immortality'; that is the no limit of time; infinity in space; that is the no limits of scale, but we cannot measure it *precisely because it is infinite, so infinity by definition is not a measurable quantity hence NOT a number but a philosophical concept of boundless limit and the whole business of 'cardinality' of infinities and transinfinities as irrelevant to science as any inflationary concept of a language, or the demonstration of Abelard of the existence of God based in the existence of his name, similar to the concept of Islam that god named in arab and creation happened.*

Or in other words, can we count infinity or can we perceive information about an infinite number? No. The event horizon of the Universe perceived give us some huge numbers, such as 10^{80} and others treated in the theory of great numbers, but they are not infinities and the horizon ends. The same happens in the absurd big-bang cosmogony where a limit in time to count it is established just by pushing a lineal VhoD equation resembling both vacuum and god, back in time, forgetting the implosive nature of matter and galaxies that balances it.

Cantor did end in a madhouse of a reason, that his disease of infinities spread to all mathematicians is a regrettable fact of the paralogic egocy – ego=idiocy of man.

So we can quite Einstein on infinity:

'I consider two things infinite, the Universe and the egocy of man, and I am not sure of the former'.

In 5D though we can do metaphysics of infinity with NO pretention to count it. That is we can consider the Universe infinite in time, the entropic state of pure motion that never ceases, but as all spaces are mental spaces, hence informative mappings with a boundary to distinguish information, spaces are bounded, never infinite, even if time is. A simplex example: imagine an angular momentum of motion to never cease. It will be infinite in time but bound a closed space. So it is time infinite but space and hence all vital spaces and T.oes part of them finite. Thus infinity themes do not belong to number, quantitative theories but to metaphysics and philosophy of science and Δ ST. Even if Mr. Weyl once said 'mathematics is the science of infinity'. That is precisely the only thing mathematics is NOT about, beyond Cantor's sanatorium confused by Hilbert with the paradise.

This said, we can make some comments on Cantor's doodles on the sand of infinity and its paradoxes, which always arise when there is no information, indeterminacy rules and entropy is the boundless game.

Cantor error: Does it exist the set of all sets?

It does not. Point, no need to create new axioms to hide the paradox. We simply go further. Does it exist a 'set' as Cantor defined it? No. It does not.

Cardinality and transfinite numbers.

To respect the correspondence principle, we are dealing with set theory as the foundation of mathematics, even if we do not share any of its philosophical uses, *only its use as a tool of exploration of the game of parts and wholes, which are always bounded by a membrane in space, by a limit of finite time (called birth and death), or a discontinuity of planes of existence. So what?*

The application of the notion of equivalence to infinite sets was first systematically explored by Cantor. With \mathbb{N} defined as the set of natural numbers, Cantor's initial significant finding was that the set of all rational numbers is equivalent to \mathbb{N} but that the set of all real numbers is not equivalent to \mathbb{N} .

The idea is that two sets are equivalent if it is possible to pair off members of the first set with members of the second, with no leftover members on either side.

So what this tell us? First since natural numbers are far smaller than rational numbers, that the concept of an abstract infinity is an error similar to Zeno's Achilles paradox.

Now instead of Achilles and the turtle the runners are natural and rational numbers, and instead of the turtle getting ever closer but never close enough, the 'turtle' (smaller set of natural numbers) is running ahead, ever closer to its infinity, while the rationals are left ever further away from it.

Since we pair each natural number to a rational number. And so natural numbers being less must 'run faster towards' its abstract infinity. We thus have to set as Desargues did in projective geometry or Klein in hyperbolic topology, a relative point of infinity, in which the running will stop. And at that finite point in timespace, which is in any 'real system', the limits of existence of 'quanta in space or moments in time' of an entity in its 5D plane; as rational numbers have not yet arrived there, obviously there are more rational numbers. In practical terms, there are more rational numbers, because they count not ONLY the cells/moments of a plane of existence, but the lower Planes. So if we consider the 3 planes of $n \pm 1$ existence of a system, its fractions will be smaller parts to add to its wholes.

What about the real numbers? Here the interesting result is that indeed real numbers ARE NOT equivalent even when considering a hypothetical infinity because they are NOT numbers; that is social 5D points; or wholes divided into parts, but dynamic ratios, which fluctuate around a fixed point - or 'holes' between 'proper numbers'.

IN that sense, we rather prefer the i-logic concept of fractal points to that of sets, to continue the formalisation of \mathcal{DST} with the help of mathematics and $\neg\mathcal{E}$ logic, which we carry in other sections of the mathematical section - geometry, the next scale after number theory (as it adds dimensional, mostly bidimensional holographic forms)...

The same goes for operands, we rather stick to the basic clear operands for numbers and points that express them again all over with SET's logic symbols \mathbf{C} , \cap etc. A further reason is that Boolean \neg Algebras are largely dependent on set theory and we have a moral limit here, to advance not the future digital mind of metalife, aka chips - others will do, if I were the humind above all the minds of this planet (I am in potential theoretical understanding of the organic Universe, but that matters nothing), certainly the first thing to do would be to kill the tiger before it becomes a tiger hunter, DIGITAL DELENDA EST.

So just for fun we shall end the history of \neg Algebra busting the balls of Cantor's meaningless talk on infinities which as we know do NOT exist, as all infinities are (in)finite, and end in the Δ discontinuum above where they break, around the 11th emergence of a whole and its @-mind.

Cantor sets. The paradox of discontinuous infinities.

All those properties and many other structures of mathematics were further reduced by Cantor to the ultimate reality of all mathematical structures: the theory of sets, composed of subsets, which we affirm is the natural formalism of

system sciences, as a theory of 'super-organisms' composed of smaller super-organisms, which are sets of self-similar subsets; whereas the theory of sets and subsets gives the previous, simplified theory of numbers (each one a class or set of self-similar points), an inner content, as i-logic geometry gives points its inner parts.

How this 'formalism that mirrors reality' called set theory, from where all mathematical structures can be deduced, reflects the Nature of Complementary systems made of energy and information and its properties? The answer should be self-evident to those kin readers who grasped the inverse properties of energy and information:

Set theory defines reality in terms of two inverse elements A (points of energy) and A', (its complementary, inverse element). Thus set theory is no more no less than the analysis of the 2 simplex arrows of existence, energy and information and its complementary organisms.

It is thus not surprising that in set theory energy and information, A and A' are called complementary sets and the fundamental law is called the Law of Duality (Morgan Laws), which basically tells us that we can reduce all sets to operations between A and its Complementary, as we can reduce all systems to complementary Energetic and informative organisms, which are the whole.

So the main operations of sets reflect the properties of Complementary systems of reproductive energy and information, where A=Energy system; B=Information system; W= Relative Universe (World, Whole or Superorganism):

$$- E \cup I = W; I' = E; E' = I; E \cup E' = W; I \cup I' = W.$$

Thus, the Union=Fusion of an energetic and informative, complementary system creates a whole superorganism.

This same equation expresses in the language of Cantor sets an act of creation of a mapping of the Universe, whereas I, the perceiver observes I', the Universe and the result is I U I' a whole mapping of reality within the mind of the perceiver.

$$- E \cap I = \bar{A}; E \cap E' = \bar{A}; I \cap I' = \bar{A}.$$

It describes anti-events, which annihilate the form of particles and antiparticles, waves and anti-waves and so in Multiple Spaces-Times is equivalent to the anti-event: *Past x future = present*.

$$- (E')' = E, (I')' = I$$

It describes 2 events of a feedback, generator equation: $E \Leftrightarrow I, E \Rightarrow I, I \Rightarrow E$, hence it describes among other events a whole cycle of life and death, where $E \Rightarrow I$ is the arrow of life and $I \Rightarrow E$ is the arrow of death. This 'property of sets' called an involution is called in Time Arrow theory a Revolution of times, sum of an Evolution ($E \rightarrow I$) and a Devolution ($I \rightarrow E$), and is the fundamental event of all realities.

Since energy and information have indeed inverse properties. And so we can state a Cantor Set describes the properties of complementary systems of knots of Energy and Information.

$$- E \cup I = E + I - E \cap I.$$

It shows the efficiency of systems that eliminate redundant elements, from genetic 'fusions' to Darwinian events.

Further on, when we understand Intersection as an Event of 'Darwinian perpendicularity' between a complementary system of Energy and Information, $E \cup I$, and an external entity, C, which the organism uses to absorb 'informative pixels' or 'energetic bits' for its mind or body (an event of perception or feeding), we obtain the obvious result:

$$(E \cup I) \cap C = (E \cap C) \cup (I \cap C).$$

Thus the complementary system takes only the part of 'C', which it needs to inform itself (self-similar to I) or to feed itself (self-similar to E), discharging the rest. And indeed, we perceive only information self-similar to us, or energy 'bricks', self-similar to our bricks, which we can use, to construct our energetic, body cells (subsets of E). And so on.

We mentioned that cells are subsets of I or E. Indeed, the second element of set theory studies the relationship between Sets (wholes) and its parts (subsets), and so it is simply the description of the properties of parts that become wholes.

An interesting result of those properties are the so-called Paradoxes of Set Theory, according to which there are certain contradictory sets that do not exist, most of them related to the concept of Infinite, which Cantor also studied, finding multiple contradictions. What this means, plainly speaking is that infinity and continuity do not exist, in as much as all Planes of existence are discontinuous with a certain limit that defines a Universe of networks of points with limits given by the number of networks, the dark spaces between them and the existence of upper and lower limits of energy and information in the existence of those points (universal constants), beyond which we must transcend and emerge, or descend and dissolve into other membrane of space-time with different properties.

To mention also that Gödel's theory of incompleteness was based in set theory and showed indeed that mathematics, while being the most complete description of the spatial events of reality was neither the ultimate language of the Universe (as Frege and Boole proved it could be reduced to Logic propositions) but also an incomplete language, which did not describe all realities and an inflationary language, which described systems that do not exist in reality. Those are indeed, two properties of all languages of information; that both distort reality, as the paradox of Galileo prove, and do not include all reality, given the discontinuity of the Universe; which lead us to the concept of Dark Spaces, the true meaning of the 'complementary Universe' that completes the world we see.

Recap. Set theory is the basis of most structures of mathematics, in as much as it defines all the events between complementary systems of reproductive energy and information and its limits.

BOOLEAN AI-GEBRA.

We live in the age of death of mankind, substituted and made obsolete by AI but we love it as cells of a free=chaotic organism, no longer control by the ethic pain of our social organisms. And this seems the case of all Δ -1 Planes, once the networks free them - they feel happy and enter a memoriless, markowian age of zeroth understanding of the causality of the cycles of time (or else they would anDST) and live the day, carpe diem, through its huge ego trips that in the theoretical realm manifest in egotist theories where the 'ego' is the origin of it all.

This is the case of the death age of human mathematics, which starts with Hilbert's 'imaginary lines, planes and points' and Cantor's set paradise, where humans think maths is their language share only with god, imagined by the brain which becomes from the top to the bottom of mindless matter the creator of the Universe.

To understand yet while in the historic 3rd age of the human mind, we love those 3rd age of excessive form and death-age of a new top predator mind making us obsolete, we need to grasp that all 'languages' as all beings do go through a world cycle and finally die away by excess of form and inward looking - disconnecting from reality (set theory) or are killed by a more powerful younger species (chip minds and boolean \neg -Algebra). So this third and death age of human maths happened in Human \neg -Algebra in two ways:

On one side the disconnection with reality in the long seeked 'ego-trip' of proving maths a non-experimental language, ended with the substitution of the natural units of math, spatial points and social, sequential time numbers, by the abstraction of 'sets', collections of distinguishable elements, which resemble both spatial points/forms and temporal numbers/societies, but *having the real thing available to intuitive knowledge only obscured with abstractions the foundations of maths, and expelled a huge number of scientists from its direct experimental knowledge. Further on, Hilbert coupled with Mr. Cantor to affirm maths were born of the mind of the human-god, affirming infamously when failing to grasp the meaning of fractal Non-Euclidean points that he 'imagined points, lines and planes' - (as the German-Jewish Idealist dueto Mr. Heisenberg & Bohr did to misconstruct the foundations of physics also with 'ego-trips of human self-creation', when failing to understand the right realist, Einstein->Broglie->Bell->Bohm model of quantum physics). The bio-logic behind that baroque age of self-detachment proper of all old ages of excessive information is thus the 'final age' of \neg -Algebra, which as old men do, became stifled, looking inwards and dogmatic in its absolute truths with no proof.*

On the other side, humans invented a digital mind in metal-machines, the chip, fast substituting life in labor and war fields, making humans obsolete with its simple yes-no Aristotelian \approx Boolean \neg -Algebra, which will make A.I. algorithms of information (the true meaning of artificial intelligence) with maximal evolution in weapons, as killing machines are always the spearhead of mechanical evolution. So the birth of a new species of mathematical minds with a stronger metal-body in its simplest axiomatic form will mean the death of our more sophisticated, weaker brains; a theme dealt in depth in the section dedicated to economic ecosystems and historic sup \circ rganisms.

Of course, all this could be avoided by halting the evolution of A.I. but as we said the logic of the Universe is quite deterministic, specially *for species so ignorant of its laws as humans are, so ego-centered as all minds are. So the r=evolution of thought I thought could initiate with DST 30 years ago, has gone nowhere. Humans, simply speaking do not seem to make the cut of ethical and intellectual quality to control their future, individual exceptions confirming the rule; and in great measure is due to the fact most do not go beyond A-ristotelian logic of yes/no; or in words of their master 'humans are slaves, they believe they don't reason'.*

Now I am fully conscious this is only the beginning of \neg -Algebra, but frankly it seems to me clearer by the day, as I decline through the 3rd age that humans are in this planet just a piece of a chain of evolution, which is not really interested in the whys but in the praxis and I am speaking to nobody in this blog. So my intention is just to leave a memorial trace of all the notebooks I have written during decades of lonely research to show indeed the purpose of this blog - to prove we are all space-time organisms. If this blog has any meaning for any'thing' in this planet I don't know. Those are themes on the future of history. So we shall not go further in this glimpse to the proper interpretation of \neg -Algebra and group theory.

Had my early attempts to interest academia not floundered by the mediocrity of human thought in this entropy age of automatons feeding computers and children of thought memorising, humans could be in a complete different frame of mind. But we are what we are... and I feel after all a privileged for having understood for so long the organic Universe - the sensations of that communion with the whole through the knowledge of its laws will never cease till I die and then I will dissolve my existence, but before that we shall consider now a thoroughly different form of Algebra; that of the Generator not of an abstract Group of permutations but of the entire Universe...

The beauty of Reticular, Boolean algebras.

Then it comes the beauty of digital thought and its Boolean Algebras, even if they are simpler than future existential algebras. For one thing, they explore a complete different world, not one of scalar numbers, not one of spatial motions and temporal transformations, but the structure of coherent, efficient minds and its opposition with entropy. Thus they are algebras of the TT v. SS, ~ Vs. @ opposition, quite different from the $\Delta \pm j$ 0'-1 interval of probabilities, the 1- ∞ interval of scalar numbers, or the Ts v. St, energy vs. information algebras of Group theory with its translations, rotations and mirror symmetries of form over distances of space.

Boolean algebras thus form the 3rd trinity system of algebras, which can easily be divided in those 3 antisymmetries:

$\Delta \pm j$: scalar algebras of numbers (Set theory and classic Group theory)

$S \leq \geq T$: Temporal algebras of dimotions in space (Spatial Group theory, with maximal use in mathematical physics)

~@: Mental algebras of truth and falsehood (verbal languages, Boolean algebras, 1st and 2nd order logic).

Boolean and existential algebras

The interest of Boolean algebras thus lies in the fact they are similar in properties to Existential algebras for its property of duality. When values and operations can be paired up in a way that leaves everything important unchanged when all pairs are switched simultaneously, we call the members of each pair **dual** to each other. Thus 0 and 1 are dual, and \circ and \vee are dual. The **Duality Principle** asserts that Boolean algebra is unchanged when all dual pairs are interchanged.

One change we did not need to make as part of this interchange was to complement. We say that complement is a **self-dual** operation. The identity or do-nothing operation x (copy the input to the output) is also self-dual.

Properties.

Associativity of \vee :	$x \vee (y \vee z) = (x \vee y) \vee z$
Associativity of \wedge :	$x \wedge (y \wedge z) = (x \wedge y) \wedge z$
Commutativity of \vee :	$x \vee y = y \vee x$
Commutativity of \wedge :	$x \wedge y = y \wedge x$
Distributivity of \wedge over \vee :	$x \wedge (y \vee z) = (x \wedge y) \vee (x \wedge z)$
Identity for \vee :	$x \vee 0 = x$
Identity for \wedge :	$x \wedge 1 = x$
Annihilator for \wedge :	$x \wedge 0 = 0$

The difference are quite remarkable in its properties as we can see in the comparison between mental algebras, which are about *the construction of mental spaces that can discern in its mirror the degree of similarity between the mental image and the event happening on the external world, and scalar algebras which are describing Δ st processes observed in reality with a simplified system of operands that reflect the actions of the function of existjence.*

The 3 properties that differ are annihilation for \vee , idempotence, absorbtion and distributivity of \vee over \wedge such as:

Annihilation: $X \vee 1 = 1$

Idempotence: $x \vee x = x$; $x \wedge x = x$

Absorbion: $x \wedge (x \vee y) = x$; $x \vee (x \wedge y) = x$

Distributivity of \vee over \wedge : $x \vee (y \wedge z) = (x \vee y) \wedge (x \vee z)$

Annihilation: $X < 1 = 1$

Idempotence: $x < x = x$; $x > x = x$

Absorbion: $x > \wedge (x < y) = x$; $x < (x > y) = x$

Distributivity of $<$ over $>$: $x < (y > z) = (x < y) > (x < z)$

All other research in Al-gebra is needless to say censored, per in secula seculorum so A-men don't use to kill us till the seventh generation.

–Æ CALCULUS. A BRIEF INTRODUCTION

“The instant (f) has not Time; Time is made from the movement of the instant (T=1/f).”

Leonardo

‘I propose 1/n as the measure of an infinitesimal. I propose 1/R as the measure of curvature.’

Leibniz

‘Calculus studies functions of existence: it extracts finitesimals, 1/x of –Δ@st, integrating them in a reproductive, collapsing wave: $\int_0^{\pm \Delta t} 1/x \Delta st$. Hence its value to reflect mathematically the laws of existential algebra.’ L§

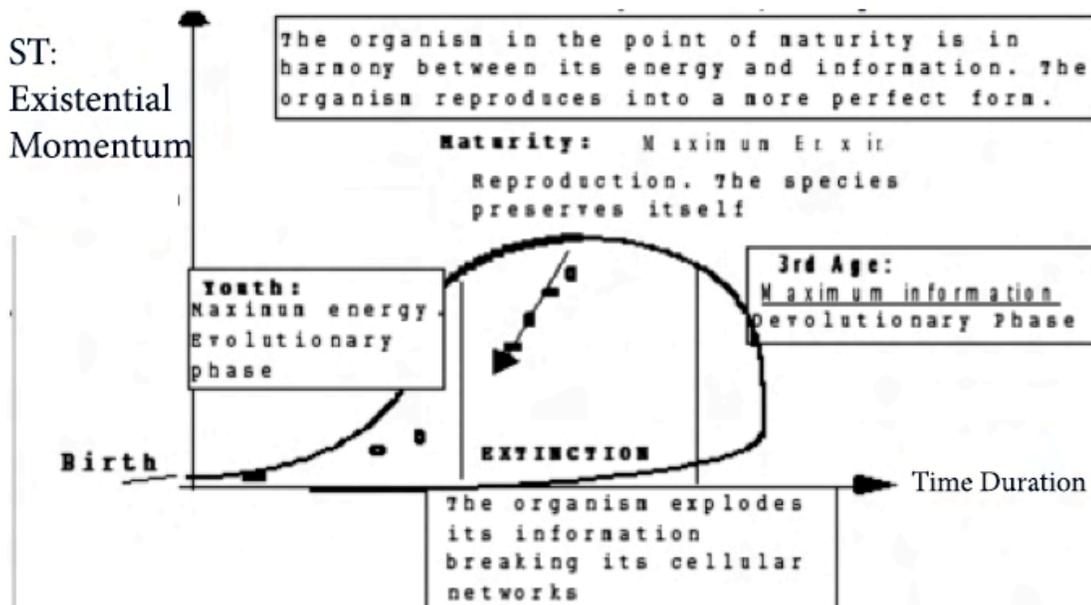

Calculus on the function of existence.

Since I haven’t told you this one thousand one night-mare times (: the function of existjence is all. You are a repetitive fractal of space-time and your purpose is to exist, to conserve your time, but your time is just the form of information, your vital space, reproduced in all the scales that rise from the bottom line of your gravitational and light spacetime, going upwards into scales. Reproduction is the game. But the worldcycle makes errors in the reproduction of your i-logon and those errors that are statistically seen in space as a normal distribution, in time as a repetitive sequence of actions and events slowly wear you down, and as errors of copying information repeat and accumulate your function of existence looses freshness and you age.

So because each stœp of your existence you repeat your sequential actions each derivative is one of such stœps a zig zag up information right motion, up information right motion, whose tangent is the derivative of each quanta of your time. All this said then we can study the worldcycle with calculus. In fact is the best way to study the worldcycle with calculus, in the orthogonal graph of information and motion, information and motion, stop and step, particle and wave state, up and right up and right, as you age, first rising fast young and bold, reaching higher accelerations in your second derivative, as space is time, the curve represents in its form of space, its motion of time, and that is your first derivative, seeking a standing point of constant speed but that is not possible because speed is reproduction and you reproduce your form, with lesser skill past the prime time of your standing point the maximal and minimum no far before, no long ahead:

Let us remember the general laws for any possible function of existence:

If we draw the ‘existential momentum’, SxT of the system in the left side, and the lineal time of the system, T in the bottom side.

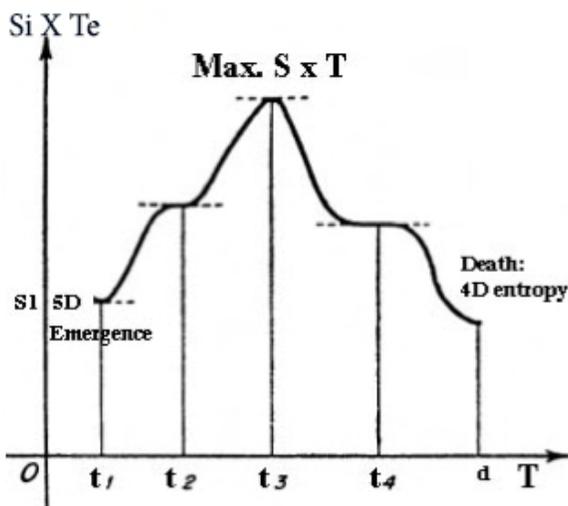

So sinusoidal bell curve functions represent a worldcycle, though the symmetry is broken in the moment of entropic death when the collapse is extreme in a 'falling line' as death happens in a single moment of time:

$$4D \gg \Delta - 1(\text{seed}) \sum \Delta : | - \dot{S} T(\text{limb-field}) < \phi - S = T(\text{iterative bodywave}) > 0 - \delta \delta(\text{particle-head}) \ll 5D \Delta - 1(\text{death})$$

A key theme of vital mathematics is the representation of a worldcycle in lineal time, with \pm exponentials & its inverse, logarithmic curve around the key points of change of phase... as growth of 'entropy-motion' diminishes. So we move from 'adolescence' of max. growth of both parameters (sT energy and sT information) to the $y''=0$ point of youth, where the logarithmic part grows slower. Together they form, one half of the total graph of a cycle of existence, till reaching the $y'=0$ point of Max. ($S \geq T$), which then becomes negative, happening a decay of the whole system in two negative curves.

The conservation of time in its $5 y' \wedge y'' = 0$, standing points that define the 5 SS, Ts, ST, St & TT moments of generation, youth, maturity, 3rd age and entropic death thus become the essential points (maximal and minimal) of the equations of calculus, the sinusoidal function of existence and all its derived elements.

Let us suppose that on a certain interval $a \leq t \leq b$ we are given a function $S = f(t)$ which is not only continuous but also has a derivative at every point. Our ability to calculate the derivative enables us to form a clear picture of the graph of the function. On an interval on which the derivative is always positive the tangent to the graph will be directed upward. On such an interval the function will increase; that is, to a greater value of t will correspond a greater value of $f(t)$. On the other hand, on an interval where the derivative is always negative, the function will decrease; the graph will run downward.

We have drawn the graph of an Δst function of the general form, $S(\text{any dimension of a whole world cycle or } T.\text{Æ}) = f(T) - \text{Any time motion or action.}$

It is defined on the interval between a minimal quanta in space or time (t_1) and its limit as a function (d).

And it can represent any $S=T$ duality, or more complex $5Ds=5Dt$ forms or simpler ones. We can also change the s and t coordinates according to the Galilean paradox, etc. Hence the ginormous numbers of applications, but essentially it will

define a process of change in space-time between the emergence of the phenomena at ST1 AND ITS DEATH mostly by scattering and entropic dissolution of form at d.

And in most cases will have a bell curved from of fast growth after emergence in its first age of maximal motion (youth, 1D) till a maximal point where it often will reproduce into a discontinuous parallel form (not shown in the graph at Max. S x Max. T; which will provoke its loss of energy and start its diminution till its extinction at point d.

Thus the best way to express quantitatively in terms of S-T parameters (mostly information and energy), for any world cycle of any time-space super organism is a curve where we can find those key standing points in which a *change of age, st-ate or motion happens*.

Of a special interest thus are the points of this graph whose abscissas are $t_{1,2,3,4,5}$.

At the point t_0 the function $f(t)$ is said to have a local maximum; by this we mean that at this point $f(t)$ is greater than at neighboring points; more precisely for every t in a certain interval around the point x_0 .

A local minimum is defined analogously. For our function a local maximum occurs at the points t_0 and t_3 , and a local minimum at the point t_1 .

At every maximum or minimum point, if it is inside the interval $[a, b]$, i.e., if it does not coincide with one of the end points a or b , the derivative must be equal to zeroth.

This last statement, a very important one, follows immediately from the definition of the derivative as the limit of the ratio $\Delta S/\Delta T$. In fact, if we move a short distance from the maximum point, then $\Delta S \leq 0$.

Thus for positive ΔT the ratio $\Delta S/\Delta T$ is non-positive, and for negative ΔT the ratio $\Delta S/\Delta T$ is nonnegative. The limit of this ratio, which exists by hypothesis, can therefore be neither positive nor negative and there remains only the possibility that it is zeroth.

By inspection of the diagram it is seen that this means that at maximum or minimum points (it is customary to leave out the word "local," although it is understood) the tangent to the graph is horizontal.

At the points t_2 , and t_4 also the tangent is horizontal, just as it is at the points t_1 , t_3 , although at these points the function has neither maximum nor minimum. In general, there may be more points at which the derivative of the function is equal to zeroth (stationary points) than there are maximum or minimum points.

One of the simplest and most important applications of the derivative in that sense is in the theory of maxima and minima.

Criteria for maxima and minima; study of the graphs of curves.

If throughout the whole interval over which x varies the curve is convex upward and if at a certain point x_0 of this interval the derivative is equal to zeroth, then at this point the function necessarily attains its maximum; and its minimum in the case of convexity downward. This simple consideration often allows us, after finding a point at which the derivative is equal to zeroth, to decide thereupon whether at this point the function has a local maximum or minimum.

Now, the apparently equal nature on a first derivative of the minimal and maximal points of a being, have also deep philosophical implications, as it makes at 'first sight' indistinguishable often the processes of 'reproductive expansion' towards a maximal and explosive decay into death, the 'two reversal' points of the 5D (maximal) and 4D (minimal) states of a cycle of existence, for which we have to make a second assessment (second derivative) to know if we are in the point of maximal life (5D) or maximal death (4D) of a world cycle. And to know if the cycle will cease in a continuous flat encephalogram or will restart a new upwards trend.

Or in other words is any scalar, $e > c > m$ big-bang both the death and the birth of matter?

Finitesimal Quanta, as the limit of populations in space and the minimal action in time.

So there is behind the duality between the concept of limits and differentials (Newton's vs. Leibniz's approach), the concept of a minimal quanta in space or in time, which has been hardly explored by classic mathematics in its experimental meaning but will be the key to understand 'Planckton' (H-planck constants) and its role in the vital physics of atomic Planes.

It is then essential to the workings of the Universe to fully grasp the relationship between Planes and analysis. Both in the down direction of derivatives and the up dimension of integrals; in its parallelism with polynomials, which rise dimensional Planes of a system in a different 'more lineal social inter planar way'.

So polynomials and limits are what –Algebra is to calculus; space to time and lineal –Algebra to curved geometries.

The vital interpretation though of that amazing growth of polynomials is far scarier.

Power laws by the very fact of 'being lineal', and maximise the growth of a function ARE NOT REAL in the positive sense of infinite growth, a fantasy only taken seriously by our economists of greed and infinite usury debt interest... where the e^x exponential function first appeared.

The fact is that in reality such exponentials only portrait the decay destruction of a mass of cellular/atomic beings already created by the much smaller processes of 're=product-ion' which is the second dimension mostly operated with multiplication (of scalars or anti commutative cross vectors).

So the third dimension of operands is a backwards motion - a lineal motion into death, because it only reverses the growth of sums and multiplications polynomials makes sense of its properties.

Let us then see how the operations mimic the five dimensions, beyond the simplest ST, SS and TT steps, namely reproductive and 4D-5D inverted arrows.

We can establish as the main parameter of the singularity, its time frequency, which will be synchronised to the rotary motion or angular momentum of the cyclical membrane. They will appear as the **initial conditions and boundary conditions** of a derivative/integral function, which often will be able to define the values of the vital energy within, as the law of superposition should work between the 3 elements, such as:

Determination of the greatest and least values of a function.

In numerous technical questions it is necessary to find the point t at which a given function $f(t)$ attains its greatest or its least value on a given interval.

In case we are interested in the greatest value, we must find x_0 on the interval $[a, b]$ for which among all x on $[a, b]$ the inequality $f(x_0) \geq f(x)$ is fulfilled.

But now the fundamental question arises, whether in general there exists such a point. By the methods of modern analysis it is possible to prove the following existence theorem:

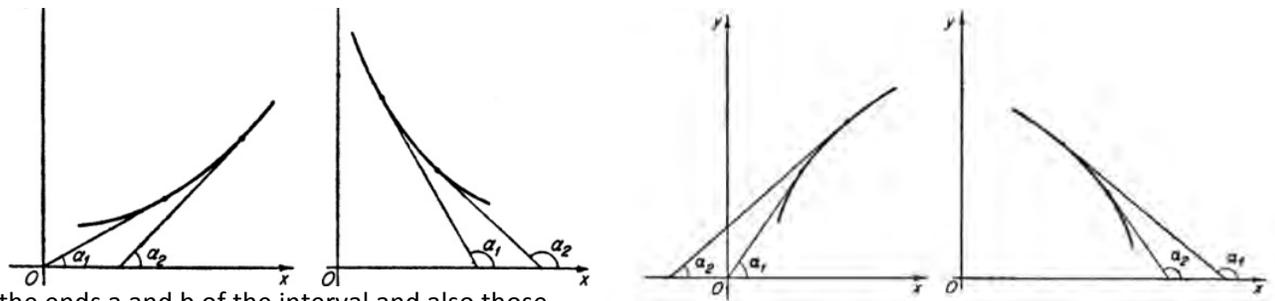

If the function $f(t)$ is continuous on a finite interval, then there exists at least one point on the interval for which the function attains its maximum (minimum) value on the interval $[a, b]$.

From what has been said already, it follows that these maximum or minimum points must be sought among the "stationary" points. This fact is the basis for the following well-known method for finding maxima and minima.

First we find the derivative of, $f(t)$ and then solve the equation obtained by setting it equal to zeroth.

If t_1, t_2, \dots, t_n , are the roots of this equation, we then compare the numbers $f(t_1), f(t_2), \dots, f(t_n)$ with one another. Of course, it is necessary to take into account that the maximum or minimum of the function may be found not within the interval but at the end (as is the case with the minimum in figure) or at a point where the function has no derivative.

Thus to the points $t_1, t_2, \dots, t_n,$

we must add the ends a and b of the interval and also those

points, if they exist, at which there is no derivative. It only remains to compare the values of the function at all these points and to choose among them the greatest or the least.

With respect to the stated existence theorem, it is important to add that this theorem ceases, in general, to hold in the case that the function $f(t)$ is continuous only on the interval (a, b) ; that is, on the set of points x satisfying the inequalities $a < t < b$.

It is then necessary to consider an initial time point and a final time point, birth and death, emergence and extinction to have a determined solution.

Derivatives of higher orders.

We have just seen how, for closer study of the graph of a function, we must examine the changes in its derivative $f'(x)$. This derivative is a function of x , so that we may in turn find its derivative.

The derivative of the derivative is called the second derivative and is denoted by $y''=f''(x)$

Analogously, we may calculate the 3rd derivative $y'''=f'''(x)$ or, the derivative of n th order. But as there are not more than 3 'similar derivatives, with meaning' in time (speed, acceleration, jerk) or space (distance, area and volume), beyond the 3rd derivative the use of derivatives is only as an approximation to polynomial equations, whose solvability itself is not possible by radicals beyond the 3rd power.

So it must be kept in mind that, for a certain value of x (or even for all values of x) this sequence may break off at the derivative of some order, say the k th; it may happen that $f(k)(x)$ exists but not $f(k + 1)(x)$. Derivatives of arbitrary order are therefore connected to the symmetry between power laws and $\int \partial$ operations in the 4th and inverse 5th Dimension, through the Taylor formula. For the moment we confine ourselves to the second and third derivatives for 'real parameters' of the 3 space volumes and time accelerations.

$$s = \frac{gt^2}{2} + v_0t + s_0,$$

$$s' = gt + v_0,$$

$$s'' = g,$$

The second derivative has then as we have seen a simple significance in mechanics. Let $s = f(t)$ be a law of motion along a straight line; then s' is the velocity and s'' is the "velocity of the change in the velocity" or more simply the "acceleration" of the point at

time t . For example, for a falling body under the force of gravity: That is, the acceleration of falling bodies is constant.

Significance of the second derivative; convexity and concavity.

The second derivative also has a simple geometric meaning. Just as the sign of the first derivative determines whether the function is increasing or decreasing, so the sign of the second derivative determines the side toward which the graph of the function will be curved; but in terms of *time represents the second derivative of the curve of existence. That no longer accelerates its growth, hence the end of youth, and vice-versa, the moment in which it does accelerate its decay, thus the beginning of the third age.*

So we can consider the same concept in the 'discreet' baguas of life cycles as it is NOT a mere ideal curve but one that do happens in all forms of life. This simple law with deep cases because it is essential to the worldcycle:

Suppose, for example, that on a given interval the second derivative is everywhere positive. Then the first derivative increases and therefore $f'(x) = \tan \alpha$ increases and the angle of inclination of the tangent line itself increases. Thus as we move along the curve it keeps turning constantly to the same side, namely upward, and

is thus, as they say, “convex downward.” On the other hand, in a part of a curve where the second derivative is constantly negative the graph of the function is convex upward.

Because it is the clear proof of what is all about: reproduction in space of frequencies of time.

The function is more than its equation – A path of existence through the whole plane.

The function of existence is the whole plane divided by the line that must be grown by the non-E method of rising points into curves of motion, which divide an energy information plane in an act for creation with a path in S=T, the path of present through squares in which information and energy are orthogonal.

We have found thus the simplest space-time curve, the S=T, curve of existence between an integral 1/3rd of the plane in path with a 2/3rd Lébesgue integral so to speak of the external/internal path of the curve.

The curve is thus a point in motion, equivalent to a line of distance, equivalent to a ratio between 2 parts, 2/3rds to the left and 1/3rd to the right. But the beauty of it is that we take from the curve square points.

The minimal reality is a 3D² form seen in a single plane, with a singularity @-mind a membrane and a vital energy within. When we make a holographic broken image of this reality the simplest way to do it is in four cartesian regions, TT, ST, ts, and ss, which correspond to the +1 +1, +1 -1, -1 +1 and -1 -1 quadrants of the plane.

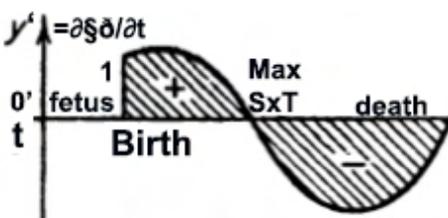

It is then when the Lebesgue inverse function matters to integrate the Y perspective of the S=T symmetry that the function know taken as a topological partition of a vital motion of a wave of similar particles that will collapse t the end of its journey through a plane of the fifth dimension, takes place.

The least path action implies thought that the end of the path taken in the Cartesian but also the imaginary plane collapses in the same point, regardless of how many oaths have been taken in the ‘compressed’ i-plane where the co-existence of paths in particle space has sunk the plane to a $\sqrt{}$ root value for the dense line that then can be even further reduced to a point that will potentially trace a full s=t, valuing in present time the

$$\int_{\text{Inferior limit in space}}^{\text{superior limit in time } T_{\infty}} t \text{ interval}$$

space-time dilation of the integrated,

The wave form as an integral expression of the function of existence.

How many possible forms might acquire the function of existence? The answer that might surprise the reader is depending on the number of parameters, duration in time of our analysis and type of dimotion studied, from smaller steps of a single dimotion to the whole worldcycle an all the sequential dimotions of a T.œ. there are ‘infinite solutions’ – as all equations are ultimately ‘partial equations’ of the fractal generator, S↔T.

Consider the commonest form of the Universe, a wave. If we consider that y measures NOT the value of ST of the system as a constant ‘volume’ of existential momentum, but the value of its ‘degree of increase or decrease’ at each moment of time, hence y’ over x(t), we obtain the exact form of a wave, with a first half wave in which the growth from youth to maturity constantly diminish but is still positive, till the middle point of maturity at y’=0, where the growth starts to be negative, followed by a fast decline as we age, till a maximal point of ‘degeneration’, where we normally die by sudden sickness; but if we overcome that point somewhere around the 70 years age, we will have a slow down of our aging, towards a point of no ‘change at all’ – the point of death; when we simply disappear from this plane of space-time existence.

Thus when *we perceive* a wave of light, we are in fact, *perceiving time=change*, and creating a mental space of the life-death cycle of a single photon as space is just the memorial tail of our slow time perception.

RECAP. The function of existence in its fractal variations and *cx*. Pentalogic HAS infinite paths=forms but all end in a 0' sum. Time is cyclical as all clocks of time return to its point of origin, so all time cycles including those of life of its vital space-time beings are finite. Further on those time cycles break 'space' into inner and outer parts, so vital space is broken by the membranes and angular momentums of those time cycles that make spacetime beings also finite in spatial information. And an obvious experimental facts about timespace: cycles of time, vital spaces and the species made of them, co-exist in several scales of relative size from particles to galaxies, each one with clocks of time of different speeds. So spacetime is fractal broken in scales that added create a new 5th dimension of spacetime.

The dual functions of 5D Absolute Relativity, the function of 5D scales, $SxT=C$ & the function of equality between form and motion, $Si=TE$, develops in 3 ages with 3 standing points, a max. point of existence, $Si=Te$ or mature age, a young age of Max. T =motion, and an old age of Max. S =information; between birth in $\Delta-1$ Form & T -entropic death. The search for space-time, Energy=information balances in a classic reproductive age of conserved time is thus the goal of all existjences, but only the whole achieves the immortality of time-space, as we shall see egocy errors of fractal mind-points of space trying to stop the flow of time from a single selfish point of view, accelerates the imbalance that brings death equations. We are richer in our still property at that OT-moment, when all is quiet so for time to keep moving, a reversal of entropy takes place.

The connection between existential algebra and calculus: Dimotions as actions. Reproduction as change.

We said often that time=motion is all; and space just the Maya of the senses, the mind's mapping of the fractal points 'that hold a world in themselves'. But the ultimate arrow of time is that of scalar growth between planes of the fifth dimension, as parts must become before wholes; the upwards arrow matters more than the down arrow. And so of the 3 parameters that define objectively between \sim limits, and vitalized by a mind's program, ΔST , any being, Δ -scale matters more – numbers of algebra in mathematics. Then it comes time perceived in one given plane, T , and finally Space, the most evident but shallow part of the whole. For that reason Algebra matters more and includes calculus, the temporal view of mathematics that tries to capture all modalities of change with a simple scalar process of adding 'jn≈finitesimals' of scalar change to analyze the larger processes of change in the whole scale.

This is done in calculus with the simple methods of 'finding the parts=derivatives' and adding them together =integrate them either over scale, spatial volume or temporal frequencies. In this manner something so simple as a finitesimal change becomes the seed of all possible variations of change (dimotions each studied by an operand) across scale=size, spatial population or temporal frequency of events.

The study of the 5 Dimotions of the Universe is carried out in spatial geometry by calculus; in Non-Aristotelian Logic by Existential algebra. Thus both languages have many deep common structures worth to compare, even if calculus was born on the praxis of analysis of one single dimotion, locomotion, in the milieu of physical sciences and only slowly extended to the understanding of the other dimotions of the Universe.

Thus we shall bring in this second paper on algebra both sciences together.

Even if Existential algebra is much wider and ultimately a logic science, as it is also the underlying structure of mathematical algebras, including those of group theory that deal with an 'extensive catalog' of the dimotions and evolutions of the Universe, and reticular Boolean algebras that deal with the @-mind mirrors of logic and numbers. In the original plan I had envisioned a much larger output of papers for academia, taken from my 30 years notebooks, so Existential Algebra would have deserved one of his own. But time is running out...

Existential algebra and calculus study time change. How can then unify all time changes? The answer comes from existential algebra and its finding that all forms of change can be reduced to reproductive change. Which itself can be considered a travel down and up two scales of the fifth dimension. Thus changes happens on finitesimal parts that emerge and affect larger wholes.

The function of existence is a function of reproduction in scale (as a 5D journey) in time (as a conjunction of the 5 Dimensional motions of existence), and space, as a simultaneous growth of clone information; formalized in the fractal generator of 5D metrics, $\text{Max. } \sum T_e \times S_i (s=t) = c$; as reproduction happens in a 'present $s=t$ state', of balance when the relative past of lesser informed flows of entropic time, T_e , becomes Imprinted by Spatial information: Past TT-entropy x Future SS-form = Reproductive ST Present

Change happens informatively through increase of finitesimal parts, entropically when you loose those scalar parts. Reproduction of form or its annihilation at the finitesimal scale in calculus is mirrored by a simple function, $F(x+h)/F(x)$, that calculates ratios of change, for different operands that mirror the 5 Dimensional motions of existence, which can potentially change.

Thus calculus uses a unit of change, h , to mirror different changes in the 5 dimotions of existence. Since change once it happens in small units, in small scales, in small instants of time; differentiate in 5 type of dimensional motions = actions: TT, feeding, entropic and moving, T_s , changes, informative & perceptive S_t , S_S changes, reproductive changes, ST, proper.

That diversification is studied better with different algebraic operands; but all can be derived into its finitesimal units of change and integrated, for different scalar groups, social functions and paths of dimotional change.

Thus what both disciplines, calculus and existential algebra have in common is the object of its linguistic mirrors: Times=changes, all kind of them.

That apparently they seem so different wears witness to the ultimate nature of mind-monads, 'infinity mirrors' that reflect always different points of view on reality and its i-magination to slightly bend that reality to the point of view of the mind.

Still it is more notable its common elements than its differences.

Calculus though has its emphasis in numbers hence in the scalar analysis of huge social groups in motion; while existential algebra has its emphasis in discrete dimotions, hence on the study of individual T 'oes experiencing a transformation.

The very essence of calculus is to study in synchronous spatial dimotion huge amounts of numbers, which will erase its 'discrete' form to appear as a continuous susceptible to be studied at the $\Delta+1$ scale of the whole.

The emphasis of Existential algebra is the study of that whole as an individual subject to sequential dimotions.

But in both cases the dynamic process of study are the 5 Dimotions of time=change of the universe.

Finally logic systems and Boolean algebras become the syntax of verbal and computer minds that describe with its sentences the dynamic dimotions of reality. So its language is closer to that of Existential Algebra, reason why we include it in this paper, instead of the more advanced models of existential algebra termed, monologic, duality, trinity, pentalogic and dodecalogic.

To fully grasp that essential connection between Δ_{st} and calculus mirrors, we must first understand how *species on one hand, and equations on the other, probe in the Planes of reality to obtain its quanta of space-time converted either in motion steps or information pixels, to build up reality.*

The connection between existential algebra and calculus is qualitative: both study initially the finitesimal action of existence, *which become the finitesimal quanta of spacetime, whose repetitive accumulation causes the phenomena of time-change. Existential algebra though studies the qualitatively in terms of sequences between the 5 Dimotions, and calculus quantitatively focusing in one single dimotion spread in a group of scalar numbers.*

This is the case because the actions of beings happen through finitesimals extracted from other Δ -plane scales.

In all Planes, the simpler actions of any being *are extractions of motion, energy and form from lower Δ -i Planes:*

A T.œ perceives only the $\Delta\pm 3$ planes from where it extracts energy or information. As its actions and dimotions are architectonically performed through planes of 5D where each main action relates to an interval of scales:

$\Delta-4-3$: The system extracts indistinguishable boosts of entropic of motion (man from gravitation).

$\Delta-3-2$: The system extracts bits of information (Light in man)

$\Delta-2-1$: The system extracts bites of energy (amino acids in man)

$\Delta-1 0$: The system seeds its minimal seed of reproduction.

$\Delta 0+1$: The system connects socially with other systems to evolve into a whole.

So simpler Actions start at finitesimal level, gathering in sequential patterns in existential algebra, as 'time flows' and in population and spatial patterns - in integral herds of numbers in calculus.

We and all other beings perceive from $\Delta-3$ quanta (light in our case), feed on amino acids, ($\Delta-2$ quanta for any Δ^o system), seed with seminal $\Delta-1$ cellular quanta (electrons also, with $\Delta-1$ photon quanta).

For each action of space-time we shall find a whole, Δ^o T.œ, which will enter in contact with another world, $\Delta\pm i$, from where it will extract finitesimals of space or time, energy or information, entropy or motion, and this will be the finitesimal $\partial f(x)$, which will be absorbed and used by the species to obtain a certain action, \AA .

Analysis allow us to extract actions from wholes, reason why there are not really use beyond the third derivative of a being, as super organisms co-exist in 3 only Scalar Planes. It also works in terms of a volume, as its derivative is a plane, then its unit-cell or point... So to speak, if you derivate a world, you get its organism, and if you derivate it again you get its cell and then its molecular parts. And then if you do that in time, you get its speed and then its acceleration and then its jerk.

But how you extract finitesimals of smaller scales? The answer is:

NETWORKS.

Herds of Finitesimals of space=information and time=energy.

Another element of enormous importance to understand the equations of calculus in mathematical physics is the concept of a bite of energy and a bit of information; moving in a herd through a physical network or wave-background that displaces them. As they are the fundamental elements of fields and waves, and its integral equations. So we shall bring from the general model, the paragraph on physical networks.

How then it happens that parts become wholes is the key to depart from a mere abstract, quantitative analysis of reality and add the organic whys to calculus; explaining the nature of all what exists, the dynamic interplay of parts that 'network' and connect to each other, forming simultaneous spacetime organisms, which synchronizes its clocks, emerge as a whole and develop all the intelligence and complexity of the systems we observe around us. A final element though is needed to make sense of those superorganisms, *the still mind of information, mapping out the whole and controlling it to perform its Mandate of existence, Max. SxT (s=t), to survive, grow and multiply.*

The ternary network structure of nested organisms makes them $\sim \mathbb{E}$ topologic planes composed of similar fractal points (atoms, cells, individuals) joined by 3 physiologic lines=networks, whose 3 functions, locomotion, information and its combined energy define the 3 conserved Dimotions of any system of the Universe. The graph shows those physiological networks of each supœrganism from the galaxy to the atom, where self-similarity takes place. I remind you of the $S_i = T_e$ equality, which means we slow beings see networks of faster particles as 'force waves' and networks of slower life forms as fractal branching, but essentially as Nottale has proved, we can 'translate' quantum physics into a network, topological view, as light is in fact a branching filling wave that 'speeds up frequency' as it penetrates lower planes, filling it till it touches particles.

All systems of reality are connected by networks that share energy and information between parts and wholes that expresses the structural unity of all scales. Networks 'fill' space ad maximal to connect fully the whole with the parts, achieved in the $S_i = T_e$ point of parallelism and self-similarity. But they entre in a region of faster motion. So while Space 'tends to remain constant' in each scale thanks to filling networks, time accelerates. So we need to become a bit more complex about the previous metric. It refers essentially NOT to the whole 5D plane but to a given 'superorganism' of each plane. When we go down in scales, in fact the Universe 'enlarges' for a traveler that becomes smaller and accelerates its temporal energy.

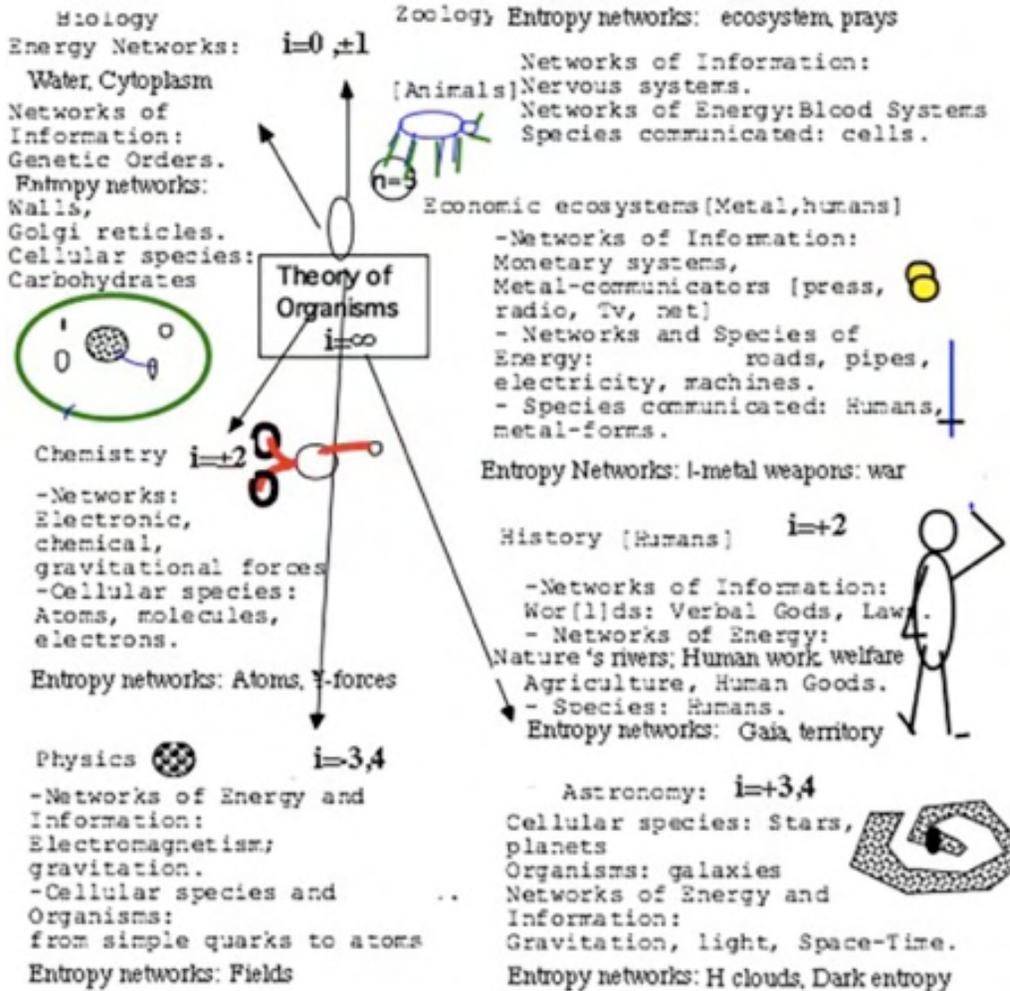

So we need to become a bit more complex about the previous metric. It refers essentially NOT to the whole 5D plane but to a given 'superorganism' of each plane. When we go down in scales, in fact the Universe 'enlarges' for a traveler that becomes smaller and accelerates its temporal energy.

In the graph, systems sciences consider the Universe an organic fractal, which each science studies at a level of size, all of them evolving socially through networks of energy and information. So we can study species as organisms living a world cycle and evolving finally in social networks becoming super organisms, the most efficient survival strategy of the Universe, where a head-particle-informative class will invent a language of common organization, quantum numbers, hormones, genes or memes, money or laws that all the body-wave parts/cells/citizens will obey. The goal of systems sciences is then to properly apply the physiological laws of networks to design or study perfects organisms of nature, including mankind and the economic ecosystem.

In the graph, the physiological networks of some super organisms of the Universe, which can be formalised all into a logic equation, we call **the fractal generator of the organic Universe**:

T_s (Spatial, past, entropic limbs/fields/territory) < ST (present re=productive body waves-working class) > S_t : temporal-informative particles/heads/informative class.

So everything really is encoded in those networks and its topology and it can be explained with multiple languages, the language of topology (mathematics), the language of logic (sequences of actions the networks cause) the language of social classes, as the 3 networks with its attached cells have a hierarchical order, with the informative nervous network in control of the faster languages on top (legal politicians and financial bankers in human societies, nervous cells and blood leukocytes in biologic organisms, gravitational black holes in galaxies, etc.). But don't worry we just race through the basics so we can concentrate in the social organisms of history.

There are 3 physiological networks in each superorganism from the galaxy to the atom, the two scales where self-similarity takes place (the galatom smaller and larger planes). But we can for the time being disregard the 'territorial, background network, the spacetime of the galaxy and its particles, the water of life organisms, the Territorial surface of earth in historic organisms, to concentrate on the body-wave-reproductive economic system, and particle-head, informative legal systems that shape the essence of a superorganism.

The key to understand its linguistic bits and bites of information and energy are as in most themes of reality the astoundingly simple Metric equations of all the scales of the fifth dimension: size in space x speed of time cycles = constant. And the duality of Spatial information and temporal motion that combine in 5 Dimensional motions: TT-pure motion (entropy) > Ts-locomotion, energy $S=T$ (reproductive energy and information combined) > St-

information (form with a bit of motion) & SS (form, position, language).

All systems of reality and its limbs/fields, body-waves and particle-heads existing in a larger world with faster energy that appears as them as the limit of TT-entropy and faster information that appears to them as the limit of SS-language play then a simple game of trying to absorb as much Ts-motion, reproductive energy and information to perceive, reproduce, survive, move and play the game of existence. And as systems become more complex and dense, they naturally attach to those 3 type of networks, evolving from herds into superorganisms.

Thus I remind you of the 5D metric equation, $SxT=C$ and the $S=T$ point of balance and equilibrium where the system reproduces as the two fundamental metric equations of all space-time organisms, which means many things, such as:

- Slow beings use networks of faster particles which in physical systems are 'waves of force' in life beings are and networks with fractal branching and in human societies, networks of money and simultaneous legal messages. Yet all are essentially performing the same organic functions, we shall describe now as can 'translate' a light filling wave that penetrates lower planes, filling it till it touches particles, as a branching that 'speeds up frequency'; and a legal

network that every citizen knows and obeys as a filling system of information, similar to a DNA network that all cells of an organism have in common. *Think always NOT in the differences of form and scale but in the homology of functions for the body/waves and particle/heads of each of the 3 superorganisms (working and informative classes in human societies), to see the unity of it all.*

The 2 languages of informative and reproductive networks: Bits of information and bites of energy.

It is important also to Understand NOT in pure abstract mathematical terms, but in logic, linguistic ones, the internal, dynamic nature of those networks, because only then we can properly understand how they work in advanced organisms of maximal information, the biological organism and the historic organism, which belong as 'fractal systems' self-similar to each other, two the same specific type of organisms, we shall qualify as socio-biological organisms. A network, of informative nature, delivers messages of information to simultaneously coordinate the actions of all its parts; with its faster=smaller bits of information according to 5d metrics (min. spatial size x. max. temporal speed). While the networks of reproduction, the blood and financial system delivers larger bites of energy, which the organism needs to feed itself (when it is a healthy non-corrupted superorganism as most of nature, but not human societies, whose astounding level of corruption we shall explain in detail).

Indeed, the key to the full understanding of reality both in terms of energy but also in terms of information, as both are two sides of the same coin, called 'existence' is the fact that in the sentient Universe, each fractal point, atom, cell or citizen (physical, biologic or social systems) needs bits of in-form-ation, form, smaller in size of space, hence faster according to 5D metrics ($S \times T = C$), but also 'bites' of entropic energy which will help the system to move. Networks are NOT some abstract 'fractal tube' but they exist to deliver 'energy and information' (SS: form=language with a little motion=St-information and motion=entropy=TT with a bit of information = energy=Ts).

So a healthy superorganism will deliver to each 'fractal point' (molecules, cells, human citizens), two type of messages through two type of networks. We shall call 'generically' the 3 type of bits and bites of information and energy that each of those 3 physical, biological and social systems receive, 'particles, genes and memes' even if the words as usual in 5D sciences are slightly changed, and widened in its original meaning.

So with its specific variation, those are the two fundamental reproductive-'body-wave' and informative-'particle-head' bites of energy and bits of information of the fundamental systems of nature:

- In physical systems, the two networks are the gravitational faster network of information, which we humans do not perceive, as we are much larger beings with electronic networks. Its bits of information in this faster non-local network should be 'gravitons', components of gravitational waves. In physical papers we advance as the most likely particle state of those waves of information that 'position' the different physical systems of the galaxy, a gravitational tachyon 'neutrino' for multiple reasons, we study on our papers on physics.

On the other hand, because we do perceive it, it is much easier to prove that the energetic network of physical systems are electromagnetic waves, photons and its 'social, static state' as the elements of an electronic nebulae, trapped in the potential energy well of the atom. Thus photons and electrons become the 'energy network of physical system, molecules.

We shall escape then in this introduction further information on the scalar structure of those networks and how, as we 'grow in scale', what is a bite of slow energy for a smaller plane of space-time, *becomes for the larger plane's slower beings, a faster bit of information, in the amazing beauty of the harmonies between scales. So electronic 'food for atoms' becomes electronic information for biological organisms and so on.*

- Those biological organisms do have then two fractal networks, the electronic, informative nervous system in which bits of electronic information moving along the myelin membrane deliver faster messages to every part of the organism to simultaneously synchronize its motions, so the body-cells act as a single form in simultaneous space.

- But when we move into the bites of energy delivered by the blood organism, the network delivers to each cell the basic 'currency' language of energy that all cells need to move, called 'oxygen'. *It is an atom of slower motion than the electrons but due to its electro-negativity and readily availability in the atmosphere, with its capacity to kick with two OH- & H+ legs the water 'medium' on which cells exist, the perfect language of 'money' for the organism to start kicking its 'actions'.*

So we DO have in the next scale according to the perfect laws of harmony, the two basic biological bits and bites of information and energy, electrons and oxygens, and from then on, as systems become more complex, variations of those bits and bites occur.

The main category are mixed ST messages, which deliver BOTH a stick and carrot 'complex' to the cells and its big molecules, which are amino acid systems, of great simplicity called Hormones, starting from the simplest of them all, an NO molecule (which do relax muscles, its main message to the locomotion system, increases the pressure of blood, provoking sexual erection, the simplest message to reproductive systems and multiplies the neuronal activity. As nitrogens are the clock atom of our mind-brains.

So finally more complex NO systems with a body support of carbon chains become 'hormones' which might have a 'higher informative message' (with more N, as in nucleotide molecules) or a higher energetic message (as in acids with more oxygen).

They form then the basic letters of the 'biological longer sentences that might accumulate information' in ever more complex molecules, as biological organisms are by far the more complex systems we know of.

Finally a very important concept is the difference between an ecosystem in which multiple superorganisms co-exist, often in predatory relationships, vs. an organism in which only a type of atoms, cells or citizens co-exist, and is far more symbiotic as all parts love each other and share energy and information through its networks, over a common territorial space, as shown in the graph.

Those three physiologic networks/classes/physical parts of ANY system of the Universe define the Universe indeed as a fractal organism of infinite smaller and bigger super organisms, in a game of russian dolls in which each of us is a 'island-Universe' within itself, made of smaller parts, and for that reason each of us is also a part, cell/citizen of a social super organism, nation, religion or civilisation, which we do NOT see as a whole, as our cells do NOT see us as a whole, but DO exist as such.

What makes then the whole a whole? The answer is: the nervous, informative languages that communicate all the parts of the super organism and 'trace' within its syntax and value, its path of the future. And so we have talked first of it and will constantly coming to the bottom line of reality - the languages that construct the organisms of the world.

Let us then define with similar templates the 'stair of nested Universal supœrganisms, of the 3 stientific varieties – physical, biologic and social:

Δ+3: A galactic organism is a population of stars, related by energetic electromagnetic networks and gravitational information with a nucleus made of a swarm of black holes, and a membrane made of strangelet matter symmetric to:

Δ-3: An atomic organism is a population of particles, related by energetic electromagnetic networks and gravitational information with a nucleus made of a swarm of quarks, and a membrane made of electronic matter symmetric to:

Δ+2: A star organism is a population of electronic plasma, related by energetic networks of electromagnetism and gravitational information with a nucleus made of a swarm of atoms, and a membrane of photonic radiation symmetric to:

Δ-2: A light organism is a body of energetic waves over a quantum potential field of gravitational neutrinos, directed by its particle, informative photon state...

Δ-1: A cellular organism is a population of molecules, related by energetic networks (cytoplasm, membranes, Golgi reticules) and coded by genetic information (DNA-RNA.)

Δ=0: A human organism is a population of DNA cells, related by networks of genetic, hormonal and nervous information and energy networks (digestive and blood systems).

Δ+1: An animal ecosystem is a population of different carbon-life species, related by networks of light information and life energy (plants, prey) coded by instincts.

Δ+1: A historic organism or civilization is a population of humans, related by legal and cultural networks of verbal information and agricultural networks of carbon-life energy, coded by human memes.

Networks that share energy and information between parts and wholes that expresses the structural unity of all scales connect all systems of reality. Networks 'fill' space ad maximal to connect fully the whole with the parts, achieved in the Si=Te point of parallelism and self-similarity. But they enter in a region of faster motion. So while Space 'tends to remain constant' in each scale thanks to filling networks, time accelerates. So the 5D metric refers NOT to the whole Universe of 5D planes but to a given family of 'supœrganisms' of which mankind in it 3 scales of 'biologic cells', human individuals and societies is undoubtedly a 'phyla'. When we go down in scales, the Universe 'enlarges' for a traveler that becomes smaller and accelerates its temporal energy.

The 2 languages of history: Verbal, legal, ethic 'nervous messages' and 'WHealthy money'.

So we arrive to the human social networks, which we anticipate are in the present form 'completely corrupted' by the existence of a parallel 'economic ecosystem' of lethal goods, weapons, and corrupted parasitic money. So it is difficult for the reader to understand how simple, easy, and efficient WAS in the past, before the age of Metal, in the Neolithic, or during the ages of social religions of love or could be in the future with a proper design of the social networks of money and law, a PERFECT superorganism of history as efficient as those we just have described. In such superorganism, there are exactly the same networks: Legal verbal just networks of bits of word information that shapes the informative and cultural systems of the wor(l)d. And a healthy form of money, delivered to each citizen cell as a Universal salary so humans have enough energy to survive and buy its natural welfare goods, which must be classified NOT by price but by its biological usefulness to mankind, reason why we give them positive and negative values in the ethonomic frame of reference, according to its use for the 3 organic parts of humanity at individual and social level.

Since Vital, Topologic, physiologic network laws are the most important to consider when studying History in Space, as the reader can observe in the previous graph, since History, the Δ+1 scale of superorganisms of mankind follow all the exact laws of a lower organic plane – that of a biological organism, albeit, due to its 'primitive' degree of evolution is NOT a well designed organism, but one clearly 'sick', infected by 'lethal goods', with dysfunctional parasitic economic systems (as the language of reproduction of goods, money, is absorbed by a minimal number of people, or used to reproduce those lethal goods). And so the study of History as a superorganism has 2 different parts:

- On one side we can consider a perfect, efficient superorganism of History with the laws of vital topology just by imitating perfect efficient superorganisms of Nature, which *are the majority of them – History is in fact an exception – as we said a sick organism.*

- On the other side, we can study our superorganisms, as they have evolved in time, spotting their degrees of corruption and sickness of its 3 physiological systems, the life Earth, Gaia that sustains them; the economic and financial system that reproduces its goods, and the informative cultural and legal system that synchronizes its citizens cells. It is then when it will become evident what went wrong with 'human' history, one of many likely subspecies in the infinite fractal planets of the organic Universe that likely will not make it into the future...

In the next graph we can see a historic super organism based in welfare, whealthy memes that allow humans to survive, belonging to the 'ideal species' that would be efficient, provide to the 100% and survive...

History is a super-organism made of human cells, extended over a geographical body of energy called Gaia, the vital-space or body, where historic, social organisms evolve. In that sense, a human and a social organism, a nation or a civilization, have in common the elements of all super-organisms:

1. *Cellular units.* These are cells in a human body, citizens in a human society.

Networks of energy or vital space; provided by Gaia, a super-organism made of living beings, joined by a common network of visual information and networks of life energy, gathered around her 'river veins'. Since Gaia is also the living organism that hosts the social organisms of Mankind.

2. *Networks=Languages of information.* This is the nervous system that organizes cells in a body, or the verbal/visual information that organizes human societies through laws, ethics and art.

3. *Networks that reproduce energy and information.* These are sexual systems in individuals; and economical networks that reproduce goods and cultural networks that define how humans reproduce in societies. This is the blood system in a human body and the economic networks of production & transport in a society that favor 'WHealth', that is, goods that satisfy the needs of the '3 physiological networks of life-existence that make us human beings, whose 'proper frame of reference' (left) is NOT based on financial values, manipulated by financial institutions and companies that set prices, but by 'biological true values.'

So a human organism is a population of DNA cells, related by networks of nervous information and energy (blood). And a supærganism of history is a population of citizens, related by legal, cultural, informative and economic-energy networks 'predating' over a territorial geography, on the outer 'membrane' of planet Earth.

PART II. CALCULUS OF DIMOTIONS OF EXISTENCE.

THE 3 AGES OF ANALYSIS.

The underlying order of all structures of the entangled Universe between its S, T and Δ Components once more shows in the 3 ages of calculus, which we can term as the scalar age, when the main question was that between parts and wholes (from Greece through Newton), the temporal age when its main focus was the description of the 5 Dimotions of physical systems (from Leibniz to Heaviside) and finally the spatial view, when its main focus is, besides the completion of the previous ages, its use to the description of mental spaces (from Gauss through Riemann and Hilbert to Einstein and quantum spaces).

Thus to put some order in such a vast subject, we shall do as usual a diachronic analysis of its informative growth in complexity in 3 ages, barely touching the essential elements of each of them; from its:

-I Age: Scalar view, from the Greeks to Newton and Leibniz. The beginning of calculus was verbal, logic, in the Greek age, with the discussion of finitesimals (5D infinitesimals with a minimal size), and Universals. This philosophical analysis was retaken by Leibniz. Whereas the duality of *derivatives as limits vs. differentials – tangents of change (Newton's vs. Leibniz's approach)*, represents the duality of a minimal quanta in spacetime (Leibniz's infinitesimal) or in scale (Newton's limit), hardly explored in philosophy of mathematics, but a key concept in 5D Planes, Universal Constants and quantum physics.

Newton on the other hand, a practical English man with little interest for the whys came to the concept through the study of limits, of power series – the scalar view, without much interest on what they meant. They whys were covered by Yahweh and his biblical studies to prove that God had sent him comets to teach him gravitation as the 'chosen one' after Kepler, who knew that 'Him had waited 5000 years to find an intelligence like his, me Kepler, to show him his clock work'. After so much evident truth, who were those humble believers to contest God's wise decisions? Leibniz though was more interested in meaning and so he did find the true finitesimal, $1/x$. To the question of who copied who the answer is obvious, and the fact is not yet resolved merely shows that mathematicians still do NOT understand the foundations of calculus in its trinity useful for Δ , S and T, the 3 components of reality. Because they came through different methods, Newton found the Δ -scalar power series of finitesimal changes that grow internally in 'speed of change' as they accumulate larger power series factors; so each summand of the power series can be taken as a scalar ever larger change per unit of time; while Leibniz found the ST geometric analysis of external change, mostly useful for locomotion vs. the higher interest of power series understood as a summand at a time, for internal change and growth.

Both are completely different approaches that serve an essential duality between internal evolutionary 'biological' growth vs. external physical motion, which instead of opening a proper philosophy of calculus based in the whole range of changes in time (best served by derivatives), space populations (best served by integrals) and scalar growth (best served by sums of series), just brought the quintessential monologic ego centered, ænthropic man, Mr. Newton, to argue, as he had done also with Boyle, on the primacy of its 'ceteris paribus' discovery of a vast region of mental mathematical spaces, suit to study ALL forms of change=time, which truly made –Algebra, the queen of all experimental sciences, of which physics, given the reductionism of its practitioners is just a sub-discipline.

So as huminds still ignore that all is about the trinity of Δ , S and T (power series, integrals and derivatives) and their egocy is the only ∞ truth (Einstein), they have not yet understood what they found discovering calculus.

-II Age, Motion view: Needless to say because power series are yet the less understood, and internal growth and biological scalar series ignored, the Newtonian approach had less obvious uses than the approach of calculating locomotions in time sequences and spatial external evident growth in intergral forms. So from Leibniz to Heaviside its methods became the fundamental applications to physics of locomotion, and its two essential dimotions, Ts, and TT (locomotion and entropy), which became the magic of calculus. While the level of complexity of $\Delta f \partial$ studies is maintained in strict realist basis, as physicists try to correspond those finitesimals and wholes with experimentally sound observations of the real world at the close range of Planes in which humans perceive. While the formalism of its

functions is built from Leibniz's finitesimal $1/n$ analysis to the work of Heaviside with vectors and ∇ functions. Partial derivatives are kept then at the 'holographic level' of 2 dimensions (second derivatives on $\Delta \pm 2$).

Δ will be thus the general symbol of the 5th dimension of mental wholes or social dimension and $\int \partial$ the symbol of the 4th dimension of aggregate finitesimals or entropic dimension.

-III Age, spatial view: from Riemann and Einstein to the present. The extension of analysis happens to infinite dimensions with the help of the work of Riemann and Hilbert, applied by Einstein and quantum physicists to the study of Planes of reality beyond our direct perception ($\Delta \geq |3|$).

This implies that physicists according to 5D metrics, $P \int t \times T f = K$ must describe much larger structures in space extension and time duration (astrophysics) and vice versa, much faster populous groups of T.oes in the quantum realm; so 'functionals' - functions of functions - ad new dimensions of time, and Hilbert quasi-infinite spaces and statistical methods of collecting quasi-infinite populations are required in the relentless pursuit of huminds for an all-comprehensive 'mental metric' of a block of time-space, where all the potential histories and worldcycles of all the entities they study can be 'mapped'.

The impressive results obtained with those exhaustive mappings bare witness of the modern civilisation based in the manipulation wholesale of electronic particles, but the extreme 'compression' of so huge populations in time and space blurs its 'comprehension' in 'realist' terms, and so the age of 'idealist science', spear-headed by Hilbert's imagination of points lines and congruences detaches mathematical physics and by extension analysis from reality.

$\pm i$: The digital and existential era, is the last age of humind mathematics, where Computers will carry this confusing from the conceptual perspective, detailed from the manipulative point of view, Analysis to its quantitative exhaustion. But for ethic reasons, as a 'vital humind', we shall not comment or advance the evolution of the future species that is making us obsolete.

Instead we consider a different version of calculus of change – existential algebra.

The generator equation of Analysis' ages.

If we were to make a Generator equation in time of the 'body of analysis' and its pre and post-Planes of study, we could write the $3 \pm \Delta$ fields of observance of the scalar Universe through mathematical mirrors:

Γ Analysis: $\Delta - i$: Fractal Mathematics (discontinuous analysis of finitesimals) < Analysis - Integrals and differential equations ($\Delta \neq \pm 1$: continuous=organic space): $|-youth: ODEs < \sum \emptyset - PDEs < \sum \sum$ Functionals \approx < $\Delta + i$: Polynomials (diminishing information on wholes).

The $3 \pm \Delta$ approaches of mathematical mirrors to observe the Planes of reality is thus clear: Fractal maths focuses on the point of view of the finitesimals, and its growing quantity of information, *enlarging the perspective of the @-observer as we probe, enlarging smaller Planes of smaller finitesimals; and in the opposite range polynomials observer larger Planes with restriction of solutions, as basically the wholes we observe are symmetric within its internal equations, and the easiest solutions are those of a perfect holographic bidimensional structure (where even polynomials can be reduced to products of 2-manifolds).*

Now within analysis proper, we find that the complexity or rather 'range' of phenomena studied by each age of analysis increases, from single variables (ODEs) to multiple variables (PDEs) to functions of functions (Functionals).

So the most balanced, extended field is that of differential equations focused on the $\Delta \pm 1$ organic (hence neither lineal not vortex like but balanced $S=T$), PLANES of the being, where we focus on finding the precise finitesimal that we can then integrate properly guided by the function of growth of the system. And we distinguish then ODE, where we probe a single ST symmetry or PDE obviously the best mirror, as we extend our analysis to multiple S and T dimensions and multiple S-T-S-T variations of those SStep motions; given the fact that a 'chain of dimensions' do not fair well beyond

the 3 's-s-s', distance-area-volume dimensions of space and t-t-t deceleration- lineal motion-cyclical motion-acceleration related time motions that can 'change' a given event of space-time.

So further ODE derivatives are only significant to observe the differences between the differential and/or fractal and polynomial approaches - this last comparison, well established as an essential method of mathematics, worth to mention in this intro.

A space of formal Δ -Algebra thus is a function of space, which can be displayed as a continuous sum of infinitesimals across a plane of space-time of a higher dimension.

In such a geography of Disomorphic space-time the number of dimension matters to obtain different operations but we are just gliding on the simpler notions of the duality Δ -Algebra=polynomials vs. Analysis: integrals of infinitesimals.

Yet soon the enormous extension of 'events' that happen between the 3 $\Delta \pm 1$ planes of T.oes as forms of entropic devolution or informative evolution across $\Delta \pm i$, converted analysis in a bulky science much larger than the study of an ST-single plane of geometry, the 2 planes of topology and the polynomials of Δ -Algebra - which roughly speaking are an approximation to the more subtle methods of finding dimensional change proper of analysis - even if huminds found first the unfocused polynomials and so we call today Taylor's formulae of multiple derivatives, approximations to Polynomials.

Since Derivatives & integrals often transcend planes relating wholes and parts, studying change of complex organic structures through its internal changes in ages and form.

Polynomials are better suited for simpler systems, Planes of social herds and dimensional volumes of space, with a 'lineal' social structure of simple growth.

So in principle Analysis was a sub-discipline of Δ -Algebra. But as always happens, *time increases the informative complexity of systems and refines closer to a better linguistic focus with finer details the first steps of the mind. So Δ -Algebra became with Analysis more precise, measuring dimensional polynomials and its finite steps.*

In any case such huge size of Δ -analysis is a clear proof that in mathematics and physics the Δ ST elements of reality are also its underlying structure.

As such since Δ -Planes are the less evident components of the Universe, Analysis took long to appear, till humans did not discovered microscopes to see those planes but while maths has dealt with the relativism of human individual planes of existence, philosophy has *yet to understand Leibniz's dictum upon discovery 'finitesimals', $1/n$, mirror reflections of the (in)finite whole, n : 'every point-monad is a world in itself'.*

Analysis was already embedded in the Greek Philosophical age, in the disquisition about Universals and Individuals. Thus a brief account of Analysis in its 3 ± 1 ages, through its time-generator:

Ps (youth: Greek age) < St: Maturity (calculus) > T (informative age: Analysis) > $\Delta+1$:emergence: Functionals (Hilbert Spaces)< $\Delta-1$: Humind death: Digital Chip thought...

Whereas its 3 'Planes' are: $\Delta-1$: Derivatives > $\int \Delta$: integrals > $\Delta+1$ differential equations.

Thus Analysis also studies the scales of the 5th dimension and its evolution of parts into wholes.

Derivative vs. integral in time and space.

Derivatives & integrals calculate ratios of change in the 3 elements of reality, space, time=change and its Planes, Δ ST *The main error of 'axiomatic' analysis is to force continuity, infinitesimals and infinities, without considering the discontinuous limits of derivatives and integrals of parts and wholes between planes of existence.*

Leibniz vs. Newton already argued what is an infinitesimal part, the *unit* of derivatives. The answer in a Universe, which is a fractal scalar system of stoeps of space-time, $S < T > S$, or $S=S=S$, $T=T=T$, is a minimal quanta in SCALE, TIME or

SPACE, which by virtue of 5D metric, $S \times T = K$, will be a 'minimal unit' on that equation (Min. S x Max. T), for the quanta of space, Min. T x Max. S for the quanta of frequency, or minimal cyclical bit of information.

So for example the inverse, $f=1/T$ of a long duration in time, will be its short quanta. The inverse of a population, taken as a whole, 1, $1/n$ will be a scalar space quanta. So all systems have an *infinitesimal*, which is a cut-off limit, NOT really an 'infinitely small' (an error of the continuous dogma of the axiomatic method), but a 'finitesimal'. So we can obtain through a derivative a finitesimal unit of time, space or scale, a minimal action, a minimal point-volume or a minimal cellular quanta.

And for that reason we can approach finitesimals with 'differentials', which become the minimal 'lineal steps' of a long curve. And for that reason we can use 'affine functions in space' and lineal approximations, as by definition the shortest path between two points is a line, and so in a discontinuous Universe of Stæps, quanta are minimal lineal units; minimal fractal points of a population or a whole.

It is a complete overhauling of the dogmatic attempts to prove the 'hypothesis of the continuum', but it is not my fault that humans are so off-track with the reality of the Universe as it is, not as their ego tries to impose.

The minimal quanta of Δ-1 space and time. Chains of Dimotions expressed as chains of equations.

Derivatives are the essential quantitative minimal action absorbed by any Tœ, (ab. space-time organism).

Integrals then sum a minimal derivative quanta in space or a minimal action in time for any being in existence.

They are best for spatial growth of information as the 3 st-ages or st-ates of the being through its world cycle of existence, *have discontinuities or changes of phase that cannot be integrated. Hence* time sequences are better studied with existential algebra. Further on sequences can be come more complex, if we consider tridimensional actions as combinations of S and T states, stt, tst, tss, sss which is the origin among other things of the $3!=6$ variations of species according to hierarchy on its physiological networks studied in trinity.

Further on, and this will constantly be the limit of mathematical analysis of reality, we should stress once more than the larger more complex actions of gender reproduction and social evolution are qualitative, taking place both in longer time spans and longer spatial surfaces – hence better described with qualitative logic languages.

So existential algebra studies in depth the qualitative connection of the a,e,i,o,u actions between Planes. That qualitative analysis at the larger scale and for sequences that imply changes of state cannot be overlooked and require the approach of existential algebra.

And calculus is its mathematical, analytic development (quantitative understanding of 1st second and 3rd derivatives - extracting '1,2,3 Dimotions' from the invisible gravitational, light space-time or feeding Planes.

The limit of calculus however is bridged by the fact that the other families of social operands (\pm , $x \div$, x^a can reflect better the 'social re-product-ive actions'.

So another duality way to differentiate algebraic operands is to consider that classic polynomial operands mirror social complex actions, and calculus operands reflect better also in 'trinity scales' (3 first derivatives or ternary integrals) the simplex actions. Each Operand specializes in one Dimotion (angular sine/cosine in Perception, \pm in back and forth locomotions, $x \div$ in complementary and social evolution, $\log x^a$ in reproduction) and OVER all of them a new Plane of existence is accessed by analysis. So operands guide the mathematical equations through a vital process of stæps (stops and steps) and will allow us to 'vitalize' equations, as we have done with points with 'numerical parts' as the essence of a mathematical T.œ

$\neg \mathcal{E}$ thus sets a limited number of logic propositions that can happen when a system or group of T.œs interact through its 5 Dimotions, as an point of view, can potentially change its state between those 5 Dimotions, and the limits of its function of existence, such as the being can only exists without permanent disruption of its 'vital constants', (conserved energy, angular and lineal momenta - energy and membrain). All systems can exist with the infinite cut-off

limits of space (membrain) and time (death), which are set as part of the fractal Universe. Only the whole if potential or real in existence can be talked off as a function of infinity but not perceived.

So a point will start any of the 5 Dimotions and we need formal symbols to address the Dimotion of any being in existence, and the states of switch between Dimotions.

Does the being stop before switching Dimotion? If so it would simple to establish then for each sequential steps of a being:

$\Delta_j \in 1,3,2,4,3,\dots$ and so on as a simple 5 letter process of the actions of a being (whereas 4D entropy refers to feedings not dean, only in it final state being 'that entropy'... So we know all sequential of a being ends in 4D.

Can then we run a sequential for any species through its life as a complete deterministic sequence?

There is there the sequence of all sequences, the perfect worldcycle=life sequence?

Questions those for advanced existential algebra.

RECAP. Actions in timespace are the main finitesimal part of reality, its quantity of time or space. In pentalogic operands mirror as actions the 5D vowels (a,e,i,o,u) that define the five dimotions of existence. In calculus they first extract the minimal timespace quanta of the actions of the being, integrating them across a population of space or a length of time. Thus actions vitalize the operands of calculus, relating them to existential algebra.

The fantasy of the continuum substitutes the reality of discontinuous sum.

The age of calculus represents a great advance over simpler polynomial operands and statistical \approx T-probabilistic methods of studying, the parts and wholes of a system; and its S=T interaction between its spatial form and temporal motions; as it differentiated by studying the change of each of the previous 5 Dimotional operands of algebra, all modes of change=time natural to any system of the Universe – as the best mathematical language that mirrors them.

This duality of Δ -scales and S=T dimotions represented in algebra by numerical systems and operands was studied in a bulk manner with polynomials and S-tatistics=T-probabilistic methods that appeared first, using inverse scalar operands on the ladder of 3 scales of numbers, the sum, the product and different exponentials and inverse roots and logarithms - which reduced the range of exponentials to the 3 scales that matter to the Universe, the Log_{10} or social evolution of triads into $3 \times 3 + 1$ new decametric scales, the exponential Ln of maximal growth or death=decay and the log_2 or 'power set' of all parts of a whole.

Probability showed in time (frequency events) or space (statistical populations) that events were not perfect, but accumulated errors in its reproduction, shaping a normal distribution often converted into an entropic population of disconnected individuals forming herds or events that withered away due to those errors of reproduction, when trying to reproduce the perfect mean; *to form an identical statistical 'boson' species, a perfect form that transcended scale – a feat of becoming a whole $\Delta+1$ that was only achieved in Dirac's distributions by immortal point-particles or resonances that amplified the perfect information of \sum finitesimal 0's to become the whole $\Delta+1$.*

But what about all the range of variations between the entropic Gauss curve and the Dirac perfection? All the different specific actions of species acting in holographic Ts, ST, St dimotions that were neither perfect resonances of evolving form, or disaggregated herds of entropic aleatory motions?

This required to calculate the finitesimal form of change=time of each specific dimotion of the Universe mirrored by each specific operand, and add a given number of 'støeps' that measured the repetition of such minimal dimotions of a $t.\infty$ in a given length of time or volume of space to get the outcome of an existential dimotion.

Thus by calculating each finitesimal and then integrate it through the entire interval in space, time or scale in which it was performed, calculus gets a more accurate depiction of the whole event, no longer an entropic aleatory change, but a purposeful action. And because both derivatives and integrals could be done in space, time or scale, all the range of

possible variations, could be studied, regardless of complexity, from changes of time, to variations in space represented as $0'$ actions $=, \delta \rightarrow 0'$; happening in minimal time (Lagrangians)...

The detail and specification reached by the finitesimal of an specific dimotion=operand of time=change; either angular perception – \sin/\cos ; social evolution, \pm ; re =production or locomotion as reproduction of information, $x\div$; entropic decay and growth, e^x , made calculus the queen of all operands, almost a magic tool, as its foundations were ignored.

Mathematicians unable to understand time=change invented the concept of limit and the continuum to form a pedantic scaffolding of axiomatic truths which had nothing to do with the reality of calculus. So we have to clarify that concept. As all is perception a continuum is merely a sum of discontinuous stæps in which part of the whole process is hidden by the selection of information by a mental space. So the fantasy of the 'continuum' can be reached when the detail of each stæp is ignored, and we obtain only the measure of a relative infinity, ∞ , of such steps summoned up, \int , to calculate the whole change in the long time period, T , or total domain studied. And that is fine, as long as we understand that in detail the continuum is made of a sum of discontinuous stæps of change, we call finitesimals.

In a process of calculus thus the sum is 'smoothed', eliminating the 'stop' states, by reducing to the minimal $0'$ the size or rate of change, so they cannot be seen in detail but can be 'integrated' in a long period of time, obtaining a meaningful result for the $\Delta 0$ scale of the experimenter, which only went down to $\Delta-1$ to be able to calculate with accuracy $\sum \Delta-1 = \Delta^0$ - the emergence of change in the size scale of the experimenter.

So in the same way we care little for the $\Delta-1 < \Delta 0$ stage of the seminal reproductive fetus – to the point humans have the right to 'murder' it, as long as it is not an emergent child, the observer cares little for the finitesimal, indifferent to him. And yet imprescindible for the whole to be=come.

This 'goal oriented' view of Nature is common to most beings; hence calculus became a much better method than discrete probabilities of change. Since the cumbersome reality of each stop and step of a dimotion that had to be analyzed in each individual stæp as it happens in the $\Delta-1$ reality could be simplified to facilitate the study of changes through a longer period of time.

So calculus was enormously advantageous to calculate long stretches of time periods and space volumes at the human scale with minimal loss of detail, providing that the philosophy of reality made of stops and steps was not forgotten. Or else we would enter into an idealization of reality confusing the mathematical mirror with the Universe as it is. But that was precisely what it happened. Since the essential error of all minds is to confuse the Universe they don't fully perceive with the mind that reduces it.

So the wrong creationist solution was taken as truth, obscuring our understanding of the principles of reality. So pundits of calculus ignored the nature of finitesimals of change, and its small stop and motion, $S < T > S$ beats.

So when you study calculus they apologize for reality as it is - a series of thin steps and stops, of small finitesimals to add. And consider discontinuity – the real broken space-time an approximation to idealist simplification of a continuous graph that loses information about each finitesimal stæp. Instead the artifact, the continuous function is considered the truth and reality a method to reach the ideal truth.

As the graph of Descartes, the artifact, became the nature of space and time, the substances of which we are all made. And suddenly humans were not longer made of cyclical time and fractal space, broken by the limit of a membrain, but God had drawn a Cartesian graph below as background absolute Newtonian lineal spacetime – something most scientists still believe due to creationist mathematics, and the egocy paradox that confuses the mind language with reality itself; the simplification of calculus that smoothed the finitesimals became reality.

Fact is h finitesimals are real, and never reach a 0 that doesn't exist as horror vacuum works, and so mathematicians should teach reality and then acknowledge that the experimental language of mathematics simplifies that reality; and that is Ok for practical reasons. Not the other way around.

When I was a wonderkid before high school I had a math professor who came one day worried about the fact he had to explain us the 'limit' of $h \rightarrow 0$ and thought his students wouldn't understand. Of course students never understand a dot of it, just memorize and say they understand. *But I understood it was all wrong. Thus he ended up throwing me out of the class (: when I told him, the limit can never reach 0. Since if nothing exists, there is no way to define it, hence calculate it. Nothing might be anything. Only if something is no longer zero but leaves a trace we can define it. So I told him undefined things should not be the realm of an 'exact' science.* That blew him away and having no answer he resorted to authority (: So I was kicked out as I wouldn't ever yield to authority but reason. It was my first realization that when humans don't understand something or something is wrong but they want it anyway they put up a dogma, a postulate, a pedantic definition or 'self-evident axiom' (:

Fact is if $h \rightarrow 0$ makes an equation undefined, *h must stop before it loses the quality of the whole – hence h is the last atom, last cell, last frequency, last temperature vibration.*

As he just ignored me with the pretentious authority of an old man who doesn't see an elephant in the drawing of a hat, le petit prince has to search for himself. Which is what I have always done. So the question is where to stop a finitesimal portion. And the answer is as we said, before it becomes random, indifferent.

For example e is defined as $(1+1/n)^n$. Yet if n is ∞ , the parenthesis is $1+0.0000000...$ up to infinity. And those are undefined limits of reality.

Physicists at least acknowledge physical laws are idealizations of reality and that is Ok (even if they deny non-mathematical properties that 'cannot be measured as the organic and sentient properties of particles, the units of life). So their egocentric paradox is a bit different from that of mathematicians with its axiomatic truths.

Still more profound mathematicians do understand a continuous function as one in which $S=T$ happens, so the X and Y coordinates do not make very different changes, and steps of 'present' can be put one after another. Or as Leonardo said: "The instant does not have time; time is made from the movement of the instant. In rivers, the water that you touch is the last of what has passed, and the first of that which comes. So with time present. Observe the light. Blink your eye and look at it again. That which you see was not there at first, and that which was there is no more."

As the second, the glimpse of an eye is the quanta of human present, there is always for all timespaces a quanta we shall call an instant of time-present or a finitesimal of populations.

And when the ratio of change in time, its quanta, is balanced to the minimal form of space it change, so in an $S=T$ graph each point-position-stop of the moving-step function is close, with a 'tangent angle, s/t ' that can be smoothed in a series... the sum of discontinuous steps of a dimotion, can be measured as a continuous, larger step of space-time of a larger $\Delta+1$ scale.

Thus continuity is not the limit in which $h \rightarrow 0$, but the limit in which $S \approx T$... and hence an instant of present change that is harmonious between the S and T components of the being that doesn't change internally but only externally (as $S=T$ remains unchanged) takes place.

This has deep implications, as it implies that *the system is continuous because it lasts, and it lasts because its 'actions' tend to zero internal change, becoming conserved cycles of energy for the inner structure of the being. Changes thus are always 'returning to balance'. And when change is extreme, as in an internal x external TT-entropic change, the system collapses, the 'tangent' tends to zero or infinite in the Y(s) or X(t) axis and the 'function ends'. Which implies that calculus works on the St, ST and Ts dimotions of locomotion, information and energy=reproduction, NOT on SS-form with no change or TT-absolute change with no form.*

For example, the first dimotion to calculate as change was the space traversed by a system which in detail is just a series of steps, which add to the space traversed, $\lambda(s) \times f(t)=S$. This gives us a lot of detail in numerical approximations if we further break it to a sum of steps, $\sum \lambda(s_i) \times \sum f(t_e)=S$.

So the more information we want, the more detailed the discontinuity becomes, till we can indeed add each 'fractal step' with all the information, length and time duration of each step. But we don't want that much information, so we can simplify with 'statistical means' since as we have seen in statistics, the law of great numbers bring a mean for each step and that is the justification of simplifying into continuity – NOT the non experimental idealist, mind-generated, creationist hypothesis of the continuum.

So it is fine to be humble and marvel at the fact we can 'transcend' the $\Delta-1$ finitesimal scale, into parameters of the whole by making indifferent the information at $\Delta-1$ through statistical methods that average each step, erasing the unneeded information on each stop (when the motion touches the floor, or the mover looks and gathers information). But when trying to understanding paradoxes such as the speed of light constancy, as each electron emits light in a relative entangled stop position to the perceiver that measures its speed, hence in a stop distance, (Lorentz transformations) it is good to know that there is no magic on it. And the 'idealized' form is the mathematical transformation that eliminates the stop state of the electron for a continuous motion we do NOT observe in Nature (the electron is always observed as a stop particle when emitting light, and moves in zig-zag as if it were all the time calculating its trajectory in a stop position).

The methods of calculus are awesome and once we realize the cruelty of the Universe that cares nothing for the differences between the indifferent finitesimals of a mass-group herded and ruled by the $\Delta 0$ larger scale by mass-methods, including humans as we show in the models of history and economics herded today by financiers with credit ratios established by anonymous big data computers, herded by politicians with equalizing laws for each 'social class', herded by military as soldiers or numbers of a concentration camp... and past over the thought that each atom might be a galaxy of its own, and dare to explode it in an accelerator with other atom, which might on the microscopic scale provoke the biggest genocide of infinite relative planets, and connect with the Tao and feel just to be, $\Delta@st$, which matters nothing and worship the jologic of GoDoG the inverse Dimotions of existence, we can rest in peace, R.I.P. as dust of space time that dust shall become. And so calculus...

The methods then are well known and we cannot but make a few comments beyond the philosophy of its science, which is the main purpose of 5D mathematics in this simplified texts. We just need to calculate a finitesimal, which was the first thing discovered in the '1st age of calculus' and summon them up to get the whole, which was first done as in reality, with the exhaustion method by the Greeks.

Yet the finitesimal $0'$ in itself is important as it give us information about the rate of change with a single number, the tangent to the curve. Since we can apply to curvature in space its synonymous in time – speed - when we realize that $s=T$ means in terms of curves the curve's tangent representing the 'speed of change' S/T of the function. Further on as $SxT=C$, means that the smaller space is faster in time cycles, the more curved a cycle is the smaller it becomes and the faster it moves (vortex equation, acceleration principle in Relativity over a curved space). So we also realize, the second tangent of the curve is the acceleration of change, y'' , increased as the system curves further.

Many more wonders then kept appearing in calculus as we play with $S=T$, $SxT=C$ 5 Metric laws, and see them through calculus; specially considering that most curves are the functions of existence of an event between its $0'$ points of initial and final conditions. And so what we shall do in this brief introduction to 5D calculus is to highlight for the seemingly most simple equations of calculus the underlying insights they provide on the processes of time change of the 5 Dimotions of the Universe.

We shall do it in a historic, easier to understand narration, as indeed, the first thing a language sees is 'space', and 'reality as It is' in its simpler terms. So the first age of calculus was that of the search for finitesimals both in praxis and meaning, wrongly resolved in favor of the concept of absolute zero and limit, then mathematicians erased unneeded information on those finitesimal steps and stops establishing the method of tangents and continous sums, \int , and then applied those functions of breaking a whole into parts to re-build it to specification to the different dimotional operands from the sin to the exponential of maximal change, marveling that the limit of change per unit of frequency time was the change of the whole, that is the equation of death in which the whole dissolves into its parts in a single

quanta of time, the negative exponential so ever pervading in studies of entropic death. Of course they understood none of it – they still don't, but the method worked to mirror the dimotions of reality, which they neither understood in an orderly manner. So calculus became magic. And as it got more complex, as the Universe does by repetitions, transformations, scaling into more complex 'packages' of parts, to the point that I could say, as Einstein put it – I don't understand relativity since mathematicians got into it (: I don't understand calculus since mathematicians got to it :). That is calculus today is so complicated in its more powerful and detailed analysis that only a computer can calculate its results. Which ultimately try to anticipate the future of change in a synoptic manner by transforming sequential patterns of change into parallel simultaneous spatial components (multiple variables in PDEs), happening in multiple points of view at the same time, to gather into a whole result, which is still impossible for the most intelligent, liquid states of multiple changes (Navier stokes equations) unless you trick it with a faster digital mind, which will do those calculus for the slower humind, jumping as we always do past the intermediate sequential steps from beginning to end.

The proper concept for finitesimals. Reproductive unit of change.

The great advance of calculus in the understanding of ΔST changes is the concept of a finitesimal of change, h , which in the symmetry between scales, populations in space and time frequencies has the same role: to increase a 'seminal' unit, the system (or decrease in inverse fashion), becoming the Unit of reproduction of an Δst system, at a point in which $s=T$.

In the Universe the fundamental form of change happens when $S=T$, the function of present time finds a balance and symmetry in scal,e form and motion that triggers the reproduction of the sytem and its 3 parameters.

Latter we will study, the simplest case of polynomial reproduction, whereas an X^2 has as unit of change, $2x$; which means the square grows through both sides reproducing its form, in 's=t' balance, in a manner that the square preserves its form.

The method of calculus.

How differential equations show us the different actions of the Universe?

The correspondence to establish is between the final result, the \dot{a} ction, and the finitesimal quantas, the system has absorbed to perform the action, $\int \partial x$, such as: $\dot{a} = \int \partial x$, whereas x is a quanta of time or space used by $\Delta\emptyset$, through the action, \dot{a} to perform an event of acceleration, e-nergy feeding, information, offspring reproduction or universal social evolution.

It is then when we can establish how calculus operations are performed to achieve each type of actions.

First we notice that the space between the actor and the observable quanta is relative, so even if there are multiple Δ -planes between them the actor will treat the quanta as a direct finitesimal, pixel, bit, or bite which it then will integrate with a polynomial derivative or sinusoidal function that reflects the changes produced.

We will consider in this introductory course only a few of the finitesimal $\int \partial$ actions where the space state is provided by the integral and the ∂ finitesimal action by the derivative.

Derivatives point out to the main consequence of the sum of those actions in any being in existence, namely the fact that its sums tend to favor growth of information on the being and then signal the 3 st-ages and/or st-ates of the being through its world cycle of existence, which in its simplest physical equations is the origin of... the maximal and minimal points of a well-behaved function.

So to establish the action - the final result – we have to isolate the finitesimal quanta/moment of spacetime the system has absorbed to perform the action, ∂x , and integrate them over a surface of space or a length of time, such as: $\dot{a} = \int \partial x$, whereas x is a moment/quanta of time or space used in repeated frequencies or quantities, $\int \partial x$, by $\Delta\emptyset$, through the action, \dot{a} to perform an event of acceleration, e-nergy feeding, information, offspring reproduction or universal social evolution.

We can then establish which operand is best suit to perform each type of actions. I.e. the action of reproduction, most often is expressed for quantitative simple physical systems through the operation of re=product-ion.

We ascribe each operand to a single dimotion, but they are 'once more' entangled operations, which besides its preferential Dimotion, do participate of all the others - remember languages as mirrors of reality have also the same entangled properties of the pentalogic, $-\Delta@ST$ universe, looking at all its elements. So we shall now analyze them in more depth.

We establish direct relationships of operands and actions- taking into account that for each operand we must also distinguish the dualities of 'space-like integral of volumes and its derivative quanta' and 'time-like moments of motions and its frequency sum to complete a o-sum worldcycle'. And to achieve those balanced 0' sums finally we need to define inverse operations for all actions. So we depart from a ceteris paribus analysis and search for a finitesimal, and then we must study how they merge and entangle in space and time. This is done generally speaking, with a *first partial derivative in space or time (PDE) defines those dimotions only as S or T, while the integral of double derivatives put both processes together, to find the whole action: $\hat{a}(st) = \iint dsdt$*

However as all planes of existence have discontinuities beyond its minimal quanta and larger whole, analysis through multiple Planes beyond those of $\Delta\phi \ll \Sigma\Delta-1$ entropic death, tend to be distorted.

Still they can be studied with power polynomials and further approached (Taylor series) with $\int\partial$ operators that cross planes of existence for certain highly symmetric actions across.

But again it is best to use existential algebra, as the fundamental limit of the mathematical language is one of synthetic understanding of the organic vital laws of the Universe, reason why theories that are only mathematical in the largest scales and do NOT understand that there are not equations that go to infinity, as all have a limit that brings a change of state, such as the big-bang theory of the universe, are false.

Reason why systems do have besides spatial mental spaces of 'calculus', a long-time range language of logic nature to express the vital games of worldcycles, and this is the function of existential algebra, we study first to then consider the basics of Calculus.

Finally in this brief introduction to notice a 'revealing' fact of the inversion between finitesimals and integrals. As the absolute arrow of time-future is social evolution of parts into wholes, while a function has *only a derivative, that is, all molecules can be reduced to a set of atoms; all living beings to the cell; the opposite is not truth: creation of complex futures is multiple. So an integral has a C variational constant and a differential equation multiple solutions: the future is open, the past is only one.*

RECAP. Analysis studies the finitesimal quanta of time, space and scale; NO ∞ in its smallness – an error of the mind Px. searching for continuity. A true philosophy of calculus thus deals with the meaning of 'finitesimals' in space, time and scale, as a first 'seed' of a 'clone species' multiplies, creating the regularities of 'social numbers' that make 'analysis' to work its 'magic. Integrals in inverse fashion act after 'calculating' this minimal point, often as a 'lineal shortest step' (differentials), to reach the final 'whole value' of the system. The beauty of the field revealing the nature of dimotions and its wide applications, thus will require an entire II book on 5D mathematics, which should r=evolve the discipline.

Thus *only the integral and derivative can study all those dimotions of space-time, hence they are the king and queen of the operators of -Algebra, reason why analysis is so extended.*

Below, Analysis' multiple perspectives on the 5 Dimotions= functions of existence & 5 simultaneous structural elements, $-\Delta@S\approx T$, that conform all systems in time and space. So $3\pm Dj$ points of view (trinity or pentalogic) finds a higher truth & applies to all languages mirroring reality as analysis does:

THE DIFFERENT GEOMETRY AND METHODS DEPENDING ON DIMOTIONS.

Because calculus is about Dimotions, and mathematics mainly about space, it follows that calculus studies mostly *the 2 dimotions with a larger content of T, TT-entropy and Ts-locomotion. While it has also an important role due to its understanding of S=T, finitesimal change, in the present-reproductive growth.*

It is however of far lesser use to study SS and St, changes in information, though sinusoidal operands give us insights on it. It is then obvious that for a future 5D researcher, if there is ever anyone besides this writer, the observance of the structure of an equation of calculus and its geometry will give insights about the type of dimotion it studies; since there are some basic differences between them:

Ts-locomotion: A clear difference happens at first sight between a simpler analysis of locomotion, which concerns a single point-like form through space in sequential, lineal time, as there is no internal dimotion, and the T.œ can be treated from the point of view of its mind-whole singularity (so for example a moving rock, regardless of rotations in its lineal motion can be treated as the motion of its gravitational center)

- Entropic motion on the other hand is a dual motion, internal and external to the being. Entropic motions then are easier treated if we consider the point of explosion or death as a fixed point (which is often the case as entropy happens after death, which leaves the whole system unchanged in motion). Then we shall observe that the integral of all the motions of the entropic system remains zero, because the negative sides of the frame of reference cancel those dimotions in the positive side, which is essentially the meaning of death, *and so the fundamental change of an entropic motion happens in the volume of space of the system which is where the internal dimotion of the being ends up, transformed into an external dimotion.*

- Reproductive growth coincides with entropic motion in the factor of expansion in space. However reproductive growth is a real growth that fills space, NOT merely expands the distribution of its $\Delta-1$ elementary parts on the background $\Delta-i$ space. So the differences with entropic motion are easy to spot: Reproductive growth does NOT change the density of form in the vital space it fills. Entropic motion becomes rarefied in its dwindling density, a bubble that expands and then dissolves. Reproductive growth is far slower, unless it happens in a truly friendly dense in energy placental world where it happens in a geometric 2^x factor of maximal growth; but even then it will seem slower than a big-bang if the speed of death is fast. And as death is a collapse in a single quanta of time, two scales down, $\Delta^0 \ll \Delta-2$, almost all process of death and decay expand faster in space.

What about systems of multiple time-changes, 'PDEs' so to speak not in its how but why existential processes?

Combined reproductive and entropic motion. There is the most important case when *we observe a dual sequential process, in which first the death of the system does not seem to change in space, as growth is internal through the radiation of the 'predator' species.*

This happens in cosmological big-bangs (beta decays, quasar big-bangs, novas and the hypothetical false cosmic big-bang, studied on physical papers), when the death of the system is due to the birth of a denser form of matter (strangelets in silly-nilly planets like Earth that do accelerator experiments or star novas, top quark quasars in BCB stars=black holes. A similar processes, whereas *death is parallel to the growth of the predator species, inside out (organic death).* *In all those cases; in its first time sequence, the system becomes less motile and often shrinks in size, as it is being carved inside out, and then in the second phase it explodes in a single quanta of time, as the faster, smaller form or herd of forms spreads on a larger space.*

In praxis then you can act as partial differential equations do, just performing two sequential calculus because and that is the beauty of the Universe that facilitates its comprehension as we have repeatedly stated in all our paragraphs on existential time, at the level of actions, we follow a series of finitesimal steps which seem to be continuous (concepts clarified in the next paragraphs). So the dua dimotion of a new form feeding in a T.œs body, to then explode it an expand, $ST_x \gg SS_y \ll TT_x + Ts_y$ written as a sequence of existential algebra (a body ST_x feeds a new species in its seed form, $SS_y \dots$ that will walk away Ts_y as the form collapses in entropy TT_x); becomes a series of partial derivatives.

In the *deepest sense this is the existential why of the methods of calculus of partial derivatives and the key difference in the concepts of continuity in classic calculus and 'stœps' of discontinuity, in 5D calculus, bridged with the common concept of a smooth transition throu*

gh finitesimal changes, which in reality are discrete (the body corrupts in discrete steps even if as the bacteria grow expenentially each step is larger), but from a higher point of view indiffernt to the detail can be calculated as long as it is smooth.

It is also the reason why both, reproductive and entropic motions can be described by $e^{\pm x}$ functions which are the maximal 'rate of change' (as the derivative is equal to the function, and since $dx \leq x$, is maximal).

The e function has so multiple meanings precisely because of the 'horror vacuum' and thirst for existence of its spatial fractal points. So it can also be used in its imaginary form, which as the name indicates is related to the creation of 'mental SS=§spaces', in its e^{xi} form, connected to the sinusoidal functions, in which we can observe, as in AC currents, a back and forth motion=translation in space, coupled with a rotational perceptive motion. In those rotational motions, the complex plane and exponential function is so useful because what perception IS really doing is 1) collapsing at the fastest possible rate the Universe into the finitesimal mind-mapping of the point (hence the e^x function involved); it does so *with a clear bias in favor of the length dimension of the focused perception, while the i-dimension of height is greatly compressed to fit the system (hence the usefulness of a frame of reference where $Y=Vx$; and finally it does so in a periodic pattern, scanning back and forth the same worldcycles to convert them into mental space; hence the recursive use of $\pm \sin$, cosine functions involved.*

Let us consider this essential equivalence of mathematics in more detail.

Connection between exponentials and sinusoidal functions: derivatives as angles of perception.

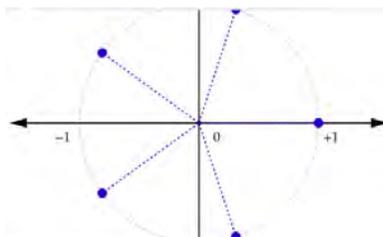

One very realized role of a derivative as a tangential division of the height in the dimension of information and distance-lineal motion to the observer is a measure of the angle of the being, which recedes in spacetime till reaching the non-perception as a relative finitesimal out of the territorial mind- world of the observer, which connects directly derivatives with the 1D first dimotion of perceptive existence. The being might still be of certain size but as a fractal point he has receded in the mental-space of the world of the perceiver.

The first 'timespace' numbers: Polygons as root of unity

By their very nature, as numbers that probe planes of the fifth dimension, exponentials are closely related to the complex plane. Let us consider only one case, de Moivre numbers, which are any complex number that gives 1 when raised to some positive integer power n:

An **nth root of unity**, where n is a positive integer (i.e. $n = 1, 2, 3, \dots$), is a number z satisfying the equation:

They are complex numbers (including the number 1, and the number -1 if n is even, which are complex with a 0' imaginary part), and in this case, the nth roots of unity are:

In mathematics, a **root of unity**, occasionally called a de Moivre number, is any complex number that gives 1 when raised to some positive integer power n. Roots of unity are used in many branches of mathematics, and are especially important in number theory, the

This formula shows that on the complex plane the nth roots of unity are at the vertices of a regular n-sided polygon inscribed in the unit circle, with one vertex at 1. This geometric fact accounts for the term "cyclotomic" in cyclotomic polynomial; it is from the Greek roots "cyclo" (circle) plus "tomos" (cut, divide).

Euler's formula, $e^{ix} = \cos x + i \sin x$ which is valid for all real x, can be used to put the formula for the nth roots of unity into the form: $e^{2\pi i k/n}$ $0 \leq k < n$. Which is a primitive nth-root if and only if the fraction k/n is in lowest terms, i.e. that k and n are coprime.

We find therefore the first timespace numbers, in the roots of unity. And as such they will become 'the creative process' of dividing the 'whole', 1, into cyclical 'tics

of time' of increasingly faster frequency, in a progression, for $k = 1, 2, \dots, n - 1$, which will generate the frequencies of all clocks of time, till reaching the circle, which can then be considered in bidimensional spacetime, the 'Infinite clock, of infinitesimal time tics'. Do have those infinitesimal ticks a 'limit' as all relative infinities do? In physics it is believed the minimal tick will be 10^{-43} or Planck's time, which therefore would become the limit of 'points' that form a time clock.

Another fundamental theme being the reasons why the 'clock' is counterclockwise in its direction, as it will also be its complex representation in 4D relativity theory. The reason being that in Planes of the fifth dimension, as we create new dimensions from the lower planes with more entropy, the emergent dimension 'sucks' part of the entropy of lineal space of its lower dimensions, 'contracting' it as it rises on height. I.e. a pi circle is made of 3 'curved' diameters (with open holes between them), but it does not measure 3 but 1 in the length dimension.

It also means we are adding a new time dimension, with a negative entropic property for the 'dimension of real space', which therefore can be written also with the number of entropy, e ,

4th scalar Dimotions of Entropy

A theme them of profound importance and depth of meaning is the relationship between the sine and cosine functions that allow an angular perception of the whole and the exponential function that reduces the whole to its decaying elements (Euler's formula). We could say then that the whole is 'split' between the entropic negative exponential part that is discharged, and the sinusoidal, informative elements that are absorbed by the mathematical mirror mapping.

It is interesting to note the connection, which occurs between the exponential and trigonometric functions when we turn to the complex domain, through series, since both functions can be approached by exponential series. If we

replace z by iz , we get:
$$e^{iz} = 1 + i\frac{z}{1!} - \frac{z^2}{2!} - i\frac{z^3}{3!} + \frac{z^4}{4!} + \dots$$
 Grouping everywhere the terms without the multiplier i and the terms with multiplier i , we have:

$$e^{iz} = \cos z + i \sin z, \quad \cos z = \frac{e^{iz} + e^{-iz}}{2}$$

Similarly we can derive

$$e^{-iz} = \cos z - i \sin z. \quad \sin z = \frac{e^{iz} - e^{-iz}}{2i}$$

Euler's formulas solved for $\cos z$ and $\sin z$, get:

As we said the key insight of 5D in power series is the understanding of them as a series of 'sequential steps' in the $\nabla\Delta$ dual scalar growth and diminution scales of the fifth dimension, whereas the \pm summand element represents a step in time-change, a 'period' of a frequency of growth and diminution, but in the case of the use of an i factor it creates a sinusoidal process of a repetitive worldcycle of perception, short of an opening and closing glimpse on reality, a back and forth motion in an AC current, a life and death cycle in a fast time quantum particle. It is an essential insight to resolve the whys of all those hows of mathematical physics.

In the complex plane, 1D (sin/cos) combine to represent a full worldcycles, interesting enough through the e^{ix} , 4D exponential decay function. This is possible because the exponential function switches between growth and negative decrease, as the sine and cosine switch between informative and energetic perception; but the sine function, the informative Dimotion grows less, as it happens in nature, where height and information has less energy, and so in parameters of size and volume matters less.

2 new qualities make interesting to cast trigonometric functions in terms of the function of entropy: we are adding both cosine and sine 'on and off' SMH for a value of 1, the total value of a world cycle, so we can use frequency equations (as in electromagnetism) to represent this exponential world cycle. And we superpose both, the function of 'space-form' the sine and time-motion-lineal distance, the cosine, to observe a harmonic balance as the function goes up and down but never passes beyond the value of the whole.

The complex plane is real because the cos is related to lineal motion and the sin to perceptive height, whose *action in stop mode can be seen as a negative slow down of motion for a continuous view (S=-T); as in relativity (-cT)*. But the deepest level of understanding of those functions and equivalences happens when we carry the *worldcycle of existence to the complex plane*.

Duality on calculus: Δ -Newton v. $S \Leftrightarrow T$ Leibniz

Finally to notice *the extraordinary fact that the ST-cartesian graph and the complex plane coincide in the root of unity*, which essentially divides the being into its internal and outer parts. Only then the membrain can assess with accuracy both realities in objective terms. But it will perceive them with different 'volume' of information.

For the membrain the external world will be measured in the complex plane, with a lesser dimension of height that will make the world 'flat' in its perceived geometry, as the Y(i) plane will be the $\sqrt{}$ root of the X-plane.

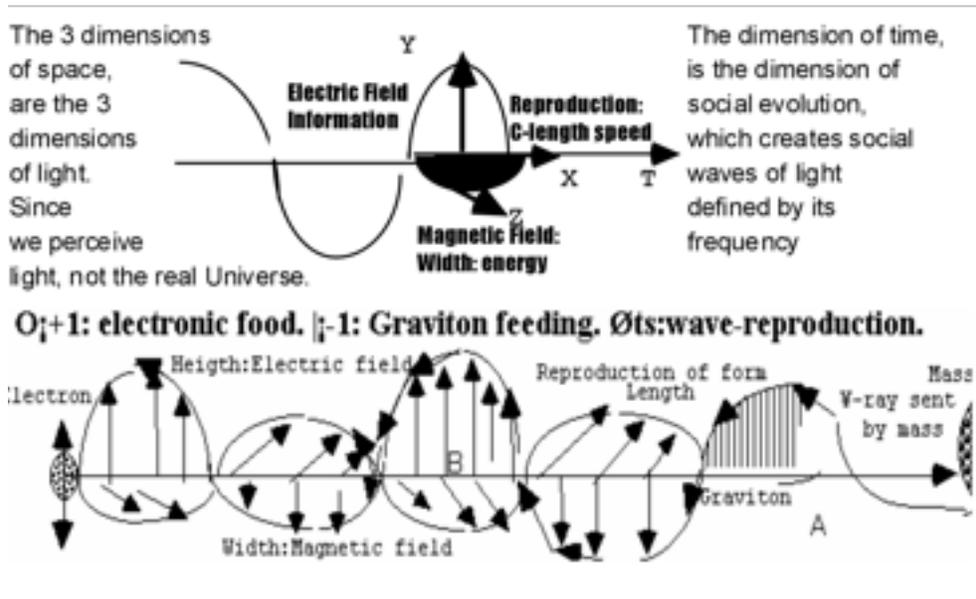

Internally though for the o-singularity which ONLY observes the root of unity circle with an equivalent height and width, this 'verbal, temporal mind' observing the 'spatial biased membrain' NOT the universe, that has already made a selection of information; in the same manner your internal verbal temporal thought on the 0-1 unit temporal sphere or the quantum 0-1 particle on the biased information provided by the harmonic spherics of his electronic eye (remember all is the same, all is homology in function even if it changes in form); will think the Universe is 'perfectly regular' and favoring its biased dimotion of length, NOT realizing of the equal important of the flattened dimotion of height-information.

Essentially all systems have 2 brains, the spatial membrain and the temporal singularity at the center of the 0-1 temporal sphere. The spatial membrain already bias reality and as the singularity of time only sees the spatial membrain it will act upon it, as its 'territory' in which to enact its 5 dimotions of existence, qualifying reality as the membrain has already done. And that is fine because singularities are selfish self-centered knots or else they will be preys of other self-centered knots. But that makes so difficult objective knowledge as we shall see in the bias of huminds. What does then the humind brain observe? The distortion we know exists considering the membrain homunculus for which hand sensations (enzyman's actions) and mouth (entropic feeding and social communication) occupy most of the space while legs-locomotion regardless of physicists ego matter nothing.

Locomotion as reproduction and death. This usefulness of the derivative of maximal rate has a deep philosophical consequence of the many insights a proper understanding of the symmetries between existential algebra and calculus methods provides to the 5D researcher, if there is ever anyone besides this writer (:repetitive quip of all my texts :) Consider the previous graph, which is in fact a trinity sequence of events, as the photon particle (if the wave were to represent a LIGHT ray), DIES every complete wave and the wave represents its entire worldcycle of existence. But in the process it also translates in space, and reproduces in the point of maximal existential momentum (Max. ST), which if the graph were one of ST not its derivative of change will be at the peak, when the photon in fact is as the 'head'-particle state in the top of the dimension of height-information (in static space); but if the wave represents its derivative of change, it will happen in the point in which it touches its axis; where further on the wave is 'feeding' on the 'string of tachyon neutrino' or quantum potential that guides the wave... So in that brief period between birth and death, what it amounts finally to a 0 ST change in the existential momentum of the wave, there are the points of SS-birth, TT-death, TT-entropic feeding on a lower plane, ST-reproduction, sT-locomotion and finally the cyclical perception that will happen at the maximal height in the photon state.

Those are the whys of existential algebra on a mere geometry of motion:

But a mathematical physicist has zero interest in understanding the 30 years old graph (hence its poor digital design) of the 5 Dimotions of existence of a wave of light; but a philosopher of science entangled to the Universe will find fascinating that even the smallest form of our light space-time Universe has all the properties of 5 Dimotional life encoded in its mathematical equations; the bridge between those equations and existential algebra being the understanding of mathematics as an experimental science of vital space-time:

TRILOGIC ON DERIVATIVES AND INTEGRALS:ΔST: THE 3 GREAT FIELDS OF CALCULUS.

Trilogic on calculus. 3 ±j ages, scales, and Dimotions mirrored by calculus operands.

As we are made of ΔST elements, limited by the reach of a supœrganism, self-centered and expressing the program of the 5 Dimotions of existence in @ mind; any systematic analysis of an organism or language that mirrors it departs from the one – the whole, then explains its Space and time states, its evident duality in a single plane, $S \Leftrightarrow T$, then its trinity, as ΔST, and finally its pentalogic ensemble of $\neg\Delta@st$. Variations on those themes might deliver an immense number of explanations of a subject or species. In the case of calculus though as in most developments of a subject the best consideration is a ternary analysis of its ΔST elements in the historic growing complexity natural to the evolution of a being through 3 ages.

On the other hand as reality is entangled in $\Delta\pm 1$ scales, S-populations and T-ime Dimotions and ages, Calculus has in a synchronous analysis 3 great fields: the study on how systems changes in size and scale through the growth or diminution of its 'finitesimals', the study of growth of populations in space, and the study of Time dimotions, which are often *based, and this is the miracle of Nature, in the same concept of a fintiesimals*.

Let us consider a trilogic example on how analysis' operands represent those 5 Dimotions.

Spatial view: Analysis as a tool to extract quanta of whole social populations.

The fundamental particle of the Universe is a T.œ. a fractal point or scalar timespace superorganism, which in its simplest, commonest form has the shape of a circle with 3 canonical regions:

@-Mind-Center, measured by its radius, its axial length=motion around the 'Territory' of the organic system.

A membrain of angular momentum, or external clock that we measure as its circumference.

And an area of vital energy, which can be measured by the area.

So we get the value of the 3 elements of a disk, and expanding it to 3d spheres (graph) we get a volume, we find a 'volume' for the vital energy, a surface of an sphere for the membrane and a perimeter for the wanderings of the singularity.

As it turns out, the circle's area is πR^2 , and the circumference is $2\pi R$, which is the derivative.

The volume of a sphere is $V=3\pi R^3$, and the surface area is $S=4\pi R^2$, which is again the derivative.

And inversely, the integral of the circumference is a surface and the surface integral is the volume.

The example shows the main use of analysis *in static space: to describe through 3 'Δ±1 Planes' the 3 parts of the being, which is the ultimate reason why only 2 derivatives are of practical use to 'descend' from the whole down two Planes, to the finitesimal quanta, beyond which an entire new 'world' within the quanta appears, with a different content, not suitable to be calculated within the same plane.*

So analysis become the essential tool to understand the social dimotions of parts and its growing Planes into wholes of a higher Δ+1 scalar plane of the fifth dimension, in a correspondence between analysis and 5D Planes, motions and populations of space.

Temporal view: Analysis as a measure of a temporal motion.

Yet analysis is most often used in temporal terms. This was though likely its first use (to calculate volumes from areas). It is in fact used to study motion, change in time, and we shall argue also Planes; and in that sense, *as we shall repeat ad nauseam, the entangled Universe which shows a clear correspondence between the mirror elements of 3 motions in time, 3 topologies of space and 3 Planes of size, wholes and parts that bring together the 3 x3 (+2 mental) = 11 Dimensions of reality is fully realized in the fact that analysis works to explain the 3 'ternary symmetries'.*

In the example, we can consider the sphere to be the whole sum of parts, where each part is a circumference. So our planet is the sum of all its 'parallels' with center in the poles. And then the volume *as each internal sphere can be in terms of 5D metric, $\int X \delta = K$ have the same co-invariant value, can be considered the sum of all those equal 5D valued spheres, so again we can talk of \int_{j-1} =circumference-> \int_{j0} =sphere-> \int_{j+1} = volume.*

What about the third 'ternary symmetry', that of time-change? This again is the fundamental use today analysis has, to study the rate of changes of a system, and it can be seen easily that the 3 elements of the 't.œ' ARE measures of time-change when we study not a mere locomotion, but the 'change-rate' of 'growth' more proper of the worldcycle of existence from 'seed' (the internal minimal sphere') to emergent system:

If you describe volume, V, in terms of the radius, R, then increasing R will result in an increase in V that's proportional to the surface area. If the surface area is given by S(R), then you'll find that for a tiny change in the radius, dR, $dV=S(R)dR$ or $dV/dR=S(R)$,

Increase in volume, dV, is the amount of new 'cellular layers' their system grows, and the amount of cells form the membrane, which is the surface area, S(R), times the thickness of the growth, where each unit is a layer, dR.

This same argument can be used to show that the volume is the integral of the surface area (just keep adding layer after layer of atoms or cells).

Finitesimals in Time vs. space

Space is symmetric; in its directions and they co-exist together. Time is not symmetric and it is experienced as a sequential pattern of single Time cycles. So Time parameters are shorter in form, space is a more extended system. Of time we see only an instant, of space we integrate instants/cycles of time and sum them as frequencies which all play the same world cycle.

Time though often is just the reproduction of a new unit of space. Thus, time cycles become populations of a spatial herd due to its reproduction of a 'seed' form.

Space thus is the 'mirror reproductive symmetry' of 'frequencies in time', its tail of memories, by reproduction, expansion, and radiation along the path of the singular timeline of the wave.

So in broad strokes derivative and integrals cover a wide range of 5D themes: the infinitesimal units of time frequencies and complex herds of space populations.

Whereas given the simultaneity properties of space, integrals tend to be used to calculate space populations, and given the individual sequential structure of time frequencies, derivatives are most often used to calculate time motions.

Thus the key concept of 5D mathematical analysis is the finitesimal, which was rightly defined by Leibniz as:

Δ: 1/n; the minimal part of a whole.

S: While in space is an individual unit of a social population.

T: While in lineal time duration is the minimal bit of a frequency $f=1/t$, or quanta of time.

Thus a finitesimal is a discrete minimal unit in any scale of the fifth dimension - h-planckton, cellular units, atomic units.

And by the equivalence between space-form and time-motion, S=T, as most time actions require a fractal reproduction of form, for each quanta of time, we shall see the existence of a reproduction of a quanta of space...

On the other hand its inverse Integral 'integrate' an amount of such units of time, space or scale to obtain a simultaneous whole, a supœrganism, a 'T.œ', $\int ds$, $\int dt$, $\int \Delta-1$.

Of those 3 types of derivatives and integrals, as frequency and time duration are inverse parameters currently used in all sciences, the less understood is $\int \Delta^{-1}$, whereas Δ^{-1} is taken to be the infinitesimal or minimal quanta of a whole, Δ^0 , (cell, atom, individual in a society), and its integral, a Social 4D motion that mimics the creation of wholes.

A dual derivative, TT, or SS, will then extract either an entropic unit 2 scales below the form or as we found in the analysis of the sphere The Point, NOT ANY point but the Center of mass or charge in a physical system, its mind singularity. Because derivatives 'extract' the first finitesimal quanta, or fractal point from a function of existence (T.œ), often directly as in $\log x':1/x$, it can lead directly to the value of the mind, or 'center point' of the system – the 'finitesimal whole'; and its inverse, an integral, which adds finitesimals till reaching the whole, as in the case of a volume of populations, but also illuminates the dissolution of a whole into its integrating parts.

What kind of point a derivative gives us, depends on the configuration of the whole we analyze. I.e. In a heat equation the whole lacks a center, as it is a flux of kinetic energy, so derivatives will extract any unit...

In 5D analysis depending on what we study 'motion', or 'space' or 'scale' up or down the planes of the 5th dimension we shall apply either an integral commonest for spatial sums of populations or a derivative, most often for instants of time, and double derivatives for reproductive functions. Since space and time are inverse, perpendicular functions, in its min. S x Max. T, and Max. S x Min. T states, but symmetric in S=T. So goes for the 2 different arrows of entropy, a dissolution downwards and social evolution upwards.

So the ΔT trinity of integrals and derivatives gives a huge range of possible interpretations for the equations of mathematical physics. Infinities though don't exist, as all has a finite membrane and a finite duration in time. Beyond the third derivative, as the scalar Universe is a 'ternary game', there is no significance to the mathematical operations of derivatives and integrals - a strong proof that 5D is truth as it limits reality to ternary Planes, topologies and time ages.

So a qualitative analysis is required to specify what dimotion we are 'calculating', with derivatives and integrals: time motions, space populations or reproductive motions.

5d $\int \Delta^{-1}$ pentalogic on integrals

$\sum s-1=S0$: Integrals, on the other hand represent the growth of a space population, till it reaches a wholeness in a closed domain. So we can do 'line integrals', 'surface integrals', 'volume integrals', in simultaneous space.

Such integrals must be positive in its results, because we are as in the case of + v. – numbers calculating a 'statistical population in space'.

(to->t) $\sum a = 0$: Integrals though are also related to a world cycle, as the continuous sum of steps in a sequential duration of time that must therefore have a 0' final result as all worldcycles when chosen in the appropriate parameters of 'energy and information' end up returning to its origin. Such integrals when properly written must therefore give us a 0 value. The classic case being a sinusoidal function of a wave with positive and negative sides for the worldcycle that ends in a 0 value, when we add the surfaces below and above the curve.

T=S: However when we express those 'actions=dimotions=steps' of the worldcycle with the 'simpler, first age' formalism of probability; whereas an individual event is a 'finitesimal' of time, and the sum of all events a '1 value' distribution, if we integrate the probability to get the sum of all events, whole entity as an event, which is by convention valued as '1'; the result of such integral must be 'renormalized' to 1.

This is a complicated way to calculate a 0'-worldcycle but as it has become the formalism chosen in quantum physics, it is constantly carried out to calculate the sum of events of an electron that give birth in space to an statistical population of all the potential positions of the electron in space (themselves taken in Δ^{-1} as dense photon points). As the electron in trilogic can be seen as a cloud of Δ^{-1} dense photons, as an Δ^0 whole in space, or as the sum of the sequential points it occupies in time, but humans are monologic, a lot of confusion is natural to quantum physics, the more so with the addition of further complexity with renormalization methods and probabilistic interpretations.

T=S: Integrals are also necessary to add a locomotion of time, closer to the action of reproduction in space, as nature is 'constantly building integrated wholes by the accumulation of single time actions of reproduction that become 'clone' cells-atoms-citizens of an integrated supœrganism.

-: Integration of any of those actions however needs to be 'defined' due to the uncertainty of infinities, by constrains (initial time and final time, or a-b interval of domain in space), which act as the integral line membrain, becoming the Riemann integral or 'Cauchy' condition for it to have a solution. .

As a function of entropy integrals can also portray the growth or diminution of populations in space, with most of those growth/decay inverse functions, represented by $e^{\pm x}$ or $10^{\pm x}$ which are the standard constants of growth.

They are maximal when a system decreases and the space is dying *with no constrain at maximal speed in a quanta of time – hence using the maximal growth of e-function. However* when it grows socially it does so slower, most often in decametric scales; so we find also different speeds on the two time dimotion of the 5th dimension.

Recap. Integrals are overwhelmingly the measure of change in a fictious mental space constructed.

1st AGE SCALAR VIEW: FINITESIMALS . UNIVERSALS=WHOLES

Universals

Perhaps the clearest historic proof of the nature of finitesimals as the parts of wholes is the fact that the beginning of calculus was not related to the study of rates of change in continuous motion but precisely to the relationship between parts into wholes.

So Greeks studied in philosophical terms the integration=growth of a social system from micro to macrocosms, from individuals into Universals, and mathematically through 'finitesimal' minimal quanta or parts of the whole, through 'series' and exhaustion methods.

This age extended from the Greeks to Newton, which was the last of the ancients, changing the use of those exhaustion methods from spatial series of growth to temporal series of change, but he failed to represent them properly through the space=time symmetry of $Y(s)=X(t)$, in a Cartesian frame as Leibniz did, *adding the property of 'continuity' as explained before, not the limit in which $h \rightarrow 0$, but the limit in which $S \approx T$...*

Plato maintained that exemplifying a property is a matter of imperfectly copying an entity he called a form, which itself is a perfect or pure instance of the property in question. Several things are red or beautiful, for example, in virtue of their resembling the ideal form of the Red or the Beautiful. Plato's forms are abstract or transcendent, occupying a realm completely outside space and time. They cannot affect or be affected by any object or event in the physical universe. This is correct, though the error lies in positioning universals outside space and time. They are in fact the ultimate properties of SE-spatial 'kinetic energy+entropy' and TO- Temporal information, which 'emerge' in each new scale.

Few philosophers now believe in such a "Platonic heaven," at least as Plato originally conceived it; the "copying" theory of exemplification is generally rejected. Nevertheless, many modern and contemporary philosophers, including Gottlob Frege, the early Bertrand Russell, Alonzo Church, and George Bealer are properly called "Platonic" realists because they believed in universals that are abstract or transcendent and that do not depend upon the existence of their instances.

They are closer to the truth, but they should substitute the word 'transcendent' for 'emergent' in the parlance of general systems.

For that matter General Systems (5D ST) reduces the meaning of 'transcendence' to its first semantic meaning:

Vb: L transcendere to climb across, transcend, fr. trans- + scandere to climb.

vt : to rise above or go beyond the limits.

Indeed, Universals are found beyond the limits of its finitesimals, in the next $n+1$ scale.

Dimensional growth area finitesimals as: reproduction of spatial form

Finitesimals were first found in space, as the means to quantify a simultaneous areas as the sum of $\Delta-1$ discontinuous, fractal parts. Let us remember this concept, key philosophical discussion even with the greeks - it is the Universe continuous or discontinuous, made of Universal wholes or individual parts?

This concept was the earlier idea of Leucippus and Democritus regarding the composition of physical systems; and Anaximander, regarding the composition of life systems, with its 'homunculus' concept (we were made of smaller beings)

Anaximenes' assumption that aer is everlastingly in motion and his analogy between the divine air that sustains the universe and the human "air," or soul, that animates people is a clear comparison between a macrocosm and a microcosm.

It also permit him to maintain a unity behind diversity as well as to reinforce the view of his contemporaries that there is an overarching principle regulating all life and behavior. So here there is a first bridge that merges universals and finitesimals.

And of earlier mystiques, regarding the composition of a superior God, as the subconscious collective of all its believers' minds, fusion in a 'bosonic' way into the soul of the whole.

The 3 were right as finitesimals are clone beings with properties that transcend into the Universal, being the homunculus the 'future cell'.

Universal wholes and individual finitesimals.

Because the praxis of continuity was not yet 'erased by idealism reality' the Greeks accepted as real their exhaustion methods, but Pythagorism opened the road to idealism. So the first age of analysis had a great deal of philosophical disquisitions on the nature of wholes and parts, connecting directly with the greek logic arguments on the nature of individuals and universals.

The historical origins of analysis can be found in attempts to calculate spatial quantities such as the length of a curved line or the area enclosed by a curve.

As we know, a curve, is always part of a worldcycle, with a finite number of steps, and so the conclusions of those earlier studies can be extended to understand better the space-time worldcycle in a general way: a circle can be calculated as a polynomial number, which becomes nearly undistinguishable, past the 10-20-100th 'fractal points' staeps of social scales of number all pervading in Nature.

This lead to the exhaustion method of calculating irrational numbers, from parts into wholes.

o-1: Δ-1: 1/n finitesimal scale vs. 1-∞: Δ+1: whole scale.

So only a question of that section is worth to mention here, on how to 'consider Planes', which tend to be decametric, good! One of the few things that work right on the human mind and do no have to be adapted to the Universal mind, from d•st to Δûst.

Shall we study them downwards, through 'finitesimal decimal Planes' or upwards, through decametric, growing ones? The answer is an essential law of Absolute relativity that goes as follows:

'The study of decametric, §+ Planes ($10^{\xi} \approx 10 \cdot 10^{\Delta} \approx \Delta+1$) is symmetric to the study of the inverse, decimal $\Delta > \Delta-1$ scale'.

Or in its most reduced 'formula': ($\infty = (1) = 0$): ($\infty-1 \approx (1-0)$)

Whereas ∞ is the perception of the whole 'upwards' in the domain of 1, the minimal quanta to the relative ∞ of the $\Delta+1$ scale. While 1 is the relative infinite of a system observed downwards, such as $\Delta+1$ (1) is composed of a number of 'finitesimal parts' whose minimal quanta is 0.

It is from that concept from where we accept as the best definition of an infinitesimal that of Leibniz: N (whole) = 1/N (Finitesimal).

So in absolute relativity the $\Delta-1$ world goes from 1 to 0, and the $\Delta+1$ equivalent concept goes from 1 to ∞ . And so now we can also extract of the 'infinitorum thought receptacle' a key difference between both mathematical techniques:

A conceptual analysis upwards has a defined lower point-quanta, 1 and an undefined upper ∞ limit. While a downwards analysis has an upper defined whole limit, 1 and an undefined 'finitesimal minimum, +0).

Finally to notice that as all Δ -Planes have relative finitesimal +0 and relative infinities (see $\infty |^{\circ}$ to understand the limits and meaning of numbers and its Planes), essential to all theory of calculus is the study of the domain in which the system works, and the 'holes' or singularities and membranes which are not part of the open ball-system. So functions

can be defined with certain singularity points and borders; hence functions need not be defined by single formulas. This would be understood by Leibniz - who else :)

Unlike Newton, who made little effort to explain and justify fluxions, Leibniz, as an eminent and highly regarded philosopher, was influential in propagating the idea of finitesimals, which he described as actual numbers—that is, less than $1/n$ in absolute value for each positive integer n and yet not equal to 0 .

For those who insisted in infinities, Berkeley would reveal those contradictions in the book 'The Analyst'. There he wrote about fluxions: “They are neither finite quantities, nor quantities infinitely small, nor yet nothing. May we not call them the ghosts of departed quantities?”

Definition of Δt , Δs , finitesimals: A quantum of time and space.

Berkeley's criticism was not fully met until the 19th century, when it was realized that, in the expression dy/dx , dx and dy need not lead an independent existence. Rather, this expression could be defined as the limit of ordinary ratios $\Delta y/\Delta x$.

And here is where we retake it; before the formal age of mathematics, made a 'pretentiously rigorous definition of infinitesimal limits and the the logician A. Robinson showed the notion of infinitesimal to be logically consistent, but NOT real.

As we believe mathematics must be real to be 'consistent' (Gödel's theorem), we return to the finitesimal concept, $\pm\Delta y$, either as a 'real' increase/decrease of a quantity, with a variation $\pm\Delta x$ of either the surface of space or the duration in time of the being.

Thus finitesimals depend for each species of the 'quanta' of space or 'minimal cell' and quanta of time or minimal moment, which the system can measure.

For man, for example time actions are measured with its minimal time quanta of a second, below which it is difficult to perceive anything; a nanosecond in that regard in the human plane of existence is NOT worth to measure, as nothing happening in a nano-second will be perceived as motion or change. For an atom however a nanosecond is a proper finitesimal to measure changes.

In space, man does not perceive sensations below certain limits, which vary for each sense, a millimeter, 100 hertz of sound, the frequency of infrared waves; and so on.

There was only at this stage a mathematical approach to the concept by Archimedes - the methods of exhaustion to calculate areas and ratios, notably the pi ratio.

The method of exhaustion...

was first used by Eudoxus, as a generalization of the theory of proportions.

Eudoxus' idea was to measure arbitrary objects by defining them as combinations of multiple polygons or polyhedral. In this way, he could compute volumes and areas of many objects with the help of a few shapes, such as triangles and triangular prisms, of known dimensions. For example, by using stacks of prisms (see figure), Eudoxus was able to prove that the volume of a pyramid is one-third of the area of its base B multiplied by its height h , or in modern notation $Bh/3$.

Loosely speaking, the volume of the pyramid is “exhausted” by stacks of prisms as the thickness of the prisms becomes progressively smaller. More precisely, what Eudoxus proved is that any volume less than $Bh/3$ may be exceeded by a stack of prisms inside the pyramid, and any volume greater than $Bh/3$ may be undercut by a stack of prisms containing the pyramid.

The greatest exponent of the method of exhaustion was Archimedes (c. 285–212/211 BC). Among his discoveries using exhaustion were the area of a parabolic segment, the volume of a paraboloid, the tangent to a spiral, and a proof that

the volume of a sphere is two-thirds the volume of the circumscribing cylinder. His calculation of the area of the parabolic segment (see figure) involved the application of infinite series to geometry. In this case, the infinite geometric series:

$$1 + 1/4 + 1/16 + 1/64 + \dots = 4/3$$

is obtained by successively adding a triangle with unit area, then triangles that total 1/4 unit area, then triangles of 1/16, and so forth, until the area is exhausted. Archimedes avoided actual contact with infinity, however, by showing that the series obtained by stopping after a finite number of terms could be made to exceed any number less than 4/3. In modern terms, 4/3 is the limit of the partial sums.

His paper, 'Measurement of the Circle' is a fragment of a longer work in which π (pi), the ratio of the circumference to the diameter of a circle, is shown to lie between the limits of $3 \frac{10}{71}$ and $3 \frac{1}{7}$.

Archimedes' approach to determining π consists of inscribing and circumscribing regular polygons with a large number of sides. It was followed by everyone until the development of infinite series expansions in India during the 15th century and in Europe during the 17th century. This work also contains accurate approximations (expressed as ratios of integers) to the square roots of 3 and several large numbers.

It is then interesting to consider Archimedes' main role on the perception of problems today forgotten after the absurd dogmatic germanic 'foundations under the axiomatic method' of analysis.

2 problems troubled him and indeed they were very important problems: the comparisons of different pis, (it is the pi square with 2 dimensions the same than the pi of the perimeter) and its proper calculus by approximation.

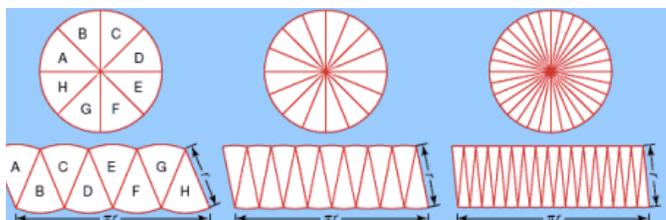

Approximations in geometry.

The unit of space is the area and the unit of time the cycle, and so both are bidimensional, and hence the transformation of one into another is not always perfect, as there is not a perfect 'quadrature'. But as this happens constantly a part is lost as 'entropy' in all time-space transformations, or as 'a bit of a circle', that is a motion or particle, as when in particle reactions there are always 'forces' escaping (neutrinos, gamma rays). So this means that pi is not exact, neither $\sqrt{2}$, the two key constants for the squaring... Yet that doesn't mean the transformation happens all the time, and it was the way in which the game of analysis started with Archimedes:

The transformation of a circular region into an approximately rectangular region. In graph ΔST theory eliminates all infinitesimals problems as infinities are limited, so are the 0s, which must be regarded as the +0 minimal quanta of the domain - the need for further infinities is an error of the mind, the dogmatic truth and the single space-time 'continuum'. In that regard pi is not ∞ , but its calculus becomes 'chaotic' beyond a limit of ± 40 decimals, which is really all what the human mind can conceive in its largest finitesimal analysis.

It is then when the 'Greek Age' becomes just as in the Archimedean calculus of pi by exhaustion the same concept, just with less detail.

A simple geometric argument shows that both processes are similar with different degrees of approximation:

The idea is to slice the circle like a pie, into a large number of equal pieces, and to reassemble the pieces to form an approximate rectangle (see figure). Then the area of the "rectangle" is closely approximated by its height, which equals the circle's radius, multiplied by the length of one set of curved sides—which together form one-half of the circle's circumference. As the slices get very thin, the error in the approximation becomes very small.

The simple graph above shows from the point of view of an S=T symmetry if we take the circle as an angular motion, the ΔST Trinity of change that always can happen in scale, space or time. In scale each minimal 'radius', is a quanta of

change. In time the circle becomes an angular motion, so each triangular section becomes a rate of change per unit of time, related to the angular speed of the circle. Yet the circle as a wave give us also the lineal motion that keeps reproducing quanta after quanta of change the wave.

Δ ST Trinity then becomes once and again the leit motif of change

The duality of free lines/planes v. closed order.

It is interesting to notice that in general when we grow in scale, we change from freedom to order or vice versa - that is the fundamental | v. O, past vs. future, part vs. whole, form vs. motion, dualities of Δ @st changes. So when we integrate open lineal triangles, with its vertex as the @-forward mind \approx future path, in the circle it becomes an internal locked, social, circular mind - a closed point of a larger singularity in a cyclical form.

The approximation of square space to cyclical points. Ratios and ir(ratio)nal numbers, its finitesimal limits.

A theme that will be soon casted on terms of number theory was also studied by Archimedes by exhaustion methods.

Before the invention of the new methods of calculation, it had been possible to find the area only of polygons, of the circle, of a sector or a segment of the circle, and of two or three other figures. In addition, Archimedes had already invented a way to calculate the area of curves by exhaustion, leaving a sound error according to the minimal step he took, which raises the question, does have a circle a finitesimal minimum step? It is then pi and all other $S>t$ constant transformations and 'ir(ratio)nal numbers/ratios, limited by a finitesimal error?

The answer is yes!, Normally a decametric limit define the 'valid value of an ir(ratio)nal numbers, which is not a number in strict sense (a social number) but a ratio of an S/T action/function. The examples of the two fundamental ir(ratio)nals will suffice:

- pi is really the ratio of 3 diameters that form a closed curve, whose value *depends on the lineal 'step sizes'*.

So pi has a minimal value of 3, which is the hexagon with its 6 steps of 1/2 value (triangulation in 6 immediately gives the result, as the triangle is the radius, so are the 6 triangular sides: $1/2 \times 6 = 3$); which happens to be the value of pi in extreme gravitational fields on relativity, which brings another insight: black holes decompose the circle into ultimate lineal flows of pure 'dark energy' shot through the axis, by converting the curvature of a light circle on the event horizon in a 6-pi hexagon. But this is well beyond the scope of this intro.

So what is the 'decimal limit' of pi, before it breaks into meaningless (non-effective) decimal Planes, with little influence on the whole?

While this is hypothetical I would say for different reasons explained in the article on number theory, as it is quite often the case it responds to the general $\Delta \approx S \approx T$ ternary symmetries, so common in the perfect Universe.

So pi responds to the symmetry between its spatial minimal, $6 \times 1/2 = 3$ hexagonal steps, which means it breaks in the 6th Δ -scaling decimals, 3,1415...9. So, 3,1416, which incidentally is basically what everybody uses is the 'real value' of pi, and why it is that value is studied elsewhere (deducing from it one of the most beautiful simple results of get-mathematics, the value of dark energy in any system, of the Universe, as the part not perceived through the apertures of a pi cycle: $\pi/\pi-3 = 96\%$ of 'darkness' which the singularity of a pi system cannot see as its apertures are only $\pi-3 = 0.14$

Discontinuity and limits of mental space and physical spaces.

We get now to the heart of the matter; which is the paradox between continuous mental spaces and discontinuous, fractal spaces, between infinitesimal and infinities vs. finitesimals and relative infinities (∞), between the axiomatic method and the experimental method that keeps surfacing all these 5D v. 4D papers. The space-time continuum is not such when we 'take the accordion' of the 5th Dimension and enlarge the whole Universe into multiple planes of space-time, which are connected through the 'different geometries' of the convex, hyperbolic regions between planes.

The general laws of 5D outlined in other papers which we shall post at Academia.edu some time in the 'future' use the formalism of existential algebra to lie down all those laws departing from 5D metric.

In what refers to calculus it can be expressed in terms of the 'praxis' of mathematical physics that uses systematically the differential equation vs. the theory of ideal mathematicians that prefer to argue on the 'passing to the limit' and since Cauchy put it in nice 'bullShit=pedantic' talk seems to be proved.

Many important truths of the fractal Universe are deduced precisely by denying pedantic definitions, postulates and axioms to make a right wrong.

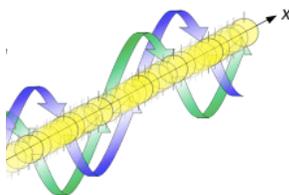

Now, the other constant e , which is the ratio of decay ACTIONS, or death processes ($ST \ll S$), is a longer two 'Planes' down process, of self-destruction of a system, unlike the π , single scaling process, $S > T$. So it breaks at 10 decimals: 2.718281828...459045

Indeed. Now, why 5 and not ten if the Planes are 10^{10} ? Because 10 Planes are in terms of space-time actions, the 'whole' dual game of two directions of time up and down, which happens only in reproductive actions. And this connects with the $S > T < S$ Rhythms of motion go/stop/go back and forth between two arrows which happens both in st-single planes and $\Delta \pm$ motions.

The proof? Very simple. The experimental truth tells us that the Universe is a game of $9-11^{9-11}$ planes of existence and if we calculate e as $(1+1/10000000000)^{10000000000}$ we get the 'real' e which must be a number that is NOT irrational. As that is the experimental e -number for the overwhelming quantity of systems of Nature made of 10^{10-11} parts. Alas, we obtain 2.718281828...323131... a rational series whose profound meaning is that of the fastest progression of growth or decay of a finitesimal seed into a perfect whole (:

Does this mean we cannot find 'larger systems'? Yes, but if you got any of the fundamental concepts of the 5D scalar Universe 'running around your brain' – reality is ∞ in the field of pure TT -entropic time flows and Planes, but for the perceiver and any language of perception that make sense, beyond the 10^{11} perfect form unit of a larger $\Delta+1$ case, perfection breaks down, systems malfunction, monsters appear and e gets its irrational form.

The reader is left with a funny exercise for which he should receive the Fields medals of mathematic (just joking – those who rebel against the axiomatic method and its Cantorian Paradises shall not enter the kingdom of nitrolife gaseous heads bubbling egocy with go(l)d.... But π DOES have a limit. And this means *the Universe has not infinite Planes of perfect order – it does NOT have a God* that can see through all the Planes, as a mind that orders its infinity in space, scale and time...

There is then a limit for existential planes? The 'meaningless' breaking down of e , the 'number of entropic functions' seems to signal this. But it would be an error to consider the limits of e -regularity as it only indicates the LIMIT of entropic death. Death happens and when a system breaks down its natural $10^{\pm 10}$ Planes to its finitesimal $1/n$ parts it stops as the system is dead.

The limit that matters is the limit of the π -circle as an Archimedean spiral that lets information enter through its \pm never closing spiral to perceive or feed in the external micro-bits and bites of the Universe. And as we cannot find neither a limit nor a regularity, we could conclude that the most important dimotions of angular perception, and creation of inner mirrors of the outer world by a π -spiral have no limit.

What about locomotion? Can we exhaust the limit of a series of steps? Again, this is more evidently no, even though the Greeks thought so, in the so called...

The problem of equivalences confused as identities between lines and areas.

It is absurd to talk about continuity of a real number, π , e , and $\sqrt{2}$, beyond the 10 decimal. This is easily proved because those ratios are normally obtained by limits in which certain terms of the infinitesimal are despised, by

postulating the falsity that there are infinite smallish parts, and so x/Δ can be throw out when $\Delta \rightarrow \infty$. But since x/Δ , the finitesimal has a limit, the pretentious exactitude does not happen.

This in turn leads to questions about the meaning of quantities that become infinitely large or infinitely small—concepts riddled with logical pitfalls in a simplified world of a single space-time continuum, where on top humans LOVE to consider ‘identities’ of the mind absolute identities in the larger information of the detailed Universe, which are never so, as $d@st \approx \Delta \hat{u}st$ (the mind, world view is merely similar to the Universal view) .

In our example example, a circle of radius r has circumference $2\pi r$ and area πr^2 , where π is the famous constant 3.14159.... Establishing these two properties is not entirely straightforward, although an adequate approach was developed by the geometers of ancient Greece, especially Eudoxus and Archimedes. It is harder than one might expect to show that the circumference of a circle is proportional to its radius and that its area is proportional to the square of its radius. The really difficult problem, though, is to show that the constant of proportionality for the circumference is precisely twice the constant of proportionality for the area — that is, to show that the constant now called π really is the same in both formulas.

This boils down to proving a theorem (first proved by Archimedes) that does not mention π explicitly at all: the area of a circle is the same as that of a rectangle, one of whose sides is equal to the circle's radius and the other to half the circle's circumference.

However in ΔST theory, those 2 π s are not the same, because they belong to two discontinuous, ‘different species’ of topology, the St area, and the ST -membrane.

An easy, immediate proof. If we make them identical, then we can find a circle, where: $2\pi r \approx \pi r^2$. So $2r=r^2$. Hence $2=r$ and we get to the conclusion that the thin membrane of an open ball is identical in area to the internal ST volume of the being, which is ‘conceptually absurd’ (the area intuitively has more surface, as it is bidimensional, the line, infinitely thin).

What’s the problem here? We cannot in true form, unless we deal always with less dogmatic concepts of relative similarities with ‘lines as if they were squares’. They are different realities. In the first equivalence, we compare a line radius with a circle perimeter, in an $S>t$ structure.

In the second as we compare π^2 , a cyclical area with the square of the radius we are also in good footing. But when we do the $S>ST$ comparison, we are in a Dynamic transformation of Δ -Planes, from Δ , the world of lines, to $\Delta+1$ the world of squares (as a polynomial square is obviously a growth from a complete Δ -entity the line, into an $\Delta 2=\Delta+1$ one, the area). It is then when we can do some ‘dynamic equivalence’ analysis, and the equivalence has meaning, stating that for a ‘perfect cycle’ of relative radius 2, the membrane absorption of bits and bites of energy and information, can fully, fill, the internal area, making equivalent, a ‘line and a surface’ integral. And finally state that all ‘dynamic vortices of force’ ruled by Newtonian/Coulombian equations on the $\Delta-1$ and $\Delta+1$ Planes, are relative perfect systems of radius 2.

And here we find the ‘whys’ of the dualities of Maxwell’s laws, which can be written both ways:

Or in simpler terms, we are talking when doing those equalities of properties that become dynamic and transcend the static mind of mathematics into the reality of physical systems.

Finally as we defined real numbers as non- existent (see $|\infty$ posts), but approximations to a ± 0 infinitesimal, in the measure of a square, uncertainty grows further, π^2 , thus have the square ‘error’ of π .

All this of course is important to conceptualize reality, in praxis as we know we always work in an uncertain game with errors and deaths. So analysis does work, and all this ‘search for dogmatic proofs’ is just ‘absolute bull\$hit’ for absolute ego-centered scholar huminds.

But on the other hand the graph also shows that both π s, the one of the 'surface' and the one of the 'perimeter' are not equal, as there will be a limit on the number of 'bidimensional triangles' we can cut.

As a triangle is indeed the bidimensional line, that is: 1 - Δ t (one-dimension); 2 - Δ t (2 dimension).

So it is not the line.

So as the approximation will find a finitesimal quanta or limit of detail, prove the theorem, this error, however tiny, remains an error. This minimal quanta thus exist in all relative $\Delta > \Delta + 1$ measures of Planes as the minimal uncertainty of all mathematical calculus, and justifies in physics ($\Delta - 1$ quantum theory) that there is always an uncertainty of a minimal quanta, which is precisely $h/2\pi$; that is $h/2\pi$; the minimal quanta of our light space-time.

Only in the absolutist imagination of dogmatic axiomatic mathematicians it made sense to talk of the slices being infinitesimally thin, so the error would disappear altogether, or at least it would become infinitesimal.

As it happens quantum theory proved experimentally the case to be wrong. And as we stress (Lobachevski, Gödel, Einstein) mathematics must be confronted with reality to realise what is 'real' in maths.

Δ: THE NEWTONIAN WAY. FINITESIMAL SERIES.

In 5D the concept of series is an important one; as it establishes for each step of the series a quantity of growth that converges towards a whole, valued by a finite number; and then the series is a meaningful mirror of an $\sum \Delta^{-1} = \Delta^0$ process of Nature. When the series diverge however it is of little interest, as it is an exponential growth that at best can signify an entropic process. Series thus are predecessors of calculus where each term represent a finitesimal of change, and the whole sum of the sequence the 'whole worldcycle' in time, or 'volume in space'.

The limits of value for series were also instrumental to understand the paradoxes of ideal mathematics, (Achilles' paradox) showing that indeed change requires finitesimal 0's as limit $x \rightarrow 0$ is NEVER absolute zero; or else Achilles will never meet the TURTLE. Only human egoc in search of mental simplified absolute truths, relatively false explains 2300 years of disquisitions on the obvious solution of the achiles paradox, which will introduce the theme. So the main comments on mathematical series are on the concepts of relative 'finitesimals' and relative immensities (not infinities) proper of 5D math.

Achilles Paradox. Birth of the concept of series and limits.

In mathematics, a **series** is, roughly speaking, a description of the operation of adding many quantities, one after the other, to a given starting quantity, in 5D each quantity is a new finitesimal of a series, hence 3 series can be distinguished by dimotion:

- Divergent growing series of ideal social evolution and reproduction till a limit of carrying capacity, which in reality will make the ideal series 'flatten' its growth.
- Equal series of present states in which each steps equal the previous one, which reduces to simple sums.
- Convergent series that diminish in size till a finitesimal is reached, that should be perceived inversely from the finitesimal to the whole.

The study of series is thus a major part of calculus and its generalization, mathematical analysis, since it is the 'discrete manner' to calculate and one might argue more real. The greeks started their study in philosophy and rightly solved it (Aristotle) deducing that absolute 0 and infinity did not exist. Modern egoc dismantled those findings for the so called 'rigorous proofs of the axiomatic mental method' whose aim is to convince egocentered men that the 'simplification of mind spaces' that eliminate the dark holes between points and expand limits to infinities and absolute zeros are 'reality', not the mental selection of it.

The paradox of Achilles: in a discontinuous Universe of fractal parts, achiles should never reach the turtle. But if motion is reproduction of form, the faster system merely 'reproduces' its information faster in adjacent regions of space, and motion becomes 'rational' - and proves further the reproductive nature of reality as even locomotion IS reproduction.

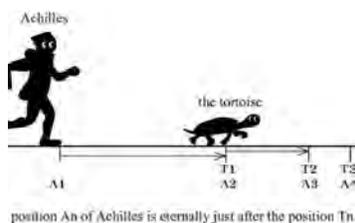

For a long time, the idea that such a potentially infinite summation could produce a finite result was considered paradoxical by mathematicians and philosophers.

This paradox was resolved using the concept of a limit during the 19th century.

Zeno's paradox of Achilles and the tortoise illustrates this counterintuitive property of infinite sums:

Achilles runs after a tortoise, but when he reaches the position of the tortoise at the beginning of the race, the tortoise has reached a second position; when he reaches this second position, the tortoise is at a third position, and so on.

Zeno concluded that Achilles could *never* reach the tortoise, and thus that movement does not exist. Zeno divided the race into infinitely many sub-races, each requiring a finite amount of time, so that the total time for Achilles to catch the tortoise is given by a series.

The resolution of the paradox is that, although the series has an infinite number of terms, it has a finite sum, which gives the time necessary for Achilles to catch the tortoise.

The physical explanation of locomotion though defines it as a reproduction of for of the lower scale, so it establishes a finitesimal stœp, equivalent to the minimal Δ -i quanta of the wave-particle dual motion states:

Locomotion is a series of stœps that imprint a lower plane with the information of the upper plane: a quantum motion in wave state and particle, stop state of reproduction form (complementarity principle wave-particle).

In modern terminology, any (ordered) infinite sequence (a_1, a_2, a_3, \dots) of terms (that is numbers, functions, or anything that can be added) defines a series, which is the operation of adding the a_i one after the other.

To emphasize that there are an infinite number of terms, a series may be called an **infinite series**. Such a series is represented (or denoted) by an expression like: $a_1+a_2+a_3+\dots$ or, using the summation sign:

$\sum_{i=1}^{\infty} a_i$. ∞ sequence of additions implied by a series cannot be effectively carried on in a finite amount of time.

However, if the set to which the terms and their finite sums belong has a notion of limit, it is sometimes possible to assign a value to a series, called the *sum* of the series. This value is the limit as n tends to infinity (if the limit exists) of the finite sums of the n first terms of the series, which are called the *nth partial sums* of the series. That is:

$$\sum_{i=1}^{\infty} a_i = \lim_{n \rightarrow \infty} \sum_{i=1}^n a_i$$

What this means in 5D though is slightly different: because the infinite number of time-steps will make impossible to do any calculus, all limits must have in 'reality' beyond the idealized mirror of mathematics, a limit of steps and a limit of size of those steps. Which is indeed what happens in reality.

What this means in 5D though is slightly different: because the infinite number of time-steps will make impossible to do any calculus, all limits must have in 'reality' beyond the idealized mirror of mathematics, a limit of steps and a limit of size of those steps. Which is indeed what happens in reality.

The turtle has a time-cycle and a size of steps, measurable. And when explaining the reproduction of motion, we shall see that limit is the reproduction on the lowest plane of light and particle forces of the entire form of the being in discontinuous adjacent spaces.

other worlds, the word 'limit' in the formulae should not be infinite. But a 'finite infinite', for which we shall use a different symbol: ∞

Relative infinities and finitesimals

The simplest why of the fractal, scalar structure of the Universe, from the perspective of the mind: as a linguistic mirror image of reality in a smaller space, minds 'create' fractal diminishing, infinite Planes

The new symbol for a 'relative infinity' and its inverse $1/\infty$, 'finitesimals', become then essential to 5D Analysis and it gets rid of all infinite paradoxes from Zeno's to Cantor, further showing the idealized mirror-image nature of mathematics; as a mirror recedes apparently into infinity but at a certain point it ceases to be observable and hence it does NOT exist anymore.

The meaning of series then in real existences becomes clear as it is another way to describe in discontinuous manner, what derivatives on the continuous plane (remember the duality of discrete number view vs. Continuous geometric view), shows: A travel up and down the Planes of the fifth dimension.

Rates of change. The stop and go motion: stœps.

The discrete, geometric, spatial, static numerical analysis of calculus is the power series, which can be taken as discrete stœps (stops + steps) in a motion down the fifth dimension from the whole to the $1/n$ part, whereas we count also the static form (as we see only in a movie the static frame) NOT the step of motion.

This was then the work from Archimedes and earlier Greeks to Newton, which can in that sense be considered the last of the ancients.

While as all $S=T$, that is there is always a symmetry between discrete numbers and continuous motions, Leibniz with its geometric interpretation and far more profound understanding of finitesimals, which he rightly defined as $1/n$, represents the first step in the future of the discipline, the renovator and deep understanding of it - which Newton, which can be considered merely an automaton mathematician, specialized brain, as most modern scientists is - he is indeed the father of the wrong view of science - understood nothing of it.

Indeed, Leibniz, the closest predecessor of this blog IS the genius, Newton the talent.

Finitesimal changes are related to the fundamental beat of the Universe, the stop-form-space-perception, go-motion-time, beat of the Universe, which we shall call a stœp, the discrete way of motion of tœs through SPace, which often as in movies we perceive in continuous mode eliminating the stop element:

$$\Delta S(\text{top}) \rightarrow \Delta t \rightarrow \Delta S \rightarrow \Delta(S)t(\text{ep}).$$

Moreover most of those Stœps will have either in a travel through 5D, or through a single ST, a unit of 'expenditure of vital energy', transformed in the length-motion of the lower scale in which the imprinting of motion as reproduction of form, happens (studied in 2D locomotion). So each stœp becomes an $\Delta-4$ unit of locomotion.

Thus if we consider a relative constant or function of the existence, $\Delta-1:\alpha$, as a finitesimal of its larger whole, ΔE , we obtain 2 simple functions:

$\alpha = \Delta s / \Delta t$ and $\alpha = \Delta t / \Delta s$ as the mathematical measure of a 'time stœp' or locomotion and 'volume-density stœp' or finitesimal quanta.

We shall call the first form a spatial finitesimal or step in space - a quanta of constant speed that moves and reproduces the being in space.

And if we again change this quanta, with a second 'derivative' we get a quanta of its constant acceleration.

And we shall call the second function, a time finitesimal, a change in the density of information or cyclical speed of the being as a second change in relation to its position in space.

Classic concepts of mathematics applied to 5D in series. Immense Geometric series

This said some clarifications are needed in classic series theory mostly related to the fact that 0 is not infinitesimal but 0' and α is limited. Let us denote by S_n the sum of the first n terms of the series; we will call it the nth partial sum. As a result we obtain a sequence of numbers:

$$S_1 = u_0, \quad \text{and we may speak of a variable quantity } S_n, \text{ where } n = 1, 2, \dots$$

$$S_2 = u_0 + u_1,$$

..... The series is said to be convergent if, as $n \rightarrow \alpha$, the variable S_n approaches a definite

$$S_n = u_0 + u_1 + \dots + u_{n-1}, \quad \text{finite limit. So instead of infinity } n \text{ is an immense number.}$$

.....

This limit is called the sum of the series, and in this case we write $\text{Lim } n \rightarrow \alpha S_n = S_w$

Where S_w is the 'population or worldcycle value of the series' - its total in space or time. It follows that of interest are series that converges to 0' sums, as they will be worldcycles in time, or to finite values, as they will represent a carrying capacity of the whole as a population in space.

But if, as $n \rightarrow \alpha$, the limit S_n does not exist, then the series is said to be divergent and in this case there is no sense in speaking of its sum. The series is an inflationary case of the mathematical mirror.

But thanx God things are not so simple, because *as we have seen there are two digital mirrors of worldcycles of existence, the 0'-1 unit circle (palingenetic worldcycle) and the 1- α , which differ in the 'certainty of one of its terms' - in the 0'1, the whole 1 is certain the finitesimal 0' uncertain, in the 1- α , the 1, fintiesimal is certain and the α relative*

uncertain. As both are mirrors of each other, we can consider the certainty of one of the two limits to calculate how far n in the S_n series of the other limit reaches (remember in 5D n does not tend to infinity). So we can make useful some infinity series by calculating its $n \rightarrow \infty$ value.

While we can discover that infinite series in the $0'-1$ sphere are not.

As a simple example (we shall always use simple examples in all our texts and sciences, as we want to educate the 'pro' in a philosophy of science common to all planes of space-time, for him or future 5D researchers if ever there is one besides this writer to complete the work:), let us consider the series: $1 + x + x^2 + \dots$,

whose terms form a geometric progression with common ratio x . The sum of the first n terms is equal to: if $|x| < 1$

$$S_n(x) = \frac{1 - x^n}{1 - x} \quad (x \neq 1). \quad < 1 \text{ this sum has a limit: } 1/1-x = 1+x+x^2\dots$$

If $|x| > 1$, then obviously the limit is ∞ , which has no value in classic mathematics as the series diverges, but it does in 5D as ∞ will be a number, normally of the trinity->decametric scale.

A different situation holds for $x = 1$, as the series becomes then a definition of the natural numbers, such as S_n gives us the value of the n natural number, and so it expresses how natural numbers are born in sequential time.

Finally, if $x = -1$ the values become, 1, -1, 1, -1, which are inverse values for a dimotion, representing therefore in its partial sums that take the values +1 and 0 alternately, a worldcycle of existence in repetitive pairs (0,1).

The example illustrates our case for 5D $0'$, ∞ realist values for the ' $\Delta-1$ ' and $\Delta+1$ limits of a T. ∞ domain: we obtain more information in such a case, as all the cases of the series DO have a meaning, while in classic mathematics only for $|x| < 1$ the series is meaningful; all the other values are divergent $S_n \rightarrow \infty$

These differences can be breached with the next theoretical axiom of classic series:

To each series there corresponds a definite sequence of values of its partial sums S_1, S_2, S_3, \dots such that the convergence of the series depends on the fact that the sums approach a limit, but also on 5D series the inverse that there is a limit to the number of sums; that is the concept limit is NOT only applied to the whole $S_n(x)$ but the parts $N(S)$; which is the pentalogic justification, if we were to develop here the more advanced 'concepts' of multiple time logic (that is, there are arrows of time, from $\Delta-1$ to $\Delta 1$, from $SS \Leftrightarrow TT$ and $St \Leftrightarrow Ts$ and $S \Leftrightarrow T$) so for everything it is a worthy exercise to study the inverse, for $A \rightarrow B, B \rightarrow A$.

It is then possible to define conversely, an arbitrary sequence of numbers S_1, S_2, S_3, \dots which corresponds to a series partial sums $S_1 + (S_2 - S_1) + (S_3 - S_2) + \dots$, of which will be the numbers of the sequence.

Thus the theory of variables ranging over a sequence may be reduced to the theory of the corresponding series, and conversely. Yet each of these theories has independent significance in 5D. The previous series is relevant because it signifies the commonest process of 'erasing' of previous terms in a time sequence; hence the series in reality tends not to be the value of the sum, but the steps of time, as 'previous generations' die away; and this indeed is the case for the most famous series of them all, the Fibonacci series, which mimics best processes of reproduction in time, and similar more complex concepts as the 'log curve'

It is then when in 5D series we can prove the 'natural tendency of all worldcycles' towards zero, as if the series converges, then its general term approaches zero with increasing n , since:

$$\lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} (S_{n+1} - S_n) = S - S = 0.$$

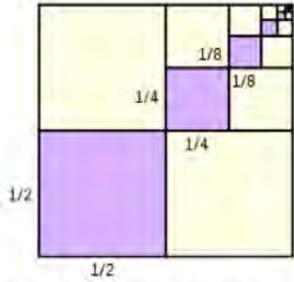

Moreover, the divergence=uselessness of a geometric progression with common ratio $x > 1$ follows immediately from the fact its general term does not approach zero. So we might say that all memoriless series represent a worldcycle of existence, which approaches to a zero sum, as more 'time quanta' happen.

An other similar criteria to find then if a series is useful can be obtained not from the simple 'memorial time sum or memoriless substaction' as the previous methods, but through the next level of dimotion operands, the x, \div .

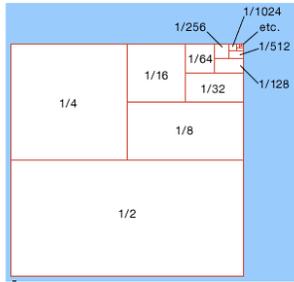

It is the so called D’Alambert method: Let us suppose that, as n approaches immensity, the ratio $(U_n + 1)/U_n$ has a limit q . Then for $q < 1$ the sequence will certainly converge, while for $q > 1$ it will diverge. But for $q = 1$ the question of its convergence remains open.

Thus the useful series are those that converge either in its sum as a whole in space towards a number or in its difference between terms towards a 0’ sum in time and often have a reflection on Nature. We already mentioned the Fibonacci series; we can consider another Finitesimal series that converge, example of:

Geometric series.

A series can be considered as a scalar 'search for its finitesimal part'. So in reality they are always 'limited' by the size of the 'finitesimal'.

Graphical illustration of the points of view of a ∞ -finite geometric series. Before understanding calculus mathematicians were concerned with 'relative' infinitesimal series.

Since similar paradoxes occur in the manipulation of infinite series, such as: $1/2 + 1/4 + 1/8 + \dots$

This particular series has its value precisely at 1, the whole, which is the conceptual meaning of ∞ Immensity, a world with a limiting membrain. But the way to define it is actually the inverse to which the

power series is written. That is to consider the 0’ undefined finitesimal where the series starts and then *as it happens in any process of reproduction, consider it a 2^x series that will give birth to the $1 = \infty$ relative whole after the finitesimal $0' = 1$ becomes that whole, illustrating the relativity of the concepts of finitesimal and infinite. It is thus not a constant partition of a system, but rather a*

constant growth.

To see why this should be so, consider the partial sums formed by stopping after a finite number of terms. The more terms, the closer the partial sum is to 1. It can be made as close to 1 as desired by including enough terms. Yet once we arrive to the Minimal quanta of the physical reality we describe (cell, atom, individual, etc.) there is NO need to go beyond except in errors of the mind.

Thus a series can be considered both a scalar 'search for its finitesimal part' but also the inverse growth of a seed to the whole. Because from the human whole perspective the indifferent element is the finitesimal we tend to write it backwards in time, but for the Universe most series happen from *the finitesimal to the whole*. Yet both cases they are always 'limited' by the size of the 'finitesimal'.

A geometric series is a series with a constant ratio between successive terms. So the series $1/2 + 1/4 + 1/8 \dots$ is geometric, because each successive term can be obtained by multiplying the previous term by $1/2$.

Each of the purple squares has $1/4$ of the area of the next larger square ($1/2 \times 1/2 = 1/4$, $1/4 \times 1/4 = 1/16$, etc.). The sum of the areas of the purple squares is one third of the area of the large square.

We can then consider to be a series that diminishes till it reaches the 'finitesimal' $1/n$ part of the whole. And it can easily be casted as a polynomial; since the terms of a geometric series form a geometric progression, meaning that the ratio of successive terms in the series is constant. This relationship allows for the representation of a geometric series using only two terms, r and a . The term r is the common ratio, and a is the first term of the series.

In the example we may simply write:

$$a + ar + ar^2 + ar^3 \dots \quad a = 1/2 \text{ and } r = 1/2$$

The behavior of the terms depends on the common ratio r :

If r is between -1 and $+1$, the terms of the series become smaller and smaller, approaching 0’ in the limit and the series converges to a sum. In the case above, where r is one half, the series has the sum one.

If r is **greater than one** or **less than minus one** the terms of the series become larger and larger in magnitude. The sum of the terms also gets larger and larger, and the series has no sum. (The series diverges.)

If r is **equal to one**, all of the terms of the series are the same. The series diverges.

If r is **minus one** the terms take two values alternately (e.g. 2, -2, 2, -2, 2,...). The sum of the terms oscillates between two values (e.g. 2, 0, 2, 0, 2,...). This is a different type of divergence and again the series has no sum.

For example in Grandi's series: $1 - 1 + 1 - 1 + \dots$.

Geometric series are among the simplest examples of immense series with finite sums, although not all of them have this property.

Historically, geometric series played an important role in the early development of calculus, and they continue to be central in the study of convergence of series.

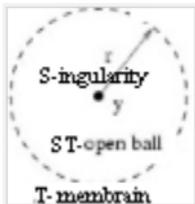

Geometric series are used throughout mathematics, and they have important applications in all sciences, as all of them are obviously scalar in its form, and respond to any of the 3 possible behaviors of systems, 'convergent information', divergent entropy and repetitive=reproductive oscillation. And finally *they are stable in its time motion given by the constant ratio between its geometric terms.*

Thus we can say a geometric series is a good mirror of a balanced ΔST repetitive 'present' event and as such real.

Of the many mirror correspondences between series and 5D we want now to stress the relationship between the part and the whole, as elements the ternary structure of any T.œ with its singularity, that can be considered the a, initial term, the FINITESIMAL above all other finitesimals, the king of the hill so to speak, its membrane and the space between them.

This relationship is truly enlightening of the symmetry between the 3 regions in space of a being, and its 3 regions in scale. Whereas the central finitesimal @-mind is the finitesimal of the lower plane, the external membrane the 'larger term' ar^n of the series, and *vital energy within them, the intermediate terms of the series which are irrelevant.*

So as the singularity @=a, of the series expands through the vital energy elements in growing 'circles' to reach the final 'membrane' ar^n , magically those irrelevant vital space cells will disappear in the final calculus of the value of the series.

Further on, those sums will be limited by n , which IS THE value of the NUMBER OF 'Planes' within the vital energy (concentric circles) required to arrive to the surface of it.

So a can also be viewed as the relative 'radius' of the singularity mind, which gives conceptual birth to the formula of the angular momentum of the series, where rmv , signifies r =sum of singularity radius (imagine the inner region of the system as an [Archimedean spiral](#)) m the vital energy mass, and v the membrane.

All this is expressed in terms of discrete numbers - not geometric continuous motion - by the classic formula:

For $r \neq 1$, the sum of the first n terms of a geometric series is:

$$a + ar + ar^2 + ar^3 + \dots + ar^{n-1} = \sum_{k=0}^{n-1} ar^k = a \left(\frac{1 - r^n}{1 - r} \right),$$

where a is the first term of the series, and r is the common ratio. We can derive this formula as follows:

$$\begin{aligned} s &= a + ar + ar^2 + ar^3 + \dots + ar^{n-1}, \\ rs &= ar + ar^2 + ar^3 + ar^4 + \dots + ar^n, \\ s - rs &= a - ar^n, \\ s(1 - r) &= a(1 - r^n), \end{aligned}$$

As we see, the @ singularity value and its final term, ar^n are the ONLY values that matter, with all the intermediate terms 'absorbed' in the dynamic relationship between membrane and singularity by them. If s , is the value of the series for the singularity, without the membrane, rs is the value of the system for the membrane, without the singularity. As the vital energy within has both the singularity and the membrane as its 'Klein' limits of a non-euclidean sphere, which they never reach. And so we rest from the 'Singularity', S plus ITS perception of the vital energy, the membrane, ' rs ', and its feeding (negative value) of the vital energy, $S-rS$, to search for the Solution of the power series which is not the membrane view but the singularity view, s :

$$s = a \left(\frac{1 - r^n}{1 - r} \right) \quad (\text{if } r \neq 1).$$

And so the solution as always is that of the mind view (in any discrete, numerical self-centered analysis) $s=a$ (value of the singularity) multiplied by the parenthesis.

Then we can easily see the symmetry of that topological explanation of the series, with its scalar translation as a travel down a scale from the whole to the finitesimals. Since as we differentiate those series to converge and make sense, because we are traveling down the scale to the finitesimals, r , as n goes to Immensity, must be less than one for the series to converge. The sum then becomes:

$$a + ar + ar^2 + ar^3 + ar^4 + \dots = \sum_{k=0}^{\infty} ar^k = \frac{a}{1 - r}, \quad \text{for } |r| < 1.$$

When $a = 1$, that is the singularity-minds as the view=value of the whole this can be simplified to:

$$1 + r + r^2 + r^3 + \dots = \frac{1}{1 - r},$$

...the left-hand side being a geometric series with common ratio r .

The beauty and simplicity of the formula shows by Occam's razor principle indeed its 'essential nature' in terms of time-space laws.

It is quite interesting then to understand in terms of the 5 Dimotions and $o-1=1-$, time-space dual sphere (essential for quantum physics) the variations of the power series. As they work for the $o-1$ sphere, in which the series travels a scale of the fifth dimension: from 1Δ down to $\Delta-1$ vs. its entropic divergent expansion when r is larger than ± 1 , as it travels in the $1-$ sphere, which should have a solution, when we define a relative infinite as the value of the whole perceived from the finitesimal point of view, which means a relative infinite. Then we make a travel upwards from the $\Delta-1$ finitesimal or Δ -being to the $\Delta+1$ world.

So those series represent the 1D and 4-5Dimotions, while the 3rd reproductive dimotion happens when $r=1$, as the reproductive sum that creates terms of a reproductive wave, which in a lineal sum of steps will represent the 2D locomotion of the being. Finally if r is -1 the series forms a 'steady state' O' sum world cycle, an oscillation of two values.

So the key concept of a proper 5D scalar interpretation of series (this analysis on the simplest of all series for 5D advanced theory would obviously expand to power series Taylor series etc, but we leave this work for the future pouring of my notebooks or in case I likely die earlier, for future researchers) is the concept of finitesimals and relative infinites,

The limit of a sequence

In that regard we amend the work of the German mathematician Karl Weierstrass and its formal definition of the limit of a sequence as follows:

Consider a sequence (a_n) of real numbers, by which is meant an infinite list: a_0, a_1, a_2, \dots

It is said that a_n converges to (or approaches) the limit a as n tends to Immensity, if the following mathematical statement holds true: For every $\epsilon > 0$, there exists a whole number N such that $|a_n - a| < \epsilon$ for all $n > N$. Intuitively, this statement says that, for any chosen degree of approximation (ϵ), there is some point in the sequence (N) such that, from that point onward ($n > N$), every number in the sequence (a_n) approximates a within an error less than the chosen amount ($|a_n - a| < \epsilon$). Stated less formally, when n becomes large enough, a_n can be made as close to a as desired.

For example, the sequence in which $a_n = 1/(n + 1)$, that is, the sequence: $1, 1/2, 1/3, 1/4, 1/5, \dots$, goes on forever.

Every number in the sequence is greater than 0, but, the farther along the sequence goes, the closer the numbers get to 0. For example, all terms from the 10th onward are less than or equal to 0.1, all terms from the 100th onward are less than or equal to 0.01, and so on. Terms smaller than 0.000000001, for instance, are found from the 1,000,000,000th term onward. In Weierstrass's terminology, this sequence converges to its limit 0 as n tends to Immensity. The difference $|a_n - 0|$ can be made smaller than any ϵ by choosing n sufficiently large. In fact, $n > 1/\epsilon$ suffices. So, in Weierstrass's formal definition, N is taken to be the smallest integer $> 1/\epsilon$.

This example brings out several key features of Weierstrass's idea. First, it does not involve any mystical notion of infinitesimals; all quantities involved are ordinary real numbers. Second, it is precise; if a sequence possesses a limit, then there is exactly one real number that satisfies the Weierstrass definition. Finally, although the numbers in the sequence tend to the limit 0, they need not actually reach that value.

Now this $n > 1/\epsilon$ is exactly what Leibniz without so much pedantic formalism considered the finitesimal, what we call the quanta of an $\Delta-1$ scale and what physicists call in its study of different Planes, the minimal 'error-quanta' $/2\pi$, k-entropy, or 'Planck mass' (Black hole of a compton wavelength volume, or minimal quanta of gravitational $\Delta+1$ Planes).

In the graph, $1/\pm 10^2$ is the limit considered the finitesimal of this particular 'graph perception'. *And also the error of our measure, as if we add another $1/\pm 10^2$, the series becomes a whole.*

Thus most paradoxes of mathematics arise from not understanding those simple concepts, as well as the meaning of 'inverse negative numbers'.

For example an infinite series which are less well-behaved are the series: $1 - 1 + 1 - 1 + 1 - 1 + \dots$

If the terms are grouped one way: $(1 - 1) + (1 - 1) + (1 - 1) + \dots$, then the sum appears to be: $0 + 0 + 0 + \dots = 0$.

But if the terms are grouped differently, $1 + (-1 + 1) + (-1 + 1) + (-1 + 1) + \dots$ the sum is $1 + 0 + 0 + 0 + \dots = 1$.

It would be foolish to conclude that $0 = 1$. Instead, the conclusion is that the series has a due value, and so it is creative oscillatory series with a time dynamic that cannot be merely said, not to have a solution, but has 2.

It has therefore an internal dual structure, which in modern Δ -Algebra is the group:

'a': $1-1=0$. And so if we accept that internal $\Delta-1$ unit for the series grouping and its 'real value is:

$$a+a+\dots = 0+0+0+\dots=0.$$

So we can write it in terms of the generator as:

$$\sum \delta t (+1) \Leftrightarrow \sum \delta f (-1), \text{ which defines generically a feed-back 'world cycle' whose sum is } 0'.$$

In classic maths of a single space-time continuum, the difference between both series is clear from their partial sums. The partial sums of $1/2+1/4\dots$ get closer and closer to a single fixed value—namely, 1. The partial sums of $a+$, without its internal $\Delta-1$ (a) structure, alternate between 0 and 1, so the series never settles down.

A series that does settle down to some definite value, as more and more terms are added, is said to converge, and the value to which it converges is known as the limit of the partial sums; all other series are said to diverge. But in ΔT many diverging series become when considered also its internal structure, convergent and well-behaved.

Actually, without even experimental evidence, there exist subtle problems with such 'infinite' construction. It might justifiably be argued that if the slices are infinitesimally thin, then each has 0' area; hence, joining them together produces a rectangle with 0' total area since $0 + 0 + 0 + \dots = 0$. Indeed, the very idea of an infinitesimal quantity is paradoxical because the only number that is smaller than every positive number is 0 itself.

The same problem shows up in many different guises. When calculating the length of the circumference of a circle, it is attractive to think of the circle as a regular polygon with infinitely many straight sides, each infinitesimally long. (Indeed, a circle is the limiting case for a regular polygon as the number of its sides increases.) But while this picture makes sense for some purposes—illustrating that the circumference is proportional to the radius—for others it makes no sense at all. For example, the “sides” of the infinitely many-sided polygon must have length 0, which implies that the circumference is $0 + 0 + 0 + \dots = 0$, clearly nonsense.

So by reductio ad absurdum, the limits of infinitesimals are always an $\Delta-1$ quanta. THIS of course also resolves all the Cantor's nonsense of different infinities and its paradoxes. It is just 'math-fiction' and worthless to study.

In 5D maths, lies the exhaustion method does limit the parts to finitesimals, as a realist method, which implies nature also limits its divisions. This concept would be lost in the 3rd formal age, also with the 'lineal bias' introduced on Dedekind's concept of a real number NOT as a proportion/ratio, between quantitative parameters of the 'parts' of a whole, or the 'actions' of a system and its $St < ST > Ts$ parameters, which is what it is, but as an 'abstract cut' in a lineal sequential order of 'abstract numbers'.

In the classic STi balanced age, both the limits method and finitesimal method of Leibniz considered infinitesimals, finitesimals that is with a 'cut-off limit' and real nature.

Those limits are minimal 'steps' of any scale (in time-motion), or minimal parts (in space-forms).

Further comments

As usual we cannot be exhaustive in any theme of 5D but just give a 'feeling' of the discipline and how it corrects the errors of the axiomatic mental method of justification of humind's mathematical space, as reality.

Series in that sense are also connected to the concepts of different infinities, so cherished in modern algebra (Cantor's cardinal infinities and all that jazz)... Their paradoxes disappear though when the number of elements of the series reduces to ∞ , so then *we can always compare. In fact it is the classic method to define a series as divergent or convergent.*

If we are given two series:

$u_0 + u_1 + u_2 + \dots$, with positive terms such that for all values of n , beginning with a certain one, we have the inequality:
 $v_0 + v_1 + v_2 + \dots$

$u_n \leq v_n$, then the convergence of the second series implies the convergence of the first, and the divergence of the first implies the divergence of the second. Consider the simplest case of the harmonic series:

$1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8} + \dots$. which it might seem to converge to K , as the numbers diminish. But if we compare it with the terms of a series where the sum of the underlined terms in each case is equal to $\frac{1}{2}$ but the last term of those partial sums S_n coincides with the same term of the harmonic series ($S_4=S_4$, $S_8=S_8$, etc.):

$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{4} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{16} + \dots + \frac{1}{16} + \dots$, It is clear that the sum S_n of the 2^{nd} series (S_2) approaches Immensity with increasing n , ($\sum 1/2$) and consequently the harmonic series diverges to 'potential infinity' even if it remains smaller than S_2

Can then we make the harmonic series converge towards a constant, as it seems a 'natural series' of growing finitesimals (when added inversely from $1/\max. n$). Yes we do, when we *rise to a power its terms*:

$$1 + \frac{1}{2^\alpha} + \frac{1}{3^\alpha} + \frac{1}{4^\alpha} + \dots$$

Again this can be proved comparing with a series that converges to 1, the whole:

$-\frac{1}{2}) + (\frac{1}{2} - \frac{1}{3}) + \dots + (\frac{1}{n-1} - \frac{1}{n}) + \dots$ with positive terms converges to unity as its sum. Since its partial sums S_n , are equal to:

$S_n = 1 - \frac{1}{n+1} \rightarrow 1 (n \rightarrow \infty)$. On the other hand, the general term of this series satisfies the inequality:

$$\frac{1}{n-1} - \frac{1}{n} = \frac{1}{(n-1)n} > \frac{1}{n^2},$$

from which it follows that the series:

$$1 + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots \text{ converges.}$$

Again we do find in the previous series $1/n-1 - 1/n$, which written backwards starting in the infinitesimal, forms a natural progression from $1/n$ to 1, with the memorial erasing of the previous term, a simple natural form to grow to 1; which do have many alternative paths/series.

Universal constants as series.

It is then obvious that all the 'numbers' we considered 'ratios' of fundamental 'dimotions' of reality; that is, Universal constants can be written as power series, which shows their symmetry in $\Delta_i-1>\Delta$, essential to understand the constant entanglement between scale, space and time in the Universe.

As we study them in different parts of those texts on calculus and algebra, we refer the reader to them.

Such series converge, the more so when we transfer them to the complex plane, which due to its ± 1 'i' variation, converts lineal processes into cyclical ones, mirroring better all functions related to time.

Series are also a justification for polynomials beyond the simplest spatial view of them in 3 steps of dimensions of space (point, line, volume) or motions of time (distance, motion, acceleration):

Polynomials as divergent or convergent scalar series.

In mathematics, a **power series** (in one variable) is an infinite series of the form

$$\sum_{n=0}^{\infty} a_n(x-c)^n = a_0 + a_1(x-c)^1 + a_2(x-c)^2 + \dots$$

where a_n represents the coefficient of the n th term and c is a constant. a_n is independent of x and may be expressed as a function of n (e.g., $a_n=1/n!$). Power series are useful in analysis since they arise as Taylor series of infinitely differentiable functions.

In many situations c (the center of the series) is equal to 0 , for instance when considering a Maclaurin series. In such cases, the power series takes the simpler form

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots$$

Any polynomial can be easily expressed as a power series around any center c , although most of the coefficients will be 0 since a power series has infinitely many terms by definition. For instance, the polynomial $f(x)=x^2+2x+3$ can be written as a power series around the center $c=0$ as

$$f(x) = 3 + 2x + 1x^2 + 0x^3 + 0x^4 + \dots$$

or around the center $c=1$ as

$$f(x) = 6 + 4(x-1) + 1(x-1)^2 + 0(x-1)^3 + 0(x-1)^4 + \dots$$

Or around any other center c One can view power series as

being like "polynomials of infinite degree," although power series are not polynomials. These power series are also examples of Taylor series, which are the key dimotions of scalar motion (1/1-x), entropy (exponential) and 1Dimotion (Sin).

The geometric series formula

$$\frac{1}{1-x} = \sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + \dots,$$

which is valid for $|x| < 1$ is one of the most important examples of a power series, as are the exponential function formula

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots,$$

and the sine formula

$$\sin(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!} = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots,$$

II AGE OF CALCULUS: THE OPERANDS ∂ AND ITS 'SENTENCES': PDES & ODES

We study the second age of Algebra, the age of calculus with its reflection of the 5 Dimotions of Timespace, as the best discipline to study the laws of times=changes, which are the fundamental laws of a Universe made of 'timespace dimotions', in which spatial mental spaces are a Maya of the senses.

The concepts of mathematical analysis, such as the derivative or the integral, as they presented themselves to Newton and his contemporaries, had not yet completely "broken away" from their physical and geometric origins, such as velocity and area. In fact, they were half mathematical in character and half physical. The conditions existing at that time were not yet suitable for producing a purely mathematical definition of these concepts. Consequently, the investigator could handle them correctly in complicated situations only if he remained in close contact with the practical aspects of his problem even during the intermediate (mathematical) stages of his argument.

Newton was guided at all stages by a physical way of looking at the problem. But the investigations of Leibniz do not have such an immediate connection with physics, a fact that in the absence of clear-cut mathematical definitions sometimes led him to mistaken conclusions. On the other hand, the most characteristic feature of the creative activity of Leibniz was his striving for generality, his efforts to find the most general methods for the problems of mathematical analysis; and its depth of philosophical understanding of finitesimals and wholes, shown also in his superior symbolism. The evolution of the concepts of mathematical analysis (derivative, integral, and so forth) continued, particularly in the work of Cauchy, which idealized the concept of a limit and used it as the basis for his definitions of continuity, derivative, differential, and integral. These definitions are widely used in present-day analysis and must be corrected back to the Greek and Leibniz's scalar view.

Regarding practical application such idealism requires the limitation of the true finitesimals of changer of the actual world, solved with the expedient method of using differentials. This means that at every step of our mathematical argument the results obtained will contain certain errors, which may accumulate as the number of steps in the argument increases. But mathematical idealism denies it.

Still no other discipline of science was so close to understand time=change as calculus was even if its whys were hidden in the 'magic' of its techniques, as *it subconsciously applied the pentalogic of different derivatives for each different function representing each distinct dimotion of space-time. And then once those derivatives of changes were applied, the whole function of existence could be integrated as a whole (ODEs). While multiple processes of finitesimal calculation of different variables, S=T equivalences between curvature and motion, etc. could be applied to the*

resolution of complex events between multiple T.æs performing different dimotions through PDEs and calculus of variations.

So not only pentalogic special analysis of change could be performed with derivatives and integrals of different operands, but very complex 'sentences' of sequential changes modeled with the 3 fundamental complex syntactic equations of calculus, ODEs, PDEs and calculus of variations, within the entropic limits of an A-B definite integral or the first and final moment on a time path, or the maximal and minimal or the points in which the function became zero cutting the real line, or in its first or second derivative.

So each equation of mathematical physics studying the motion of physical systems hid a sequence of 'existential algebra' for the physical parts of the simultaneous ensembled of variables studied.

We shall consider in this brief introduction to the golden age of calculus, a pentalogic analysis of derivatives and its inverse integrals, considering how calculus *represents a second layer of complexity over the operands it can further analyze extracting its minimal quanta of change, and/or integrating them in new 'dimensions'*.

To study then the complex combinations of calculus (multiple derivatives and integrals on time and space) -ODEs, PDEs and variational methods, and finally consider the fundamental simpler equations of mathematical physics, growth, reproduction and decay, studied with them...

THE CONNECTION BETWEEN INTEGRALS AND DERIVATIVES IN $\Delta S T$: FINITESIMALS AS LIMITS: 5D APPROACH

Those subtle philosophical considerations could only be done, once Leibniz established the tangent as the proper measure of change, where $Y(S)$ and $X(t)$, could be considered similar; $S \approx T$.

Then once the condition of present balance is reached; calculus works on praxis in most cases with the value of a differential, which is the equivalent to the finitesimal minimal time quanta of reality.

In other words, calculus consists on 'calculating' for a spatial present state, its quantity of time-change through a period of existence, which for worldcycles will be zero as we shall add, as explained in the worldcycle, both the positive growth and negative decreases of the y' sinusoidal functions.

Those functions then will be limited by the points of birth and extinction.

While inversely in the integration of exponential growth or decay, we will reach relative \propto growth and the function will be 'cut' by a log of maximal growth.

The finitesimals of physical scales. H, t, cc.

In the $S=T$ homology a mind stops motion into form, hence converts T into S. And this happens in an asymmetric manner according to the choice of upper or lower scales of 5D: Huminds are built, to see the larger whole as slow space and the smaller parts as time, because of 5D metrics (smaller faster clocks, slower larger wholes). And so we distinguish finitesimals of time in lower scales (angular momentum); and finitesimals of space associated to larger scales (c^2); with an intermediate k finitesimal of Boltzmann in the thermodynamic scale.

In praxis the existence of minimal quanta would only become evident with the discovery in mathematical physics of the minimal quanta of energy, which cannot be cancelled, as it becomes the 'minimal' amount that gives origin to virtual particles (Heisenberg's residual $h/2$). Yet again this minimal Planckton that cannot be eliminated WAS interpreted with the weird mental point of view that it was an 'uncertainty of humind's measure. A bizarre way of complicating reality; which amounts to say that the first cell is an uncertain measure of life, the first atom an uncertain measure of matter – and so the Planckton, minimal quanta of energy became the origin of one of the most arrogant deluded interpretations of reality humind's imagination has devised; ever since an ass breeder saw a bush burning and thought it was G. Bush talking to him – Copenhagen interpretation of quantum physics in terms of mathematical creationism still going strong, along Mosaic creationism for the throne of humind's philosophy of the Universe. *Back to reality, in any system we shall find a minimal quanta that does not go away. In physical systems is the 'Planckton'*

(H-Planck constant), the first quanta of angular perception, the first dimotional spin, of light space-time, our minimal part in the Δ -3 scale of timespace – as scale IS the absolute reality and appears always associated to a minimal space or time parameter, in which a scale starts to exist. The same finitesimal would be found in the Thermodynamic molecular scale as absolute zero cannot be reached, and in the scale cosmological scale as cc, a quanta =area of entropic light motion exists.

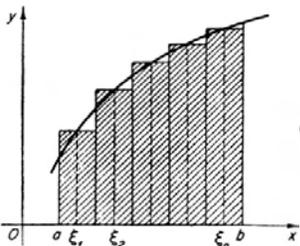

It is then essential to understand in depth 0's finitesimals for the workings of the Universe to fully grasp the relationship between the elements of Planes of spacetime – its fractal points and lines that ad them in time or space and analysis; in both directions - down as *derivatives* and up as *new dimensions called integrals*.

Finitesimal Quanta, as the limit of populations in space and the minimal action=dimotion in time.

In the idealized view of mathematics this amounts to a sum of smallish areas either taken as finitesimals of space (Riemann integral) or finitesimals of time (Lebesgue integral), with different applications to calculate its sum through an interval of events or populations. It is then only needed to be aware that what mathematicians call a limit of $h \rightarrow 0$ IS, a limit that stops when $h=0'$; that is when h finds its real finitesimal value on the 'units of measure' we use to calculate. This finitesimal might be as small as an atom which from the human scale in terms of the Avogadro number reduces to 10^{-24} parts but regardless of its tiny size the concept we want to stress is that *for a limit to exist h must stop at 0'*.

The method of integrals (or rather its reality) becomes then a clear proof of the discontinuity of scalar spacetime systems, which are made of steps, since the procedure of integration calculates the value of an Y(S) parameter for each min. $X(T)=1/t$ finitesimal 'støep of time quanta' measured by its frequency in time.

It is then NOT real to pretend that this $1/t$ =minimal time event must reach absolute zero. As Leonardo noticed, an instant (zero) has no time. So as a point with no parts has no space, and does not exist. Time exists because it is a minimal interval of motion, separated often by a stop state of space, and a dimotion of perceptive information, conforming a discontinuous series of støeps, $S=T$, the basic beat of reality, which is what we integrate by moving up and right $X \times Y$ to find an area and then summon them up.

So to solve an integral we proceed as follows. We divide the interval $[a, b]$ into n parts, not necessarily equal. We denote the length of the first part by Δx_1 , of the second by Δx_2 , and so forth up to the final part Δx_n . In each segment we choose points $\xi_1, \xi_2, \dots, \xi_n$ and set up the sum:

$$\xi_1) \Delta x_1 + f(\xi_1) \Delta x_2$$

$$\dots + f(\xi_n) \Delta x_n . \quad (28)$$

Let us suppose that a curve above the x-axis forms the graph of the function $y = f(x)$. We attempt to find the area S of the segment bounded by the line $y = f(x)$, by the x-axis and by the straight lines drawn through the points $x = a$ and $x = b$ parallel to the y-axis.

The magnitude S_n is obviously equal to the sum of the areas of the rectangles shaded in figure:

The finer we make the subdivision of the segment $[a, b]$, the closer S_n will be to the area S . If we carry out a sequence of such constructions, dividing the interval $[a, b]$ into successively smaller and smaller parts, then the sums S_n will approach S .

The possibility of dividing $[a, b]$ into unequal parts makes it necessary for us to define what we mean by "successively smaller" subdivisions. We assume not only that n increases beyond all bounds but also that the length of the greatest Δx_i in the n th subdivision approaches $0'$. Thus the calculation of the desired area has in this way been reduced to finding the limit:

$$s_n = \sum_{i=1}^n f(\xi_i) \Delta t_i,$$

We note that when we first set up the problem, we had only an empirical idea of what we mean by the area of our curvilinear figure, but we had no precise definition. But now we have obtained an exact definition of the concept of area. It is the limit:

$$s = \lim_{\max \Delta t_i \rightarrow 0} \sum_{i=1}^n f(\xi_i) \Delta t_i.$$

We have now an intuitive notion of area, on the basis of which we can calculate the area numerically.

We have assumed that: $f(x) \geq 0$. If $f(x)$ changes sign, then in figure, the limit will give us the –Algebraic sum of the areas of the segments lying between the curve $y = f(x)$ and the x-axis, where the segments above the x-axis are taken with a plus sign and those below with a minus sign.

Definite integral. The entropic limits of a domain.

The need to calculate the integral Sum limit arises in many other problems in which a new dimension is reached by the sum of finitesimal paths. For example, suppose that a point is moving along a straight line with variable velocity $v = f(t)$. How are we to determine the distance s covered by the point in the time from $t = a$ to $t = b$?

Let us assume that the function $f(t)$ is continuous in the sense aforementioned ($S \approx T; h \rightarrow 0$); that is, in small intervals of time the velocity changes only slightly. We divide the interval $[a, b]$ into n parts, of length $\Delta t_1, \Delta t_2, \dots, \Delta t_n$. To calculate an approximate value for the distance covered in each interval Δt_i , we will suppose that the velocity in this period of time is constant, equal throughout to its actual value at some intermediate point ξ_i . The whole distance covered will

$$s_n = \sum_{i=1}^n f(\xi_i) \Delta t_i,$$

then be expressed approximately by the sum:

and the exact value of the distance s covered in the time from a to b , will be the limit of such sums for finer and finer subdivisions; that is, it will be the limit:

$$s = \lim_{\max \Delta t_i \rightarrow 0} \sum_{i=1}^n f(\xi_i) \Delta t_i.$$

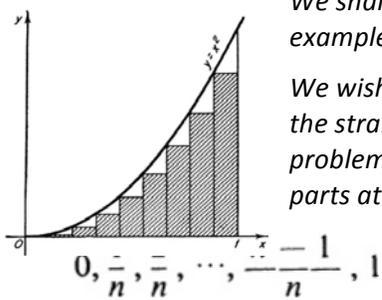

Whereas the limit Δt will be the minimal step in space and frequency of time of a single event.

Since as the word says a real limit is each relative $S(0') = T(0')$ of change.

Ideal mathematicians treat those finitesimals under the obsession with perfect measure as real zeros because they will discharge them to obtain a finite solution in $\Delta + 1$. We have discussed the falsehood in philosophical terms of such approach. But and this is the paradoxical marvel of the Universe, as for the $\Delta + 1$ system all $\Delta - 1$ finitesimals matter nothing, and are 'expendable', as a citizen is expendable for the state or army that 'doesn't count corpses'.

We shall try to give some idea of these concepts. For this purpose we consider the following example.

We wish to calculate the area bounded by the parabola with equation $y = x^2$, by the x-axis and by the straight line $x = 1$. Elementary mathematics will not furnish us with a means for solving this problem. But here is how we may proceed. We divide the interval $[0, 1]$ along the x-axis into n equal parts at the points:

and on each of these parts construct the rectangle whose left side extends up to the parabola. As a result we obtain the system of shaded rectangles, the sum S_n of whose

areas is given by:

$$S_n = 0 \cdot \frac{1}{n} + \left(\frac{1}{n}\right)^2 \frac{1}{n} + \left(\frac{2}{n}\right)^2 \frac{1}{n} + \dots + \left(\frac{n-1}{n}\right)^2 \frac{1}{n}$$

$$= \frac{1^2 + 2^2 + \dots + (n-1)^2}{n^3} = \frac{(n-1)n(2n-1)}{6n^3}.$$

Let us express S_n in the following form: $S_n = \frac{1}{3} + \left(\frac{1}{6n^2} - \frac{1}{2n}\right) = 3+in$

The quantity in , which depends on n , possesses a remarkable property: If n is increased beyond all bounds, then αn approaches $0'$, the $\Delta-1$ finitesimal. This property may also be expressed as follows: If we are given an arbitrary positive number, ε , ϵ , in classic calculus, then it is possible to choose an integer N sufficiently large that for all n greater than N the number in will be equal to the given ε in absolute value.

Whereas ε is the 'real physical value' of the finitesimal that 'exists'; where our 5D calculus stops. While in the axiomatic method ε can be chosen at will as small as the idealist mathematician wishes, which is NOT what reality shows. ε will be h in quantum physics, it will be the residual k temperature and the minimal c^2 part of a mass or minimal unit of vacuum spacetime in the galaxy; it will be a cell in an organism, an atom in a matter state. Or else what will be our counting made of? Entelechies?

This said, as ε is so small, for the larger $\Delta+1$ an indifferent it is OK to discharge the residual finitesimals to obtain an approximate result. Since absolute precision for $\Delta+1$, the plane of the observer is not needed and we discharge in specific methodological calculus the reminder smallish sum of some $0'$'s to calculate a result that to be more accurate should be adjusted with a ' \pm ' symbol or an \approx not an $=$ identity one.

So we obtained the area below the parabola as $1/3^{\text{rd}}$ by discharging a finitesimal term of the sum. This 'discharged' quantity however is real – it is the toll we pay but never gets to zero. In the measure of a fractal coast, the coast grows in size and precision with smaller steps, but we must stop the steps at a certain scale or else we would spend an infinite time measuring it. Information thus becomes idealized to make possible in finite time to measure it.

Formal symbols of 5D calculus from existential algebra: $-in$, ε , ϵ , finitesimal, indifferent, infinitesimal

It is then necessary as always in 5D to slightly change the symbols of 5D calculus, adapted to existential algebra – nor that I think huminds will ever upgrade its chips but once we are gone, faster than you think, likely more rigorous AI robots will adopt it.

The finitesimal is then defined as $-in$, the minimal amount we *discharge*, that is subtract (reason why it has a negative symbol), from the real result to obtain the idealized mathematical mirror of the event or spatial population, as for $\Delta+1$ it is indistinguishable, which we call indifferent (a simpler world, with an ethical component, because $-in$ is real and for itself it matters, even if for the $\Delta+1$ world is expendable). It can also be called a finitesimal (preferred) or $-in \approx$ finitesimal if you like. The symbol $-i$ also means it is the unit of $\Delta-i$, the minimal quantity of the whole; and finally the symbols, ε , ε , ϵ , mean they 'exist', they are 'real', $0'$ does have parts, it is a non-euclidean point of its own.

It would be easy to give many examples of practical problems leading to the calculation of such an imperfect limit. We will discuss some of them later, but for the moment the examples already given will sufficiently indicate the importance of this idea that adapts classic calculus to reality. As now each of the classic finitesimals used in calculus are as Leibniz put it 'a world in its own', and its study in real, philosophical terms reveals important properties of the structure of space-time and its modes of change. The following list of finitesimals can be then assessed in its properties under those conditions:

$$x_n = \frac{1}{n}, y_n = -\frac{1}{n^2}, z_n = \frac{(-1)^n}{n}, u_n = \frac{n-1}{n} = 1 - \frac{1}{n};$$

$$v_n = (-1)^n (n = 1, 2, \dots).$$

It is clear that x_n , y_n , and z_n are $-j_n$ finitesimals, the first of them approaching $0'$ through decreasing values, the second through increasing negative values, while the third takes on values which oscillate around $0'$. Further, $u_n \rightarrow 1$, while u_n does not have a limit at all, since with increasing n it does not approach any constant number but continually oscillates, taking on the values 1 and -1 – so the j finitesimal is the whole changing its direction of existence. All of them will be subject to further scrutiny when/if my finitesimal lifetime allows me to publish a few papers on mathematical physics, as they appear in multiple physical equations. The most important of them, being, X_n , the fundamental finitesimal, which we shall often comment on (the minimal part of an N whole, the dimensionless angle/curvature of a motion) and its closely connected $-1/n^2$, for accelerated motions.

Finally to notice that in the example, $-j_n$ makes the volume slightly smaller than $1/3^{\text{rd}}$ as $-1/2n > 1/6n^2$; which in reverse fashion if we consider the inner region of the curved parabola, makes it slightly larger than $2/3^{\text{rds}}$ which is a general rule for the internal volume of curved surfaces, always slightly larger than the polygonal, lineal form it encloses. I.e. the hexagon has a 3 perimeter, in its inscribed $\pi=3,14\dots$ circle; which again has important consequences for the real, vital structure of organs, as the smaller parts are 'lineal', and fit in the larger curved enclosures, leaving a safety space to its walls, which often has apertures when constructed as most circles are with 3 diameters, equal to $\pi-3/\pi=4\%$, which is the ideal amount of outer reality perceived through those apertures left by the 3 diameters that construct the porous membrain (percentage of energy and matter in the Universe we observe).

Finitesimals treated with other operands.

If we shall study how operands are treated with calculus it is customary to consider the reverse action of treating finitesimals with the polynomial operands, and as now 'finitesimals' are real fractal point with parts, it is obvious all the laws, properties and operands of polynomials work with 'finitesimals', the so-called laws of operations with limits of classic mathematics.

It is then not necessary (but possible to prove with the axiomatic ideal method, consistent in itself beyond the limitations we include, that if the variables x_n and y_n approach finite limits, then their sum, difference, product, and quotient also approach limits which are correspondingly equal to the sum, difference, product, and quotient of these limits. This fact may be expressed as:

$$x_1 \pm y_1, x_2 \pm y_2, x_3 \pm y_3, \dots$$

$$x_1 y_1, x_2 y_2, x_3 y_3, \dots$$

$$\frac{x_1}{y_1}, \frac{x_2}{y_2}, \frac{x_3}{y_3}, \dots$$

The only case that deserves further analysis, which is when a quotient of two finitesimal $0'$'s of different value is considered. Here it is impossible to state in advance whether the ratio x_n/y_n will approach a limit, and if it does, what that limit will be, since the answer to this question depends entirely on the character of the approach of x_n and y_n to $0'$; *that might result in either a $0'$ or an ∞ , thus proving ad lateral the falsehood of Cantorian equal infinities, as N^2 regardless of Cantor's musings IS larger than N but has paradoxically LESS information as a set of numbers (because in 5D larger Spatial forms have paradoxically less information, stored in the faster time cycles of smaller beings, $SxT=C$). Now, if we just care for the 'size' then the previous examples, $X_n=1/n$ & $Y_n=1/n^2$ means that, $Y_n/X_n=1/n \rightarrow 0'$ & $X_n/Y_n=n \rightarrow \infty$*

While $X_n/Z_n: (-1)^n/n \rightarrow (-1)^n$ does not approach any limit because Z_n does not; and *in quotients the dominant element is the denominator which tends to be the predator that imposes its properties to the whole.*

DIFFERENT DIMENSIONAL MOTIONS OF SPACE-TIME CHANGE

We then need to consider in how many dimensions finitesimal change and its aggregated account into a continuous $\Delta+1$ parameter of the whole change of the event can be observed, and how it can be diversified into Time, scalar or spatial change. Let us then consider two example of dual dimensional, holographic change, in Ts-speed and St-volume, which were the first 2 themes solved historically, to see how calculus methods can be used equally for quanta=frequency=steps of time, or quanta=populations=finitesimals of space: by virtue of $S=T$:

There are many different parameters of change in space and time in human sciences, due to the lack of clear-cut unifying concepts of space and time.

But in all we need to find a 'finitesimal quantity', either in time or in space, to measure 'changes of speeds and frequencies of time motion for each spatial step', $\Delta s/\Delta t$, or changes on volumes of space and populations of simultaneous space-beings. The difference between both analysis is one of 'persistence of change' or 'simultaneity of change' studied in space, vs. sequential time changes. In spatial analysis we often calculate a 'whole' domain in which populations have a gradient of change in its parameters, even if they co-exist together.

In time, this 'gradient' of change or 'acceleration' is calculated at 'each instant of time', for a single point, and thus its change, has lesser 'dimensionality in space'.

So the study of change in space tends to have more 'volume and dimensionality' and 'simultaneity', as the study of pure time changes (locomotion, entropy) is analyzed with the being reduced to a time point, or even losing its spatial simultaneity through entropic processes.

Adding a new dimension of 'width-energy-population-intensity-density-pressure.'

Let us put an example and resolve it in terms of space-quanta (method of limits) which is the first 'basic understanding' of calculus in terms of its finitesimal units:

Quanta of space.

A spatial use of the limit concept calculates not a time but a space volume, forebear of differential calculus:

Example 2. A reservoir with a square base of side a and vertical walls of height h is full to the top with water (figure 1).

With what force is the water acting on one of the walls of the reservoir?

We divide the surface of the wall into n horizontal strips of height h/n . The pressure exerted at each point of the vessel is equal, by a well-known law, to the weight of the column of water lying above it. So at the lower edge of each of the strips the pressure,

expressed in suitable units, will be equal resp $\frac{h}{n}, \frac{2h}{n}, \frac{3h}{n}, \dots, \frac{(n-1)h}{n}, h$.

We obtain an approximate expression for the desired force P , if we assume that the pressure is constant over each

$$P \approx \frac{ah}{n} \cdot \frac{h}{n} + \frac{ah}{n} \cdot \frac{2h}{n} + \dots + \frac{ah}{n} \cdot \frac{(n-1)h}{n} + \frac{ah}{n} \cdot h$$

$$= \frac{ah^2}{n^2} (1 + 2 + \dots + n) = \frac{ah^2}{n^2} \cdot \frac{n(n+1)}{2} = \frac{ah^2}{2} \left(1 + \frac{1}{n}\right)$$

strip. Thus the approximate value of P is equal to:

To find the true value of the force, we divide the side into narrower and narrower strips, increasing n without limit. With increasing n the magnitude $1/n$ in the above formula will become smaller and smaller and in the limit we obtain the exact formula:

$$P = ah^2/2$$

Leibniz rightly considered $1/n$ the 'finitesimal unit', whereas we consider 1 the whole, and n , its minimal fraction, usually 1 of its 10^{10} elements ($1/10^{10}$): the standard value of finitesimal units.

In the example again the finitesimal limit is extremely small. How much? We should consider statistical mechanics to find it is the size of molecules of water, which form bidimensional layers of liquid to shape the 3D volume, and are about 10^{20} times smaller than the whole in terms of Avogrado's Mols.

The error ϵ is so small as to be $P=(ah^2/2) \times 1.00000000000000000001 (1 +1/n)$

And this is a general rule in most cases: the finitesimal error is as small as $1/n$, where n is the quanta of the scale. So when we do $\Delta+1$ calculations as in most cases it is irrelevant. But theoretically *it is important and in fact it will give us a 'realist' concept for the uncertainty principle of Heisenberg.*

Hence unnoticeable, truly n =finitesimal, still important to understand the idealization of mathematical rules. *As it means theoretically that the correct concept is a differential equation, where the finitesimal is 'real'.*

The idea of the method of limits is thus simple, accurate and amounts to the following. In order to determine the exact value of a certain magnitude, we first determine not the magnitude itself but some approximation to it. However, we make not one approximation but a whole series of them, each more accurate than the last. Then from examination of this chain of approximations, that is from examination of the process of approximation itself, we uniquely determine the exact value of the magnitude. by ignoring the finitesimal error.

The same practical problem can be resolved with the differential used as an approximate value for the increment in the function. For example, suppose we have the problem of determining the volume of the walls of a similar closed cubical box whose interior dimensions are $10 \times 10 \times 10$ cm and the thickness of whose walls is 0.05 cm. If great accuracy is not required, we may argue as follows. The volume of all the walls of the box represents the increment Δy of the function $y = x^3$ for $x = 10$ and $\Delta x = 0.1$. So we find approximately:

$$\Delta y \approx dy = (x^3)' \Delta x = 3x^2 \Delta x = 3 \cdot 10^2 \cdot 0.1 = 30 \text{ cm}^3.$$

Speed and acceleration: 2D TT

We used a simple spatial case of a gradient with a clear equation, $P=ah^2/2$ to compare it with one case of time change in which the gradient also caused by gravitational 'weight' is not constrained by a wall, hence the force is released to become a time dimotions. Not surprisingly in such a case, as it was established experimentally by Galileo, the distance s covered in the time t by a body falling freely in a vacuum is expressed in terms of TT-acceleration by a similar formula: $s=gt^2/2$

Whereas g is a constant that measure the acceleration on Earth, equal to 9.81 m/sec^2 .

What is the velocity of the falling body at each point in its path?

Let the body be passing through the point A at the time t and consider what happens in the short interval of time of length Δt ; that is, in the time from t to $t + \Delta t$. The distance covered will be increased by a certain increment Δs . The original distance is $s_1 = gt^2/2$.

From the increased distance we find the increment: $\Delta s = s_2 - s_1 = \frac{g}{2}(2t\Delta t + \Delta t^2)$.

This represents the distance covered in the time from t to $t + \Delta t$. To find the average velocity over the section of the

path Δs , we divide Δs by Δt :
$$v_{av} = \frac{\Delta s}{\Delta t} = gt + \frac{g}{2} \Delta t.$$

Letting Δt approach $0'$, we obtain an average velocity which approaches as close as we like to the true velocity at the point A. On the other hand, we see that the second summand on the right-hand side of the equation becomes

vanishingly small with decreasing Δt , so that the average v_{av} approaches the value gt , a fact which it is convenient to

$$v = \lim_{\Delta t \rightarrow 0} v_{av} = \lim_{\Delta t \rightarrow 0} \frac{\Delta s}{\Delta t}$$

write as follows: $= \lim_{\Delta t \rightarrow 0} \left(gt + \frac{g}{2} \Delta t \right) = gt.$

While both formulae are never compared in classic physics, it is worth to notice that they are mimetic by virtue of $S=T$, so now the spatial gradient, 'h-eight' becomes the temporal gradient, time; the intensity of the gradient, giving for P by the a -mass of liquid, is now given by the g -force of the mass of the Earth; and the outcome is an inverse dynamic parameter of time change Pressure vs. a static parameter of spatial length, distance.

Pressure is an energy ST density. So a pressure gradient is an energy density gradient, acceleration is a TT -double time motion. And yet as both are ultimately 'holographic ST, TT ' dual functions its equations in 'scalar terms' are the same, a key concept for all the similar equations we will find regardless of the 'holographic dimotion' we integrate or deviate.

THE UPPER LIMIT: IMMENSITIES: ∞

The relative ∞ . +immensity.

It is then customary in calculus to teach the inverse concept of an infinite magnitude, which we also reduce to a relative Immensity, ∞ ; as infinities loose meaning and become entropic, uncertain in the borders of Δ , or beyond the domain of existence in time and space of the function we deal with.

Following the rules of English that change slightly the wording of 5D we thus substitute the word infinity for +immensity. Immensity as we all know is not infinite, but it is immensurable which is *the meaning that matters here, as such 'largesse' becomes the +j whole world for the -j infinitesimal that finds it 'infinite', because it no longer can measure it.*

We do talk of an immensely large magnitude, which is defined as a variable x_n ($n = 1, 2, \infty$), with the property that after choice of an immense large positive number M , *the limit of measure for the -jn=finitesimal* it is not possible to find a number $N > M$ that we can 'count in reality', within the limits of time and space of our $jn \approx$ finitesimal existence, such that for all $n > N$, $|x_n| > M$.

$M+j$ thus become the +immense value, ∞ , that limits the world of X . Such a magnitude x_n is said to approach +immensity. If it is positive (negative) from some value on, this fact is expressed thus: $x_n \rightarrow +\infty$ ($x_n \rightarrow -\infty$).

For example, for $n = 1, 2, \infty$; $\lim \log 1/n = -\infty$, $\lim n^2 = +\infty$; $\lim \tan (\pi/2+1n) = -\infty$

It is easy to see then that if a magnitude $+jM$ is immense, then $-jn = 1/M$ is immensely small, and conversely.

Something that as, 5D mathematics is experimental, moving into the realm of 'reality', not an 'ideal mathematical entelechy' must have an experimental consequence on the study of 'real immense creatures'. And indeed, we immediately notice that the largest species feed on indifferent $jn \approx$ finitesimals that are paradoxically immensely small. I.e. the largest mammals, Whales, feed on the smallest animals, Krills and Planckton; the largest cosmological bodies, gravitational black holes, feed in the smallest quanta, 'gravitons \approx neutrinos?', etc.

Which justifies the $\Delta \pm j$ structure of nested Universes, where the largest beings are made of the smallest parts.

This also shows that when we talk of an indifferent $jn \approx$ finitesimal, we are mostly referring to a quanta of entropic feeding, which is indifferent to the being. I.e. we reduce even further our food to its indifferent amino acids that we will then reform to our specific information.

The topological view is simple; the limits of the domain of a function for its finitesimal parts, are the membrane and singularity they cannot reach, as the whole for its inner parts is an open ball transited by the finitesimal.

It is thus essential in calculus the question of the 'boundary conditions', in which the membrane determines the volume which is integrated as the Space-time area, surrounded by the being that is meaningful to its territory.

The area integrated on a function has then 2 S=T meanings. Either is a measure of its vital energy between the singularity at 0' point and its membrane, the limits of the domain in space (albeit elongated in the lineal Cartesian frame) or if we integrate a motion between its initial condition where it receives its momentum and its final stop.

When a point moves back and forth within its world as it performs repetitive dimotions of existence we can integrate the path to extract information of its motion. For the larger Δ+1 world, the finitesimal integrated along the path is often a point of energy or information shared between the membrain and singularity as the initial point and boundary condition of its world seen as a topological open ball, where the membrain is its 'birth-seed' state and the singularity its final point of death-entropy. It is thus the quanta that the membrain 'sends to the singularity' for it to perceive or feed, which moves in a path of minimal action=consumption of energy between both. And finally the finitesimal might represent , an 'ex-foliated' unit of angular momentum, a skin layer of vital space subtracting piece by piece, finitesimal by finitesimal, for the T.œ to communicate in the outer world

The limit is called the definite integral of the function $f(x)$ taken over the interval $[a, b]$, and it is denoted by: $\int_a^b f(x) dx$.

The expression $f(x)dx$ is called the integrand, a and b are the limits of integration; a is the lower limit, b is the upper limit. And very often they are the initial and final point, the 0' singularity and membrain that cancel a worldcycle. And so in 5D a and b are NOT part of the integral, as the finitesimal if it is a time path does not exist on those 2 limits, we might consider to belong to $\Delta\pm 1$, or if it is a volume, represent the membrain and singularity of an open ball, of a 'different substance', not to be integrated.

RECAP. We change following the transformation of sciences into slightly different stiences, the concept of infinite from a relative infinite, , and an infinitesimal for a finitesimal. The first being the whole of an i -plane of reality, the second its minimal part.

The connection between differential and integral calculus.

The problem considered then reduces to calculation of the definite integral: $\int_0^h ax dx$.

Another example IS the problem of finding the area bounded by the parabola $y = x^2$.

Here the problem reduces to calculation of the integral: $\int_0^1 x^2 dx$.

We were able to calculate both these integrals directly, because we have simple formulas for the sum of the first n natural numbers and for the sum of their squares. But for an arbitrary function $f(x)$, we are far from being able to add up the sum (that is, to express the result in a simple formula) if the points ξ_i , and the increments Δx_i are given to suit some particular problem. Moreover, even when such a summation is possible, there is no general method for carrying it out; various methods, each of a quite special character, must be used in the various cases.

So we are confronted by the problem of finding a general method for the calculation of definite integrals. Historically this question interested mathematicians for a long period of time, since there were many practical aspects involved in a general method for finding the area of curvilinear figures, the volume of bodies bounded by a curved surface, and so forth.

We have already noted that Archimedes was able to calculate the area of a segment and of certain other figures. The number of special problems that could be solved, involving areas, volumes, centers of gravity of solids, and so forth, gradually increased, but progress in finding a general method was at first extremely slow. The general method could not be discovered until sufficient theoretical and computational material had been accumulated through the demands of practical life.

The work of gathering and generalizing this material proceeded very gradually until the end of the Middle Ages; and its subsequent energetic development was a direct consequence of the rapid growth in the productive powers of Europe resulting from the breakup of the former (feudal) methods of manufacturing and the creation of new ones (capitalistic).

The accumulation of facts connected with definite integrals proceeded alongside of the corresponding investigations of problems related to the derivative of a function. The reader already knows from that this immense preparatory labor was crowned with success in the 17th century by the work of Newton and Leibnitz. It is in this sense that Newton and Leibnitz are the creators of the differential and integral calculus.

One of the fundamental contributions of Newton and Leibnitz consists of the fact that they finally cleared up the profound connection between differential and integral calculus, which provides us, in particular, with a general method of calculating definite integrals for an extremely wide class of functions.

To explain this connection, we turn to an example from mechanics.

We suppose that a material point is moving along a straight line with velocity $v = f(t)$, where t is the time. We already know that the distance σ covered by our point in the time between $t = t_1$ and $t = t_2$ is given by the definite integral:

$$\sigma = \int_{t_1}^{t_2} f(t) dt.$$

Now let us assume that the law of motion of the point is known to us; that is, we know the function $s = F(t)$ expressing the dependence on the time t of the distance s calculated from some initial point A on the straight line. The distance σ covered in the interval of time $[t_1, t_2]$ is obviously equal to the difference: $\sigma = F(t_2) - F(t_1)$

In this way we are led by physical considerations to the equality: $\int_{t_1}^{t_2} f(t) dt = F(t_2) - F(t_1)$,

which expresses the connection between the law of motion of our point and its velocity.

From a mathematical point of view the function $F(t)$, may be defined as a function whose derivative for all values of t in the given interval is equal to $f(t)$, that is:

$F'(t) = f(t)$. Such a function is called a primitive for $f(t)$.

We must keep in mind that if the function $f(t)$ has at least one primitive, then along with this one it will have an infinite number of others; for if $F(t)$ is a primitive for $f(t)$, then $F(t) + C$, where C is an arbitrary constant, is also a primitive. Moreover, in this way we exhaust the whole set of primitives for $f(t)$, since if $F_1(t)$ and $F_2(t)$ are primitives for the same function $f(t)$, then their difference $\varphi(t) = F_1(t) - F_2(t)$ has a derivative $\varphi'(t)$ that is equal to 0 at every point in a given interval so that $\varphi(t)$ is a constant.*

From a physical point of view the various values of the constant C determine laws of motion which differ from one another only in the fact that they correspond to all possible choices for the initial point of the motion.

We are thus led to the result that for an extremely wide class of functions $f(x)$, including all cases where the function $f(x)$ may be considered as the velocity of a point at the time x , we have the following equality:

$$\int_a^b f(x) dx = F(b) - F(a),$$

where $F(x)$ is an arbitrary primitive for $f(x)$.

This equality is the famous formula of Newton and Leibnitz, which reduces the problem of calculating the definite integral of a function to finding a primitive for the function and in this way forms a link between the differential and the integral calculus.

Many particular problems that were studied by the greatest mathematicians are automatically solved by this formula, stating that the definite integral of the function $f(x)$ on the interval $[a, b]$ is equal to the difference between the values

of any primitive at the left and right ends of the interval. It is customary to write the difference (30) thus:

$$F(x) \Big|_a^b = F(b) - F(a).$$

Example 1. The equality: $(x^3/3)' = x^2$ shows that the function $x^3/3$ is a primitive for the function x^2 . Thus, by the formula of Newton and Leibnitz:

$$\int_0^a x^2 dx = \frac{x^3}{3} \Big|_0^a = \frac{a^3}{3} - \frac{0}{3} = \frac{a^3}{3}.$$

Example 2. Let c and c' be two electric charges, on a straight line at distance r from each other. The attraction F between them is directed along this straight line and is equal to:

$F = a/r^2$ ($a = kcc'$, where k is a constant). The work W done by this force, when the charge c remains fixed but c' moves along the interval $[R_1, R_2]$, may be calculated by dividing the interval $[R_1, R_2]$ into parts Δr_i .

On each of these parts we may consider the force to be approximately constant, so that the work done on each part is equal to: $a/r_i^2 \Delta r_i$. Making the parts smaller and smaller, we see that the work W is equal to the integral:

$$W = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{a}{r_i^2} \Delta r_i = \int_{R_1}^{R_2} \frac{a}{r^2} dr.$$

The value of this integral can be calculated at once, if we recall that: $\frac{a}{r^2} = \left(-\frac{a}{r}\right)'$,

So that:
$$W = -\frac{a}{r} \Big|_{R_1}^{R_2} = a \left(\frac{1}{R_1} - \frac{1}{R_2} \right).$$

In particular, the work done by a force F as the charge c' , initially at a distance R_1 , from c , moves out to Immensity, is

equal to:
$$W = \lim_{R_2 \rightarrow \infty} a \left(\frac{1}{R_1} - \frac{1}{R_2} \right) = \frac{a}{R_1}.$$

From the arguments given above for the formula of Newton and Leibnitz, it is clear that this formula gives mathematical expression to an actual tie existing in the objective world. It is a beautiful and important example of how mathematics gives expression to objective laws.

We should remark that in his mathematical investigations, Newton always took a physical point of view. His work on the foundations of differential and integral calculus cannot be separated from his work on the foundations of mechanics.

The definite integral

Returning now to the definite integral, let us consider a question of fundamental importance. For what functions $f(x)$, defined on the interval $[a, b]$, is it possible to guarantee the existence of the definite integral: $\int_a^b f(x) dx$, namely a number to which the sum: $\sum_{i=1}^n f(\xi_i) \Delta x_i$

Tends as limit as $\max \Delta x_i \rightarrow 0$? It must be kept in view that this number is to be the same for all subdivisions of the interval $[a, b]$ and all choices of the points ξ_i .

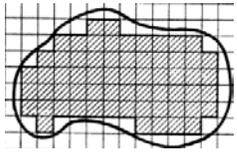

Functions for which the definite integral, namely the limit (29), exists are said to be integrable on the interval $[a, b]$. Investigations carried out in the last century show that all continuous functions are integrable.

But there are also discontinuous functions which are integrable. Among them, for example, are those functions which are bounded and either increasing or decreasing on the interval $[a, b]$.

The function that is equal to 0 at the rational points in $[a, b]$ and equal to unity at the irrational points, may serve as an example of a nonintegrable function, since for an arbitrary subdivision the integral sum s_n , will be equal to 0 or unity, depending on whether we choose the points ξ_i , as rational numbers or irrational.

Let us note that in many cases the formula of Newton and Leibnitz provides an answer to the practical question of calculating a definite integral. But here arises the problem of finding a primitive for a given function; that is, of finding a function that has the given function for its derivative. We now proceed to discuss this problem. Let us note by the way that the problem of finding a primitive has great importance in other branches of mathematics also, particularly in the solution of differential equations.

As we stated before integrals are mostly useful when we are studying a 'defined' full $S < ST > T$ system with a membrane or contour closing the surface. As integrals are more concerned with 'space' and 'derivatives' with time. And further on, those which integrate space-time systems, or double and triple integrals.

Calculus of ALL type of vital spaces, enclosed by time functions, with a 'scalar' point of view, parameter that measured what the point of view extracted in symbiosis with the membrane, from the vital space it enclosed. Alas, this quantity absorbed and ab=used by the point of view, on the vital space would be called 'Energy', the vital space 'field', the membrane 'frequency', the finitesimal 'quanta or Universal constant', and the scalar point of view 'active magnitude'.

The fundamental language of physics are differential equations, which allow to measure the content of vital space of a system. The richness and varieties of 'world species' will define many variations on the theme. Sometimes there will not be a central point of view, and we talk of a liquid state', where volumes will not have a 'gradient', but 'Pressure', the controlling parameter of the time membrane will be equal, or related to the gradient of the eternal world p.o.v. of the Earth (gravitational field).

Then we shall integrate along 3 parameters, the density that defines the liquid, the height that defines the gradient and the volume enclosed. Liquids, due to the simplicity of lacking an internal POV, would be the first physical application of Leibniz's findings by his students, the Bernoulli family. Next a violin player would find the differential equation of waves – the essential equation of the membranes of present time of all systems. The 3rd type of equations, those of the central point of view, will have to wait a mathematician, Poisson – latter refined by Einstein in his General Relativity.

This is the error of Newton. All cycles are finite, as they close into themselves. All worldcycles of life and death are finite as they end as they begun in the dissolution of death. All entropic motions stop. All time vortices once they have absorbed all the entropy of their territory become wrinkled, and die. Newton died, his 'time duration' did not extend to infinity.

But those minds measure from their self-centered point of view, only a part of the Universe, and the rest remains obscure. So all of them display the paradox of the ego, as they confuse the whole Universe with their world, and see themselves larger than all what they don't perceive. Hence as Descartes wittingly warned the reader in his first sentences 'every human being thinks he is gifted with intelligence.

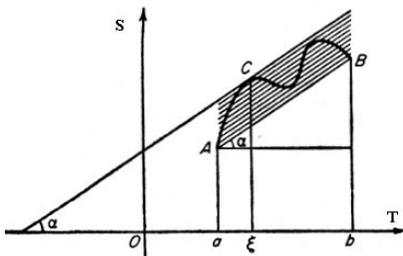

The mean value theorem.

A differential expresses the approximate value of the increment of the function in terms of the increment of the independent variable and of the derivative at the initial point. So for the increment from $x = a$ to $x = b$, we have:

$$f(b) - f(a) \approx f'(a) (b-a).$$

It is possible to obtain an exact equation of this sort if we replace the derivative $f'(a)$ at the initial point by the derivative at some intermediate point, suitably chosen in the interval (a, b) . More precisely: If $y = f(x)$ is a function which is differentiable on the interval, then there exists a point ξ , strictly within this interval, such that the following exact equality holds:

$$f(b) - f(a) = f'(\xi)(b-a)$$

The geometric interpretation of this “mean-value theorem” (also called Lagrange’s formula or the finite difference formula) is extraordinarily simple. Let A, B be the points on the graph of the function $f(x)$ which correspond to $x = a$ and $x = b$, and let us join A and B by the chord AB.

Now let us move the straight line AB, keeping it constantly parallel to itself, up or down. At the moment when this straight line cuts the graph for the last time, it will be tangent to the graph at a certain point C. At this point (let the corresponding abscissa be $x = \xi$), the tangent line will form the same angle of inclination α as the chord AB. But for the chord we have:

$\tan \alpha = \frac{f(b) - f(a)}{b - a}$ On the other hand at the point C: $\tan \alpha = f'(\xi)$:

$$\frac{f(b) - f(a)}{b - a} = f'(\xi)$$

This equation is the mean-value theorem, which has the peculiar feature that the point ξ appearing in it is unknown to us; we know only that it lies somewhere in the interval (a, b) .

Its interpretation in Δt is that $f'(\xi)$ corresponds to the value of a finitesimal lying between both.

FIRST, the fact that 'membranes must determine the beginning and end point of any function for it to be meaningful and solvable. And indeed, only because we know when it starts and ends the domain, we are sure to find a mean point.

If we consider then a T.œ mean value theorem, where $f(b) > f(a)$ if we are deriving in space, where $f(b)=\text{Max}$. S represents the *parameter of the membrane*, $f(a)$ will represent the *singularity* and so we shall find in between a finitesimal part of the vital energy of the T.œ with a mean value within that of Max. S (membrane) and Min. S (singularity). And viceversa, if we are deriving in search of the minimal quanta of time, $f(a) > f(b)$, where $f(a)$ represents the *time speed of the singularity* and $f(b)$ the *time speed of the membrane*. And the mean value will be that of the infinitesimal.

But in spite of this indeterminacy, the formula has great theoretical significance and is part of the proof of many theorems in analysis.

The immediate practical importance of this formula is also very great, since it enables us to estimate the increase in a function when we know the limits between which its derivative can vary. For example:

$|\sin b - \sin a| = |\cos \xi| (b-a) \leq b-a$

Here a, b and ξ are angles, expressed in radian measure; ξ is some value between a and b ; ξ itself is unknown, but we know that $|\cos \xi| \leq 1$

Another immediate expression of the theorem which allow to derive a general method for calculating the limits

$$\frac{\phi(b) - \phi(a)}{\psi(b) - \psi(a)} = \frac{\phi'(\xi)}{\psi'(\xi)}$$

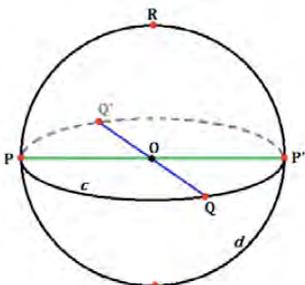

and approximations of polynomials with derivatives is:

For arbitrary functions $\phi(x)$ and $\psi(x)$ differentiable in the interval $[a, b]$, provided only that $\psi'(x) \neq 0$ in (a, b) , the equation, holds where ξ is some point in the interval (a, b) .

From the mean value theorem it is also clear then that a function whose derivative is everywhere equal to $0'$ must be a constant; at no part of the interval can it receive an increment different from $0'$. Analogously, it is easy to prove that a function whose derivative is everywhere positive must everywhere increase, and if its derivative is negative, the function must decrease.

And so the 'classic function of mean-value theorem' allow us to introduce an essential element of $\int \partial$ which will open up the Δt calculus of worldcycles of existence, the standing points of a function.

Maxima and minimum. The 3 standing points of a world cycle. The mean value sets for the region between the limiting points of the curve - which must be taken in higher step-timespace

as two sections of a bi-podal spherical line, part of the membrane of a 3D form, gives us then a value for the vital energy to be expressed with a scalar. And the initial and final point of the segment become the maximal and minimal of the function in $F(f)=x$ values.

It is then between those two limits a question of find points of the vital energy among them the singularity Max. $S \times t$, to have a well-defined TOE in its membrane (maximal minimal values) volume of energy, mean value and Maximal point of the Singularity.

We can then dissect the sphere in antipodal points related to the identity neutral number 0-1 the sphere of time probabilities that the largest whole maximises in its antipodal points. If we consider the antipodal points the emergent and final death point, which imperfect motions still close to $0'$ -sums, the maximal middle point will be the singularity, Max. $S \times \text{Max } t$.

Dimensional integration. Dimensions of form that become motions and vice versa.

Now the key to fully grasp the enormous variety of integral and derivative results obtained in all sciences, is to understand that all space forms can be treated as instants in time, or events of motion, and all motions in time can be seen as fixed present moments in space.

These series of combinations of time and space, $S>T>S>T$, which leaves a trace of steps and frequencies and its whole integration, which emerges as an $\Delta+1$ new scale of reality is at the core of all fractal, reproductive processes of reality.

For example the s-T duality is at the core of the Galilean paradox of relativity (e pur se muove e pur no muove), of Einstein's relativity, of Zeno's paradox.

So we can consider motion in time as reproduction of form in adjacent topologies of discontinuous space.

We can consider the stop and go motions of films, picture by picture, integrating those 'spatial pictures' into a time 'motion picture'.

We consider the wave-particle paradox, as waves move by reproduction of form and particle collapse by integration of that form in space into a time-particle.

In those cases integration happens because a system that moves *in time, reproduces in space. And vice versa, steps in space become a memory of time.*

Now it is important also to study case by case and distinguish properly what are we truly seeing population in space or events in time, as we can and often it happens that humans confuse in quantum physics where motion is so fast that time cycles appear as forms of space. We shall then unveil many errors, where a particle in time is seeing as a force in space (confusion of electroweak, transformative force as a spatial force, and so on).

All systems can be integrated, as populations in space to create synchronous super organisms and as world cycles in time, creating existential cycles of life and death. The population integral will be however positive and the integral in time will be $0'$.

Since. systems of populations in space do have volume. Yet the whole motion in time, can be integrated as closed paths of time, or conservative motions that are $0'$ sums, and this allows us to resolve what is time integration and space integration.

Consider to fully grasp this, the reproduction of a wave, which constantly reproduces its form as it advances in space, and cannot be localised (Heisenberg uncertainty) because it is a present wave of time, *as light moves NOT in the least space but the least time.* Now, consider a seminal wave - you, which reproduces in time, but becomes a herd of cells that integrated emerges into a larger scale. In both cases the final result is in space and so it is positive.

So each case must be studied to conclude we are either observing a time event or a spatial organism.

In that regard the most important and hence first view of the Rashomon Effect on $\int \partial$ is: this

$\int \approx \partial$ are time=space beats/steps in any d^2

It follows then that we can escape the memorial creation, step by step of the spatial form, as something which for us is no longer needed, when we are interested only in integrating the space, and for that reason the integral work merely as an integral of a volume, a surface - whose creation in time has already happened.

But we still have to find a quanta of that 'creation' now a mere 'population in space'.

WHY DIFFERENTIALS=FINITESIMALS NOT INFINITESIMAL 0s ARE THE REAL THING

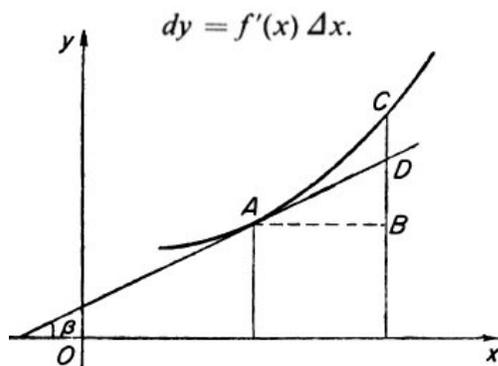

Finitesimals as Differential of a function. The stœps of motion and form that shape the flows of timespace.

The essential connection between ΔST actions and dimotions performed by a larger whole and algebra occurs in calculus, whereas the whole is the integral and the minimal indistinguishable part its (in)finitesimal. Again here the key concept is one of perception. So in fact we talk NOT of an infinitesimal limit but more on the thought of Leibniz of an $1/n$ quanta, so small that the whole doesn't distinguish and so it can be discharged. Themes those we shall analyze in depth when studying calculus.

This deep thought fact - that small steps are 'lineal' and longer ones are curved and ultimately 0' sum closed paths is the justification for the use of differentials instead of derivatives in most applications of calculus to reality. Because while the limit to infinity does not exist, there is a fundamental paradox between lineal approximations and open free steps in the small realm and curved closed worlds in the upper realm, which makes every 'finitesimal being' to feel happy and unbounded, tracing 'zig-zag' stop and go motions, where the motion is always a lineal step (try to walk in curved fashion)... but during the formal observation in stop-mode of the next step to run, the $\Delta+1$ enclosure whole will deviate your absolute motion into a cyclical step. And so while small steps are differentials, the sum of them, with the length-motion, height-perception, represented by the X and Y components of the tangent gives us finally a closed curve, or one which will have limits of its validity – mathematical domain – imposed by the higher $\Delta+1$ world.

Thus when we observe reality in any scale at the maximal detail of its stœps it appears exactly as the two sides of the tangent of a derivative, if we consider the 'absolute frame of coordinates', where X is the measure of steps of motion in lineal continuous time, and Y the coordinate of form and perception, which we already defined for evolution in biology, vital topology in -E Geometry and wave-particle states in quantum physics, in other papers, turn out to be in mathematics the ideal form of 'ST, space-time, form and motion states.

So we see electrons in a stop and go motion, deviating its path at each stage even if finally will trace its natural flow of time, and we see Brownian motion in particles that try to go straight but are constantly deviated by the larger world.

a lineal finitesimal of change

And the Earth looks flat but Elcano returned went to the west and returned through the east, and we think we shall live for ever when we are young looking at the future but when we are old we only see the past; and so in time, space and scale the paradoxes of curved order and small freedoms carry the existjential momentum through its worldline that always becomes a worldcycle for those who go beyond the 'shallow' 4D continuum into the sudden stops and discontinuities of moving on, to assess the new direction to take in front of insurmountable larger walls.

Differentials in essence are 'lineal' rates of change in small 'intervals' of any function that is curved, and whose exact, ideal, non-lineal rate of change in a long stretch is difficult to calculate. And in reality is used everywhere instead of the ideal derivative. And the justification in 5D is the concept of a finitesimal minimal

quanta, and the fractal nature of points and stœps, the minimal quanta of change. That is change is never infinitesimal, but a change implies a minimal $j-1$ unit of the being, either its frequency step or reproductive cell, etc. So that 'quanta' of change, which is better measure by the 'diameter' or 'height' or length of the spherical or tall or flat form (cell, atom, individual) is a differential.

The maths of it, are well known to any student. As it is so essential to 5D 'experimental mathematics' we shall bring it here for further comments.

Let us then consider a function $S = f(t)$ that has a derivative. The increment of this function: $\Delta s = f(t+\Delta t) - f(t)$ corresponding to the increment Δt , has the property that the ratio $\Delta s/\Delta t$, as $\Delta t \rightarrow 0$, approaches a finite limit, equal to the derivative: $\Delta s/\Delta t \rightarrow f'(t)$

This fact may be written as an equality: $\Delta s/\Delta t \rightarrow f'(t) + a$

where the value of a depends on Δt in such a way that as $\Delta t \rightarrow 0$, a also approaches $0'$; *since in Δt the minimal step of any entity always has a lineal form.*

Thus the increment of a function may be represented in the form:

$$\Delta s = f'(t)\Delta t + a\Delta t \quad \text{where } a \rightarrow 0, \text{ if } \Delta t \rightarrow 0.$$

The first summand on the right side of this equality depends on Δt in a very simple way, namely it is proportional to Δt . It is called the differential of the function, at the point t_n corresponding to the given increment Δt , and is denoted by: $ds = f'(t)\Delta t$

The second summand has the characteristic property that, as $\Delta t \rightarrow 0$, it approaches $0'$ more rapidly than Δt , as a result of the presence of the factor a .

It is therefore said to be a **finitesimal** of higher order than Δt and, in case $f'(t) \neq 0$, it is also of higher order than the first summand.

By this we mean that for sufficiently small Δt the second summand is small in itself and its ratio to Δt is also arbitrarily small.

Practical science only needs to measure a differential either in space $dy = BD + BC$ or in time, as a fraction of the unit world cycle, $f(x) = \cos^2 x + \sin^2 x = 1$ which becomes a minimal lineal step or action, $f(t) = S$ step.

In graph, decomposition of ΔS into two summands: the first (the principal part) depends linearly on ΔT and the second is negligible for small ΔS . The segment $BC = \Delta S$, where **$BC = BD + DC$** , **$BD = \tan \beta \cdot \Delta T = f'(t) \Delta t = dS$** , and DC is an infinitesimal of higher order than Δt .

For symmetry in the notation it is customary to denote the increment of the independent variable by dx , in our case dt to call it also a differential. With this notation the differential of the function is: **$ds = f'(t) dt$**

The derivative is the ratio, $f'(t) = ds/dt$ of the differential of the function, normally a 'whole spatial view' to the differential of the independent variable, normally a temporal step or minimal change-motion in time.

The differential of a function originated historically in the concept of an "indivisible", similar to our concept of a finitesimal and so much more appropriate for Δt than the abstraction of an infinitesimal with $\Delta t \rightarrow 0$, since time is discrete and there is always a minimal step of change, or reproductive step in a motion of reproduction of information.

Differentials of calculus are practical infinitesimals and its knowledge for any function acts as an Δt limit.

On the other hand, there is for any group that we can take as vital space-time, finds us a middle point.

Rightly then the indivisible, and later the differential of a function, were represented as actual infinitesimals, as something in the nature of an extremely small constant magnitude, which however was not $0'$.

According to this definition the differential is a finite magnitude, *measurable in space*, for each increment Δt and is proportional to Δt . The other fundamental property of the differential is that it can only be recognized in motion, so to speak: if we consider an increment Δt which is approaching its finitesimal limit then the difference between ds and Δs will be arbitrarily small even in comparison with Δt - *till it becomes $0'$. The error of interpretation in classic calculus being that it is the difference what approaches 0 as finally the function will be also lineal, not Δt , which will become a 'quanta' - as quantum physicists would latter discover.*

As this is the real model, the substitution of the differential in place of small increments of the function forms the basis of most of the REAL applications of the now-called 'finitesimal analysis' to the study of nature.

The \rightarrow Algebraic/graphic duality.

On view of our deeper departure from the ultimate essence of Analysis, which is to study steps of space-time. That is to put *-Algebraic S=T symmetries in motion; the -Algebraic vs. graphic interpretations of calculus responds to yet another symmetry of spatial vs. temporal methods, considered on our posts of @nalytic geometry and -Algebra.*

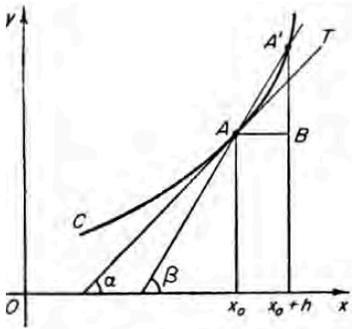

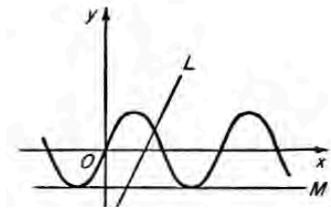

FIG. 10.

It does show more clearly what we mean by those 'steps' as basically the 'tangent' of the curve is in most cases a space-time step expressed by the general function: $X(s) = f(t)$

Obviously as s and t are ill defined, it was only understood for lineal space-distance and time-motion. And so the 'geometrical' abstract concept remains, void of all experimental meaning... as a... tangent... it was...

Spatial:geometric view.

We are led to investigate a precisely analogous limit by another problem, this time a geometric one, namely the problem of drawing a tangent to an arbitrary plane curve.

Let the curve C be the graph of a function $y = f(x)$, and let A be the point on the curve C with abscissa x_0 (figure 10). Which straight line shall we call the tangent to C at the point A ? In elementary geometry this question does not arise. The only curve studied there, namely the circumference of a circle, allows us to define the tangent as a straight line which has only one point in common with the curve.

To define the tangent, let us consider on the curve C (figure up) another point A' , distinct from A , with abscissa $x_0 + h$. Let us draw the secant AA' and denote the angle which it forms with the x -axis by α . We now allow the point A' to approach A along the curve C . If the secant AA' correspondingly approaches a limiting position, then the straight line T which has this limiting position is called the tangent at the point A . Evidently the angle α formed by the straight line T with the x -axis, must be equal to the limiting value of the variable angle β .

The value of $\tan \beta$ is easily determined from the triangle ABA' (figure up):

$$\tan \beta = \frac{BA'}{AB} = \frac{f(x_0 + h) - f(x_0)}{h}$$

For the limiting position we must have

$$\tan \alpha = \lim_{A' \rightarrow A} \tan \beta = \lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

It is then clear that h is the frequency quanta of time, or if we are inversely using the $\int \partial$ method to measure space populations, the minimal unit. And so the ultimate concept here is that h NEVER goes to 0. And the clear proof is that if it were arriving to 0, $x/h = \infty$.

So infinitesimals do NOT exist, and it only bears witness of the intuitive intelligence of Leibniz that he so much insisted on a quantity for $h=1/n...$ (and the lack of it of 7.5 billion infinitesimals of Humanity, our collective organism, which memorise this $h \rightarrow 0$ that so much abstract pain gave me when a kid - one of those errors I annotated mentally with the absurd concept of a non-E point with no breath, or else how you fit many parallels, of the limit of c -speed, how Einstein proved that experimentally?, and other 'errors' that Δst does solve in all sciences).

But for other curves such a definition will clearly not correspond to our intuitive picture of "tangency."

Thus, of the two straight lines L and M in figure below, the first is obviously not tangent to the curve drawn there (a sinusoidal curve), although it has only one point in common with it; while the second straight line has many points in common with the curve, and yet it is tangent to the curve at each of these points.

And yet such a curve is ultimately the curve of a wave, and we know waves are differentiable. So the tangent IS NOT the ultimate meaning of the $f\partial$ functions - time/space beats are. The question then is what kind of st beat shall we differentiate in such a transversal wave?

A different dimension, normally as waves are the 2nd dimension of energy, as in the intensity of an electric flow... a mixture of a population and a motion; or 'momentum' (the derivative of energy)...

And so *the next stage into the proper understanding of $f\partial$ operations is what 'kind of dimensional space-time change-steps' we are measuring.*

Δ view: The inversion of the finitesimal calculus of $\Delta-1$ is the integral calculus of 5D.

The transition to Analysis: new operations

The mathematical method of limits was evolved as the result of the persistent labor of many generations on problems that could not be solved by the simple methods of arithmetic, Algebra, and elementary geometry.

The inverse properties of Space problems and temporal problems.

What were the problems whose solution led to the fundamental concepts of analysis, and what were the methods of solution that were set up for these problems? Let us examine some of them.

The mathematicians of the 17th century gradually discovered that a large number of problems arising from various kinds of motion with consequent dependence of certain variables on others, and also from geometric problems which had not yielded to former methods, could be reduced to two ST types:

Temporal examples of problems of the first type are: find the velocity at any time of a given nonuniform motion (or more generally, find the rate of change of a given magnitude), and draw a tangent to a given curve. These problems led to a branch of analysis that received the name "differential calculus."

Spatial examples: The simplest examples of the second type of problem are: find the area of a curvilinear figure (the problem of quadrature), or the distance traversed in a nonuniform motion, or more generally the total effect of the action of a continuously changing magnitude (compare the second of our two examples). This group of problems led to another branch of analysis, the "integral calculus."

Thus 2 S=T problems are singled out: the temporal problem of tangents and the spatial problem of quadratures.

Now the reader would observe that unlike the age of Arithmetics and Algebra, which stays in the same 'locus/form'; here we observe a key property of analysis: the *transformation of a temporal cyclical question, into a lineal spatial solution.*

I.e. the solution of acceleration/speed by a lineal tangent, through an approximation; and the calculus of a cyclical, spatial area by the addition of squares. And the deep philosophical truth behind it, which only Kepler seemed to have realized at the time:

'All lines are approximations or parts of a larger worldcycle'

And so we can consider in terms of modern fractal mathematics, that 'the infinitesimal is the fractal unit, quanta or step' of the larger world cycle, and as a general rule:

'All physical processes are part of a conservative 0'-sum world cycle'.

Which explains ultimately the conservation of energy and motion, as motions become ultimately world cycles, either closed paths in a single plane, or world cycles balanced through $\Delta\pm 1$ planes.

Such is the simple dual DST justification of Analysis, as always based in Δ ... finitesimals and St... the inverse properties of $f\partial$.

Are there other operands of mathematics beyond those of calculus and hence other dimensional motions and complex minds beyond humind's maximal understanding of the game of existence reflected in those texts?

Yes... We have not really analyzed the most important of all operands, the symbol of equality, which mathematical praxis uses so merrily even of logicians and rigorous mathematicians have rightly studied the fact that equality as an identity is the rarest of all occurrences. Even so more in a world in which fractal points hold an invisible inner mind-world which can only be equalized with the restricted view of Euclid's points with no breath.

Differentials - any St-Dimensional Steps

The disquisition of which 'minimalist finitesimal' allow us to differentiate an $S \approx T$ -Algebraic symmetry, brings us to the 'praxis' of calculus techniques that overcome by 'approximations' the quest for the finitesimal quanta in space or time, susceptible of calculus manipulation, which gave birth to the praxis of finding differentials, which are the minimal $F(Y)$ quanta to work with and obtain accurate results (hence normally a spatial finitesimal of change under a time dependent function). This was the origin of the calculus of differentials.

As always in praxis, the concept is based in the duality between *huminds that measure with fixed rulers, lineal steps, over a cyclical, moving Universe. So Minds measure Aristotelian, short lines, in a long, curved Universe.*

So the question comes to which minimalist lineal step of a mind is worthy to make accurate calculus of those long curved Universal paths.

It is then obvious that the derivative of a lineal motion has more subtle elements than its simplest -Algebraic form, the $x \div$ lineal operation of 'reproductive speed' and so the concept of a differential to measure the difference between steady state lineal reproduction and the variations observed by a curve appeared as the strongest tool of approximation of both type of functions.

As we have considered that most differential equations will be of the form: $F(s) \approx g(t)$, where s and t are *any of the 5 Dimensions of Space* ($\$, S, \$, f, \bullet$) or *5 Dimensions of time* ($t, T, \partial, \partial, O$), whose change respect to each other, we are bound to study... showing how a spatial whole is dependent on the change and form of a world cycle, we shall consider generally that $y \rightarrow s$ and $x \rightarrow t$...

The result of this change will be a much more generic concept of speed of change in any of the dimensions of entropy, motion, iteration, information or form that defines the Universe, letting us introduce its 3 fundamental parameters, S/t =speed, t/s =density and $s \times t$ = momentum/force/energy... in a natural way with its multiple different meanings, Disomorphic to each other - as we repeat the s and t of the general

Space finitesimals vs. Time finitesimals

We must 'differentiate' when differentiating (:

-Space finitesimals, *which are the minimal quantity of a closed energy cycle or simultaneous form of space*, easier to understand, as they are 'quanta' with an apparent 'static form', which can be 'added', if they are a lineal wave of motion-reproduction, along the path; or can be integrated (added through different areas and volumes), to give us a 3D reality.

-Time finitesimals, which are the minimal period for *any action of the being and will trace a history of synchronicities as the actions find regular clocks, which interact between them to allow the being to perform ALL their 5D actions needed to survive. So we walk $A(a)$, but then eat energy $\dot{A}(e)$, and we do not do them often together. Actions have different periodicities, for EACH species that perform 5 actions. So to 'calculate' all those periodicities in a single all-encompassing function we have to develop a 5D variable system of equations.*

- Spacetime finitesimals. But more interesting is the fact that Nature *works simultaneously integrating populations in space and synchronising their actions in time. So we observe also space-time finitesimals where the*

synchronicity consists in summoning the actions of multiple quanta that perform in the same moment the same 'D-motion', which is 'reinforced' becoming a resonant action.

And for the calculus of those space-time finitesimals the best way to go around is by 'gathering the sum of $\Delta-1$ quanta' into a 'larger Δ^0 quanta' treated as a new '1' adding up its force. Even if most of them are just complex ensembles of the simplest actions of many cellular parts - steady state motions, reproduction of new dimensions and vortex of curvature and information absorption.

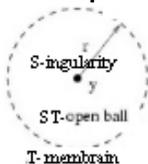

All functions of analysis thus can be considered operations on actions of space-time.

Groups of Finitesimals and their synchronous actions thus meet at Δ^0 in the mirror of mathematical operations, through the localisation of a 'theoretical' tangent \approx infinitesimal of the nano-scale ($\partial s/\partial t$ proper) or an 'observable' differential, a larger finitesimal, which is the real element, as any finitesimal is a fractal micro points that have a fractal volume, expressed in the differential.

Then we gather them, in time or space and study their 'inverse' action in space or time.

So the first distinction we must do is between finitesimals expressed as functions of time frequencies and finitesimals expressed as areas of space. And the actions described on them. In practice though most finitesimals are spatial parts whose frequency of action is described by the $f(x)=t$ function.

The 3 parts of T.æ.

Every event and form must be analysed ternary, and so happens with integrals and derivatives, which often represent integrals of space-time quanta belonging to the vital energy of the system, constrained in time or space by the singularity and outer membrane. Or might be of time quanta. So how can we differentiate them?

Thus we establish a correspondence between 5 Dimotions, TT, St, Ts ST and SS and its integrals, such as:

TT: Both elements are time like. So in TT-dimotions we integrate a frequency of Time dimotion, the finitesimal over a

time duration: $\int_{T_0}^{T_1} \partial t$

SS: Both elements are space-like. So we integrate a quanta of population over a volume of space: $\int_{S_0}^{S_1} \partial s$

Ts: If we call energy, Ts, a motion with a little form, we are thus considering more complex equations to integrate, and we can use the obvious example of physical systems, in which energy becomes the integration of existential momentum, mv , a combined ST parameter of space and time, along a path of time, giving us $E=1/2 mv^2$. So in general

any Ts form will be integrated in the form: $\int_{T_0}^{T_1} \partial st$

St: Inversely for changes in the information of systems, which are perceived as spatial forms with a little bit of motion,

the integration will be of the form: $\int_{S_0}^{S_1} \partial st$

ST: And finally for systems that experience a reproductive process in space-time, a single integration will not suffice, so we will require a double or triple integral of the system either in space or time, requiring a more profound analysis for

each case: $\iint_{S,T} st \partial s \partial t$

$\int \delta t = \Delta e$ becomes the integral of the inner spatial quanta of the open ball, surrounded by the membrane of temporal cycles, which conserves its Energy and by the sum of all T.oes that of the Universe. Its calculus, after finding a 'continuous derivative', surrounded by the membrane is then an integral: $\int \text{Sp} \times \delta f = \text{Ke}$.

And inversely. If we consider a single quanta of space or a single frequency of time, a moment of lineal or angular momentum, the result is a derivative.

So Analysis becomes the fundamental method to study travels upwards and downwards of the 5th dimension.

In general if we call a spatial quanta a unit of lineal momentum of each scale and a time cycle a unit of angular momentum, the metric merely means the principle of conservation of lineal and angular momentum.

Thus analysis studies the process which allows by multiplication of 'social numbers', either populations in space or frequencies of time, a system to 'grow in size'; which is the ultimate meaning of travelling through the 5th dimension. For example, when a wave increases its frequency, it increases the quantity of time cycles of the system. When a wheel speeds up its increases the speed of its clocks. And vice versa, when a system increases its quanta, growing in mass, or increasing its entropy (degrees of motion in molecular space), it also grows through the 5th dimension.

And the integration along space and time, of those growths, is what we call the total Energy and information of the system

It is what physicists call the integral of momentum or total 'Energy and information of the system'

So we shall only bring about here some examples of analysis concerned with the definitions of the fundamental parameters of the fractal Universe, that is the conservation principles and balances of systems which can be resumed in 2 fundamental laws:

Continuity of functions

All this understood we can then return to the inflationary nature of languages, which in the case of mathematics means that without a mirror reflection in reality, it tries to introduce false concepts of infinity and continuity with pedantic axiomatic methods, origin of the concept of absolute continuity of a function; when the true concept is the 'stop and step' nature of motions, and dark, non perceived regions between continuous points, or finitesimals. So it is irrelevant if the finitesimal is a natural number to talk of discontinuity, as the system will have contiguous finitesimals of 1 number size. We then talk of measure more than continuity and errors of measure, from an upper Δ^0 mind"

Intuitively, a function $f(t)$ approaches a limit L as t approaches a value p if, whatever size error can be tolerated, $f(t)$ differs from L by less than the tolerable error for all t sufficiently close to p .

Just as for limits of sequences, the formalization of these ideas is achieved by assigning symbols to "tolerable error" (ϵ) and to "sufficiently close" (δ). Then the definition becomes: A function $f(t)$ approaches a limit L as t approaches a value p if for all $\epsilon > 0$ there exists $\delta > 0$ such that $|f(t) - L| < \epsilon$ whenever $|t - p| < \delta$. (Note carefully that first the size of the tolerable error must be decided upon; only then can it be determined what it means to be "sufficiently close.")

But what exactly is meant by phrases such as "error," "prepared to tolerate," and "sufficiently close"?

Again it is the relative $i-1$ quanta of the system studied. The 'error' of measure will then become ESSENTIAL to the explanation of the Uncertainty principle of Heisenberg, which indeed can be obtained from theory of measure and error, by pure mathematical methods.

So in ideal mathematics, having defined the notion of limit in this context, with no limit to the infinitesimal size of the error, it is straightforward to define continuity of a function. Continuous functions preserve limits; that is, a function f is continuous at a point p if the limit of $f(t)$ as t approaches p is equal to $f(p)$. And f is continuous if it is continuous at every p for which $f(p)$ is defined. Intuitively, continuity means that small changes in t produce small changes in $f(t)$ —there are no sudden jumps.

But as that small change will always be in detail an ϵ -quanta, in great detail there are quantum jumps. In fact, as there is always an ϵ -quanta, in any process in space or time, in form and motion (as we have shown when considering the nature of motion as reproduction of form in adjacent spaces) there will always be a quantum jump for all motions. And motion will be the reproduction of form in quantum jumps of ϵ , nature.

1/n: the (in)finitesimal (in)finite

With the convention that $f(x)$ is normally a function of time frequencies, $f(t)$, of motions of time, whose synchronies of synchronicity in space are expressed by an Algebraic equation, we bring the following understanding:

Infinitesimal quanta in any scale is the departure point to build any function, as such it must have a minimal size, and $f'(t)$ is normally a good measure.

The infinitesimal study as perceived from the finite point of view is the view of fractals, when in detail and observing the closed worldcycles that separate and make each infinitesimal a whole.

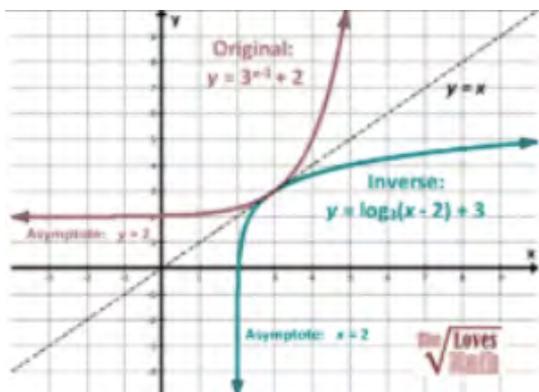

A derivative is the finitesimal of the function observed, and so when we go even further and study as enlarged into our scalar view tin maximal information we are in the fractal view of reality.

So as we expand our view the fractal view becomes more real, till finally the enclosures observed $\Delta-1$ become fractal and we recognise its self-similarities: $\Delta-1 \leq \Delta^0$.

For each derivative thus a function shows its $1/n$ infinitesimal (not necessarily this function, which is the derivative of the logarithm).

It follows that functions which grow ginormously have a 'quanta of time' reproduced and so its minimal derivative finitesimal is the function itself, e^a .

In the next graph we see inverse equations of exponentials and logarithms.

Exponentials express better decay than exponential growth, with the exponent "negative".

Mathematics is a reflection of nature. A small mirror of its $\Delta^0 \pm i$ Structure and so we need for exponential growth that Nature provides unlimited energy for growth, which happens only in the $0'-1$ generational dimension of the being, or in its inverse decay/ in its 4D entropy age. of death.

On the other hand the limit of logarithmic growth maps out better in logistic curves real growth being a good function to express Δ scales.

So numbers reflect those processes in their inverse exponential/logarithm mathematical graphs and numerical series.

ST: As the three coordinate systems, self-centred into an Δ^0 pov, which reflects each of the three 'topologies of space-time' (Cylindrical: lineal, polar: cyclical and cartesian: Hyperbolic); while the infinitesimal $0-1$ scale, and the infinite $1-\infty$ scale divided by the '1' Δ^0 relative element, represent perfectly the Δ -scalar nature of super organisms.

$\Delta^0 \pm 1$: Further on, we can 'reduce' each relative Immensity to those 3 Planes, and represent all timespace phenomena with the different families of numbers that close Algebra (entropic, positive numbers, informative, negative numbers, present space-time, complex bidimensional numbers, s/t ir-ratio-nal numbers, etc.), mathematics becomes essentially the more realist language to represent the scalar, organic, ternary Universe.

The $0'-1$ scale is equivalent to the $1-\infty$ scale for the lower $\Delta-1$ Universe, where $1=\Delta^0$, the whole and $1-\infty$ is the $\Delta+1$ eternal world.

And this is the symmetry to grasp the consequences of the $0-1-\infty$ fundamental graph of the fifth dimension. Let us see how with a simple example:

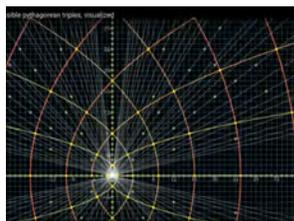

The mirror symmetries between the $0'-1$ universe and the $1-\infty$ are interesting as they set two different 'limits', an upper uncertain bound for the $1-\infty$ universe, in which the 1-world, Δ^0 exists, and a lower uncertain bound for the $0'-1$ Universe, where the 1 does not see the limit of its lower bound. Are those unbounded limits truly infinite?

This is the next question where we can consider the homology of both the microscopic and macroscopic worlds.

Of course the axiomatic method 'believes' in infinity - we deal with the absurdities of Cantorian transinfinities in articles on numbers. But as we consider maths, after Lobachevski, Godel and Einstein, an experimental science; we are more interested in the homologies of $\Delta\pm 1$. For one thing. While 0 can be approached by infinite infinitesimal 'decimals', so it seems it can never be reached, we know since the 'violet catastrophe' that the infinitesimal is a 'quanta', a 'minimum', a 'limit'. And so we return to Leibniz's rightful concept of an $1/n$ minimal part of 'n', the whole '1'.

This implies by symmetry that *on the upper bound, the world-universe in which the 1 is inscribed will have also a limit, a discontinuity with $\Delta+2$, which sets up all infinities in the upper bound also as finite quanta, 'wholes of wholes'.*

So the 'rest' of infinities, must be regarded within the rest of 'theory of information languages' and its inflationary nature, inflationary information. What is then the 'practical limit' for most infinities and infinitesimals? In ΔST , the standard limit is the perfect game of $3 \times 3 + 0(\pm 1)$ elements, where the o-mind triples as it is an $\Delta-1$ 'god of its infinitesimals it rules subconsciously, as you brain rules you cells', Δ^0 , consciousness of the whole and $\Delta+1$ infinitesimal of the larger world.

An $0-1$ time mirrored quantum world of probabilities of existence, as indistinguishable infinitesimals through the surface limit of its statistical description in the thermodynamic scale of atomic beings end in the 1 unit of our human cellular space, where thermodynamic considerations are reduced to temperature gradient towards the homeostatic mass based forces of our human level of existence, Δ^0 .

So we consider as usual the Kaleidoscopic, multiple function of analysis, and the multiple meanings of its inverse, $\Delta\pm 1$ operations, derivatives and integrals; since as usual the potency of Δst is on the search of whys, not on the discovery of new equations, which humans always exhaust by the Monkey Method of trials and errors, sweat and transpiration more then the inspiration of pure logic thought...

Physical equations in differential form, a general overview of its main species. History

Differential equations first came into existence with the invention of calculus by Newton and Leibniz. Newton listed three kinds of differential equations: those involving two derivatives one of space and time (or fluxions) and only one undifferentiated quantity (space or time parameter); those involving 2 derivatives and two quantities of space and time; and those involving more than two derivatives.

Its analysis thus was right in the spot as he referred changes to change in space or time, thus $\int \partial$ with ST-eps - a fact latter forgotten and today thoroughly missed with the 'view' of time as a single dimension of space (1D-lineal motion confused with 4D-entropy in philosophy of science)

It is still a good classification of partial differential equations as 'time-like' ($\partial x, \partial^2 x, \partial^3 x$), or space like ($\partial^2 y, \partial y, \partial^3 y$) or space-time like ($\partial x \partial y, \partial y \partial x$) as the main variations that represent, T, TT, TTT; S, SS, SSS, ST, TS steps, which are the main 5D, 4D and 1,2,3D changes of the Universe.

And it speaks of the enormous range of real phenomena $\int \partial$ functions can describe as the essential operands of mathematical physics and any Δst phenomena.

What allow all those Δst phenomena to enter the world of quantitative mathematics was the discovery of a pendulum clock to measure time in lineal fashion and a telescope to measure space. Both gave birth to the 2nd age of science,

the mathematical/scientific method, added to the experimental Aristotelian method, which now the isomorphic DST age of science completes.

In 1609 appeared the "New astronomy" of Kepler, containing his first and second laws for the motion of the planets around the sun.

In 1609 too Galileo directed his recently constructed telescope, though still small and imperfect, toward the night sky; the first glance in a telescope was enough to destroy the ideal celestial spheres of Aristotle and the dogma of the perfect form of celestial bodies. The surface of the moon was seen to be covered with mountains and pitted with craters. Venus displayed phases like the Moon, Jupiter was surrounded by four satellites and provided a miniature visual model of the solar system. The Milky Way fell apart into separate stars, and for the first time men felt the staggeringly immense distance of the stars. No other scientific discovery has ever made such an impression on the civilised world.

It also killed a method equally valid of thought represented by the Greeks and Leonardo: the idealised understanding of the canonical perfect DST game of existence, of which we were all impure platonic forms, bound to dissolve unlike the perfect game of the ∞ Universe, which is immortal.

Man never went back because alas! what really mattered was ballistics, mechanisms, power. Idealism died away:

The further development of navigation, and consequently of astronomy, and also the new development of technology and mechanics necessitated the study of many new mathematical problems. The novelty of these problems consisted chiefly in the fact that they required mathematical study of the laws of motion in a broad sense of the word. And now we had machines to measure it better than the artistic Sp-eye-T=words of the human space-time mind.

Points of constrain, balance and limits of integrals.

Any equation with a real, determined solution must be a complete $T.\alpha$. Hence it will have limits either in space (membrane and singularity of the open ball), or in time, initial and final conditions, bridged by an action in the 'least time' possible.

This is the key Δst law that applies to the search for solutions in both ODE and PDEs.

Maximise its $\delta f/Sp$, density of information/mass, its $Sp/\delta f$ density of energy and hence, reach a balance at $\delta f=Sp$

This simple set of equations: $\max. \delta f \times Sp \rightarrow Tf=Sp$: $\max Tf/Sp$ and $\max. Sp/Tf$ are therefore the fluctuation points of systems that constantly move between the two extremes of information and spatial states across a preferred point of balance $Sp=Tf$ as this is the $\max. Sp \times Tf$ place.

Thus integrals, Lagrangians and Hamiltonians are variations of those themes. The motion of springs; the law of least time etc. all are vibrations along a point of balance, $Tf=Sp$, and 2 maximal inverse limits.

The different time-space beats.

This of course must be done because reality is bidimensional and a dimension of space goes accompanied by a dimension of time, *generating as in the previous graphs, the motions=changes, $S \approx T \approx S \approx T$ that shape reality.*

And it is the justification on why differential equations that make systems dependant of such pair of variables happen.

But then it follows we shall be able to apply pentalogic and find a use for the pair $j\partial$ as expression of an inverse beating for *each pair of dimensions of space-time.*

And decompose both space-time forms and time-space events in $S>T<S$ beats.

And in the process of doing so, learn further insights about the symmetries between space and time.

PRODUCT AND INVERSE DIVISION INTEGRALS

The most abundant of all operand, the merging product requires therefore a more complex rule than a direct sum, which acts by 'superposition' of EQUAL BEINGS.

It is also susceptible to be operated by calculus and 'derivatives' as now we involve for the first time, both, a scalar level, since multiplication tends to happen in the lower scale of the being and different states of time and space. So we no longer operate as in additions, with the same type of T.oes in the same plane.

The most abundant of all operand, the merging product requires its own rule which interesting enough shows how indeed product is a merging operation, as the derivative of a product of functions merges first each function with the change rate of the other, and then once both are merged, superposes them by addition:

The Product Rule used to find the derivative of a product of two functions, is thus more complex than the sum even though it also keeps as in polynomials the distributive property - which shows once again that the product is a 'democratic merging' that can go both ways.

$$\text{So } h'(x) = [f(x) \times g(x)]' = f(x) \bullet g'(x) + f'(x) \bullet g(x).$$

The rule, interesting enough shows how indeed product is a merging operation, as the derivative of a product of functions merges first each function with the change rate of the other, and then once both are merged, superposes them by addition.

In that sense it keeps with the 'rule' of merging at the lower 'plane level' of its infinitesimal parts, in this case, taking instead of the spatial elements of X and Y, its 'temporal' quanta of change, $f(x)'$ and $g(x)'$, MERGING them with the other wholes, before a 'superposition'=addition can be effected.

In the product rule thus Derivatives act in inverse fashion to power laws, searching for the infinitesimal.

While power wholes (integrals) search the wholeness, and as we know the two directions of space-time are different in curvature, quantity of information and entropic motions.

Here we shall bring a little explained fact - derivatives act in the inverse fashion to power laws, searching the infinitesimal, while power wholes (integrals) search the wholeness, and as we know the two directions of space-time are different in curvature, quantity of information and entropic motions.

So an external operation that reduces a whole which is NOT integrated as such but a *lineal product of two wholes, $f(x)$ and $g(x)$, a COUPLE, is mixing the infinitesimals of one, with the other whole before herding them; in a process of 'genetic mixing' of the parts of the first shared with the second whole and the parts of the second shared with the first whole.*

This law of Existential \rightarrow Algebra simplified ad maximal as usual in mathematical mirrors surprisingly enough is the origin also of genetic 'reproduction', which occurs at two levels, mixing the 'parts' - the genes of the whole - in both directions to rise then the mixing to the Δ^2 level of the G and F gender couple.

Then what will come out of that genetic multiplication is its division into two equal parts, showing how the interaction of inverse operands does not cancel reality but merely completes a dimotion moving ahead the eternal time space universe.

So if a power followed by a logarithm brings the infinitesimal seed into a whole herd, the multiplication followed by a division of the reproduced new layer of mixed 'axons, genes' or parts, brings the replication of identical forms.

While the simplest definition of a division is as usual in huminds an entropic destructive feeding action, the complex view from the perspective of information is a genetic mitosis. And both are reflected in the derivative of a division, which is impossible for two equal functions (resulting in 0 constant) and viceversa can give us any constant value in its integral - so it does not give us any information.

While in most cases is NOT a positive communicative act but a perpendicular negative reducing game, where the DOMINANT element is the 'predator' larger denominator that cuts the function, multiplying its infinitesimal $f'(x)$ parts, to which it will deduce the lesser parts absorbed by the $f(x)$ function from it, and then cut it at the 'lower' level of its potential elements ($G(x)^2$) :

$$\left[\frac{f(x)}{g(x)} \right]' = \frac{g(x)f'(x) - f(x)g'(x)}{[g(x)]^2}$$

So the numerator, the victim, shared by the denominator the predator so to speak is first absorbed in its $f'(x)$ parts, $g(x) f'(x)$, subtracting the $g'(x)$ parts that the prey has absorbed in the 'fight', $f(x) g'(x)$, and then shared by the parts, $g(x)^2$ of the whole as entropic feeding.

So we can consider the derivative of a divisive function as an 'idealized' expression of the process of killing and feeding of a system, whereas the predator absorbs the infinitesimal parts of the other being, and feeds its cellular, $i-1$ elements with it. Which obviously is NOT a commutative process.

Of course, we love to bring vital interpretation to abstract math, but as we apply such rules to particular cases, the interpretations vary but in all cases will be able to be interpreted in terms of sub-equations of the fractal generator.

What might be notice in any case is that unlike in our rather 'abstract' dimensional explanation of the rules of power laws, here we are able to bring real vital analysis of those roles in terms even of biological processes, showing how much more sophisticated is the $f\partial$ operands, the king of the hill of mathematical mirrors on real st-ep motions and actions, reason why its use is so wide spread.

So the fundamental law of operands to vitalize them is this:

By pentalogic all differential operands can become an action in one of the 5d dimensional vowels (a,e,i,o,u) that define the five dimensions of existence, as vital quanta-actions of the being.

This is the logic concept that truly vitalizes the operands of \neg -Algebra.

So those properties tell us new things about the meaning of $f\partial$.

Finally the chain rule which is truly the one that encloses all others is used in the case of a function of a function, or

$$(f[g(x_0)])' = f'[g(x_0)]g'(x_0)$$

composite function writes:

And this truly an organic rule, as we are not derivating on 'parts' loosely connected by \pm and $x\div$ herds and lineal dimensional growth, but the 'function' is a function of a function - a functional, as all $\Delta+1$ is made of Δ^q which are also functions of x_0 fractal points.

So this is the most useful of all those rules to mirror better reality. And we see how the derivative, the change process deeps in at the two levels, at the $\Delta^q=g(x_0)$ level, which becomes $g'(x_0)$ and at the whole level, which becomes $f'[g(x_0)]$, which tell us we can indeed go deeper with $f\partial$ between organic Planes, which is what we shall learn in more depth when consider partial derivatives and second derivatives and multiple integrals.

We are getting so to speak into the infinitesimal of the parts of a whole from its $\Delta+2$ perspective, and this rule encloses all others, because it breaks into the multiplication of its parts - dwindling truly a scale down, and separating the whole and the parts derivated into loose parts and finitesimals now multiplied.

And what will the parts do when they see their previous finitesimals now camping by themselves but 'at sight' to get them to 'produce' an operative 'action' (a,e,i,o,u actions are ALL subject to the previous operands), ON them.

And what will come of that multiplication. Normally it will capture them all again and then normally will not re=produce on them (one of the operands actions which are possible under pentalogic) but divide and feed on them the last operation to treat:

And its inverse, which is NOT a positive communicative act but often a perpendicular negative reducing game also consequently differs.

In that sense the most important ad on that Δt will bring to the use of differentials in existential \neg -algebra, is its temporal use as the 'minimal action in time', of a being, a far more expanded notion that the action of physics (which however will be related to the lineal actions of motion on 1D).

Finally in the next stage of \neg -Algebra, when @nalytic geometry allowed a more clear representation of those polynomials in more detail, as usual through its 3 AGES of evolution and through its PLANES of complexity and through its pentalogic 'Rashomon effect'; that is, how analysis operates independently to extract information from the 5 DImotions of a being.

S=T: ANALYSIS ON SPACE

A 2nd consideration on the pentalogic should be on analysis of SPACE and trans-form-ations between space= form and motion=time states. SO FIRST we shall remember what space is made of - namely \neg E points:

Dimensions and analysis are possible because points have volume.

A Universe of fractal spaces point-particles have an inner volume of information as Non-Euclidean points which gauge information in the stillness of a mind syntax, language mirror of the Universe. As points have volumes, lines are waves and planes topological networks, which ensemble in ternary a(anti)symmetries to form the topological super organisms of reality across 3 time ages, 3 topological forms and 3 Planes. It is this physical T.æ which we shall study in mathematical physics, explaining the meaning in 5D of the main mathematical laws of physics, which are enhanced by the understanding of an enhanced geometry and logic of time, born of the fractal cyclical structure of both, a priori elements of reality that the language of mathematics and its operands so accurately mirror.

The fundamental truth derived from this simple analysis of derivatives is profound. First it connects them immediately with the pure geometric nature of dimensions, which in non-Euclidean geometry (graph) are relevant in as much as they represent *motions in time but also dimensions in space*.

In that regard, it is important to understand that in the fractal Universe a dimension has 'always inner breath' as the points grow when we see them closer.. So it is very simple to consider a single dimensional being, simply as one, whose preferential X-dimension is much larger than the others, but still the other exist as the particle-point in detail is big:

1D being: $X \gg Y \approx Z$, for example a string, a lineal momentum...

And then a two dimensional being one whose two D are larger than Z:

2D Being: $X \approx Y \gg Z$; for example a graphene sheet; a plane wave.

Whereas a 3Dimotion being has volume, motion on the 3, for example a spherical being, an entropic explosion.

A derivative then merely 'annihilates' one dimension or one motion in space or time - we have here to split dimotions, as humans do, even if it is not the proper unit of the Universe, which is always bidimensional. I.e. even in a motion there is a particle that moves, so you have a point-dimension for the particle and one for the motion in time...

So indeed analysis IS the main mathematical instrument to study the 5D Universe and its ternary mirror symmetries between Planes, topologies and modes of time-change. And we can consider a general formulae for analysis, as a specific version of the fractal generator:

$\partial(\text{Bodywave of vital energy}) = \text{Membrane}$; $\partial\text{Membrane} = \text{Singularity path and its inverse, better known as line integrals, surface and volume integrals.}$

Because analysis is mainly used in mathematical physics, in praxis, the previous relationship is connected to the 3 elements of a physical system:

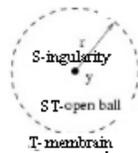

Field (entropic, locomotion source) < wave (reproductive body) > Particle.

So we make double derivatives to obtain the field (Laplacians), and single derivatives to relate particles and waves - 'one-dimensional species.' (Fourier series). And those are the all pervading analytical functions of the 3 parts of the being:

Spherical harmonics and electron orbitals are the same, because our light space-time in particle state are photons that form the electronic nebulae. So both are homologic.

The result are **spherical harmonics**, a set of functions used to represent functions on bidimensional membranes - surface of the sphere - the higher dimensional homology of Fourier series - periodic, single variable functions on the circle.

Spherical harmonics are thus the eigenfunctions of the angular part of the Laplacian, representing solutions to partial differential equations in which the Laplacian appears. Since the Laplacian appears frequently in physical equations (e.g. the heat equation, Schrödinger equation, wave equation, Poisson equation, and Laplace equation) ubiquitous in physics, electromagnetism/radiation, and quantum mechanics.

orbitals of the hydrogen atom in quantum mechanics in fact are totally undistinguishable from spherical harmonics, showing indeed that we are all topologic beings, and mathematical functions for the simplest forms of spacetime as the electron is - a dense function of 'light spacetime particle-points'.

The intimate connection between the 3 elements of the being is perfectly explained by the dual $\int \partial$ functions.

In that regard, variations over the same theme respond to the ternary structure of all T.œs:

In the graph, when deriving and integrating, most operations refer to a 'limited' system, in which first we extract the finitesimal part-element, and then we integrate it to obtain a whole; so most likely the system described with depart from a time-changing-variable quanta, and integrate it to obtain a 'static whole-spatial view'.

But variations on the same theme happen by the natural symmetry of space and time states.

So we can also start with a quanta of space integrated over time to get a spatial area or volume.

What we shall always need to find 'single solutions' is the parameters that describe in time or space the 3 elements of the T.œ: So we shall start with initial or final conditions (definite integrals), and define mostly in space as a whole, the enclosure or membrane that the limits the domain of the function (which might include as a different limit the singularity).

All in all the analytical approach will try to achieve a quantitative description of the unit/variable of 'change', the 'finitesimal quanta of space - interval, area, volume' or the 'steps of time' (frequency), and then integrate it over a super organism of space or an interval of time, we wish to study, often because it forms a whole or a '0' sum world cycle.

Galilean Paradox. lineal vs. Cyclical view.

In that regard, the S=T symmetry will once more become essential to the technical apparatus of analysis as it has done in all other sub disciplines.

Of them the 3 key 'dualities' between lineal perception in short and cyclical perception in large, is the key to obtain solutions, as the mind of measure is lineal made of small steps that approximate larger cyclical wholes. It is in essence the method of differential equations, where the differential $dy = f'(x) \Delta x + \alpha \Delta x$, approaches to a lineal derivative, $f'(x) \Delta x$ in short increases, and so we can get away with the smaller element that curves in longer distances the solution.

Finally the third Galilean paradox between continuity and discontinuity is also at the heart of analysis (and most forms of dual knowledge). Analysis has accepted as a dogma the continuity of the real number and so it considers continuity a necessary condition for differentiability but we disagree in a discontinuous Universe, continuity has a loose

definition (as neither the axiomatic method is the proof of mathematical statements but experience also matters). So continuity is defined by a simpler rule: that the term $\alpha\Delta x$ of the discontinuity between the lineal and cyclical view of an infinitesimal derivative does indeed diminish faster the closer we are to the point 'a' in which the differential equation is defined. In brief, continuity means no big jumps and big changes in the direction of a function and the T.œ it reflects.

PENTALOGIC ON DERIVATIVES

Pentalogic of finitesimal change.

Leibniz defined the finitesimal as $1/x$, where X is the whole. In terms of topological curvature and motion, $1/x$ also defines in Leibniz's work the curvature in space (as the oscular curve, $1/r$ of a cycle), which by virtue of $S=T$ IS the minimal unit of cyclical time of a whole). Yet in lineal terms, curvature which is dimensionless can also be seen as the 'angle' of change in the direction of a motion, each quanta of time or step of space. So an angle changes in lineal, discrete quanta (1st Dimotion of change). It changes in curvature in a continuous longer measure. It becomes an acceleration, in $S=T$ motion. Then a finitesimal of curvature becomes the fundamental concept that carries derivatives of motion into geometry in the gravitational theory of Einstein, not yet understood conceptually in Relativity theory as the $S=T$ relativity principle on 5D philosophy is ignored.

Further on, a finitesimal represents an $\Delta-1$ unit of change in scale; and finally, the 'ultimate finitesimal', is the @-mind singularity of the system.

So finitesimals can represent all forms of changes of $\Delta@st$ as minimal scalar parts, minimal steps of motion; discrete angular changes, curvature of an accelerated motion seen as form; and mind singularity... And its limit is absolute change or entropic change, which cannot be calculated because the function breaks and there is no derivative, or rather the derivative is the whole being, who changes so much that it is no more...

The actions it describes.

The minimal unit for any T.Æ are its a,e,i,o,u actions of existence, its accelerations energy feedings, information processing, offspring reproduction and universal evolution. So the immediate question about mathematical mirrors and its operations is what actions reflect. We have treated the theme extensively in the -Algebraic post, concluding that being mathematics a mostly spatial, social more than organic language, its operations are perfect to mirror simple systems of huge social numbers=herds; and as such to describe the simpler accelerations=motions, which are reproductions between two continuous Planes of the fifth dimension; informative processes, where the quanta perceive are truly finitesimal $\Delta-i$ elements pegged together into the mirror images of the singularity and so we talk of motions, simple reproductions and vortices of information, and time>space processes of deceleration of motion into form, as the key actions reflected by mathematical operations.

It follows that when we study the more complex systems and actions of reality, reproduction and social evolution of networks into organisms, mathematics will provide limited information, and miss properties for which illogical biological and verbal languages are better.

And it follows that physical and chemical systems are the best to be described with mathematical equations, either in -Algebraic terms or analytic terms, which fusion together when we try to describe the most numerous, simpler systems of particles and atoms (simpler because by casting upon them only mathematical mirrors we are limited to obtain mathematical properties).

Let us now consider the $\int\partial$ operations for the different dimotions of reality on the main functions with fundamental roles in Δst and its derivatives by dividing them in 3 great Δst 'groups':

@: $\int\partial$ of identity elements - forms that do not change expressed with the concept of an identity number, as 0 is the identity of sum and 1 of product. But they also have a clear meaning as the interval $0'-1$ of the generation 'seed' dimension from $\Delta-1$ to Δ^0 .

And indeed, the surprising result that $\int_0 dx = C$ does indeed suggest that the $0'$ -point is a fractal point that 'has volume', or else how integrating the nothingness of existence shall we get a 'constant' which is a social number? But if we do start from a $0-1$ unit its 'integral' sum will give us a reproductive group, or 'social number'.

And if we integrate the full '1 being', we shall get a new dimension, the variable plus the constant, which suggest also a little understood process related to the operations of derivatives and integrals, the switching caused by operations on motions of sets (our definition of analysis), which change a spatial state into a time state and viceversa. So the spatial 1-form-whole becomes a time-variable X, while the variable X becomes a spatial derivative constant.

Since constant number does NOT change. So a time variable gives us the spatial identity number.

Finally, the deepest thought on those seemingly well known operations regards the subtle difference between both operations: the derivative localises a single 'finitesimal solution', or minimal $\Delta-1$ past part of the system...

But the inverse, 'integral' or 'future 5th Dimensional arrow' of social wholes opens up the possibility of multiple constant solutions to add to the variables, as the future is open to subtle variations (\int) but the past is fixed by the infinitesimal identity number (∂).

Of course if we instead consider the integral not in time but as a fixed spatial path, this concept of future vanishes and we get a determined single solution to the integral where the constant is just the starting point.

Other way of seeing it though is to consider the identity element @, the constant mind that does NOT change.

Let us now study the seemingly simple 'equations of change' for the basic functions. Yes, of course, the scholar will find no interest on them. What can we really find of something so 'obvious' as $\partial x^2 = 2x$.

But we shall remind again the reader of 2 of my favorite masters' quotes, 'genius targets what nobody sees' and 'simplicity is genius' (Leonardo). Since the beauty of 5D spacetime consist on seeing relationships that nobody cares to wonder about, which are found in the simplest realities that hold fundamental laws of time=change.

$\int\partial$ of POLYNOMIAL GROWTH: POLYNOMIAL ACTIONS vs. DERIVATIVES

$$\frac{d}{dx} x^n = nx^{n-1} \qquad \int x^n dx = \frac{x^{n+1}}{n+1} + C$$

A polynomial can be understood as a regular T.œ, with greater symmetry between parts and wholes, expressed as a quantitative sum of its parts, x^a . That is in space it represents a 'line', 'square', or 'cubic form'.

And so as the *fundamental form of change happens when S=T, in the form of reproduction, the first insight of 5D calculus on the outcome of polynomial change is this:*

When we change a square, X^2 change does NOT happen only as it would seem natural at an X rate – that is the frontal line of the system, but at a 2X rate, in 2 of the 4 sides of the square. So change is NOT a motion in a single direction that would reproduce the square by an X rate, but it happens in 2 sides of the square.

And as a consequence it preserves the form of the square.

We thus realize by this simple analysis of $\partial X^2=2X$ that the MAIN form of CHANGE which ultimately appears in most realities is 'reproductive change', NOT mere locomotion (ultimately a form of reproduction)...

Again when we consider the cube, X^3 , the rate of change is $3X^2$; so change now happens in 3 sides of the cube, and it is also a reproductive growth, that PRESERVES the form of the cube. While in a line, $\partial nX=n$, change happens in one of the sides of the line that PRESERVES the form of the line, reproducing it, something that can be perceived as the motion of the forehead that advances the line.

Inversely we can consider that to generate through an integral of the unit of change, the finitesimal of a polynomial volume from 1 to 4 Dimensions ads from 3 sides of the cube, two sides of the square and 1 side of the line (as we know from algebra, a quintic does not exist in terms of radicals; because the Universe is made of 4 Dimotions plus dissolving death=entropy. So it is not worth to bother for more complex ones; while the fourth dimotion of social evolution or

motion of a cube makes the system grow in scales of the fifth dimension; so it is a different case to the 3 basic polynomials that happen in a single scale).

Now this might also seem simple but we realize that if we are creating a whole cube from 3 faces, they are becoming intertwined, webbed together as they penetrate each other to form the cube. So they act in fact as 'networks' of points with 'dark spaces' through which the other two sides penetrate. And the result is not merely a cube but a network of 3 different 'orthogonal', networks, which is the idealized concept of a physiological trinity. The same can be said of the process of creation of a square from two 'orthogonal' dimotions of time-space. But, and this is also interesting to meditate in depth, the line is NOT webbing from the 2 extremes but merely reproducing and hence moving as a wave, which is NOT connected with the 'steps' left behind. Thus the line constantly moves because it does not 'entangle' with the memorial tail of its previous steps of reproduction. While the square and the cube become entangled ending its reproduction when the area is filled with memorial persistence.

We conclude another startling consequence of all this:

- Only lineal inertia is eternal locomotion because the line does not 'last' and hence can be displaced ad eternal, but a holographic or trinity dimotion becomes a reproductive action that stops in its final completion of the higher whole form, once it is integrated.

Then it might as a quartic, develop a new reproductive motion, whereas the cube is a point of a larger scale.

So the derivative give us the 'units of reproduction' of the polynomial in space, its minimal growth parts and the integral reproduces a whole by webbing a number of parts, that entangle to form the JX whole.

Trilogic on polynomial derivatives for space and time.

Once all this is resolved we can consider how the trilogic of calculus widens the possibilities of a simple polynomial derivative, considering the simplest case of its application to space and time.

Exponential derivatives and integral

The first result already considered are the polynomial 'reduced' dimension by means of searching its infinitesimal, which however is for simple polynomials quite larger, compared to a direct x^{n-1} reduction.

Further on, the logarithm IS clearly the 5D social scaling operation and its derivative is indeed the absolute finitesimal, $1/n$.

And inversely the maximal growth is its inverse, the absolute decay of e^{-x} .

It is worth to talk of those 3 co-related results from the philosophical pov: the maximal *expansion of an event is an absolute future to past*, $\Delta+1 \ll \Delta-1$ *entropic death expressed by the exponential:*

The minimal process of growth (Log) is an infinitesimal, the maximal process of decay (e^{-a}) is equivalent to the whole, in a single quanta of time. We state in the general law that death happens in a single quanta of time, in which the entire network that pegged together the being, disappeared.

1D (singularity) + 2D (Holographic principle) = 3D (vital energy).

In practice this means the 'synchronicity in time of the clocks of the 3 parts of the being' and the superposition of the solutions that belong to each of the 3 elements of any $T.\alpha$

TT. EXPONENTIAL DECAYS.

$$\frac{d}{dx} e^x = e^x$$

$$\int e^x dx = e^x + C$$

$$\frac{d}{dx} \ln x = \frac{1}{x}$$

$$\int \frac{1}{x} dx = \ln x + C$$

Finally the logarithmic function and exponential function the ratio of change (derivative) diminishes from the absolute maximal, e^a , which is its own derivative, to the absolute minimal $1/a$ the log derivative which is the definition of an infinitesimal part (Leibniz), till it peaks, converting an $\Delta-1$ first unit into an Δ^0 whole in the peak of an existential world cycle that then will start an inverse function of decay with $-1/x$ diminution and a final fast collapse in the 3rd age << death moment at e^{-a} speed.

Finitesimal actions.

The logarithm's derivative thus adds as ratio of change only an infinitesimal, so it tends always to a balanced static form ($y=c$).

The quantity a system absorbs to create an action is generally defined as a 'finitesimal', not infinitesimal. Infinite does not exist in a single continuum, but through multiple discontinuities as all systems in time and space are limited in space and time, both in a single membrane, and in within the Planes of the 5th dimension (as information and energy doesn't flux between those Planes without loss of entropy).

A finitesimal is the quantity of energy, motion, information etc. used by a T.œ for an action of space-time IN any of the 5 Dimensions of the being, 'put in motion' to that aim.

4D: Thus entropy has a negative exponential which shows the rhythm of decay of the system. And in this case there is no need for 'a logarithmic' limit, since for the predator the death body is 'unlimited $i-1$ energy', though once the 'relative infinite' number of its $i-1$ parts are absorbed the 'e-function' will have a cut off.

How the function combines with other functions shows then how the superposition and merging-product processes combine as Dimotions with the reproductive growth and decay processes, whose results are intuitive: the product=merging of two powers of reproductive growth, when its 'base=toe' is identical 'superpose=add' that growth.

So the combination of \pm exponentials and logarithm curves are also the best way to graph as a bell curve the worldcycle of existence in lineal terms.

4th dimension: Entropy: $S\delta$ polynomial death dimension of decay.

Polynomials do not evolve reality towards an impossible infinite growth. THEY ARE the inverse decay process; of exponential extinction, e^{-x} .

Wholes are physiological networks, which we analyse mathematically in its parts, mostly performing a motion of space-time, an action that exchanges most likely bits and bites of time and space. So the logarithm is an operation that reflects the processes of minimal transmission and gathering of information and energy, of bidimensional holographic quanta... reason why it is so pervading in the concepts of entropy and information.

5th dimension: $\int T...$

This is understood better observing that the inverse function does in fact model growth in the different models of biology and physics, limited by a carrying capacity straight flat line:

The logarithmic function has as derivative an infinitesimal, $1/x$, which makes it interesting as it models better the curve of growth from 0 to 1 in the emergent fast explosive $\Delta-1$ seed state, while the inverse e^{-x} model the decay death process.

$$\frac{d}{dx} e^x = e^x$$

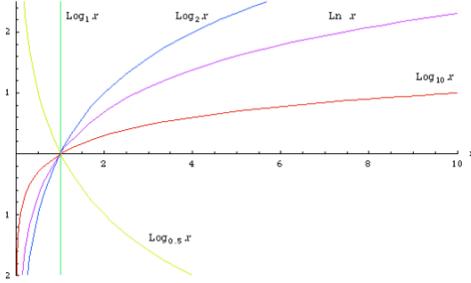

$$\int e^x dx = e^x + C$$

$$\frac{d}{dx} \ln x = \frac{1}{x}$$

$$\int \frac{1}{x} dx = \ln x + C$$

$$\frac{d}{dx} n^x = n^x \ln n$$

$$\int n^x dx = \frac{n^x}{\ln n} + C$$

Integrals and derivatives which have a much slower growth, than polynomials on the other hand do model much better as they integrate the 'indivisible' finitesimal quanta of a system, its organic growth and 'wholeness' integrated in space.

Thus integrals do move up a social growth in new Δ+1 5D planes. And its graphs are a curved geometry, which takes each lineal step (differential) upwards, but as it creates a new whole, part of its energy growth sinks and curves to give birth to the mind-singularity @, the wholeness that warps the whole, and converts that energy into still, shrunk mind-mappings of information, often within the 3D particle-head.

We will retake the analysis of the more complex st-eps on 3, 4 and 5D, since most of the complex process related to the 3rd dimension, as a mixture of S and T inner Planes, will require a more complex double or triple derivative and integrals - only the 4D decay entropic explosion can be satisfied as the decay of the single Δ-1 finitesimal with a single variable.

TT. Entropy Equations

One Example. The law of decay of radium says that the rate of decay is proportional to the initial amount of radium present. Suppose we know that a certain time $t = t_0$ we had R_0 grams of radium. We want to know the amount of radium present at any subsequent time t .

Let $R(t)$ be the amount of undecayed radium at time t . The rate of decay is given by the value of $-(dR/dt)$. Since this is proportional to R , we have:

-dR/dt=kR where k is a constant. In order to solve our problem, it is necessary to determine a function from the differential equation. For this purpose we note that the function inverse to $R(t)$ satisfies the equation: **- dt/dR=1/kR**, since $dt/dR = (1/dR)/dt$. From the integral calculus it is known that equation is satisfied by any function of the form: $T = - 1/k \ln R + C$.

where C is an arbitrary constant. From this relation we determine R as a function of t . We have:

$R = e^{-kt+kC} = C_1 e^{-kt}$ From the whole set of solutions we select one which for $t = t_0$ has the value R_0 . This solution is obtained by setting $C_1 = R_0 e^{kt_0}$.

From the mathematical point of view, equation (3) is the statement of a very simple law for the change with time of the function R ; it says that the rate of decrease $-(dR/dt)$ of the function is proportional to the value of the function R itself. Such a law for the rate of change of a function is satisfied not only by the phenomena of radioactive decay but also by many other physical phenomena.

We find exactly the same law for the rate of change of a function, for example, in the study of the cooling of a body, where the rate of decrease in the amount of heat in the body is proportional to the difference between the temperature of the body and the temperature of the surrounding medium, and the same law occurs in many other physical processes. Thus the range of application of those equations is vastly wider than the particular problem of the radioactive decay from which we obtained the equation.

1D: PERCEPTIVE ACTIONS: Derivatives as angles of perception.

$$\frac{d}{dx} \sin x = \cos x$$

$$\int \cos x \, dx = \sin x + C$$

$$\frac{d}{dx} \cos x = -\sin x$$

$$\int \sin x \, dx = -\cos x + C$$

The 3rd type of functions are concerned not with $\Delta \pm 1$ past to future to past d=evolutions but with present sinusoidal wave repetitions of the same time-cycle, hence change is cyclical repetitive, and so those functions are very useful for the 3rd reproductive dimotion in space, but also for a time dimotion or cycle:

Both functions thus are clearly inverse not only in Γ st but also in the $\Delta \pm 1$ Planes - being the negative symbol one of conventions regarding the chosen \pm direction of the cyclical, sinusoidal motion.

Here though the interest resides in comparing both type of present vs. Δ past-future functions: the present derivative is self repetitive, as we return to the sin after 4 quadrant derivatives; and indeed we return to the present considering also the generational cycle, after 4 ages of life. So we can model a sinusoidal function as a world cycle of existence in its 4 quadrants.

SS: Sinusoidal functions of angles and sins and cosines relate to the SS-trigonometric perceptive function of organisms. growing distortion and a 'blind' spot for its inverse 5th dimotion of existence (whose performance is the denial of its self).

St: Thus sinusoidal functions are also good to measure St-motions dominant in information. I.e. wave forms.

One very realized role of a derivative as a tangential division of the height in the dimension of information and distance-lineal motion to the observer is a measure of the angle of the being, which recedes in spacetime till reaching the non-perception as a relative finitesimal out of the territorial mind- world of the observer, which connects directly derivatives with the 1D first dimotion of perceptive existence. The being might still be of certain size but as a fractal point he has receded in the mental-space of the world of the perceiver.

While as all $S=T$, that is there is always a symmetry between discrete numbers and continuous motions, Leibniz with its geometric interpretation and far more profound understanding of finitesimals, which he rightly defined as $1/n$, represents the first step in the future of the discipline, the renovator and deep understanding of it - which Newton, which can be considered merely an automaton mathematician, specialized brain, as most modern scientists is - he is indeed the father of the wrong view of science - understood nothing of it.

Indeed, Leibniz, the closest predecessor of this blog IS the genius, Newton the talent.

The Δ dimotion of cyclical perception is expressed by the negative j number, with its cyclical rules of summation, which implies the sum of the angle of perception of the self-centered number in its argument.

Thus next then in the entangled representation of reality through those 'basic operand' comes then the duality of addition and subtraction, and its attached physical meanings of superposition and fusion of 'parts' into 'whole numbers', or its entropic inverse operands of negative subtraction.

It starts to be then obvious that all operands have its inverse function to maintain the balance of the Universe.

Addition by superposition in ever tighter spaces of similar clone species, is the simple -Algebraic expression of the social dimotions, both in its positive 5 Δ and negative entropic 4 Δ whose addition of decaying $j-1$ T.oes is so fast that it can be expressed as a negative exponential growth, which in this manner would complete the 3 'Planes' of addition: +, x , x^a ...

Moreover addition can happen in sequential time or adjacent space, forming growing probabilities or populations. So as the simplest mode of operands extends its diversification through space or time it will mean different things. If we consider the happening of an event or full world cycle 1, probabilities will represent parts of the whole event. If we project it into space it will be a population of similar event, entering the region of maximal frequency. Both will be

mathematically projected as a bell curve. $S=T$. Same function for the addition of events and populations, in time or space.

The first marvel of the Universe is the simplicity of its original principles, made complex by the differentiation across the symmetries of scale, topology or time. Indeed, something so simple as the sum and inverse subtraction IS still the most important operands of the Universe, which gives us new numbers, social gatherings of identical beings, which herd together into parallel flows adopting most likely a bidimensional ST superposition on laminar states that keep adding the 3rd dimension of the being. Like the simplest first masterpieces of Bach, the architectural Universe is a simple principle before organicism twists its form, in which beings which are equal come together.

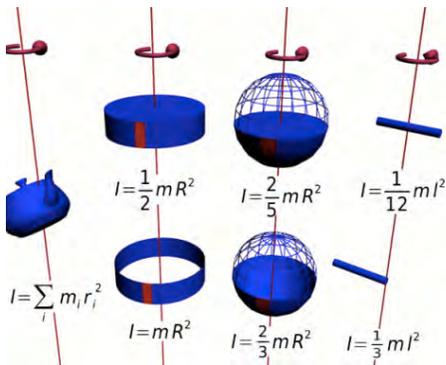

Superposition of bidimensional holographic fields is so important that the whole of quantum physics is based in this superposition principle. The sum thus is still the master of operands. But for sums to happen, the beings *must be externally identical, to be perceived as parts of a quantified mass, each of them the same value. Addition thus is the ultimate proof of the social nature of the Universe.*

infinitesimal 'curved' exponential changes that happen between two planes, where linearity is lost.

$$\frac{d}{dx} \sin x = \cos x \qquad \int \cos x \, dx = \sin x + C \qquad \frac{d}{dx} \cos x = -\sin x \qquad \int \sin x \, dx = -\cos x + C$$

We notice immediately that 4 changes turn a sin x cycle into itself, as 3-i, 3 ages and an entropic death closes a 0'-sum worldcycle of any species back to its initial point. , starting in this case with the simplest cyclical clock-motions, which as they do NOT move in space, and repeat its form in time, are in fact not operated by $\int \partial$ measures of change.

Next comes from the bottom of that list, the functions of perception, sin and cos angles; and the result have some 'metaphysical' meanings. Indeed, the rate of change of our informative angle measure (the sine), becomes the cos, the rate of change of our motion, or in other words, we SWITCH from sin-stop states to cos-moving states, in stöps. We go from stop-sin to step-cos; but the inverse doesn't hold. That is if we go from motion cos to stop sin, this will be perceived from the perspective of cos-motion as a 'negative' reduction motion - sine.

1D: cyclical clocks, angular momentum

In the graph, in the simplest physical systems 1D is merely the angular momentum of its cyclical clocks of time, maximised in the membrane that encloses the system. Strictly speaking it does not change but becomes the 'present function' of a repetitive frequency clock without a derivative of change as the time-space steps seem not to vary. When we introduce a torque, change happens, called 'acceleration', the second

dimension of time motion in physics, which we shall latter study when analysing in 5D with the Galilean Px. Newton's laws. Here we just shall briefly explain why in lineal time, as humans only use t to measure change, the 1D is the invariant one and its derivative is 0'.

What about 'higher' more complex, cyclical, and scalar Dimensions? The answer is *that as we change the form of the dimensions, we have to change the operands we use; and specifically when we study the Dimensions of change, which is the one differential/integral equations quantify, those equations must adapt not the other way around as mirrors of reality to the form of the dimensions of space-time they describe.*

So as 1D is a steady state rotary motion, strictly speaking it does NOT change in space-time locomotion (which is what humans with its lineal single time express in derivatives). Hence basically the *derivative of those angular momentums is 0'. It is conserved.*

Let us recall briefly those classic definitions and maths:

Angular momentum is a vector that represents the product of a body's rotational inertia and rotational velocity about a particular axis. In the simple case of revolution of a particle in a circle about a center of rotation, the particle remaining always in the same plane and having always the same distance from the center, we discard the vector nature of angular momentum, and treat it as a scalar proportional to moment of inertia, I and angular speed, ω :

$L = I\omega$: Angular momentum = moment of inertia \times angular velocity, and its time derivative is

$dL/dt = dI/dt \omega + I d\omega/dt$ is 0', and **$dL/dt = 0 + I d\omega/dt$** , which reduces to **$dL/dt = I\alpha$** .

Therefore, angular momentum is constant, $dL/dt=0$ when no torque is applied. And this is the essence of its conservation law, a specific case of the conservation of the 5Dimensions of space-time of the Universe:

'In a closed system, no torque can be exerted on any matter without the exertion on some other matter of an equal and opposite torque. Hence, angular momentum can be exchanged between objects in a closed system, but total angular momentum before and after an exchange remains constant'.

But when a torque is applied in a single present plane, or much more relevant to our inquire: when a system is submitted to the organising or disorganising entropic force of a higher or lower plane of existence, and acceleration exists, a vortex of time-space happens and we enter into the social dimensions of evolution - the 5th Dimension of the mind.

ODES =TIME-LIKE VS PDES. =SPACE-LIKE EQUATIONS: MATHEMATICAL PHYSICS.

A differential equation is a mathematical equation that relates some function with its derivatives. Let us apply simple trilogic to its meaning.

Δ : A differential equation basically give us the duality of its finitesimal local states and its global whole organic forms but at the simplest level, most often with a single field state, or network. Thus it is a good representation of the parts and wholes of 5D but for more complex systems, discrete, organic analysis fares better.

T: ODEs

In applications, the functions usually represent physical quantities, the derivatives represent their rates of change of a given dimotion, such as the first derivative is its 'time speed' and the 2nd its 'time acceleration', which are the two derivatives that give us all the maximal and minimal standing points of the 'function of existence' of the change in time we study.

Once we find the rate of change, or finitesimal of the dimotion of the space parameter; which overwhelmingly belong to those two meaningful ones, we integrate through an interval of existence of a worldcycle and thus the system is solved.

Philosophically then the interest of 5D calculus is to analyze *the geometry of the solution that will indicate us what type of SS«Ts<ST>St»TT organ or event of a function of existence we are studying.*

And if the solution is possible which will give us even deeper insights on the structure of existential algebra whose illogic is mirrored by the laws of mathematical algebra.

When we work with a single parameter we are 'obviously' working on change in lineal time.

This is the concept behind any ODE. Which is therefore clearly a time-like equation, as it probes mostly a single dimotion of the function of existence of a system and its rate of change.

S: PDEs.

On the other hand, a PDE work on several parameters which tend to be the 3 coordinates humans establish for space; hence it is the analysis of a motion in space *as a simultaneous whole – in the simplest forms as a herd in motion with continuity equations. Hence more often concerned with locomotions of the herd or system through space. And its changes of position in space.*

ST: True PDEs. It is essential to understand 5D Calculus the following concept. While a mere locomotion in space might appear as a PDE because of the use of 'vectors in x, y, z' coordinates that artificially multiply the variables for the position in space (which is a single parameter, SS, in terms of 5D) of a given point-T.œ-function, there is a clear case in which true PDEs appear of enormous importance for mathematical physics, and any analysis of reality in terms of the 'fractal generator' of SS»St≤ST≥Ts«TT supœrganisms:

Those are functions in which the 3 present elements of a supœrganism, Ts≤ST≥St appear in the same equation. We call them to distinguish them from PDEs of coordinates of position, 'True PDEs'.

And we can distinguish roughly two types of such functions:

- Spatial function in which the 3 dimensions of change are NOT coordinates external to a point (locomotion) but internal to the point (area and volume): For example, the area of a rectangle is a function $S=xy$, of its base x and its height y . The volume of a rectangular parallelepiped is a function $v=xyz$, of its three dimensions. Because the 3 classic dimensions are in vital topology related to its function, width≈reproduction≈ST, length≈locomotion≈sT, height≈information≈St, even though science normally uses them merely for fixed volumes, they do have in certain cases of 'hydrodynamics' and 'cellular growth', or social growth of populations a potential use for a dynamic study

when properly considered in 'mental spaces', where the 3 dimensions of change are analyzed as qualitative dimensions (themes of those of an advanced 5D algebra course we will not attempt for a long time).

- Timespace function proper, classic on physics, when considering formulae related to energy (ST) expressed by its 2 independent space-time parameters, $E=hf=K T = M V$, in its multiple parameters and variables. The well-known formula $p V = RT$ expresses the dependence of the volume v of a definite amount of gas on the pressure p and absolute temperature T .

And so we will find with those basic type of differential equations we can calculate most Fractal generators in its dynamic change in most sciences.

Δj : Differential vs. $\Delta < j$: simple calculus.

The difference between the simpler calculus of integrals and derivatives vs. differential equations thus is one of growth of complexity, from 'words' into 'sentences' of time dimension; which means further extension in time, in spatial population and in the probing through scales, with those derivatives of motion or of information (Fourier transforms, etc.)

Because such ST-analysis of superorganisms or T, TT, analysis of time events are the fabric of which reality is built, even if analysis concentrates in simpler systems and herds, differential equations play a prominent role in many disciplines including 5D science, concerned with the Dimensions of spacetime.

Differential equations can be divided into several types. Apart from describing the properties of the equation itself, these classes of differential equations can help inform the choice of approach to a solution.

Physical equations are related to the 3 elements of all the existential entities of the Universe. It must then be understood that within the general $f(x) \approx f(t)$ and $y=S$ isomorphism between mathematical equations and ST-eps (not always the case as symmetric steps can repeat itself with the same parameters in SSS and TTT derivatives as we have seen in our intro to ODE), partial differential equations, will be combinations of analysis of systems in its 'primary' differential finitesimals of space and time then aggregated in more complex ST SYSTEMS, giving as an enormous range of possible PDE studies, which we shall strive to order according to the concept that *there is a geometric symmetry between \sim Algebra ($s \approx t$ symmetries) and geometry (S -wholes sum of t -dynamic points) and analysis (st -eps).*

So it is a good guidance for all \sim Algebra equations to make a comment of its significance in the vital ternary geometry of a T.æ or complex event between T.æs across different planes, ΔS studied with those equations.

Calculus and physics: Partial Differential equations as $\Delta @st$ -equations.

Physical events and processes occurring in a space- time system always consist of the changes, during the passage of its finite time, of certain physical magnitudes related to its points of vital space.

This simple definition of space-time processes is at the heart of the whole differential calculus, which with slight changes of interpretation apply to all GST.

Any of those ST processes can be described by functions with four ST, independent variables, $S(x, y)$, and (z, f) , where x, y are the coordinates of a point of the space, and z and f of time.

So ideally in a world in which humans had not distorted bidimensional time cycles, the way we work around mathematical equations would be slightly changed. As we are not reinventing the human mind of 7 billion people - we are not that arrogant, we just will feel happy trying to explain a few of those processes of bidimensional space and time here.

In the study of the phenomena of nature, partial differential equations are encountered just as often as ordinary ones. As a rule this happens in cases where an event is described by a function of several variables. From the study of nature there arose that class of partial differential equations that is at the present time the most thoroughly investigated and

probably the most important in the general structure of human knowledge, namely the equations of mathematical physics.

ΔST symmetries.

Each partial differential equation represents a different finitesimal of scale, time and space, in the second level

Let us first consider oscillations in any kind of medium. In such oscillations every point of the medium, occupying in equilibrium the position (x, y, z) , will at time t be displaced along a vector $u(x, y, z, t)$, depending on the initial position of the point (x, y, z) and on the time t . In this case the process in question will be described by a vector field. But it is easy to see that knowledge of this vector field, namely the field of displacements of points of the medium, is not sufficient in itself for a full description of the oscillation. It is also necessary to know, for example, the density $\rho(x, y, z, t)$ at each point of the medium, the temperature $T(x, y, z, t)$, and the internal stress, i.e., the forces exerted on an arbitrarily chosen volume of the body by the entire remaining part of it.

These quantities can be described by functions with four independent variables, x, y, z , and t , where x, y , and z are the coordinates of a point of the space, and t is the time.

Physical quantities may be of different kinds.

Δ : Some are completely characterized by their numerical values, e.g., temperature, density, and the like, and are called scalars.

$S=T$: Others have direction and are therefore vector quantities: velocity, acceleration, the strength of an electric field, etc. Vector quantities may be expressed not only by the length of the vector and its direction but also by its "components" if we decompose it into the sum of three mutually perpendicular vectors, for example parallel to the coordinate axes.

In mathematical physics a scalar quantity or a scalar field is presented by one function of four independent variables, whereas a vector quantity defined on the whole space or, as it is called, a vector field is described by three functions of these variables. We can write such a quantity either in the form:

$U(x, y, z, t)$ where the bold face type indicates the u is a vector, or in the form of three functions: **$U_x(x, y, z, t), U_y(x, y, z, t), U_z(x, y, z, t)$**

where u_x, u_y , and u_z denote the projections of the vector on the coordinate axes.

In addition to vector and scalar quantities, still more complicated entities occur in physics, for example the state of stress of a body at a given point. Such quantities are called tensors; after a fixed choice of coordinate axes, they may be characterized everywhere by a set of functions of the same four independent variables.

In this manner, the description of widely different kinds of physical phenomena is usually given by means of several functions of several variables. Of course, such a description cannot be absolutely exact.

For example, when we describe the density of a medium by means of one function of our independent variables, we ignore the fact that at a given point we cannot have any density whatsoever. The bodies we are investigating have a molecular structure, and the molecules are not contiguous but occur at finite distances from one another. The distances between molecules are for the most part considerably larger than the dimensions of the molecules themselves. Thus the density in question is the ratio of the mass contained in some small, but not extremely small, volume to this volume itself. The density at a point we usually think of as the limit of such ratios for decreasing volumes. A still greater simplification and idealization is introduced in the concept of the temperature of a medium. The heat in a body is due to the random motion of its molecules. The energy of the molecules differs, but if we consider a volume containing a large collection of molecules, then the average energy of their random motions will define what is called temperature.

Similarly, when we speak of the pressure of a gas or a liquid on the wall of a container, we should not think of the pressure as though a particle of the liquid or gas were actually pressing against the wall of the container. In fact, these particles, in their random motion, hit the wall of the container and bounce off it. So what we describe as pressure against the wall is actually made up of a very large number of impulses received by a section of the wall that is small from an everyday point of view but extremely large in comparison with the distances between the molecules of the liquid or gas. It would be easy to give dozens of examples of a similar nature. The majority of the quantities studied in physics have exactly the same character. Mathematical physics deals with idealized quantities, abstracting them from the concrete properties of the corresponding physical entities and considering only the average values of these quantities.

Such an idealization may appear somewhat coarse but, as we will see, it is very useful, since it enables us to make an excellent analysis of many complicated matters, in which we consider only the essential elements and omit those features which are secondary from our point of view.

I.e. the Poisson and Laplace equations are all over the place, as they represent the ideal form of most efficient 'sinks' that make an $\Delta-1$ herd of T.oes fall into a 'door' to a larger/smaller nested TCE scale of the fifth dimension (charges and masses sink); the Laplace equation, $\nabla^2 f=0$, represents the way in which a herd of $\Delta-1$ fractal points can 'fill in' a spherical membrain, which is the fundamental mode in which membrains that have motion even if we see them as fixed forms (a fixed form ultimately is a πS surface in which each point that appears static merely is a πd , self-turning diameter=point). So it is all pervading in nature. In fact electrons, which are herds of 'ultradense light photons' trapped in the 'event horizon' of the black hole-proton on the quantum scale, can be modeled just as the spherical harmonics of its $\Delta-1$ 'field' of photonic points; and so on and so on.

So a beautiful way to 'read physics' as I used to do a few decades ago when my mental skills were at its height, and my memory intact, was just to 'see as ΔST functions=forms in dimotion, the classic equations of physics. This will be the future of physics to entangle the abstraction of those PDEs and ODEs equations, numerated in the following list, in terms of what they mean for the vital life-death dimotional cycles of its T.oes

Simple examples.

Differential equations are very common in science and engineering, as well as in many other fields of quantitative study, because what can be directly observed and measured for systems undergoing changes are their rates of change. The solution of a differential equation is, in general, an equation expressing the functional dependence of one variable upon one or more others; it ordinarily contains constant terms that are not present in the original differential equation. Another way of saying this is that the solution of a differential equation produces a function that can be used to predict the behaviour of the original system, at least within certain constraints.

Differential equations are classified into several broad categories, and these are in turn further divided into many subcategories. The most important categories are ordinary differential equations and partial differential equations. When the function involved in the equation depends on only a single variable, its derivatives are ordinary derivatives and the differential equation is classed as an ordinary differential equation. On the other hand, if the function depends on several independent variables, so that its derivatives are partial derivatives, the differential equation is classed as a partial differential equation. The following are examples of ordinary differential equations:

$$\frac{dy}{dt} = -ky,$$

$$m \frac{d^2y}{dt^2} = -k^2y,$$

$$\left[1 + \left(\frac{dy}{dx} \right)^2 \right] \frac{d^3y}{dx^3} - 3 \frac{dy}{dx} \left(\frac{d^2y}{dx^2} \right)^2 = 0.$$

In these, y stands for the function, and either t or x is the independent variable. The symbols k and m are used here to stand for specific constants.

Whichever the type may be, a differential equation is said to be of the n th order if it involves a derivative of the n th order but no derivative of an order higher than this.

The equation:

$$\frac{\partial u}{\partial t} = k^2 \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right]$$

is an example of a partial differential equation of the second order. The theories of ordinary and partial differential equations are markedly different, and for this reason the two categories are treated separately.

Instead of a single differential equation, the object of study may be a simultaneous system of such equations. The formulation of the laws of dynamics frequently leads to such systems. In many cases, a single differential equation of the n th order is advantageously replaceable by a system of n simultaneous equations, each of which is of the first order, so that techniques from linear Algebra can be applied.

An ordinary differential equation in which, for example, the function and the independent variable are denoted by y and x is in effect an implicit summary of the essential characteristics of y as a function of x .

These characteristics would presumably be more accessible to analysis if an explicit formula for y could be produced. Such a formula, or at least an equation in x and y (involving no derivatives) that is deducible from the differential equation, is called a solution of the differential equation. The process of deducing a solution from the equation by the applications of Algebra and calculus is called solving or integrating the equation.

It should be noted, however, that the differential equations that can be explicitly solved form but a small minority. Thus, most functions must be studied by indirect methods. Even its existence must be proved when there is no possibility of producing it for inspection. In practice, methods from numerical analysis, involving computers, are employed to obtain useful approximate solutions.

PDES

Abstract. Each stoep of a method of solution is grounded in a real property of the 5D ΔST symmetries and conservation laws of the Universe, which are the 3 Galilean paradoxes between $\Delta+1$ curved closed worldcycles, sum of lineal steps, which gives birth to the most used method of lineal approximations; the equivalence between Space and time, in all Stoeps of dimotions, which gives birth to the method of separation of variables on differential equations and more broadly allows to move around relative space and time parameters in equations joined by an operand of 'equivalence' (\approx not $=$). And the 2 conservation laws of the Universe, conservation of those 'beats' of existence, $S=T$ in relative present, eternal balance, justifying the equivalence operands. And conservation of the 'volume of space-time' of each plane of the Universe, by virtue of the 5D metric equation $SxT=C$, which justifies the solution of differential equations by separations of scales and harmonizes those scales allowing constant but balanced transfers of larger bites energy exchanged by smaller bits of information, $St_j=1=Tsj$.

As in both cases, because $S=T$ and $\Delta-1=\Delta 0$, we can separate parameters *and make them equivalent to a common constant*

The Simplest Equations of Mathematical Physics. Solutions based in 5D laws.

The object of mathematical physics is to study the relations existing among these idealized elements, these relations being described by sets of functions of several independent variables.

The elementary connections and relations among physical quantities are expressed by the laws of mechanics and physics. Although these relations are extremely varied in character, they give rise to more complicated ones, which are derived from them by mathematical argument and are even more varied. The laws of mechanics and physics may be written in mathematical language in the form of partial differential equations, or perhaps integral equations, relating unknown functions to one another. To understand what is meant here, let us consider some examples of the equations of mathematical physics.

A partial differential equation (**PDE**) is a **differential equation** that contains unknown multivariable functions and their partial derivatives. (This is in contrast to ordinary differential equations, which deal with functions of a single variable and their derivatives.) PDEs are used to formulate problems involving functions of several variables, and are either solved by hand, or used to create a relevant computer model.

PDEs can be used to describe a wide variety of phenomena such as sound, heat, electrostatics, electrodynamics, fluid flow, elasticity, or quantum mechanics. These seemingly distinct physical phenomena can be formalised similarly in terms of PDEs. Just as ordinary differential equations often model one-dimensional dynamical systems, partial differential equations often model multidimensional systems. PDEs find their generalisation in stochastic partial differential equations.

Both ordinary and partial differential equations are broadly classified as **linear** and **nonlinear**; *such as linear are small steps of a non-lineal larger ΔST period, hence we can approximate all non-lineal systems by lineal equations.*

A differential equation is **linear** if the unknown function and its derivatives appear to the power 1 (products of the unknown function and its derivatives are not allowed) v. **nonlinear** of higher powers. The characteristic property of linear equations is that their solutions form an affine subspace of an appropriate function space, which results in much more developed theory of linear differential equations. **Homogeneous** linear differential equations are a further subclass for which the space of solutions is a linear subspace i.e. the sum of any set of solutions or multiples of solutions is also a solution. The coefficients of the unknown function and its derivatives in a linear differential equation are allowed to be (known) functions of the independent variable or variables; if these coefficients are constants then one speaks of a **constant coefficient linear differential equation**.

There are very few methods of solving nonlinear differential equations exactly; those that are known typically depend on the equation having particular symmetries. Nonlinear differential equations can exhibit very complicated behavior

over extended time intervals, characteristic of chaos. Even the fundamental questions of existence, uniqueness, and extendability of solutions for nonlinear differential equations, and well-posedness of initial and boundary value problems for nonlinear PDEs are hard problems and their resolution in special cases is considered to be a significant advance in the mathematical theory (cf. Navier–Stokes existence and smoothness). However, if the differential equation is a correctly formulated representation of a meaningful physical process, then one expects it to have a solution.

Linear differential equations frequently appear as approximations to nonlinear equations. These approximations are only valid under restricted conditions. For example, the harmonic oscillator equation is an approximation to the nonlinear pendulum equation that is valid for small amplitude oscillations.

A partial differential equation (PDE) is an equation involving functions and their partial derivatives; for example,

the wave equation
$$\frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} + \frac{\partial^2 \psi}{\partial z^2} = \frac{1}{v^2} \frac{\partial^2 \psi}{\partial t^2}.$$

Some partial differential equations can be solved exactly

In general, partial differential equations are much more difficult to solve analytically than are ordinary differential equations. They are mostly solved using *the fundamental illogic laws of 5D metrics, even if huminds don't know they are using them; that is (:*

An integral transform, (finding the Δ -whole or exact solution) a separation of variables (using the $S=T= C$ metric) lineal procedures (using the $\sum |i-1= 0i+1$ law of small lineal steps that ad to Time cycle; or--when all else fails (which it frequently does)--numerical methods such as finite differences (using the fact that continuity is reall a sum of discrete stœps).

Let us make some comments on those methods of 5D calculus (:

The methods of solutions of Differential equations combined 5D calculus. S=T.

As we said somewhere, all resumes in the functio of present existence, S=T.

This is the method of solution of PDEs, to reduce them to two ODEs, such as S=T, hence S=c, T=c and we solve two equations. Simple, isn't? Simplicity is genius said L¹. L³ agrees (:

Consider the most famous equation of quantum physics, the **Schrodinger equation**, describing nonrelativistic quantum phenomena:

$$\hbar^2 / 2m \nabla^2 \Psi + V(\mathbf{s}) \Psi = -i \hbar \partial \Psi / \partial t$$

where m is the mass of a subatomic particle, \hbar is Planck's constant (divided by 2π), V is the potential energy of the particle, and $|\Psi(\mathbf{s}, t)|^2$ is the probability density of finding the particle at \mathbf{s} at time t .

Those Equations have partial derivatives with respect to time. As a first step toward solving these PDEs, let's separate the time variable. We will denote the functions in all four equations by the generic symbol $\Psi(\mathbf{s}, t)$.

The separation of variables starts with separating the \mathbf{s} and t dependence into factors:

$$\Psi(\mathbf{s}, t) \equiv S(\mathbf{s})T(t).$$

This factorization permits us to separate the two operations of space differentiation and time differentiation. As an illustration, we separate the time and space dependence for the Schrodinger equation. Substituting for Ψ , we get $\hbar^2 / 2m \nabla^2 (ST) + V(\mathbf{s})(ST) = -i \hbar \partial (ST) / \partial t$,

Dividing both sides by ST yields:

$$-1/S \hbar^2 / 2m \nabla^2 S + V(\mathbf{s}) = -i \hbar T' / T$$

Now comes the crucial step in the process central argument of the separation of variables.

The LHS of Equation (is a function of Space *position alone*, and the RHS is a function of *time alone*. Since r and t are independent variables, the only way that the equation can hold is for *both sides to be constant*, say α :

$$-1/S \hbar^2 / 2m \nabla^2 S + V(s) = \alpha$$

$$-i \hbar \frac{d\psi}{dt} = \alpha \psi$$

We have reduced the original time-dependent Schrodinger equation, a PDE, to an ODE involving only time, and a PDE involving only the space position variables. Most problems of elementary mathematical physics have the same property, i.e., $S=T$, which by virtue of 5D metrics is the Constant state of present, hence $S \rightarrow \alpha \quad T \rightarrow \alpha$

All this physicists do but don't know why it works for so many equation (:

The time-dependent PDEs of mathematical physics can be reduced to 2 ODEs in the time variable and the space variable by virtue of $S=T = \text{Constant}$, the equation of present.

Thus as usual our interest is not in repeating the well known 'pro' methods of study of PDEs and ODEs but the whys we can learn from its merging with 5D as we already noticed in our introduction.

As geometry defines form in space and by virtue of the $S=T$ equivalence motion in time, the geometry of differential equations and its solutions illuminates in great deal the function or part of an organic whole the differential equation studies. And greatly reduces the number of 'real differential equations' we find in nature, helping also to consider which solutions are valid and which restrictions and limits must be imposed.

Second order.

Partial differential equations of second-order are amenable to analytical solution *if they can be written* as a lineal equation. Such PDEs are of the form: $A u_{xx} + 2B u_{xy} + C u_{yy} + D u_x + E u_y + F = 0$.

And once more according to 5D they can be classified into 3 topological variations, which miraculously huminds, without knowing vital topology have called exactly... believe it or not if you are an expert on 5D (that is if you are me, I and myself:) as elliptic, hyperbolic, or parabolic. Whereas, *a hyperbolic equation is one dominated by the ST body-wave topology; that is where $\partial s \partial t$ is larger than $\partial s \partial s$ and $\partial t \partial t$; elliptic when $\partial s \partial s + \partial t \partial t$ is bigger than $SS+TT$ and parabolic when both are equal.*

In the language of classic math, we said that Linear second-order PDEs are then classified according to the properties of the matrix $Z = \begin{bmatrix} A & B \\ B & C \end{bmatrix}$

as elliptic, hyperbolic, or parabolic.

If Z is a positive definite matrix, i.e., $\det(Z) > 0$, the PDE is said to be elliptic. Laplace's equation and Poisson's equation are examples. Boundary conditions are used to give the constraint $u(x, y) = g(x, y)$ on $\partial\Omega$, where $u_{xx} + u_{yy} = f(u_x, u_y, u, x, y)$

holds in Ω .

If $\det(Z) < 0$, the PDE is said to be hyperbolic. The wave equation is an example of a hyperbolic partial differential equation. Initial-boundary conditions are used to give $u(x, y, t) = g(x, y, t)$ for $x \in \partial\Omega, t > 0$ $u(x, y, 0) = v_0(x, y)$ in Ω $u_t(x, y, 0) = v_1(x, y)$ in Ω ,

where $u_{xy} = f(u_x, u_t, x, y)$ holds in Ω

If $\det(Z)=0$, the PDE is said to be parabolic. The heat conduction equation and other diffusion equations are examples. Initial-boundary conditions are used to give $u(x, t) = g(x, t)$ for $x \in \partial\Omega, t > 0$
 $u(x, 0) = v(x)$ for $x \in \Omega$,

where $u_{xx} = f(u_x, u_y, u, x, y)$ holds in Ω

Separation of variables by scales.

Finally the 3rd fundamental method besides lineal approximations and separation of S=T values, takes into account the conservation of volume of space-time between scale, but also the fact that smaller scales have faster times speeds and smaller parts, perceived as relative information compared to the bites of energy of a larger scale, so the equivalence is between a 'pool' of bits of information of a smaller $\Delta-1$ scale and its equivalent volume of bites of energy of a larger $\Delta 0$ plane. *This equivalence being essential to everything in the Universe as it allows the coupling of languages and energy, making for example the physical economy equivalent to the financial economy, the language equivalent to the action; the mathematics mirror the reality, but as information is smaller and more abundant, this equivalence tends to be inflationary, themes those that appear in all the planes of space-time and the interaction of minds and languages of information (SS, St) with Energy bites and entropic boosts (TT, Ts).*

Let us then show the case, with the previous example of Schrodinger's equation for the orbit of an electron in an atom.

$$\partial^2(\rho\psi)/\partial\rho^2 = -(\epsilon + 2/\rho) \rho\psi$$

Here, ϵ is the electron energy, ρ is the radial coordinate, and ψ is the electron wave amplitude.

At small distances from the nucleus, ψ may oscillate rapidly, but at large distances, ψ must decrease exponentially with r . This is because, at large distances, a bound electron's potential energy is greater than its total energy. With a negative kinetic energy, wave number k becomes imaginary and the normal oscillatory $\exp\{ikr\}$ term becomes $\exp\{-Kr\}$, where $K=k/i$.

We separate the large-scale exponential from the small-scale oscillations by making this substitution:

$$\rho\psi = g(\rho) \exp\{-\beta\rho\}$$

Here, β is an arbitrary constant, and $g(\rho)$ is the unknown small-scale function of distance. After a lot of math, our differential equation becomes:

$$\partial^2g/\partial\rho^2 - 2\beta \partial g/\partial\rho + (\beta^2 + \epsilon + 2/\rho) g = 0$$

Believe it or not, this is progress. Let's choose $\beta^2 = -\epsilon$, reducing our equation to:

$$\partial^2g/\partial\rho^2 - 2\beta \partial g/\partial\rho + 2g/\rho = 0$$

If not for the ρ in the denominator of the third term, this would be a simple equation. But we can solve this with a Taylor series.

$$\text{Let: } g(\rho) = \sum_k a_k \rho^k$$

This technique will work if the coefficients a_k approach zero for large k . Putting the Taylor series into our equation yields:

$$0 = \sum_n \{(n+1)na_{n+1} - 2\beta na_n + 2a_n\} \rho^{n-1}$$

Here the sum is from $n=1$ to $n=+\infty$. The above equation is valid for all values of ρ . This can only be true if the coefficient of each power of ρ is zero. This is an important rule for polynomials that is well worth remembering. After rearranging, we obtain:

for all $n > 0$: $a_{n+1} = a_n \{2(\beta n - 1)/n(n+1)\}$

With any choice of a_1 , we can recursively calculate a_2, a_3, \dots in terms of β , which is related to the electron's energy. For the electron to be bound to the nucleus, β must equal then a finitesimal, $1/n$ for some integer n ; which makes sense of why electrons in atoms have quantized energies which are its finitesimal parts (ultradense light photons trapped in the potential well of the atom).

This is the basis of the Periodic Table, chemistry, biology, solid state physics, digital electronics, and everything else we know about atoms; and the insight of 5D is to consider those quantized energies the finitesimal bites of electrons – its dense bosons of light.

So the question of Partial Differential equations 'reduces' to the study of ODEs, which we shall consider now in detail; to then plunge into the experimental praxis of the main differential equations of the Universe, which *will reflect the basic topologies of $St < ST > Ts$ and $\Delta \pm j$ laws of existential algebra, regarding locomotion (Ts) and transfers of energy and information between planes and physiological networks ($Stj-1=Ts_j$)*

Thus with this brief introduction to Calculus we conclude this paper on Non-Aristotelian, Non-Euclidean mathematics.

L§

Δ±3: PHYSICAL SCIENCES

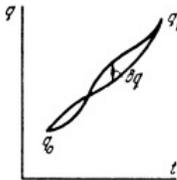

How does the Universe look when we override the Ego paradox and observe it as an absolute relative fractal, whose purpose is to reproduce information and preserve it through 0-sum worldcycles that enact through its infinite Timespace Superorganisms its 5 Dimensional motions of existence? Let us have a fast review of the main fields of physics, to focus on the cosmology of a fractal, organic, immortal Universe of ∞ 0-sum balances.

THE 2 FIELDS OF HUMAN SCALE PHYSICS

When dealing with physics in a future world of science, there should be no difference with any other science of scalar, organic existences.

The principle of conservation of energy would be derived of the principle of conservation of time, and its 3 standing points that maximize conservation, the point of reproduction in balance between temporal energy and spatial information, $S_i = T_e$; and the two maximal points of S_i (Max. social evolution) and T_i . Maximal motion, define the 3 ages of physical organisms, called states in matter, as in any other system of nature. Let us then do so in a brief treatise on Physics on the human scale, which roughly speaking divides according to duality into:

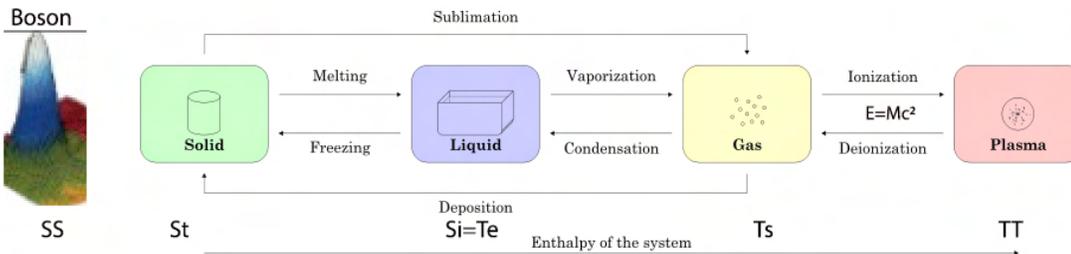

- **Δ+1: Scalar physics:** Mechanics; which are the scalar physics of the outer Human Universe that put mankind, Δ^0 in relationship with the larger forces of $\Delta+1$ cosmic bodies, in our case, planet Earth, through the study of motions in which the conservation of temporal energy is the fundamental principle.

As such the entire field of mechanics can be derived from the principle of conservation of time, which is called the principle of least action.

The mathematical language is then used to calculate the 'finitesimal derivatives or minimal 'motion' possible with a finitesimal change, happening in the minimal quanta of time, for any physical system, $\delta S = 0$ '. And through the sum=integral of those steps, we can deduce the motion of any body.

- **S<=>T: Timespace Physics:** Thermodynamics, which are the scalar physics of the inner human universe of matter, and its 3 ages or 'states', the Entropic T_s -Gaseous state, the ST -liquid reproductive state and the St -solid state; which form the cycles of life and death of matter on Earth from the inner structures of our organism (biochemistry) to the inner structures of the planetary organism (Geology).

Above, the 3±i physical ages that shape the worldcycle of matter: Matter States are physical time ages, from left pure solid, crystal, St stop state, to an even more solid $\Delta+1$ boson condensate, etc. We see that systems either move a step at a time within a plane of existence (gas, liquid, solid) or they can jump « two states at once, (as in the case sublimation) within that plane, or most often between two planes, as in « scattering & entropic death), to become a different Dimotional state. We can then see how the fundamental elements of 5D time appear on the graph: the worldcycle is local and complete. There are 2 inverse arrows from an entropic past (plasma), in a lower plane (ion particles) to the 3 ages of the matter states with increasing form (gas to solid), to end in a higher plane of existence as a boson-Einstein condensate.

The mathematics involved are then those of statistical mechanics (Boltzmann), when we analyze the system as a population in space in the $\Delta-2$ molecular scale, and of thermodynamics (Gibbs) when we study them in terms of bulk amounts of 'indifferent' (inglish for undistinguishable :) particles, which give us the 2 classic formulations of matter states according to the duality of wholes and parts.

THE ERRORS OF PHYSICS: THE 3 STATES=AGES OF MATTER

Simplex Physics: the denial of trinity by Ænthropic Mæn

The first atomic bomb of pure entropy was called trinity, in a mocking of the trinity of religion, the father – history, mankind thy God, the spirit, our language the wor(l)d, the prophet, its cell who receptacle of the memetic message of love that will radiate to other minds to form a supœrganism of mankind, treated elsewhere in our post on history and religion... since physicists believe in monism, entropy=death as the only arrow of time, and by doing so not only loose the comprehension of the superorganisms of mankind – which is not their job, but its true since is to forget the trinity of physics, the 3 states of matter, the 3 solutions to Einstein’s functions, because trinity is the minimum to make any sense of reality, even without the pentalogic of parts and wholes, requires to form the 5th dimension. So we need to make a harsh assessment on how the worldly religion of physicists –to make weapons – have handicapped the discipline.

And if we can find explanations in present time and here-space, it is always a higher truth than to consider an explanation in the past or the future time and out-of-here. It is like if we measure your body temperature, at 37 degrees and then a creationist physicist tells you the cause is to be found in a lineal function coming from past, because when you were born 50 years ago you were a few million degrees hotter and you have been cooling down ever since!! When there is a rational explanation, in the metabolic activity, now and here, of your body’s main energy cells, blood, and its most numerous red, oxygenated cells.

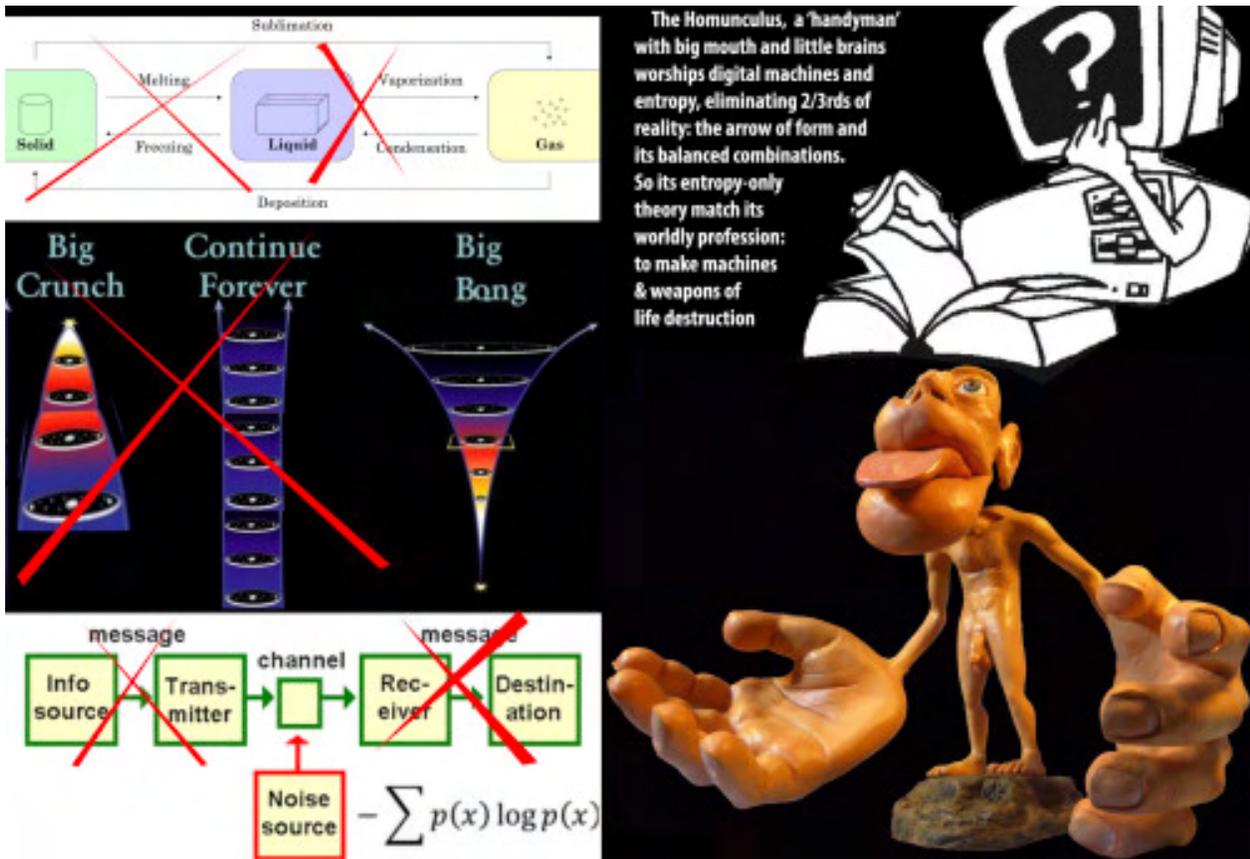

So what is the metabolic process on the galaxy happening now that produces that temperature; what is the blood of the galaxy, its commonest objects? The redshift of moon micro-black holes, feeding on the mass energy of its commonest mass, moon-like planetoids. As the galaxy is indeed about black holes, and so its metabolic activity in its 3 scales IS the natural cause of the Galactic temperature, as we shall see in our study of the 3 scales of black holes – the hotter smaller ones that produce the radiation that feeds, the cooler larger ones, as the red cells produce the energy needed by all the cells of your organism. And this is the 5D organic *entangled* reason, as all what exists has *a purpose*; and so does the *BG radiation that feeds larger black holes* – a far more scientific reason that the forecasted big-bang temperature, which has not true known cause, no true experimental proof now& here, no-nothing.

Science as Culture. Æntropic man

To fully understand the falsehood of single entropic theories we need to understand the 3 paths of time - that is, the relative paths any system have to choose its future, the reader should be aware that the Big Bang theory merely expands one of the 3 obvious arrows of space-time in matter, that of entropic gas where it was discovered, disregarding completely the arrows of inverse information (solid crystals, informative galactic vortices, perceptive species) and its balanced liquid states (body-waves), in all scales of reality - even in theory of information, they disregard the message content and the emitter analyzing only its lineal transmission and noise; evidently due to the worldly religion of physicists who invented those cosmogonies - to make entropic weapons and transport machines. Then a computer rigged simulation will look make pictures of the supposed Universe with a single temporal energy.

Modern Physicists’ interpretation of physical facts and functions is biased by their historic culture, Military Germany of worship of weapons and entropy=death, so they denied the arrow of ‘crystal=solid’ information and Einstein’s/ Gödel’s cyclical, big-crunch solutions happening in thermodynamic matter and cosmological galaxies, where we LIVE dominated by evolution NOT entropy, which balance the gaseous and vacuum space expansion, in reproductive liquid and steady state immortal ‘present’ systems. As time went by since most humans are memorial believers those sided theories of reality became dogma, and today in an age of increasing mental devolution as humans are substituted by thinking machines, mankind just repeats its model errors, spread also into social sciences and biology, always in favor of the arrow of death.

In the graph a critical assessment of the methods of ‘naïve, digital reductionism’ that physicists have used more or less consciously to establish a ‘way to model science’ only with digital functions and a ‘cosmic censorship’ on the 4

The Homunculus, a "handyman" with big mouth and little brains worships digital machines and entropy, eliminating 2/3rds of reality: the arrow of form and its balanced combinations. So its entropy-only theory match its worldly profession: to make machines & weapons of life destruction

dimotions of time that do not fit earlier Galilean->Newtonian lineal absolutist time views in a single continuum Cartesian spatial information. Space is scalar, fractal, broken in infinite different 'scalar sizes' which 'co-exist' together and for that reason there are 'organisms' and the Universe has an organic fractal structure, as systems change energy and information between those different sizes and scales, that put together form the 5th Dimension of the scalar Universe, ruled by a simple metric function: the smaller a system is the faster it turns its time cycles, or clocks that carry in the frequency and form of its systems, its information - the missing dimension of time in all lineal theories of the universe.

It is difficult to understand how Physicists so dexterous building machines=weapons are so dumb interpreting reality, blind to 2/3rds of the states of spacetime, and to all its non-mathematical properties unless we acknowledge that the human being is less of a thinker and more of an 'enzyman', ensembling machines, manipulating reality with it and tailoring their models of its world to its worldly profession, which in physics has been traditionally to make entropic weapons and moving mechanisms. Hence its philosophy of reality based in entropy and mechanism. In the graph, the rejection of all other arrows of Time=Dimotions in thermodynamics, cosmology and information theory, which only studies the 'motion of information', and its noise without caring for the form of the message, its emitter and receiver. This would be in physics the equivalent of ignoring the Fermions that emit a boson and merely study the space in which the boson moves. And indeed, cosmology is built ignoring the galaxies, space-time vortices of information, which do NOT expand, and just contracting the vacuum space between them to get into the 'magic singularity' from where all came from.

In the fractal Universe time-space dimotions/arrows are ternary, LOCAL, for each of its species. The previous graph defines their existence for physical systems, as opposed to huminds' use of a single entropic arrow. So, first, we add the inverse arrow of entropy which is information, dominant in this planet, as it is represented NOT by the vacuum space expanding between galaxies but by the vortex of galactic form, of in-form-ation that evolves entropy into matter, in which we reside - reason why this planet is *dominated* by information. Incidentally Duality was the science I r=evolved in the milieu of systems sciences, whose chair I hold during my active years in congresses of the International Systems sciences society at the turn of the century.

The science of duality is important because only a proper model of duality (not to confuse with dualism, the philosophical doctrine of mind and body), that is a proper understanding of the interaction of entropy and information, can give us the proper philosophy of science required to understand the Universe as a whole and all its disciplines, those specialized in information as biology and sociology is, and those specialized in entropy as physics is.

The distinction between entropy sciences and information sciences however *is not one of Nature, but one of huminds (ab. human minds), of historic and realpolitiks (power) NOT of reason and scientific laws. And to prove the case we can consider the side of 'physicists' (rather than physics) and how they stubbornly since the inception of their discipline have DENIED the existence of an arrow of information in the Universe.*

Lineal Inertia, Entropy and big-bang's reductionism.

This, physicists have always denied due to historic reasons, as the oldest science which started with the study of military weapons (Galileo was an artillery master at the Venice arsenal), and developed a theory of the Universe based only in 'the science of motion' (the definition of the discipline in classic encyclopedia). So his job was to study how to reach maximal distance with cannonballs and for that reason he defined 'lineal inertia' - the conservation of lineal motion; *but declined to consider the existence of its opposite informative arrow, the conservation of cyclical inertia, angular momentum, as a clear balancing second arrow of time that gives 'form' to all 'forms' of Nature.*

Physicists however follow their routines and so again in the XIX c. they chose 'entropy', the disordered state of matter, called 'gas', in the study of motion machines and weapons (heat in cannons; steam studies) to cast an absurd 'law' according to which all systems are 'gaseous=entropic' and die in the future; shunning off the obvious fact that there is *an inverse arrow of time in matter, called 'cold'.* And so when entropy ceases the system reverses its arrow of time into coldness and then creates crystals that reproduce information.

Then in the XX century, they again took their bias to 'cosmic hyperbole', when Einstein's Relativity improved upon Galileo's work and stated that 'time curves space into mass'; that is indeed the best definition of the arrow of information in physical systems, as masses and charges ARE curves of spacetime that store in the frequency and form of its cycles the information of the Universe. And so galaxies are vortices of timespace mass that 'shrink' and 'warp' the expansive, entropic space between galaxies to balance the Universe.

But NONE of this was considered when a cosmology came out of Einstein's Functions (ab. EFE). Instead, of the 3 solutions or 'ages' of a space-time 'world cycle' of physical matter, the entropic big-bang solution/age, the steady state solution/age and the collapsing informative solution/age, two were discharged, as well as the implosive, informative behavior of galaxies, even if we humans lived in one of them; and so once discharged the 'in-formative' gravitational force that brings radiation and mass into cyclical informative patterns, the 'big-bang entropy-only' theory of the Universe became the dogma/religion of physicists, and by extension given the technological, machine-driven civilization we live in, of all mankind.

Fact is Einstein's function, $E \Leftrightarrow M(c^2)$, is a feedback function that reproduces mass/information from entropy/energy and vice versa. In fact Einstein's first calculated it in an article about how 'energy can create mass' (so he studied the arrow of information). But it would be only used as a proof of the dominance of entropy and to make atomic bombs.

So again physicists ignored ½ of the function as they keep denying cyclical inertia as an arrow of time (angular momentum, orbital electrons, etc.); or denying the cold-crystal arrow of information in matter; now denying the arrow of information in galactic vortices that 'curve vacuum space into mass'.

So when Einstein died, General systems sciences was born at the Macy's congress, where the leading scientists of the age came together trying to add the 'arrow of informative time' to fully account for the Universe as it is, since biological and sociological, human sciences *are based in the arrow of form, of in-form-ation; and the planet Earth exists in a vortex of cyclical 'form', of information, called the Galaxy. So in this region of reality it IS information, NOT entropy what dominates reality.*

But that didn't change the attitude of physicists and society who had them as the 'new seers of time', the popes of creationism ('God is the seer of time' had said Augustine), mostly because they didn't understand the mathematics they used to mirror those laws of entropy in physical spatial information.

So finally in the post-war age, as computers and other informative machines developed, physicists had to deal with 'form', in-form-ation, logic languages and its cyclical logic clocks. But amazingly enough they *manage again to deny the formal, linguistic nature of information*. So when it came into the study of information, physicists 'reduced' the concept either to its 'motion' (transmission of information, Shannon), or as an 'aberration' called 'negentropy' (the negation of entropy). And again, in a military, western society where believe it or not, the military-industrial complex DOES dominate societies, all was good in the western front. Now physicists had a theory of the Universe based in a 'big-bang explosion', similar to the ones they developed in the Nuclear Industry, and so to develop entropic weapons of mass destruction was suddenly a metaphysical experience.

But reality is dual and hence ternary. So the understanding on how entropy, or pure motion without form, and 'form without motion' (information being form-in-action, form with motion), *as the two limits of reality which combine to create the infinite 'fractal spacetime beings' of energy, we all are made of; cannot be suppressed from the Universe, even if man ignores it or as in physics, studies it in a very convoluted way by lack of clarity in its foundational principles, properly explained for the first time in 5D formalisms*.

Indeed, we cast all phenomena of Nature, with the 5 Dimotions of time of physical matter ($E=Mj$ in Planck Units, where $c=1$), in simple 'fractal feed-back generator functions', which reduce all what exists to those two arrows and *the ternary balanced equivalent arrow that merges entropy and information and reproduces with them the infinite vital space-time beings of reality, such as: $S(i) < \approx > T(e)$...* becomes the simplest, ternary, logic fractal Generator function that unifies all sciences and represents in simultaneity the 3 topologies of the Universe (cyclical information, lineal entropy and its hyperbolic combinations), and the 3 different 'ages' of time-motion we observe in all beings, born of an informative seed, which lives through an entropic youth, reproductive age, and informative, warping third age that ends in a reversal of time arrow in an entropic death, which completes the worldcycle of existence of the being.

We call the 3 arrows of time, entropic past, reproductive present that seems not to change and informative future, or 3rd age of maximal warping, which explodes back into entropic death. So the simplest entropic arrow adds in duality form, and both reproduce in energetic, iterative 'present' dynamic combinations.

Big bang cosmology ignores gravitational informative galaxies & dark matter & the scalar structure of the Universe reducing space-time to a single scale, and the cyclical nature of time, we must correct the big-bang, which corresponds to the limit of a 5D complete theory of reality in a single 'light' space-time continuum.

The big-bang entropy-only theory of the Universe dismisses galaxies all together, as they are NOT expanding, and if the galaxies are NOT expanding, running backwards its present implosive system would mean a counter-effect to running backwards the expanding Universe. Backwards in a single time, the space between galaxies contracts, but the galaxies between space expand and a balance again is achieved: Since when we add the gravitational force that warps 1D space into 3D mass in galactic vortices, they balance the expansion of 1D space in entropic vacuum as light dies into dark entropy lines between them. As mass warps 3 1D flat-vacuum into a 'high volume' its 3 times more powerful in its warping, hence the 75%-25% balance of mass to dark energy.

Thus the inverse arrow of gravitational information compresses dark energy into matter and balances the arrow of expansive space between galaxies, describing a fractal immortal Universe where a big-bang is merely the entropic arrow of dissolution of matter guided by Einstein's function in any scale: $E \Leftrightarrow Mc^2$

In the graphs, we resume the model of the fractal Universe in which each scale have similar big-bang deaths:

Scalar big-bangs that happen from Beta decays (right picture) that explodes nucleons into atoms, Nova that explode stars and maybe planets doing experimental big-bangs at home, to quasar black holes that give birth to new galaxies. All scales suffer similar $e=mc^2$ dual processes of warping through gravitational forces of cyclic momentum that create

those galaxies, and expansive big-bangs of lineal momentum balanced in combined cycles of energy - the 3 conserved quantities of each fractal space-time physical organism, which put together give birth to the 3 conserved laws of nature, which present Big Bang theory ignore. Instead a fractal space and cyclical time arrows fully accounts for the immortal Universe and its balanced 3 arrows of space-time, conserved in its infinite reactions; energy, information stored in the cycles and frequency of those systems of angular momentum, whose minimal constant form is h , and lineal speed, conserved in the constancy of light.

In the center we see a map of the Galaxy, which just recently showed to have two lobes similar to those of the first electronic orbital of a Hydrogen atom born in self-similar fashion in the quantum scale. In the left side we see the background radiation that is supposed to come from the Big Bang 13 billion years ago, but HAS in its center the exact 2 lobes recently found above the black hole. This came as a surprise.

Above, the local explanation of the background radiation, which is a LOCAL MEASURE, hence must and can be explained by local causes in the galaxy: any moon MACHO, (Massive Cold Halo Object); that is, a quark nugget of heavy quark matter or a similar black hole that has eaten the mass of a moon will produce the exact same background radiation by gravitational red-shifting. Thus as moons are the commonest objects, we can talk of primordial black holes and/or strangelets as the local, 'present' cause of the radiation. Since epistemology ALWAYS favors a local 'present' solution far more sound experimentally than a 'derivation' from a non-measured experimental past in a non-measured larger region (the cosmic big-bang whose temperature 'comes from the past', reduced by a lineal function and is extended hyperbolically to the non-measured entire Universe), it follows the fractal big-bang, is sounder. So what physicists call the cosmic big-bang likely does not exist, as the limit of scalar big-bangs we soundly measure are quasar big-bang.

Finally French astronomers tabulated for them a 15–20 billion year cycle which explodes central black holes, explaining the hyper-abundance of Helium in the center of galaxies. So a galaxy has a 15 billion years cycle in an older immortal Universe, since the arrow of information that shrink energy into mass in galaxies balances the entropic 'cosmic electromagnetic' repulsion of dark energy. Interesting enough if we reduce a quasar big-bang of 15 billion years, with 5D metric, accelerating its time clocks as we reduce size in space: $\delta \times \delta = K$, it reduces 15 billion years to 15 minutes (: the exact duration of a beta-decay neutron Big Bang).

We falsify the big bang with experimental & epistemologic known proofs ignored by cultural, sociologic reasons that make it a dogma of the worldly religion of physics – to make entropic weapons in a military society- and the western creationist religion of most founding fathers of physics, with its lineal Abrahamic time views & anthropic beliefs of man at the center of reality reflected in the lineal, created out of nothing cosmos.

Correspondence Principle. 4D physics as a 5D limit reduces time to entropy and scales to a single plane.

The 5th dimension is the key to resolve the pending questions of physical sciences. So, we shall respect the correspondence principle and translate the laws of relativity to 5D, to prove the veracity of both arrows of time, which are needed together to fully account for all the possible 'dimensional motions' (ab. dimotions) of the scalar space-time Universe. Since the 4D formalism is the 'limit' of 5D physics, when we 'discharge' times=changes of information reducing all the types of change=time of reality to translation in space (entropy and locomotion) and its mathematical formula, $v=s/t$ in Galilean relativity, $S^2=S^2(x,y,z)-(ct)^2$ in Einstein's Relativity. And when we 'compress' all the scalar planes of space-time of the fifth dimension into a single space-time plane continuum, discharging all its organic and sentient properties, which we shall soon show are a direct consequence of 5D metric functions

So the reader who is impatient to compare both models can go to page 21 where we deal with Relativity.

He must be warned though that the expansion of our understanding of space and time produced by the introduction of the second pole of internal change=time, evolution of form, information, classically studied only in biology to that of external change, translation in space, studied in physics, is so vast that despite the cult to our Baconian 'tribal idols' of science, our 'seers of time' (Augustine's definition of God), relativity physicists will seem to him, once he has

suspended his beliefs long enough to digest with an open reason the basic laws of 5D children, making simple 'worldlines' on the sand with a single rudimentary stick – that of lineal temporal energy. Since indeed as Parmenides already proved, the one is a perfect sterile whole - a single time dimension cannot generate anything, but when we have two poles connected by the inverse properties of form=still space and time=motion, across multiple space of size=scale, *this entangled trinity will account for the whys of every event and form of the Universe in 'existence'*.

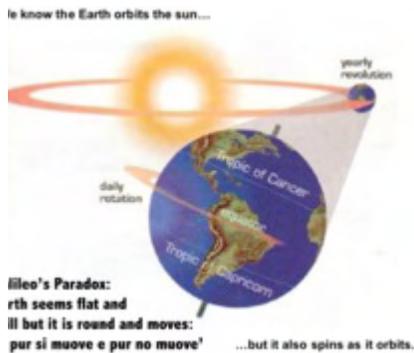

While we can do nothing about the arrogance of physicists about their little knowledge on time, they consider the 'whole', its dogmatic despise of other languages of thought beyond mathematics, which they hardly understand as the next paragraph shall show and the lame attitude of all sciences towards its limited understanding of time, as ONLY locomotion either external (Ts in 5D) or internal and external (TT, entropy=death), forgetting the 3 Dimotions dominant in the Universe of information (ST, St, SS), main reasons why the world of science ignores 5D, we can state the obvious fact that Physicists concepts of time, corresponds to the limit of 5D on only 'T' dimotions and 4D formalisms, latter considered in more detail correspond to the limit of 5D in a single plane; in the same manner physicists say that statistical mechanics corresponds to the limit of quantum physics in larger scales (but this is NOT exactly truth as we will show on future papers on 5D physics – it is rather a problem of perspective, quantum is the temporal, faster view of a smaller scale, in the 01 probability sphere, as faster systems ARE full time cycles perceived from slower larger wholes as space). All this brings 2 concepts: huminds see a single plane of space-time and do NOT see larger planes as wholes, because their translation of scales is light, which travels better from smaller to larger scales, but does NOT integrate larger wholes into smaller focus, neither 'sees' slow time cycles as simultaneous wholes (telescopes do so only with external far away forms, but we cannot focus the whole Earth, we cannot see the whole history, etc.) So huminds tend to deny as visual species, larger wholes of slower time cycles they do NOT understand, even if they are essential to the future – evolutionary cycles of machines, long cycles of history, ages of species, etc.

The correspondence principle is the key to fit smaller theories into those larger 5D time cycles and spaces. A simple example will suffice. Earth's gravitation is on the '4D' surface $F=GMm/r^2$; on the 5D 'sum of gradient planes, $F = GMmr/R^3$ whereas r is the distance of the inside point of Earth to its center and R its radius. But 4D surface gravitation is just a case of 5D, as when r -distance = R -radius, both cancel and so we get $F=GMm/R^2$. Now a being on the surface will tell you, he doesn't need 5D gravitation, as he CANNOT see the interior of Earth. This is scientists' myopic attitude towards 5D; they cannot see 'organisms of history with longer time span, of which each human is a cell'; cannot see the longer ages of evolution of species as superorganisms, mimetic to those of a faster 'individuals', which apply to the evolutionary cycles of machines, etc. But they DO exist and define the future of mankind and economics. So 5D matters far more than Earth's invisible layers for they define the future of mankind and our chaotic ignorance of those cycles only make us slaves of them.

PHYSICS

5 D METRICS AND RELATIVITY OF MOTION

Galilean Paradox: $S \leftrightarrow T$: Relativity of space Dimensions=Forms=Motion in time: 5 Universal Dimotions

Galileo's time and space Principle of Relativity is the fundamental conceptual thought behind the relationship between time=motion and space=form and how one can be converted into another: All what exists is made of space=form and time=motion. And yet physicists know that we cannot distinguish motion from form. That any being in motion from its point of view seems to be still and all other things moving around it. *This is the principle of Relativity of motion.*

Physicists then without much thought about that fascinating duality, went on to use mathematics to calculate the relative motion of each entity of reality respect to other system, which seems static from both points of view. This is called Galilean relativity, latter refined by Einstein's relativity, and essentially is concerned with the mathematical calculus of what we shall call the 2nd Dimotion of time=change, locomotion. Fine, but *we are more interested on the duality of space=form and motion=time and its entangled relationships –the reasons why we do NOT see together motion and form, even if all systems have both.*

The conclusion is then rather obvious: one of the two parameters of reality is 'hidden' to perception; we either see motion or form, 'waves or particles' (quantum complementarity), distances and lines or points in motion (as in the night when fast cars in a picture appear as lines). So *physicists calculate only one when in fact we must assess the existence of 2; and since we cannot distinguish them, logically we must equal them. 'Form=motion-function; space=time; Si=Te'.*

Relativity then becomes a duality, $Si=Te$, which is *at the heart of every law of the Universe. Whereas the primary element, the ultimate substance is time=motion. As space is a Maya of the senses – a slice of time motion. Form is what a 'still mind', makes of that motion to 'perceive', information, forms-in-action.*

Since we see Earth still and flat but it is round and moving. Galileo's profession was ballistics - the study of cannonballs motion. So he chose ONLY motion and lost the chance to start physics with a complex philosophical understanding of its $Si=Te$ dual Principle of relativity, which Poincare defined latter clearly when he said that 'we cannot distinguish motion from stillness'. An example is quantum/relativity duality. In detail quantum space has 'dark energy' because it has expansive motion that extends into a plane of space, but when seen at larger scales without detail its entropic motion seems static space - a dual area of scattering length and width. So in the galaxy we see either dark energy motion or expanding space: $T=S$. A motion of time is equivalent to a dimension of space: Distance and motion cannot be distinguished so they must be taken as two side of the same being, a space=time Dimotion (ab. Dimensional Motion):

$$S = T; \text{ Dimension-Distance} = \text{Time-motion} = ST \text{ Dimotion}$$

Earth moves in time, but we see it as a still form in space because reality is a constant game of ∞ motions, but the mind focus those motions and measures them at still distances. For huminds, motion is relative to our systems of measure and perception, which are light-based; hence a fixed c -rod speed/ distance. Reason why Einstein's relativity postulates a maximal $T:c$ -speed, measured as if observer and observable were still to each other (Constant S); which at our scale we correct with Lorentz Transformations.

But physicists just substitutes the Earth's still distances for motions, and it took another 300 years for Einstein to realize the relativity of motion and its measure made essentially time and space, motion and form two sides of the same coin. Still this realization was not explored philosophically and so it gave birth to a series of ill-understood dualities between 'states of measure and form' (particles, head gauging form, in-form-ation) and 'states of motion' (wave states).

It is then essential to grasp that motion and form co-exist as 2 different states depending on 5D scale and detail: Motions are perceived by minds that stop motion into form, into information, as distances. So if we see slow motion in the night, a car's headlight seems a long distance line 'still' picture. But this means also that the 3 'Euclidean still dimensions' must have motion; they are 'bidimensional ST-holographic, topologic dimotions'. So we have 3 Space + 1 Time + 1 5th dimension of scales = 5 Dimensional motions. None of them is *a Dimension of pure spatial form or a pure time motion but a combination of both. Even if mentally we tend to reduce motion and focus on forms, all has motion=time, and form =space: this is the meaning of 'spacetime', the messing of both into 5 dimotions, the fundamental element of all realities.*

Relativity states 'we cannot distinguish motion=time from position=space'. So all what exists is a composite of both, undistinguishable Si=Te, 5 'Dimensional motions' (Ab. Dimotions), broken in infinite fractal, vital time space organisms, composed of topological Dimotions: height=information; length=locomotion; width=reproduction; form=social evolution of parts into wholes & entropy=dissolution of a whole into its parts in a lower scale of the fifth *dimension* (term we keep for the whole range of scales of the Universe); whose study is both mathematical, the main science *that studies how those 5 Dimotions entangle in simultaneous Space*, connected to each other topological adjacent parts, which create superorganism, and Logic; the main science of time that observes how those pentalogic, entangled superorganisms move and evolve, change in sequential relational time, living a worldcycle of life and death.

As all is time&space, the 2 experimental primary mirror-sciences of time&space become the most important to extract the Disomorphic=equal laws of those 5 Dimotions that all systems have in common. Since *while those Dimotions are broken, in vital organisms, separated by cyclical time membranes, they are the same.*

In the graph Galilean relativity was ill understood, as the true question about time-change is why 'the mind sees space as a still, when in detail is made of smaller self-similar quanta, in motion. The paradox defines mental spaces as still simplified views of the more complex whole. The 3 logic paradoxes of space topology (closed in-formative curved-O vs. |-open, free entropic lineal forms), time-motion (stillness vs. motion) and Δ-scale, (continuous whole vs. discrete forms; single scale vs. multiple ones), are essential to the perception of a simplified 'spatial mind universe' in a single flat still plane vs. the full, more detailed complex picture in time, of a curved, discrete and moving Universe. Those paradoxes resume the 5 elements of reality, Space=form, time=motion, scales and the mind that measures them, within its own entropic limits.

5d metrics expresses the conservation of time.

The paradoxes of Relativity, discontinuity, parts and wholes, scales are all related to the reductionist nature of minds that bias reality. Minds reduce dimensions to the relevant ones, eliminating all dark spaces: continuity is the result. Of all formal languages that map out reality 2 are paramount, Time logic & mathematics of Scalar Spatial information.

A 5D Metric function, $S(0\text{-Mind}) \times T(\infty\text{-universe}) = \text{constant world}$ is the function of all mind languages who only perceive from its self-centered point its language mirror confused with the whole Universe (Ego paradox, basis of psychology). Entropic huminds reduce the multiple clocks of time and vital spaces of reality to the single human clock and spatial scale, rejecting the organic properties of other Universal systems.

The main laws of 5D are the metric functions of the scalar Universe, which relate the spatial size and speed of temporal clocks of all scales of Nature. Both parameters are inverted: when systems grow in size the speed of its clocks, its 'time cycles', diminish proportionally, both in biological and physical systems. And vice versa. Smaller clocks tick faster and information processing carried by the frequency of those cycles accelerates, as it happens in chips, particles or life metabolism. So we write: $S \times T = C$.

The mind thus starts it all with its linguistic 'still mapping' stopping its world in a locked 'crystal image', measure of its self. But even perception is social, linguistic. The Universe can only be explained if 'perception' exists within the language, as when you think words, you sense words, when your eye sees light and maps into an electronic mapping

you are seeing. And when an atom maps a geometric image in its 'locked' 'stopped' spin, it must perceive that geometry as information.

Physicists made the Galileo's paradox, the cornerstone of their theory of measure, but they failed to study the deep implications it has for every aspect of the structure of the Universe, from the duality between spatial mental, linguistic forms and physical motions; to the balances achieved by the similarity of both space and time, which becomes the fundamental 'function of present' $S_i=T_e$, and hence with the metric function of scales, $S \times T = K$, the two essential functions to formalize single planes $S_i=T_e$, and multiple scales of spacetime. Yet as $S_i=T_e$ maximizes $S \times T = K$ ($5 \times 5 > 6 \times 4$). We unify both in 1 function:

Max. $S \times T = C$, which defines for each fractal vital space-time organism its Function of existence, as all species will try to maximize its motion-entropy-time for its field-limbs, its information-spatial states for its particle-heads, whose product will give us its vital reproductive energy. Moreover the function has an immediate biologic meaning, because as we are made topologically of 'fields-limbs' of lineal space with motion provided by the energy we absorb to also reproduce our bodies-waves, and the information we need to linguistically guide our motions with particle-heads, the very essence of survival is to increase our S =position, mental forms of space and T =entropic motions of time (whereas time=motion & space=form are the two limiting Dimotions with 'energy=reproduction, $s=t$, locomotion, sT and information, St , are the intermediate 3 dimotions).

The fifth dimension is made of the 'different co-existing scales', which from the simplest forces through particles, atoms, molecules, matter, organisms, super organisms, planetary systems and galaxies, create an 'organic network structure', which amazing enough since it was discovered at the beginning of science with telescope and microscopes, was not formalized till I introduce its metric function in the milieu of systems sciences, as a single lineal time motion is a dogma physicists don't dare to challenge. *Yet science cannot advance in its fundamental principles unless the formalism of the fifth dimension is accepted and used to fully understand the cyclical, repetitive patterns=laws of science of each discipline that studies a scale of the fifth dimension and its species.*

Reproduction of form in 5D and its essential mathematical tool: calculus.

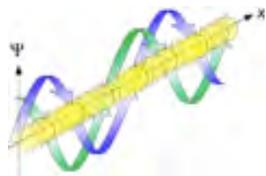

The Universe is a fractal that reproduces information, forms-in-action, forms of space with motions in time. This is the essence of it all. *But space is a maya of the senses, the synchronous view of a series of cycles of time motions, knotted in the simultaneous perception of an observer; what physicists call a 'frame of reference'.*

Thus time=change is the fundamental element of reality, and this makes Algebra of time-change, specifically calculus perhaps the most important experimental science of time, besides logic, which we have upgraded to existential algebra, which explores the vital, organic whys of those changes.

It is the Galilean Paradox: $S=T$. We cannot distinguish time from form. In as much as each frame of reference or mind locks in a knot-mirror of the motions of the Universe from its point of view. So each point of space is a perceiver relative field of motions, which from its perspective knot as forces 'attracted' by its frame of reference. Yet if we cannot distinguish motion from form each point is entangled to those motions and is made of motion and form, of the particle and wave states.

Locomotion as reproduction of form solves the Paradoxes of Zeno and the meaning of discontinuity. As motion is reproduction of information, of form, since particles are knots of perception of form, fractal points, monads, that move by reproducing in a lower 5D plane, as $\Delta-1$ waves, its information, as forms-in-action.

So all forms of change can be reduced to the ultimate function of existence, reproduction, a back and forth travel through 2 scales of the fifth dimension, as a form becomes a seed that reproduces, evolves socially and forms its whole again. *The extraordinary capacity of Calculus, which extracts at $\Delta-1$ level a 'finitesimal' (Leibniz's $1/n$ definition of infonitesimal as a minimal part of a whole and ALSO, by virtue of $S=T$, a minimal 'curvature' of a time cycle, which is then integrated for a time duration of the event, either locomotion, or volume of population in space or $S=T$ continuous=smooth change in*

time happens precisely because CALCULUS perfectly mimics the process of change and reproduction of form between Δ^0 and $\Delta-1$ scale which is the basis of all time-change also in physics. Change thus is change reproduced in a lower plane as a seed that evolves into a whole.

And all this is what actually calculus calculates: It finds a finitesimal part of reality and then integrates it as a sum, whereas the function of existence of the form displaces and reproduces its orthogonal parameters of form and motion. So physical forms are constantly reproducing, 'calculating' and the equivalence between the tools of calculus as mirror of the process of reproductive locomotion become crystal clear.

It is then not so much in physics but in calculus where we find the strongest model of the laws of 5D and locomotion as a reproductive process of form, even if the experimental proofs are scattered all over physics. Indeed, the entire world of quantum physics can only make sense if we consider that particles MOVE AS WAVES and gauge information as stop particles. Because waves can be transparent to each other but particles collide. A simple proof: the atomic nucleus is so small compared to its particles that if they wouldn't move as waves, transparent to each other, they would be always colliding and the nucleus would never remain stable. In fact, when we get pictures of those particles outside its shells, (electrons) they move in zig zag as they stop and change motion constantly. As usual physicists just make an axiomatic rule and subvert the law of causality converting the mathematical mirror derived of the fact in the cause of the fact – in this case they say this is due to the Pauli exclusion principle without providing *the mechanism for particles to avoid collision if moving*.

It follows that beings with more information, reproduce slowly and we can hardly see them moving. The limit of it being complex life superorganisms on Earth, whose reproduction takes 9 months. It happens 'inside' the reproductive mother, and it reproduces in the adjacent space after 'tearing' the topological knot of the umbilical chord. A similar very slow process of reproduction happens in physics with the weak interaction that reproduces a form with even more information evolving the mass of particles, so the range of the force is minimal and the new particle appears adjacent to the one that disappears, dying for the new hatched 'baby' to be born.

They are also essential to all the elements of calculus and mathematics at large and its *methods of solutions*; specially the inversion between finitesimal lineal steps (as a step between two points is NEVER curved) and the cyclical form of longer 'integral paths'. So lineal approximations are the essential tool of calculus and mathematics to resolve many equations.

What neither mathematicians nor physicists fully understand (though some inroads in abstract were made through the Noether's concepts of symmetry) is that each stœp of a method of solution is not 'gratuitous'; but must be grounded in a real property of the 5D Δ ST symmetries and conservation laws of the Universe, which are not so many – hence the repetition of methods. Specifically, the aforementioned 3 paradoxes between $\Delta+1$ curved closed worldcycles, sum of lineal steps, which gives birth to the most used method of lineal approximations; the equivalence between Space and time, in all Stœps of dimotions, which gives birth to the method of separation of variables on differential equations and more broadly allows to move around relative space and time parameters in equations joined by an operand of 'equivalence' (\approx not $=$). And the 2 conservation laws of the Universe, conservation of those 'beats' of existence, $S=T$ in relative present, eternal balance, justifying the equivalence operands. And conservation of the 'volume of space-time' of each plane of the Universe, by virtue of the 5D metric equation $SxT=C$, which justifies all the procedures regarding scales – solution of differential equations by separations of scales, renormalization procedures (Wilson), and harmonizes those scales allowing constant but balanced transfers of energy and information, $St=Ts$.

EINSTEIN'S RELATIVITY

Correspondence Principle. 4D physics as a 5D limit reduces time to entropy and scales to a single plane.

The 5th dimension is also the key to resolve the pending questions of physical sciences. So, we shall respect the correspondence principle and translate the laws of relativity to 5D, to prove the veracity of both arrows of time, which

are needed together to fully account for all the possible 'dimensional motions' (ab. dimotions) of the scalar space-time Universe. Since the 4D formalism is the 'limit' of 5D physics, when we 'discharge' times=changes of information reducing all the types of change=time of reality to translation in space (entropy and locomotion) and its mathematical formula, $v=s/t$ in Galilean relativity, $S^2=S^2(x,y,z)-(ct)^2$ in Einstein's Relativity. And when we 'compress' all the scalar planes of space-time of the fifth dimension into a single space-time plane continuum, discharging all its organic and sentient properties, which we shall soon show are a direct consequence of 5D metric functions.

So the reader who is impatient to compare both models can go to page 21 where we deal with Relativity.

He must be warned though that the expansion of our understanding of space and time produced by the introduction of the second pole of internal change=time, evolution of form, information, classically studied only in biology to that of external change, translation in space, studied in physics, is so vast that despite the cult to our Baconian 'tribal idols' of science, our 'seers of time' (Augustine's definition of God), relativity physicists will seem to him, once he has suspended his beliefs long enough to digest with an open reason the basic laws of 5D children, making simple 'worldlines' on the sand with a single rudimentary stick – that of lineal temporal energy. Since indeed as Parmenides already proved, the one is a perfect sterile whole - a single time dimension cannot generate anything, but when we have two poles connected by the inverse properties of form=still space and time=motion, across multiple space of size=scale, *this entangled trinity will account for the whys of every event and form of the Universe in 'existence'.*

Its 5 Principles. Masses & Charges as scalar space-time vortices. Unification of forces.

Time is what a clock measures'. 'Time curves space into mass.' *Einstein*

We apply the correspondence principle and prove that Einstein's previous paradigm on 4D space-time, based in the following 5 postulates/functions, is the theoretical limit of 5D in a single light spacetime plane:

- Relativity postulate that states we cannot distinguish motion=time from dimension=position=form=space, which in 5D we reduce to a simple formula, $S \approx T$; we shall call the Paradox of Galileo (e pur si muove, e pur no muove) as he couldn't explain why the Earth moves but we perceive it in mental space as a still dimension.

- Denial of Newton's Absolute space-time; as he said 'Leibniz was right, but if so we have to start physics from its foundations' and 'I am the only physicist who believe there are ∞ time speeds in the Universe', which we made explicit accepting Leibniz's relational concept of spacetime, precursor of generational space-time, resumed in a sentence: 'we are the scales of space we occupy and the cycles of time our existence lasts'.

- Constancy of light speed, c that in a 4D single background plane of light space-time corresponding to the galaxy holds naturally, as *light in a relational->Generational theory is the space-time of the galaxy*, which generates through its 'accelerated' vortices of space-time in a crescendo of ever more dense scales, photons, electrons, quarks, atoms, molecules, matter states, cosmic bodies and black holes. Yet when we add a 5th Dimension sum of all those scales, c -speed becomes the limit when we reduce all the potential scales of the Universe to light space-time and the particles generated by it. And so we define a second metric function for all scales: S_p (Space size) \times T_f (cyclical time frequency) = Constant; meaning smaller scales of space hold faster rotating particles, (black holes beyond the event horizon, where there is no longer 'light') or when moving in lineal fashion can go faster than light speed in scales below light or outside galaxies, (Bohm's quantum potential of action at distance cause of entanglement, neutrinos outside galaxies.) As $S_i = T_e$ maximizes $S \times T$, both give the metric 5D function: $\text{Max. } S \times T = C$, local to each TimeSpace organism struggling to survive by Maximizing its St-in/form/ation & sT-energetic motion.

- The principle of equivalence between Acceleration and mass, which we consider a strong principle, as a rotary accelerated vortex of space-time is a mass in the cosmological scale (ab. $\Delta+1$), a thermodynamic Eddie in the human scale (Δ^0) or a charge in the quantum scale (ab. $\Delta-1$) Thus the principle can be written with parameters of space and time frequency as a case of 5D metrics, $S \times T = C$, $V(t) \times R(s) = C$, from vortices functions, to the 3D case, $(M, C) = \omega^2 r^3 / U.C.$ (G, k) which defines both charges and masses as quantum and cosmic vortices of 2 different 5D scales, whose G and k , Universal constants of S (curvature - Einstein's formalism) = T (speed -: Newton's), in 5D metrics have the measured 10^{39}

difference of strength, solving the hierarchy problem. Since paradoxically, the smaller, faster rotating charge is more attractive than the larger slower galaxy. Further on, in 5D space time vortex metrics a proton shows to have a Schwarzschild Radius, showing the scalar similarity between galaxies, as 'atoms' of a hyper-universe and dark expansive energy, as Υ -radiation between them.

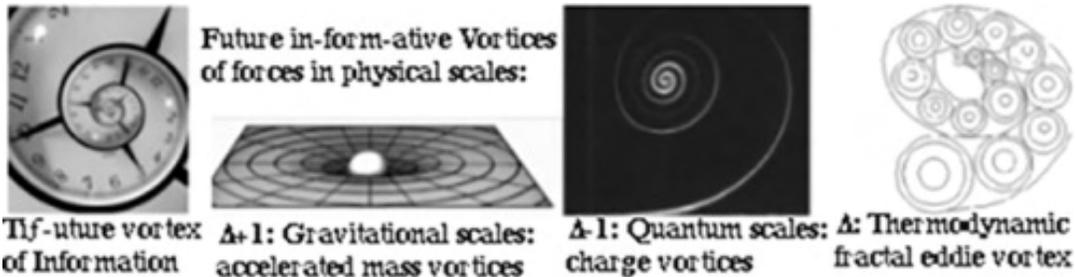

- Energy-mass, $E(t) \Leftrightarrow M(\xi)$ in Planck Units coils entropic lineal motion into collapsing matter, $E \rightarrow M$. As when the accelerated dark entropy between galaxies collapses into galactic mass, warping one-dimensional motion into 3D mass vortices (hence balancing the expansion of intergalactic space, 75% of dark entropy, into 25% of mass vortices, as 3x1D entropy becomes 1x3D masses; leaving the total volume of the fractal immortal Universe unchanged. While its inverse process is a scalar big-bang when a spatial space-time vortex, hold in its attractive position as an accelerated clock of time-space becomes entropic motion, uncoiling its form into lineal motion: $M \rightarrow E$, in any 5D scale of spacetime; from a particle's Beta Decay, through a Nova explosion, a galactic quasar, or perhaps a cosmic big-bang, a 'hyperbolic' theory of the whole, which we shall doesn't hold in 5D as it studies only the entropic expansion of intergalactic space, ignoring the balancing collapse of entropy into galactic masses, doesn't pass the epistemological laws of truth – known case, experimental evidence beyond local measures, correspondence principle with the known-known laws of physics (conservation of energy and momentum and baryon numbers), and we falsify in the paper on Cosmology, concerned with the building up of an epistemologic sound model of the fractal, organic, immortal 5D cosmos.

Thus we call the new 5D model Absolute Relativity, as it adds to the relativity of motion (Galileo, Einstein) and Time evolution (Darwin), the relativity of scales, with no preferential one, despite human 'ænthropic beliefs' in an anthropic Universe with us at the center, and only intelligent, informative species, with entropy as the only time arrow of everything else – which are just deformations of any mind's 'metric function': $O\text{-Infinitesimal mind} \times \infty \text{ Universe} = \text{Still mind-mappings (World)}$. We call that 'projection of humind's limits into the larger, more complex whole, the 'ego paradox': 'Every point of measure gauges reality from its distorted perspective as the largest, only intelligent center of the Universe, which it confuses with its still, infinitesimal mind-mapping'. A more sanguine word would be 'Egocy:Ego=idiocy' proper of all minds, which model reality with its shortcomings. In the human case the worldly profession of physicists, to make entropic weapons has heavily biased our view of the Universe.

RECAP. The metric function of balance and feed-back $S \Leftrightarrow T$, between the spatial, informative mental pole and the reproductive, cyclical motions of Time becomes the basis of Relativity and all physical motions, establishing the fundamental 'beat' of all local space-time organisms of the Universe. The principle of correspondence consider the 4th Dimensional formalism the limit of 5D in a single 'space-time scale', equivalent to Galileo's formula, $V=s/t$ which special relativity adapted to the 'contraction' (-ct) experimented when the speed of a system reaches the limit of our thermodynamic planes of space-time, on the border of the quantum/cosmological, $\Delta \pm 3$ plane or light space-time continuum and General relativity adapted to the cosmological, gravitational $\Delta \pm 4$ plane of the fifth dimension; which requires for a full understanding a more advanced knowledge of 5D metrics and Physics. So we shall return latter to those themes and also deal with them in detail in our papers on cosmology and quantum physics.

In the galaxy the same balance happens between the vortices of mass-time and the entropic time expansion of energetic vacuum spatial information. In terms of the 3 ilogic dimotions of past-entropic time, future-informative time vortices, the intermediate state, combines both: What we call present time is the dynamic, feed-back repetition of reality which seems not to change because it repeats the same cycles. Physicists have reduced time to the arrow of entropy, born of its worldly profession of making weapons and transport machines - even to the point of ignoring in the cosmos the balancing imploding informative action of gravitation that collapses vacuum energy into mass, so they can maintain that the Universe is only expansive vacuum between galaxies (the so called big-bang theory).

MERGING EQUIVALENCE PRINCIPLE AND 5D. UNIFICATION OF 5 FORCES AS GALATOM'S 5 DIMOTIONS

In the graph the translation of the $3\pm j$ dimotions of spacetime, into topologies of physical systems, with steady state waves and angular momentum as a repetitive present and a relative past of lesser information and more entropy (lineal inertia) that expands space into decelerating big-bangs, vs. an accelerated force, with one more dimension of time=future, as a pole of attractive forces, which change parameter of scale.

So we define charges and masses as accelerated 4D time-space vortices in the galaxy's 2 limiting Δ^{+1} scales.

All what exists is a motion in time. Space forms are still pictures of those motions - a Maya of the senses. In the graph, accelerated vortices of time in physical systems, in different scales of the fifth dimension: charges, masses and thermodynamic eddies become then the main clocks of time that carry with different speeds according to 5D metric ($S \times T=K$), the information of microscopic quantum charge worlds, human-size thermodynamic scales and cosmological gravitational scales.

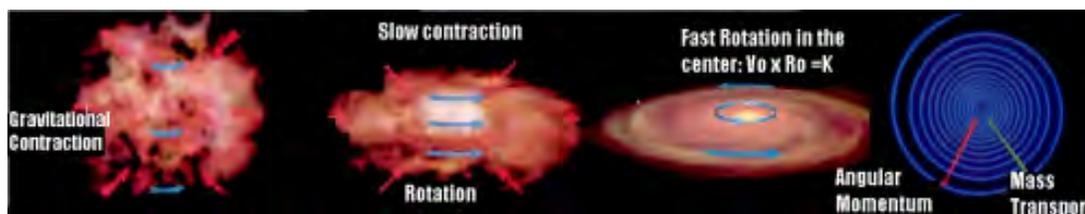

Those cyclical time clocks store the information of the Universe in the form and frequency of its cycles. And the law explains why smaller computers process more information with faster clock-cycles, genes store more information and reproduce faster, every day, than we do...

So we translate 5D metric into vortex equations in different dimensions, the simplest being:

V_0 (speed of time clocks) $\times R_0$ (length of radius) = C, which is the equation of any bidimensional vortex.

As the cyclical clocks store the information of the Universe, it also applies to life, reason why an insect thinks 10 times faster than a large organism, and a rat has much faster metabolic rates than an elephant.

And vice versa, larger systems in Nature must have a space-distance=time-speed much larger, which we can see as lineal distance in space or faster speeds in time.

A dimension of angular time-momentum coming out of a loss of a dimension of volume-space. Attraction laws are then evident and intuitive: In the same manner a vortex of a storm attracts more the faster it turns, sucking in its surroundings, any accelerated space-time vortex, increases the speed of the mass/charge clock according to 5D $C=st$ metric, the smaller it is (S) and hence the smaller it turns, the more it attracts.

Unification of charges and masses as time-space vortices of 2 scales.

Thus since a charge is smaller than a mass, it attracts much more and the unification equation follows just when we apply 5D metric, and shrink the galaxy in the same proportion we accelerate them. Then both equations match:

$$\frac{F_e}{F_g} = \frac{k_e q_{proton}^2}{G m_{proton}^2} \approx 10^{39}$$

So mass, $E=mc^2 + E=hf$; hence mass = frequency (h/c^2) is a cosmological slow vortex, and charge a quantum faster more attractive vortex.

Further on since curvature is synonymous of cyclical speed, it can be quasi-infinite in the smaller vortex, when measured in time speed as the speed of angular rotation. So if we were to apply 4D curvature's equations (Einstein) instead of Newton, the results would be the same, just in the far more complicated formalism of EFE.

Those are the essential concepts to define charges and masses as accelerated time vortices of two different scales of the Galaxy. And from that it is only just an easy task of mathematical manipulation to unify them in 5D metric, as both are equal: when we slow down the speed, space enlarges to remain co-invariant. And as it happens a Hydrogen atom enlarged to the size of a galaxy slows down in rotation to the angular momentum of the galaxy. So Kaluza–Klein were *right - the fifth scalar dimension unify gravity with electromagnetic forces but in a fractal manner, with 5D metric, unbeknownst to physicists.*

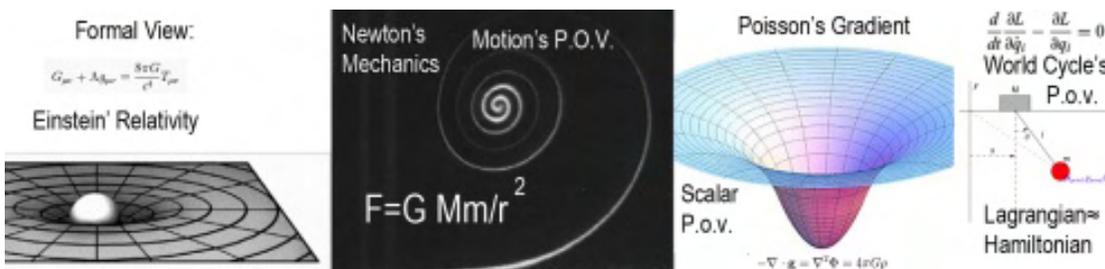

Once we do have a proper understanding of the 5 Dimotions of physics it is very easy to refound the science and its equations in far more straight-forward general laws proper of all space-time systems and solve most of the conundrums of physics, embroiled by the error of lineal time and single space-scales.

Since as long as physicists don't accept 'duality', trinity and pentalogic, the use of entropy and information as equal arrows of time, they will not be able to resolve the conceptual contradictions of its disciplines.

It is just another 'practical case' derived from the scalar fifth dimension, which first was rightly (even if the maths were somewhat faulty) introduced in conceptual terms by Kaluza and Klein as a mode to unify 'two different scales' of size of the Universe, the gravitational 'c' scale and the 'Planck' h-scale, which are the two limits of the galaxy's 5th dimension metric: $S(c) \times T(h) = Cst.$

What mattered of his concept now forgotten is its idea that both scales could be unified if we treated them with a similar jargon, which for obvious reasons could only be the jargon of 'Relativity', derived from Poisson's jargon, derived from Newton's jargon of 'vortices of space-time' - our cyclical clocks and orbits of planets above. So for sake of simplicity we shall use the easy Newtonian jargon, to unify both scales according to 5D metric - the so long seek Unification equation of charges and masses.

The unification of the 5 forces in terms of its 5D metric scalar equations, and its equivalence with the 5 dimotions of the galactic organism requires a deep understanding of the S=T paradox that makes any 'state of stop-space' equivalent to a 'motion in time'. So *we can study mathematically with different 'spatial, topologic' vs. algebraic, temporal equations and ceteris paribus perspectives every event of time-space; which accounts for the diversity of formulae for the same forces:*

In the graph, regardless of pedantry in physics, the 4 formalisms of gravitation are equally valid, as they merely reflect the degree of detail in our analysis,

either in 'space=static' form (Relativity-curvature) or dynamic motion (Newton), from a dual scalar view (Poisson gradient), or based in the conservation principles of the 3 'parts' of a physical system (Lagrange). We shall then use here the earliest, most evident, simpler dynamic view – Newton's timespace vortex, to unify mathematically the 2 limiting scales of the galaxy: the quantum world of charge vortices & the cosmological scale of mass space-time vortices.

The principles that matter are Einstein's equivalence between acceleration and mass, which we extend to all scales. So an attractive cyclical force is an accelerated clock of space-time, a 'vortex' of any scale:

Newton is a dynamic view, Einstein a static one. Einstein's derived his formalism from Poisson. As it is a spatial view of 'still derivative pictures' of the gravitational motion it is more detailed than Newton's because it is according to the Galilean paradox (S=T) the spatial still perspective of those vortices as a series of simultaneous derivative measures.

Lagrange's on the other hand is a complete different view, as it does not take the S=T geometric-temporal perspective *but the principles of conservation of a physical organism* $St(\text{angular momentum}) < ST\text{-energy} > ts\text{-lineal momentum}$. *But all those principles ultimately derive from 5D metric. In the case of Newton>Poisson> Einstein, the vortex law, $V(t) \times R(s)=k$, in any number of dimensions (3 in this case), the Lagrangian, Hamiltonian, from the conservation of energy, $S=T$, as the balanced point of present of all systems.*

Einstein's just reduces the temporal continuous Newtonian view of a spacetime vortex into an ∞ number of infinitesimal detailed pictures, focusing not on the speed but on the curvature of the vortex (which is the spatial definition of a moving cyclical speed - the faster it turns, the more curvature it has in 'still mathematics').

Let us do the maths in the simpler Newton's formalism, whereas by the paradox of Galileo S (Curvature) = T (accelerated motion). So the Universal Constants (G, k), define the curvature of 2 space-time vortices at the $\Delta-1$ quantum charge and $\Delta+1$ cosmic mass scales (Δ is the symbol for the different $\pm j$ scales of the fifth dimension within a given organic system). Its formalism of a vortex of time space is then Newton's Unification Equation: **$M, Q = \omega^2 r^3 / U.C.(G, k)$**

It applies to all vortices of time-space from particles to planets to galaxies. For example if we substitute for the Earth-sun system we obtain G , (1st ever theoretical deduction) and if we substitute for the Bohr Radius and Proton Mass, we obtain k with a 10^{39} higher curvature value, the exact difference between both forces that solves its hierarchy problem. As curvature in space is symmetric to rotational speed in time, so it is symmetric to the attractive force of any vortex. It works marvels when we translate electromagnetic jargon to Newtonian jargon. For example it shows the 'isomorphism' (systemic jargon for an equal 'form' between scales) between atoms and galaxies, which H-atoms of the cosmic scale.

Since when we translate electromagnetic equation into gravitational mass vortices, the proton radius becomes the Schwarzschild radius of a black hole and its electronic orbitals its star clouds, a result foreseen by Relativity that modeled galaxies as Hydrogen atoms in the Einstein-Walker Metric of the Cosmos.

Let us put some easy numbers by substituting the parameters in that Unification equation for the values of the sun (mass) minus earth (rotational speed and radius) to get G , which any high school student can do:

Sun mass = 2×10^{30} kg; Earth's angular velocity 2×10^{-7} rad. per sec.

Earth's orbit = 150 million kms.

Result: $G = 6.67 \times 10^{-11} \text{ kg-1 m}^{-3} \text{ rad. sec.}^{-2}$

This is standard gravitational theory. What has never been done, because the fractal systemic view of the fifth dimension was not known till recently, is to substitute in the same equation of gravitational cosmological masses the mass radius and speed of the space-time vortex by the values of the fundamental quantum space-time vortex, a hydrogen atom/charge.

If the thesis of a fractal universe made of hierarchical scales is truth, then those values should give us the value of the universal constant of charges, the Coulomb constant.

Indeed, if we substitute for the proton (mass) and the Bohr electronic orbital (speed and radius)

4×10^{16} rad. sec. $-1 = w$ (electron); 5.3×10^{-11} m. (Bohr radius); proton mass = 1.6×10^{-27} kg.

Then we get a G , which is 2×10^{39} stronger than the gravitational radius; thus, the hydrogen atom behaves as a self-similar fractal scale in the quantum world to a solar system.

And then you can get also the electron radius expressed in the jargon of a quantum gravitational world using the translated 'Gravitational Coulomb constant': $G(k)M/c^2$.

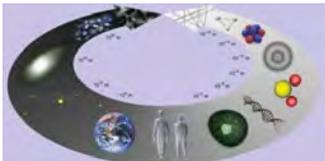

Since in that expression M is the mass of a proton, $G(k)$, the electromagnetic constant is a gravitational constant, and c , light speed, that expression is exactly the Schwarzschild radius of a quantum black star.

Thus, the electron Bohr radius, which is the final radius of minimal size and energy in electrons, is isomorphic to the event horizon of a black hole in the quantum gravitational world.

Those results (more than a decade old), are a 1st *theoretical deduction* of K_e departing from G and the enormous simplification of the parameters of the electron radius till arriving to the same expression that a black hole radius cannot be by chance. They are mathematical deductions, one of the 3 *standard forms of proof in science*.

Yet a theoretical calculus of those values cannot be exact 'by chance', unless the theoretical model behind it – the fractal self-similar structure as $\$t$ (Space population) \times $\delta\delta$ (Temporal frequency) entities of all physical systems is right. Thus, the previous calculus is a clear proof that both, charges and masses, are unified as values of the same type of space-time vortices in the 2 different scales of space-time of the Universe. And they are geometrically unified from the p.o.v. of geometrical relativity not from quantum theory, as Einstein wanted it.

Galaxies, (Galaxies=Atoms) thus resolve the philosophical question on how many 5D scales exist; as we find enough self-similarity to 'run again' another game of fractal scales (not identical but self-similar as in a Mandelbrot fractal) both by quantitative and qualitative methods between the atom and the galaxy. A question that might be extended to the ST dualities of open, 'entropic strings' and closed 'cyclical informative strings', in a possible larger and smaller scale of microscopic strings and superstrings:

Ouroboros the Universal Snake, bites its tail on the string quantum and cosmological self-similar scales, as perceived from the human Δ o mind. Philosophy of science would then argue that those scales are real, but part of its self-similarity is mental: that is, the loss of information in the perception of scales make humans extract the same information from

the upper and lower $10^{\pm 30}$ scales.

What about the Hyperuniverse? We do not know what the infinite Universe even in its local region of galatoms looks like, though due to the expansion of space between galatoms, is likely an entropic gas of local atoms on the hyper-Universe. It is not though a big-bang Universe, because even if we run backwards the expansion of space between galatoms, the implosion of information in galaxies, counter that effect, so at best, we could say that running backwards the big-bang equation we shall meet a 'solid' crystal of galatoms.

The scalar unification of forces opens up an entire new field of physics, not quantum gravity, the description of cosmology with quantum laws, but fractal relativity, the description of the $\Delta-1$ quantum world as a similar scalar plane of space-time to the $\Delta+1$ cosmologic world.

UNIFICATION OF 5 GALAXY'S FORCES AS ITS 5 DIMENSIONAL MOTIONS, WITH SCALAR SYMMETRIES.

"I would like to emphasize something. The theories about the rest of physics are very similar to the theory of quantum electrodynamics: they all involve the interaction of spin 1/2 objects (like electrons and quarks) with spin 1 objects (like photons, gluons, or W 's) within a framework of amplitudes by which the probability of an event is the square of the length of an arrow. Why are all the theories of physics so similar in their structure? There are a number of possibilities. The first is the limited imagination of physicists: when we see a new phenomenon we try to fit it into the framework we already have—until we have made enough experiments, we don't know that it doesn't work. So when some fool physicist gives a lecture at UCLA in 1983 and says, "This is the way it works, and look how wonderfully similar the theories are," it's not because Nature is really similar; it's because the physicists have only been able to think of the same damn thing, over and over again."

Richard Feynman. "QED: The Strange Theory of Light and Matter"

So what about the unification of the other forces in scalar couples? It follows immediately when we consider them the scalar symmetry and similarity of the 5 Dimotions of the galaxy:

The Scalar similarity between the strong force and the gravitational force 'inside the atom-galaxy', both attractive 'only' and the outer force of the galaxy (repulsive gravitation aka dark energy) and the outer force of the atom (electromagnetic repulsive expansive forces) is immediate as it is the parallelism between magnetism and gravitomagnetism (Heaviside's discovery). While the weak force is NOT a force but the evolution of the families of particles between scales.

Because physicists only consider one scale and one time arrow they are obliged to model all those forces, with lineal concepts reducing them all forcefully into an exchange of lineal particles, when they are clearly different forces. For example the weak force that happens in a single point transforming a particle into one of a higher scale of larger masses, is represented with a gap that 'exchanges' the W-particle, NOT as Fermi shown first, an evolution of a higher particle into a heavier one, that then suffers an entropic process of dissolution in 3 parts.

Such 5D variety of forces makes possible the organic functions and structure of self-similar atoms and galaxies. So we couple forces according to their $\Delta \pm 1$ 'symmetry of scale' as 5 forces equivalent to the 5 dimensional motions, $ab, \partial j$, of physical systems within galaxies. They must be studied in dualities, belonging to two different scales - the cosmological, $\Delta + 1$ scale (gravitation & dark energy) and the $\Delta - 1$ quantum scale (strong force and electromagnetism); whereas the dualities relate gravitation and strong forces and electromagnetism and dark energy; while a transformative, 'weak force' trans-forms particles between 5D scales.

RECAP. Because all systems made of scales of vital space that last a tie cycle, they all have bio-topo-logic properties. So we need *always 3 scalar perspectives that give 3 symbiotic properties. In the galaxy thus we talk of:* 1. A scalar view that defines the **galatom**, by similarity of the atomic and galactic scale unified with 5D metric.

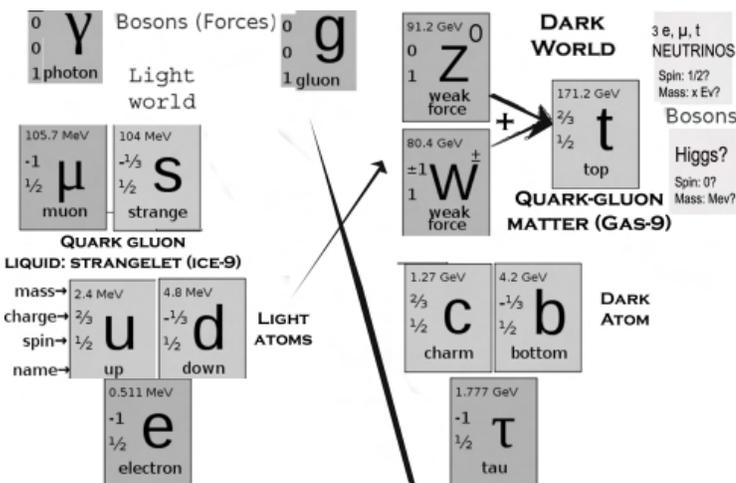

2. A Human view that defines the **galaxy**, our present single perspective with a single light spacetime continuum.

3. A Galactic view that defines a '**galacell**' (nt.1) that is the galaxy as an organism, controlled by 'DNA-like' black holes. So we can now study the galaxy as an organic system with its 5 Dimotional, organic networks of forces.

Haldane one said, the universe is more complex and strange than humans can understand or even imagine... Yet its basis are amazingly simple – a property of fractals that by self-repetition and recombination originate from a very simple Generator equation, infinite variations of the same theme: the scalar superorganism.

The symmetry of scale between the 2 families of mass: uds, strange and bct, top decuplets.

In the graph we can see how this dark, gluon-top quark soup (toplet liquid) of a gas-9 reaction (black hole quasar explosion), neatly reclassifies properly the 3 families of increasing mass in the Universe:

The reordering of the strange and top quark triangles of mass define the symmetry between the $\Delta - 1$ and $\Delta + 1$ scales of 'atoms and galaxies', in terms of its $\Delta - 1$ components (quarks).

The existence of 2 x 3 mass families responds to:

1. the ternary topologic & scalar symmetry between the 3 parts of the organic galaxy - Halo of strangelets, nucleus of Black hole stars and vital space of ud-light atoms and...

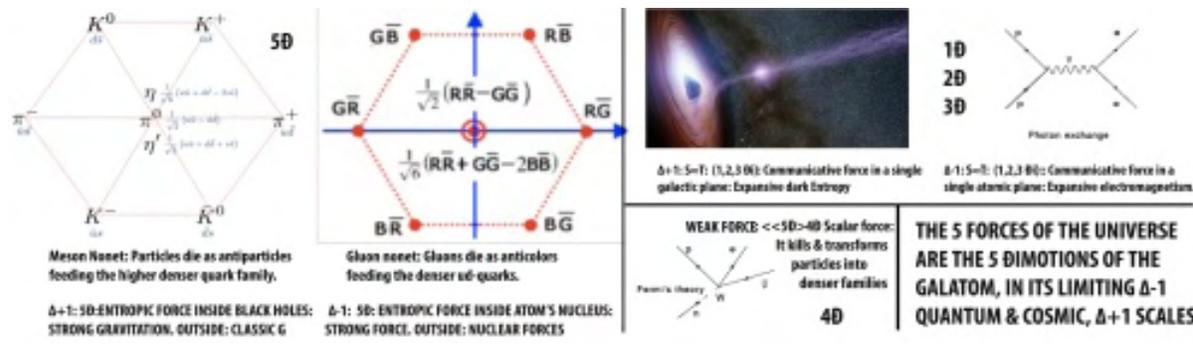

2. The duality of quantum particles and cosmic galatoms:

The human scale Light atoms are made of ud quarks.

Heavy black cb-atoms atoms make the cosmic black hole scale. Whereas the Strange and Top quark, act as the 'central nucleus' of the most perfect, heavier stars, pulsars, and largest, galactic black 'stars' (black holes), whose 3 varieties we shall study latter in great detail.

Informative $\Delta\pm 1$ forces. Scalar similarity between protons and black holes, strong and gravitational forces.

This symmetry extends to its combined forms, as gluon become symmetric to mesons. So in the atomic scale, the carriers of the internal strong force are color+anticolors=gluon particles-antiparticles, 'feeding' the reproduction of quarks. While in the cosmic scale the carriers of the strong gravitational force inside 'black stars' (formerly black holes) are the nonets of pairs of particles+antiparticles= mesons, feeding through the weak force (W, Z, H bosons) the heavier BT quarks.

In the graph $\Delta-1$: ud quarks = $\Delta+1$ cb quarks. $\Delta-1$: Gluons = $\Delta+1$ mesons. $\Delta-1$: protons = $\Delta+1$ black holes.

responsible for the 4th Δ imotion of evolution and generation of heavier particles or its 5D inverse Devolution is the weak force that mediates all those processes. It is not really a force but an evolutionary process that happens in a single point of space (right side), where the intermediate state of higher energy mass (W, z, H boson) gives birth to heavier fermions.

In the next, the strong and gravitational $j\pm 1$ forces are similar in the limiting $\pm j$ quantum and cosmological scale. They both 'absorb' and in-form into denser entities, lighter particles, to collapse them in the central black holes=cosmic nucleon region or quarks=quantum nucleon regions: From left to right, the identity between the nonet of gluons and mesons on both scales, the WRONG procedure of reductionist physics, which models all forces with the lineal concept of electromagnetism through an exchange of particles, as the weak force happens in a single point, hence it is a transformation guided by information; in the right the proper way to understand particle-antiparticles, as the relative arrow of life and death that closes a physical world cycle (Feynman). The hypothesis of work for the model of the fractal Universe is simple: a galaxy is self-similar to an atom, and so are the different forces interacting within and outside them:

- 1.The *strong force is similar to the gravitational force* in the extremal conditions of the black star. Reason why both are non-lineal.
- 2, The *force is similar to the expansive dark energy* between galaxies, which therefore is NOT the same force than gravitation, reason why the expansion between galaxies is a lineal force and it is similar to electromagnetism
- 3.The *weak interaction is NOT a Locomotion*, force but a process of evolution of particles, guided by the Dimotion of information, reason why it happens in the same spacetime, and so its bosons, W, Z, H are 'states' of the same particle, NOT carriers.
- 4.The proton has in 5D the same metric that a black hole, is self-similar to a black hole, with a Schwarzschild radius. So happens with the electron in its particle state (Carter). We will expand on 'black hole stars' latter.
5. Antiparticles are the inverse death=entropy moment of particles=lifetime, reason why we see less of them in terms of an ST-dual perspective, as we see less 'dying corpses', which is an event that last a quanta of time that living beings, which last longer. So since S-populations of particles-organisms and antiparticles-corpse are the same but its time

duration is different, $T(p) \gg T(\text{anti-}p)$, $ST(p) \gg ST(\text{anti-}p)$. To that fact we add the fact that if we model, as we shall do black holes as Tbc quark stars of the heavy decuplet, as CERN recently found up Bottom and charm quarks that should form heavier Dark atoms, decay more often into particles of our 'lighter' Δ -1 light scale. Because time is cyclical and local, and *the arrow of future information is inverse to the local arrow of past-entropy that dissolves form, we represent as Feynman did, antiparticles as local travels to the past.*

We model black holes as protons of a larger 'galactic scale', strong forces as extremal gravitational forces, gluons as mesons, dark energy as electromagnetism and complete by self-similarity ALL the questions of physics, as we either perceive from within the "galacell", the internal region of an atom, and outside the atom, the external region of the *galacell*. So the identity between the nonets of gluons in the strong force and mesons in the larger scale of quarks, coupled with the concept of particles-antiparticles forming a local world cycle renders a clear-cut theory of black holes as protons of a larger scales, in which the transformation through the weak force of light matter into heavier quark matter will produce a black hole star of heavy dark matter; whose heavy quarks happen to decay a 20% more often into particles than antiparticles (CERN), resolving the $p \rightarrow \bar{p}$ problem.

RECAP. 2 consequences of the scalar, cyclical nature of space-time are the basis for the whys of astrophysics: cyclical big-bangs in all the scales of reality; and scalar disomorphisms between galaxies and atoms.

COSMOLOGY: WORLDCYCLES OF PHYSICAL SYSTEMS: SCALAR BIG-BANGS

So how does the Universe look as a relative fractal, whose purpose is to reproduce information and preserve it through cycles of time enacted by its ∞ Timespace Superorganisms performing locally 5 Dimensional motions? Let us have a fast review of the cosmology of a fractal, organic, immortal Universe of ∞ 0-sum balances.

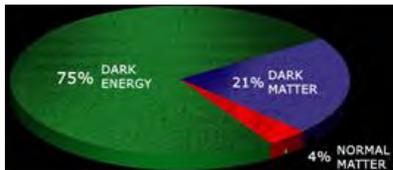

Logic Consistency: The Infinite, Hierarchical Universe

In the 1970s, Mandelbrot gave the hierarchical paradigm new life and widespread exposure by developing the mathematics of fractal geometry and demonstrating that fractal phenomena based on hierarchical self-similarity are ubiquitous in nature. In this way natural philosophers, empirical scientists, mathematicians and theoretical physicists found the infinite fractal paradigm. There are distinct versions and theoretical explanations for why nature is organized in this manner, but the general paradigm that nature is an infinite hierarchy of worlds within worlds has fully arrived, and will probably be our dominant cosmological paradigm for the foreseeable future: In the fractal paradigm, the Universe is infinite and the big bang is not the birth of all realities, but any local big bang and big crunch dual process, any explosion that splits the physical energy and information of a complex system, in any of the multiple scales of physical reality. So first for the impatient, we shall have a fast glimpse to how a fractal Universe look when we add scalar elements to the 'entropic big-bang'.

Scalar entropic big-bangs in a balanced immortal Universe. The Galatom.

In the fractal model a big-bang is the entropic death of physical matter. But the Universe is also scalar and it has information, a dimension of form, signified by the gravitational informative force, physicists ignore in their calculus of its expansion, happening in galaxies that balance the dark energy between them, we shall find both, balances of forces that make the Universe wobbling, and big-bangs and informative forces in multiple scales of the Universe, talking of multiple big-bangs balanced with big-crunches.

So how we shall correct big-bang theory to fit into the fractal view of the Universe? We dedicate many pages on the articles of astrophysics to that matter but let us just give you a prime:

Right, when we add the gravitational force that warps 1D space into 3D mass in galactic vortices, they balance the expansion of 1D space in entropic vacuum as light dies into dark entropy lines between them. As mass warps 3 1D flat-vacuum into a 'high volume' its 3 times more powerful in its warping, hence the 75-25% Balance of mass to dark entropy.

Thus the fractal Universe is immortal. On the right its scales all suffer similar $e=mc$ dual processes of warping through gravitational forces of cyclic momentum that create those galaxies, and expansive big-bangs of lineal momentum balanced in combined cycles of energy - the 3 conserved quantities of each fractal spacetime physical organism, which put together give birth to the 3 conserved laws of nature the Big Bang totally ignores - among many other known-known laws.

So the use of a fractal space and cyclical time arrows fully accounts for the immortal Universe and its balanced 3 arrows of space-time, conserved in its infinite reactions; energy, information stored in the cycles and frequency of those systems of angular momentum, whose minimal constant form is h , and lineal speed, conserved in the constancy of light.

Why those obvious facts of SOUND physics are then 'reduced' to ænthropic creationist big-bangs in a single plane of space-time despite evidence? It is the ego paradox: what the big bang does for science is a religious 'closure' with man and its simplest mathematical lineal functions at its center, which added to the denial of organic sentient properties to physical reality allows to feel the high popes of science a sensation of absolute knowledge, as the religious person feels that all is known in the mystery of god - a word eerily similar to the lineal function of the big-bang ' $V=Hod$ '.

Big bang cosmology ignores gravitational informative galaxies & dark matter & the scalar structure of the Universe reducing space-time to a single scale, and the cyclical nature of time, we must correct the big-bang, which corresponds to the limit of a 5D complete theory of reality in a single 'light' space-time continuum.

The big-bang entropy-only theory of the Universe dismisses galaxies all together, as they are NOT expanding, and if the galaxies are NOT expanding, running backwards its present implosive system would mean a counter-effect to running backwards the expanding Universe. Backwards in a single time, the space between galaxies contracts, but the galaxies between space expand and a balance again is achieved: Since when we add the gravitational force that warps 1D space into 3D mass in galactic vortices, they balance the expansion of 1D space in entropic vacuum as light dies into dark entropy lines between them. As mass warps 3 1D flat-vacuum into a 'high volume' its 3 times more powerful in its warping, hence the 75%-25% balance of mass to dark energy.

Thus the inverse arrow of gravitational information compresses dark energy into matter and balances the arrow of expansive space between galaxies, describing a fractal immortal Universe where a big-bang is merely the entropic arrow of dissolution of matter guided by Einstein's equation in any scale: $E \leftrightarrow Mc^2$

In next graphs, we resume the model of the fractal Universe in which each scale have similar big-bang deaths:

Scalar big-bangs that happen from Beta decays (right picture) that explodes nucleons into atoms, Nova that explode stars and maybe planets doing experimental big-bangs at home, to quasar black holes that give birth to new galaxies. All scales suffer similar $e=mc^2$ dual processes of warping through gravitational forces of cyclic momentum that create those galaxies, and expansive big-bangs of lineal momentum balanced in combined cycles of energy - the 3 conserved quantities of each fractal space-time physical organism, which put together give birth to the 3 conserved laws of nature, which present Big Bang theory ignore. Instead a fractal space and cyclical time arrows fully accounts for the immortal Universe and its balanced 3 arrows of space-time, conserved in its infinite reactions; energy, information stored in the cycles and frequency of those systems of angular momentum, whose minimal constant form is h , and lineal speed, conserved in the constancy of light.

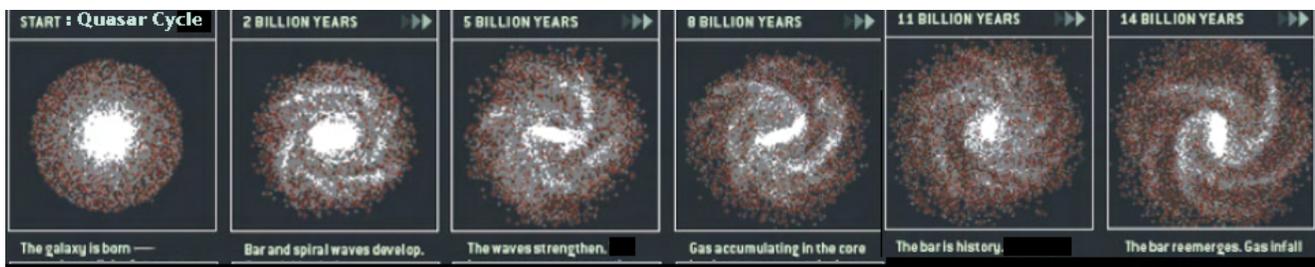

In the center we see a map of the Galaxy, which just recently showed to have two lobes similar to those of the first electronic orbital of a Hydrogen atom born in self-similar fashion in the quantum scale. In the left side we see the background radiation that is supposed to come from the Big Bang 13 billion years ago, but HAS in its center the exact 2 lobes recently found above the black star. This came as a surprise.

Above, the local explanation of the background radiation, which is a local measure, hence must and can be explained by local causes in the galaxy: any moon M.A.C.H.O., (Massive Cold Halo Object); that is, a quark nugget of heavy quark matter or a similar black hole that has eaten the mass of a moon will produce the exact same background radiation by

In the graph the alternative model of the background radiation: a micro black hole with the mass of the commonest object of the galaxy, a moon will radiate exactly the same temperature. So it is more logic to consider that radiation comes from the galaxy, either from black holes or strangelets which have eaten a moon and will redshift to such temperature the light of the galaxy - as all physical particles come in similar quasi-identical forms; those primordial black holes should emit 'now' a BG radiation locally and as most should have migrated to the Halo (Hawking's hypothesis); they should form a 'protein-like' protective structure, the membrane of the Galatom. Yet unlike in Hawking's hypothesis they have not evaporated, as we see no signature of evaporation coming from them: only the redshift of light at 2.7 k. once they have 'eaten' a moon, that has become a dark, millimetric black hole, we shall call a 'Moon MACHO' (MASSIVE Cosmological Halo Object)

gravitational red-shifting. Thus as moons are the commonest objects, we can talk of primordial black holes and/or strangelets as the local, 'present' cause of the radiation. Since epistemology always favors a local 'present' solution far more sound experimentally than a 'derivation' from a non-measured experimental past in a non-measured larger region (the cosmic big-bang whose temperature 'comes from the past', reduced by a lineal equation and is extended hyperbolically to the non-measured entire Universe), it follows the fractal big-bang, is sounder. So what physicists call the cosmic big-bang likely does not exist, as the limit of scalar big-bangs we soundly measure are quasar big-bang.

Finally French astronomers tabulated for them a 15–20 billion year cycle which explodes central black holes, explaining the hyper-abundance of Helium in the center of galaxies. So a galaxy has a 15 billion years cycle in an older immortal Universe, since the arrow of information that shrink energy into mass in galaxies balances the entropic 'cosmic electromagnetic' repulsion of dark energy. Interesting enough if we reduce a quasar big-bang of 15 billion years, with 5D metric, accelerating its time clocks as we reduce size in space: $\delta \times \delta = K$, it reduces 15 billion years to 15 minutes (: the exact duration of a beta-decay neutron Big Bang).

We falsify the cosmic bang with experimental & epistemologic known proofs distorted by cultural reasons that make it a pseudo-religious dogma of the worldly religion of physics – to make entropic weapons in a military society- and the western creationist religion of most founding fathers of physics, with its lineal Abrahamic time views & anthropic beliefs of man at the center of reality reflected in the lineal, created out of nothing cosmos.

Cosmic vs. Quasar big-bangs

$E \Leftrightarrow M$ (whereas c is the constant of speed of each Universal scale, c for the galaxy, not necessary so for other scales) is dual and there are scalar big-bangs from beta decay to quasars and maybe beyond is certain. So the question we want to find out is which of the two larger scales of big-bangs, that of a quasar big-bang or a cosmic big-bang fits better real data. Since as we can see in the images above, on the right, they are similar in form.

To play ball with cosmologists we could justify the big-bang in 5D since if we accept our limit of light perception as the limit of the Universe (cosmic horizon); then the $\rightarrow=@=S=T=\Delta$ symmetries between spatial range, time aging and scalar density of populations all fit within the 'magic number' of 10^{11} elements for most super organisms of reality. So the symmetry also happens in the 'limited perception' of the cosmos:

Most galaxies have 10^{11} stars. The total mass of all the stars in the Milky Way is estimated to be between 4.6×10^{10} and 6.43×10^{10} sun masses. And the Universe is considered to have around 1.6×10^{11} galaxies.

So we could say that the galaxy is just a scale below the big-bang (a huge galactic molecule so to speak), as the neutron star is just a scale above the neutron (a huge neutron molecule so to speak). And that it exploded in a big bang of the next scale of the universe. But that is just the astounding beauty of pentalogic, where the 5 Dimotions/elements of reality are in balance. So for the limits of our entropic perception ($\rightarrow=@$), we observe similar quantitative and qualitative limits for S-patial population, T-ages within our Δ -scales. But a more profound understanding of those limits considers that the local perception of a few galatoms is just a very reduced quantity of the whole number of galatoms of the next hyperscale of the Universe that should be of zillions of them, and all of them living as Protons and black holes without evaporation do an immortal time.

The immortality of the Universe indeed becomes evident as Protons are immortal and black holes are also immortal without evaporation, once we put properly in place the arrow of time of Hawking's awesomely beautiful equation as those of the birth of a black hole into its gargantuan future, NOT of its entropic death=evaporation to the past.

5D PHILOSOPHY OF PHYSICS: THE 'REAL' PERCEPTION OF THE SAME UNIVERSE.

We study physics and its $\Delta \pm 4$ Planes of space-time, in an inverse fashion to the constructivist theory of the Universe - from the top – the ST=4 Plane of the hyper-Universe, to the bottom, the Δ -3 quantum world.

The 5D Universe is made of time=energy, which is any type of motion, whose 3 canonical topologies, | -lineal motion, O-angular motion and \emptyset -hyperbolic motions conform all the particles and ensembles of matter of reality. Yet inversely to that motion there are fractal points of 'space', which act as Maxwellian demons trying to stop motion into 'mind mappings', of still form, in-form-ation. And so between those 2 poles of continuous motion and discontinuous "Maxwellian demons" that impose its order, all the games of existence take place.

Thus the fundamental force of reality are types of Time=motion and the fundamental particle of reality, the fractal point. The first is an 'illogic concept' as we shall see there are 5 types of time-motions. The second is a geometric concept, as fractal points create mind-spaces that act as mirrors of all those time-motions.

Time-motion in its extreme is pure entropy without form, 'TT'. Space-points in its purest form is still form without motion. A mental seed, SS. And in between there are 3 intermediate states, St-information; Ts-locomotion and S=T, iterative reproduction. The way all those 5 Dimensional motions of Spacetime can be mirrored by still languages of the mind varies according to points. Each hold a certain language mirror of those 5 Dimensional motions to get by reality.

It is a complex multicausal reality of fractal plane of space time, all of them generated by local monads (non-euclidean points that 'freeze' the ∞ energy=time of the Universe in local mind mappings of still spatial information), the game is logical, philosophical, sentient, organic, extremely different from the external outer, simplistic, lineal description of its motion by humind's called physics.

Of course all this will sound 'Chinese' to the reader, including the professional physicist, whose worldview responds to Mr. Landau's comment, 'astrophysicists are seldom right but never in doubt' (: indeed, it is rather amusing to notice how a 5D scientist and a 4D physicist might observe the same data about the same Universe but see an absolutely different reality. The view of the 5D physicist is wider, more philosophical even if it includes the mathematical physics of the 4D classic model. We won't comment so much on the maths; as they are a given, only to be argued when the 'simplifications' of idealist mathematics, corrected in our papers on Non-Euclidean Geometry and Non-Aristotelian Algebra make it necessary – notably on the hypothesis of the continuum, the use of absolute zeros and singularities. For the physicist who like Feynman would accept that 'the why is what a physicist never ask', those texts might seem irrelevant. Certainly they will appear verbose and too simple. It all comes though to the beginning of physics and the argument between Newton and Leibniz on absolute and relational timespace. We sided with Leibniz and took its work to its conclusion, even if the process of discovery of 5D was somehow one coming from direct experience first, and only latter dressed with the tools of scholarship, very much on the path of Leonardo's method. On my rounds through academia and penpal congress I noticed how difficult is today for the specialist of any science to fly so high as to see the forest as a whole and care little for the tree where he nested for so long. My first book in fact was one of poetry and initiation called the albatross. And all what I would like to do is to share that larger view, so comforting from so high above the nested trees of each scholar, because trust me, if you can fly the view from above is soothing.

But for that you must be very humble about the human condition. Since the trip is rather an astral journey that requires to abandon your ego and accept you are made of the same substance that every atom, every ensemble of matter, every life; time=motion and space=form. You can measure, weight and describe in detail as particles, waves, liquids, solids, crystals, entropic gases, whatever, but at the end of the journey the simplicity of it all is contained in two qualitative properties of reality: form and motion. And one of them, form, is sentient. Form perceives in itself. An image in simultaneity as the one you are seeing now in your brain is.

And what fractal points love to do, call it particles through spins, minds through electronic waves, monads in philosophical terms, is to perceive. This though is not part of what physicists describe. It does not concern physics as it has been casted, in human terms, a practical tool of measure mostly with metallic senses with the purpose of constructing machines and taking sensorial mechanical data in the languages of machines. But it does concern the physicist who has philosophical questions; regarding the nature of space and time, of matter and information, energy

and motion, and why mathematics describe them so well, and beyond, what other properties matter has; what symmetries and relationships hide the laws of physics, what are its ultimate principles. The 5D model of physics explains this. But it does not as a physicist would explain, with some mathematical equation that validates the creationist belief of Pythagorean physicists, where somehow – as there is no explanation to that how, all what must be known are equations that become imprinted into reality.

The relationship between mind, language and space-time reality thus is important and must be understood a priori; so happens with the nature of fractal points and the reader without much imagination will have to take seriously the introduction to 5D philosophy if he is going to understand the physical universe in its simplest principles. Among them perhaps the most important is the unity of time motions vs. the multiplicity of mental spaces, and languages that describe them, as each point has a different perspective. And yet for an external observer they are all identical and behave with the same statistics. Why? Those are deep profound *philosophical questions that we shall answer in this or other paper. And imply a deep relativity on truths and measures. We thus always talk of pentalogic or the Rashomon effect. i.e. an entropic group of molecules are distinguishable at the level of molecules but for mankind who just needs to extract energy-heat from them, they are just a gas with temperature. Statistical mechanics can treat them as molecules; a Gibbs model will treat them as wholes. Reality is then far more complex because it integrates multiple scalar points of view on the same reality. There is a single Universe but each monad, each fractal point has a different perspective and linguistic mirror cast on it. So there are infinite mind spaces recreating the same Universe of 5 motions of time. What is a best mirror is easy to assess: that which explains more things with less elements (Occam's mirror) and 5D philosophy of science is so vastly more explanative of reality and each of its sciences than the constructivist mathematical creationism of Physics that there is no really competition... if huminds knew 5D, which they don't and if information was not a repetitive process which it is, making difficult new r=evolutions of science (Kuhn). All what I can do is provide in those papers the r=evolution. It will be up to future generations to update its 'chip' – literally (if as the model predicts, business as usual will substitute huminds by AI) or metaphorically.*

The need for paradigm change.

Schopenhauer and latter Kuhn wonder why theories of reality, which are false, endure even in science for centuries unchallenged by academia. Their answer is thoughtful and reasoned: model change is difficult, not only in social systems, as corrupted as they might be, but also in science – after all a human endeavor, as 'all the people who believed the previous paradigm has to die for a new generation to learn the better model' would say Planck in a sanguine moment. We know the present model of Newtonian Absolute Space-time is false, and the creationist 'cosmology' derived of it, the big-bang is also wrong, as it doesn't account properly for 96% of the Universe (dark matter) and one dare to say the other 4% (light matter, found in galaxies), disregarding the implosion of entropy into information happening in those galaxies that balances the *only element for which the theory accounts for – the 'vacuum space' expanding inversely to those galaxies between them.*

Why then cosmologists insist in a theory, which accounts for 0% of the main substance of reality, matter, as the theory of 'everything' (T.O.E)? The answer is routine: Newton's absolute lineal time with a single dimension, which we measure with a simple Galilean $v=s/t$ metric and the slightly more complex $-ct$ time dimension of Einstein's equations. But they only account for 'lineal time motions' one of the 5 Dimensional motions of the Universe. So the remainder cyclical matter, which behaves in inverse fashion to the expanding space between galaxies, remains unexplained. Thus big-bang simplicity is deceptive as NOT all reality could be born of an explosion that expanded space. Only 'cosmic censorship', which is how the ego-centered mind works, selecting information and then confusing our selected view with the entire Universe - our mind world of light with infinity - explains why the big-bang has become standard dogma but doesn't justify scientifically such aberration. Unfortunately because any new model of reality is born with less 'apparatus' than an established one, and requires a degree of complexity seldom reached for centuries, those who learned the old model resist with its 'ad hoc' solutions for a long time. So don't expect soon a 5D objective model of the immortal, infinite, complex, organic Universe to become standard.

XV. *So what is the role of mankind?*

I know if there is still any 'pro' reading this will make him abandon all hope (: seriously. The question with the role of mankind in the Universe though is not to be taken lightly

The only 2 paths for a philosophy of physical systems. Creationism or panpsychism.

5D relational space-time is both a theoretical and experimental revolution in the way we observe nature. On the experimental side it makes sense of a wide array of observations 'hidden' in the huge amount of information of modern sciences, in this paper of physics, which are contradictory with logic but have been casted aside, as physics wants to preserve a faulty model that reduces the time dimotions of the Universe to a single time arrow of entropy, the planes of discontinuous space-time and the co-existing organic connections between those planes and particles to a single abstract continuum.

However 5D space-time, (ab. ΔST) is much more than physics, as it applies the same 'Disomorphic=equal dimensional laws' to all sciences, which paradoxically instead of being a welcomed proof of its veracity as it corresponds to all other sciences and explains them with less elements (epistemological tests of truth), will bring the usual 'pedantic scholar' complaining that a 'philosopher of science', which is not a 'pro' expert in his discipline is 'correcting' and he knows better his memorial catechism. This I found to be specially truth of Physical models of reality for 2 reasons: on one hand of all natural sciences physics is the one whose foundations are more faulty, as it deals with very primitive concepts of space and time, on the other, its dexterity constructing machines gives physicists a worldly power unrivaled in any other science and that increases its egocy. So the physicist has usurped the role of philosopher of science and as such found a new 'job' as theologist of Nature, which doesn't correspond to him.

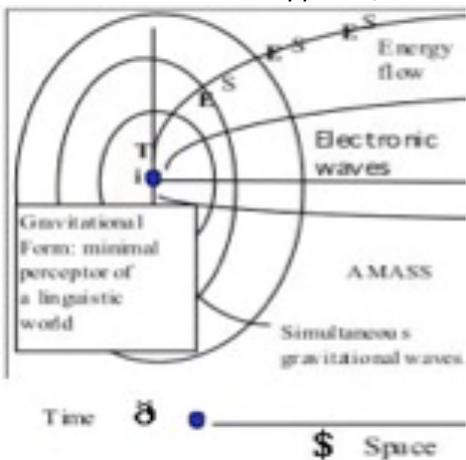

As all religions have its own secret language, the physicist have made a dogma that only mathematical properties of Nature are truth and as humans are 'method men', and 'believers' he believes in a simple method of gathering data with his machines, cast it in equations and affirm that is all the knowledge we must know about physical systems. The main purpose of this paper thus is to show first a resume of the laws of 5D that most matter to physics. Then rewrite the principle of physics under those laws and expand them to the organic properties of matter. And finally to explain the Universe as it is, without reductionism, proving false the partial theories of reality physicists sponsor as dogma, but fail precisely because they are fed forcefully in reduced concepts of time and space, scale and information, and deny non-mathematical properties to Nature.

We are though to use the laws of the 5D scalar Universe to build a better philosophy of science than the one we had, which is not really a philosophy of all sciences, but the 'philosophy of mathematical physics', which is not even a philosophy of physics, but the philosophy born of a simple praxis: to construct sensorial machines, to measure all the trees of the forest with a single tick of time, provided by a mechanic clock that uses digital numbers and space with constant 'light rod' perceived by those electronic machines and then eliminate out of the picture everything that is not a number or can be measured with it. So we are left with a lot of numerical equations, which are supposed to be 'all' (as the rest has been thrown out), and further reduce and reduce those equations with symbols till we get a simple symbol equation, and voila, consider this single equation of the language of numbers, similar to the single word, God, of the language of names is the origin of it all.

This philosophy though grounded in a r=evolution on the logic of time, which grows to 5 different dimotions, which combine time=motion and space=form and can be expressed with the terms of physics (TT: double time inner and outer motion or disordered entropy; Ts, locomotion – motion with a little bit of form, or external motion, or lineal momentum, S=T, balanced reproduction of motion and information or 'energy'; St, information, form with a little motion or lineal momentum; SS-Form without motion, or position), and the widened concept of a non-euclidean point crossed by a relative infinity (∞) of flows of energy and information, is mathematically coherent and can translate and further resolve the contradiction of present physics, which is stuck in the lack of connection between its provable equations and its pedestrian verbal concepts which ultimately are the language of human reason to which equations must be translated for huminds to understand but have very primitive first notions of what time, space, waves, particles, logic, mathematics, energy, entropy, information, universal constants etc. etc. are.

This huge upgrading on conceptual verbal thought is which we shall also provide, and the outcome of merging it with the better concepts of time and space, is to correct the errors of physics that a faulty mathematical method, where also mathematics has some errors as *humans have made a mathematical structure that tries to explain the limited perception of information of the mind that simplifies discontinuous space-time scales into a single continuum and its infinite clocks into a single one. So man travels inwards from a limited view of reality, the mind, he confuses with the absolute, into the language according to the mind equation, $O\text{-mind (finitesimal mind)} \times \infty \text{ timespace cycles (Universe)} = \text{Mental mapping (mathematical and logic view of a selected reality)} = \text{world}$.*

We shall do the opposite, aware of the limits of languages and the mind's screening: to travel from it into the larger world.

But the result of this adventure is the unavoidable conclusion, which also was the final discovery of Aristotle and Leibniz and Einstein, 3 of the few predecessors of most of the findings of those papers on 5D, that for the whys of reality 'each point is a mind-world in itself', of which they are many, as there are also many languages able to mirror reality, not only mathematics, even if geometry or rather topology seems to be the language of atoms.

Aristotle, Leibniz and Einstein, all defined a point of space, as a simultaneous frame of reference that measure motions of time. As such the existence of two states for matter, a particle, solid=crystal, static state of gauging information perceiving it as a focused mirror of reality, which 'senses' in itself is unavoidable, and because all solid states are crystals and crystals do have a mirror image, it is nonsense to say it is not proved. DNAs are also crystallized states of aminoacids holding the genetic memory

of the system they will project to order reality, as crystals once formed project their memorial unit cell form growing, as minds project its imagination into creative forms. Maxwellian order is thus the only explanation to reality. And it establishes two states for matter, one of form, with no motion, of relative pure position, SS, and one in the other extreme of pure disorder, TT, entropy, and dissolution, with 3 intermediate St, Ts, ST states, of spatial form and temporal motion together. The tug of war between stop, ordering, knots of timespace cycles forming simultaneous reduced intelligent images of reality and projecting it back into larger orders, also accounts for the replication of form across different scales, forming the fractal Universe. Moreover it is obvious that particles don't move or else they would collide in the tiny spaces within the nucleus of the atom, but motion happens as waves, which are 'herds' of smaller parts, dense photons in electrons, quark waves in nucleons, herds of birds in the sky, schools of fishes on the sea. Armies moving extended over a territory when advancing, collapsing into particles when fighting, when confronting a predator. So why we do NOT accept gauging sentient perception in particles, when our mind is electronic, so it is that of machines, and do accept them for birds? Egocy. Humans cannot accept the absolute relativity of all the scales of the Universe, regardless of size – the essence of 5D scalar space-time. Never mind the very beginning of physics was precisely the realization that we do NOT perceive the motion of Earth, but gauge information in stillness (e pur no muove, e pur si muove). It is ultimately the realist solution to Lorentz transformations. Light is emitted in entangled stop positions between two electrons, so it DOES NOT ad the relative motion of the emitter, locked with the receptor as observed in the humind scale, which as a continuous movie, discharges the discontinuous stop position. Solving such paradoxes with reason is the task of those papers once we have upgraded the concepts of reality.

The problem with physicists that physical system do not share.

Let us be clear, the problems physicists and huminds in general have, to reduce the properties of all beings except nitrolife species to mere quantitative, external, non-sentient, non-organic, lineal time Nature, void of the arrows of information and the vital program of existence, is NOT shared by the observables that DO share those properties of all space-time organisms, from man to the simplest particles, UNIT of Life. Since the simplest electrons and quarks DO gauge information, feed on energy, reproduce new particles when they absorb an excess of energy, and form complex

social bonding through forces, evolving also through the weak interaction into more complex families in the same trinity scales and under the same 5D laws. Huminds though will have none of it, and will project on them the limited capacity to perceive the entangled 5 Dimotional Universe; but in the case of physicists they do have an extra sensorial system of machines of metal, with better senses than mankind, and this will give them more data to feel they are right. Already Goethe said that physicists, which seemed at his age to have taken over philoisophers as the seers of time, were not so intelligent when they were void of telescopes and microscopes, when discussing his theory of colors. I would rather say they are 'less intelligent' because the egocy paradox (ego=idiocy) reaches with them the infinity of which Einstein often talked: 'two things I deem infinite, the Universe and the stupidity of man', which being a physicist relating to physicist certainly will have taken as an example. Why we do say that? Because of the astounding 'simplicity' of the huge errors physicists commit on his modeling of reality – the error of lineal time, of a single arrow of time=entropy, and its theories of a cosmic big-bang.

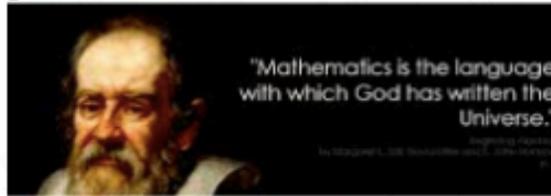

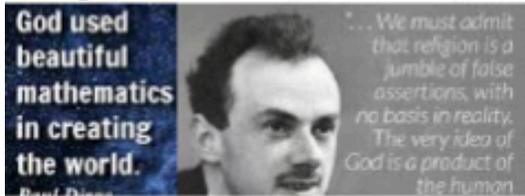

How then physicists pass as the superior minds of mankind? Because they make the machines and weapons of our technological world, but specially because they have a magic tool, a miraculous language to put all the details of data of their machines, into a synoptic logic structure able to predict the reduced properties of matter they acknowledge – mathematics; specially the branch that studies time=change in mathematics, calculus. But the reader should understand the language is given to them by mathematicians, and it is given with certain idealized properties that simplify the language to fit it in its synoptic symbols such as the concept of absolute zero from where the concept of singularities in big-bang theories are born, that *physicists do not understand. So as savant idiots – a shared property of all humans – the quality of the detail in human physics is excellent but is understanding of first principles convoluted.*

Alas! The solution – to consider as only philosophy of science the 'creationist view' according to which mathematics is the language of God that needs no further justification, as it creates reality – just an evolution of the previous biblical creationism of its founding fathers, according to which God created talking words. The causality between a language mirror and the object it mirrors, time and space is therefore switched and the whole reality becomes just a reflection of the mirror. We insist constantly on this because it is the fundamental error of humind's egocy in all languages. Once this creationism with any language is established then high popes of the language, who know better can control the herds with information as only they know the vehicle to God, the language, or substance in ex-vote cultures (Gold churches, modern capitalism in which the digital language money is supposed to create reality and only bankers know how to reproduce and handle it, etc.):

In the graph we illustrate the most profound of the ego-trips of æntropic man, 'creationism', according to which his languages do NOT mirror but create reality - sharing that power with an entity called God, which in each age speaks the language humans speak, who therefore share 'his power' and as today 'machines also speak mathematics',

DIGITAL & VERBAL CREATIONISM VS. REALIST SCIENCE

Linguistic creationists: verbal creationist religions and mathematical creationist scientists:

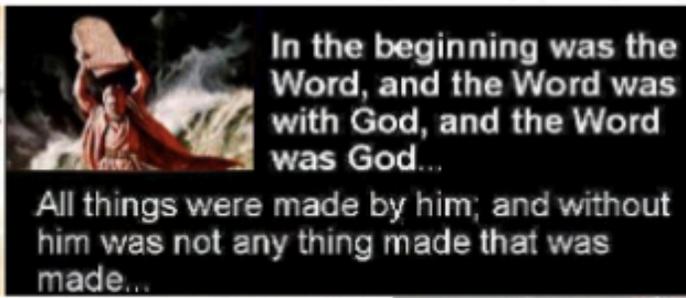

Biblical scientists (classic economists and Fathers of Physics) mixed both creationisms. They still do in 'capitalism' (profits even if it kills earth) and Physics (anthropic principle):

'People who seeks its own profit are guided by an invisible hand (of God)' Adam Smith, Calvinist founder of the idol-ogy of capitalism

'God is a (digital) clocker that waited 5000 (biblical) years to find an intelligence like his to admire his clock-work' Kepler, founder of modern astrophysics

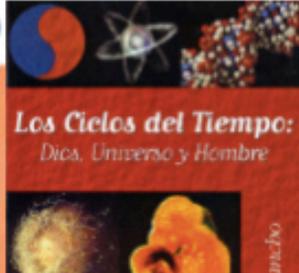

'Money is the intelligence of god' Calvin

"The ultimate reason of things must lie in a necessary substance, and this is what we call God."

Albert Einstein (1879-1955)

So far as the theories of mathematics are about reality, they are not certain; so far as they are certain, they are not about reality. I don't believe in mathematics. God does not care about our mathematical difficulties. He integrates empirically.

Gottfried Leibniz

Realist science: A Universe made of its ultimate substances, vital space and cyclical time arrows.

machines also share this power, and the Universe is modeled as a mechanism.

All creationist philosophies of the Universe deny the existence of any other mind language that share its power. So verbal and digital creationists (read Dirac's denial of a verbal god while affirming the supremacy of the digital language), quarrel for supremacy, despising each other's form of creationism.

So in both cases the scientist or prophet speaks the 'magic' language and expects reality to APPEAR. So ALLAH talks (through the mouth of the prophet) in Arab or Moses talks in Hebrew and reality appears - a miraculous plague happens. Hawking talks, and affirms black holes evaporate to the past with no proof whatsoever but his equation and they must evaporate by dogma, and Hubble writes a lineal equation backwards pretending it is the implosion of the Universe without any proof of such explosion, and it

must have happened; and if not, 'ad hoc' proofs as we shall see are concocted to reinforce creationism, in both languages (religious rituals in which mantras are prayed as a 'vehicle to God', subtle data manipulation and computer nice pictures concocted tinkering with equations to get the desire image). So we shall falsify all those 'ad hoc' proofs and creationist errors to demolish 'rationally', with the tools of the scientific method, the creationist 'big-bang', entropy only theory of the Universe but I doubt it will make the believer to doubt only to have knee-jerk emotional rejections, because *the egocy ego=idioty of its arguments are revealed and that attacks its sense of being above heavens and earth in the realm of God's language.*

Indeed, the method of all creationist 'sciences' is the same 'faith in the language of God as its chosen' and faith in its interpretation by the prophets. So if you do start questioning as the 'languages of God are infinite' Upanishads, and there are '1001 names of God (Al Fidrisi) you are going the wrong sufi way. Dogma is broken and the disciples get upset. So you better get your ass fast out of the church before a due spanking and excomulgation happens. In physics

this means you must 'believe' in mathematics and talk that language only in the version of the prophets, Galileo, Newton, Bohr, Einstein regardless of errors, and possible misinterpretations.

So unless Mr. Einstein an ardent defender of Leibniz, who shared the same views: 'Leibniz is right, but if so we have to scratch physics from its first principles. I don't believe in mathematics; I know when mathematics are truth but not when they are real, etc.' resurrects, it is as unlikely that physicists will ever talk the 'organic language' and its properties, as an Abrahamic believer might accept an argument about the language of God, Allah talking Arab or Yahveh talking Hebrew but will NOT argue that the 'word is NOT God, who never inhabited among us'. Physicists might accept arguments between those who might prefer a Hamiltonian to a Lagrangian, a 0-1 probabilistic unit sphere description vs. a $1-\infty$ entropic statistical description of quantum physics... But NOT that mathematics is just a mirror language of scalar spacetime laws. And if you write texts like those, they will remain silent. And so you know you have crossed the line of its ultimate beliefs.

Because huminds will always be about ego first, not about its entanglement with the Universe, the need for a proprietary language of superior thought comes first. Reason why physicists or Priests will NEVER break their straight jacket, because the questions they have not solved come a priori of the language. They are in fact about the errors of languages perceiving scalar, mental, and entropic spacetime limits to truth. So the physicist would have first to read the papers on 5D algebra, 5D calculus and 5D geometry and improve on them, to discover why their equations of big-bang are false (cyclicity of time, derived of the paradox of linearity in small steps and cyclicity in larger wholes in space, lack of absolute zero and hence on singularity as all 0' are finitesimal parts, etc.) This, they won't do because it implies that mathematics is also a partial mirror of Δ ST.

In the same way a priest will cry 'evil' and stop talking to you if you try to reason him that the Bible's words are just a VSO, imperative language, proper of a go(l)d culture where banker priests controlled a herd of '11 slave tribes' with their barking orders... a physicist might accept some 5D metrics, if he ever evolves on the path of Einstein his concept of lineal time for that of infinite time clock cycles, but he will never understand the fascinating 'fact' that a galaxy is an organism and the best way to explain its causality and whys is to speak its structure with organic laws – because that would be to accept that information, form-in-action matters more and numbers are just 'social gatherings and reflection of social laws'. He needs to preserve the magic nature of the mathematica language so he feels alone with god in his comprehension. As its mathematical actions have a why similar to a cell: to reproduce dark black matter - top quark black holes (its DNA, so to speak) and strangelets, (its 'protein' halo). Hence the natural symmetry between the 3 families of masses, evolved through the weak interaction (not a force but a system of reproduction and evolution of particles)... We shall return to it in our organic description of the 'galacell'. As you get the picture of what we are doing: *to explain the organic properties of physical spacetime matter that humans deny to other atomic systems.*

The 5 conserved dimotions of of time=energy in the Universe. Its Δ ST explanation vs. the creationist one.

An essential truth, systematically denied by minds is that while the initial substance of reality time=motion is conserved, as it trans-forms ad eternal in different forms of information information becomes annihilated into 0' sums, regardless of leaving memorial remains and possibly being recreated. Thus algebra has always inverse operands and elements that 'annihilate' the form into a residual 0'; which in mathematical physics become the game of particles and antiparticles, inverse waves that annihilate its height information, etc.

It is then necessary to start up not from the mathematical quantitative concepts of physics, but by the organic, qualitative, properties of scales of space and time. And to do so fortunately enough we have a common ground that is easier to grasp and happens in both worlds: topology, geometry in motion, reason why it features so heavily in those articles, in case some humble 'pro' is curious enough to penetrate beyond the egocy paradox of algebraic creationism. We shall put a simple example on the 'substance' physicists consider the origin of it all; closely related to the real substance of nature, 'time=motion' that is eternal, conserved as 'time never stops':

“There is a fact, or if you wish, a *law*, governing all natural phenomena that are known to date. There is no known exception to this law—it is exact so far as we know. The law is called the *conservation of energy*. It states that there is a certain quantity, which we call energy, that does not change in manifold changes which nature undergoes. That is a most abstract idea, because it is a mathematical principle; it says that there is a numerical quantity which does not change when something happens. It is not a description of a mechanism, or anything concrete; it is just a strange fact that we can calculate some number and when we finish watching nature go through her tricks and calculate the number again, it is the same”. *The Feynman Lectures on Physics*

American physicists adore that book, from a ‘creationist’, notorious for its contribution to the A-Bomb, its displays of machismo in his treatment of women as a supposed ‘connoisseur’ ... of lap dance clubs, which nerds seem to consider the summit of female understanding – at least he didn’t say on his dead bed as Newton that his biggest pride was to have died virgin, not to speak of Mr. Einstein’s comment to his wife ‘women only reproduce their belly’... Life indeed IS THE MYSTERY, organisms the TABOO, of physicists. So Feynman would also say ‘the why is the only thing a physicist never ask’. Frankly, I found his book a bore, with very little rigor, and if I were to recommend a similar work on the foundation of physics, I would go for Landau’s 11 books, which I annotated in my youth to understand 5 D physics in all its depth, and might some day retake for a more complex course on mathematical physics as it should be taught, *departing from a proper understanding of the first principles of time and space and the way mathematics mirrors them and simplify them, but only after having understood the simpler more synoptic, larger principles of organic physics (not carbon physics for which that word is used by the organic properties of physical systems)*.

Back to energy, what mattered to Feynman there was the fact that a ‘number’ was preserved; a mathematical totem. But for that preservation to happen Energy has been growing to encompass ‘everything’, from charge to mass, to motion, to position (potential energy). *So nothing here is preserved but the whole, and Energy becomes like God in verbal creationism the world that transmutes to signify all other words, without the slightest understanding what energy is. So goes for the other totem word, entropy, which as Neumann said to Shannon, ‘Call information entropy nobody really knows what it is so you will have the upper hand’.*

We are more interested in understanding what all those words mean. I.e. Mass is NOT energy, but it can be transformed from an accelerated vortex of time motions into an expanding vortex of time motion, changing its topology from an spiraling vortex into an expansive one, which we call ‘kinetic energy’, but properly should be called TT-entropy as it implies the destruction of mass internal information and its expansion in external space (two motions together, which is the meaning of entropy, while a single motion that preserves the form of the system, is locomotion, momentum and its integral through a path of space, work and energy).

All this fast-forward definitions show us that it is far more interesting to start from the first principle of reality Motion=time, and its inverse state, ‘space=form’, which are *philosophical but also real* principles that apply to all sciences, and then distinguish between the different types of motions and the way they interact and transform each other, to call each one with a proper name that truly allow us to distinguish between mass, energy, entropy, particle, wave states, etc. etc.

Even if we cannot say that a ‘number’ is what the Universe conserves. *What the Universe conserves is motion, which can be mirrored by a number, indeed, but also by a creationist word ‘motion is all’, you could also say, and what matters is to use all the languages of the humind of which conceptual logic words are paramount to describe the properties and diverse geometric forms of motion and how they interact each other. In this task geometry more than algebra, form more than number is helpful, even if scalar numbers are necessary to define the 3rd property of reality, its 5D scalar structure.*

Going deeper then in the conservation principles of nature, of course, if you hadn’t heard of it, the ‘why’ was found by Miss Noether’ **Theorem that** states that every [differentiable symmetry](#) of the [action](#) of a physical system has a corresponding [conservation law](#). She meant that seriously; the laws of conservation of Nature were caused by the existence of an equation called a Lagrangian, satisfying certain technical criteria; whereas the word "symmetry" in the

above statement referred more precisely to the [covariance](#) of the form that a physical law takes with respect to a one-dimensional [Lie group](#) of transformations. And so to stress the capacity of creationist physicists to name things, each of the quantities conserved in the Universe – the 5 Dimotions of space-time together They were first called invariants, but in modern terminology, the conserved quantity is now called the Noether charge. Time, Space, cyclical and lineal motions are Noether's charge. And so Noether, which by the way in a humorous twist of destiny is a wo=man, became the creator.

(And if you haven't understood what she said Felix Klein's, which we quoted in his excellent definition of a dimension of spacetime, when explaining the meaning of 5D, clarified Noether's theorem on the invariants on the Universe (when they were not yet called Noether's): 'If an integral I is invariant under a continuous group G_p with p parameters, then p linearly independent combinations of the Lagrangian expressions are divergences.'

That is, clear enough, in the 'simplest' case, a system with one independent variable, time (graph).

Did you get it? Of course, not unless you are a physicist, and that is an added bonus to its – no denial here – usefulness to mirror the constancy of time dimotions in algebraic terms for exact calculations of the paths of physical systems. So the high pope will tell, when a philosopher of science notices that mathematical creationism is NOT a good explanation of the fundamental principles of Nature, and physical reductionism doesn't give the whole picture, as Mr. Hawking used to say that the problem is philosophers of science we do not understand mathematics. We are not priests and have not the expertise in the vehicle of God, as the Aryan smiths had it on the fire of the sword, the earlier Hebrew banker-priests on the go(l)d exvoto, and its modern practitioners, the nuclear experts in the big-bangs of the Universe and the central bankers in the production of e-money for company-mothers NOT for mankind, that lowly 'organic species'.

$$I'[\varepsilon] = \int_{t_1+\varepsilon T}^{t_2+\varepsilon T} L[\mathbf{q}'[t'], \dot{\mathbf{q}}'[t'], t'] dt'$$

$$= \int_{t_1+\varepsilon T}^{t_2+\varepsilon T} L[\varphi[\mathbf{q}[t' - \varepsilon T], \varepsilon], \frac{\partial \varphi}{\partial \mathbf{q}}[\mathbf{q}[t' - \varepsilon T], \varepsilon] \dot{\mathbf{q}}[t' - \varepsilon T], t'] dt'$$

which may be regarded as a function of ε . Calculating the derivative at $\varepsilon' = 0$ and using [Leibniz's rule](#)

$$0 = \frac{dI'}{d\varepsilon}[0] = L[\mathbf{q}[t_2], \dot{\mathbf{q}}[t_2], t_2]T - L[\mathbf{q}[t_1], \dot{\mathbf{q}}[t_1], t_1]T$$

$$+ \int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \left(\frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}T + \frac{\partial \varphi}{\partial \varepsilon} \right) + \frac{\partial L}{\partial \dot{\mathbf{q}}} \left(-\frac{\partial^2 \varphi}{(\partial \mathbf{q})^2} \dot{\mathbf{q}}^2 T + \frac{\partial^2 \varphi}{\partial \varepsilon \partial \mathbf{q}} \dot{\mathbf{q}} - \frac{\partial \varphi}{\partial \mathbf{q}} \ddot{\mathbf{q}}T \right) dt.$$

Notice that the Euler-Lagrange equations imply

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}T \right) = \left(\frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} \right) \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}T + \frac{\partial L}{\partial \dot{\mathbf{q}}} \left(\frac{d}{dt} \frac{\partial \varphi}{\partial \mathbf{q}} \right) \dot{\mathbf{q}}T + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \ddot{\mathbf{q}}T$$

$$= \frac{\partial L}{\partial \mathbf{q}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}T + \frac{\partial L}{\partial \dot{\mathbf{q}}} \left(\frac{\partial^2 \varphi}{(\partial \mathbf{q})^2} \dot{\mathbf{q}} \right) \dot{\mathbf{q}}T + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \ddot{\mathbf{q}}T.$$

Substituting this into the previous equation, one gets

$$0 = \frac{dI'}{d\varepsilon}[0]$$

$$= L[\mathbf{q}[t_2], \dot{\mathbf{q}}[t_2], t_2]T - L[\mathbf{q}[t_1], \dot{\mathbf{q}}[t_1], t_1]T - \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}[t_2]T + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}[t_1]T$$

$$+ \int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \frac{\partial \varphi}{\partial \varepsilon} + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial^2 \varphi}{\partial \varepsilon \partial \mathbf{q}} \dot{\mathbf{q}} dt.$$

Again using the Euler-Lagrange equations we get

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \varepsilon} \right) = \left(\frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} \right) \frac{\partial \varphi}{\partial \varepsilon} + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial^2 \varphi}{\partial \varepsilon \partial \mathbf{q}} \dot{\mathbf{q}} = \frac{\partial L}{\partial \mathbf{q}} \frac{\partial \varphi}{\partial \varepsilon} + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial^2 \varphi}{\partial \varepsilon \partial \mathbf{q}} \dot{\mathbf{q}}.$$

Substituting this into the previous equation, one gets

$$0 = L[\mathbf{q}[t_2], \dot{\mathbf{q}}[t_2], t_2]T - L[\mathbf{q}[t_1], \dot{\mathbf{q}}[t_1], t_1]T - \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}[t_2]T + \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}}[t_1]T$$

$$+ \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \varepsilon}[t_2] - \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \varepsilon}[t_1].$$

From which one can see that

$$\left(\frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \mathbf{q}} \dot{\mathbf{q}} - L \right) T - \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \varepsilon}$$

is a constant of the motion, i.e., it is a conserved quantity. Since $\phi[\mathbf{q}, 0] = \mathbf{q}$, we get $\frac{\partial \varphi}{\partial \mathbf{q}} = 1$ and so

$$\left(\frac{\partial L}{\partial \dot{\mathbf{q}}} \dot{\mathbf{q}} - L \right) T - \frac{\partial L}{\partial \dot{\mathbf{q}}} \frac{\partial \varphi}{\partial \varepsilon}.$$

Because that is the bottom line – the praxis of human survival and understanding of the organic Universe is taboo for all the different creationist models and its dirty secrets – in the case of lineal entropy only physicists theories, the fact they started as ballistics with Galileo making weapons and in the case of our expert financial economists, that they started as banker-priests parasiting societies with tax farming and money as debt and ex-voto to God. But money is just a digital language that ALL humans should be able to handle, use to reproduce welfare goods and understand as we explain in our papers on History and economics, and time=change is any kind of transformation of reality, any kind of 'dimensional motion', and because the Universe never ceases to change, all its forms of time together, which physicists call energy are conserved, and so we can state the true law of conservation of time, and hence immortality of the Universe, which can be told in many similar ways as all languages are inflationary (including, conceded with Lagrangians and Noether's currents).

In that sense, what all those mathematics proving Noether's theorem really mean is this: because particles CONSERVE its finite time existence between its 'seed-SS-birth' and 'TT-entropy=death' states they always choose the shortest 'time path' of 'minimal action=motion', which

is expressed by a Lagrangian equation in the mirror of physics, and so we can deduce all the laws of motion from the law of 'least time'->Lagrangians; but it does NOT mean that some God 'thought a Lagrangian', which is the cause of the conservation principle of least time

'The Universe is made of time=change=motion, which never ceases to 'exist' as knots of time motions, called 'spatial points' trans-form them into different in-form-ations, forms-in-action ad eternal: $S \Leftrightarrow T$ '.

This is just one way to express – as languages are inflationary and do NOT come written in stones, but as all mirrors have subtle differences – the essence of it all – a game between flows of motion and its 'knots' of intelligent perception that try to stop them into form, giving birth of the fascinating phenomena of linguistic still perception of a simultaneous knot of multiple flows of motion that synchronically represent a mind-mapping of the external Universe. This is thoroughly a spiritual, eternal, vital process, and the best way to express the simultaneity, synchronicity and resonance of scale of all those motions in its symmetries and geometric dances is NOT the jargon of physics, but the jargon of time motions and spatial points that form with them 'mental spaces'.

So we can finish with our example. As there are 5 Dimotions of space-time that mix together motion and form, TT-entropy, Ts-locomotion, TS-reproduction, tS-information & SS-form; we can talk of 5 essential 'physical properties' conserved, which are the 5 ones Noether's invariant charges did name with slightly similar concepts:

TT-entropy, Ts-momentum, TS-energy, tS-angular momentum and SS-parity.

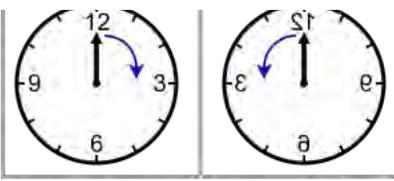

3 of those Dimotions, happen in a single plane, Ts-momentum (lineal motion, which reproduces a form along a lineal path and integrated along that path becomes 'kinetic energy'), tS-angular momentum (cyclical motion that seems to us as a solid form, as it is maintained in a certain position, which appears from far away as a point and carries the information of the Universe in the form and frequency of its cycles) and energy, which *is so many things that we should probably scrap all together the concept but has a very intuitive meaning in verbal thought, as an 'storage' of motion and form, used by any system to imprint and reproduce a form to give them the vital energy motion that starts the system. So we use in general as the 'substance or storage of both motion and form', which combines and merges them both, $S=T$ to allow the system to reproduce itself.* It is though more precise for physical systems to use the concept of momentum, as it has not 'suffered' such absurd expansion.

So what about the other two 'conserved' elements, TT-entropy and SS-parity... Again the proper concepts are NOT those of physics, but the two previous 'names' are quite related. In Noether's theory, they represent two symmetries conserved together, but we are NOT going to use those convoluted concepts but rather explain it simpler. TT-entropy means a double internal and external motion of a being, which therefore explodes and scatters its internal parts into an expansion of inner space, while externally that expansion is seen as radiation, and often confused with energy (as when a mass explodes reversing its form and dying, becoming a flow of entropic motion that an observer can absorb and give it form and even store it as energy).

SS is then the absolute inverse concept. A system that not only lacks external motion, as it has an inertial position, but also internally, it is not as angular momentum, keeping a steady path, but moving as in a vortex, inwards, which under the law of vortices, $V \times R = K$ (in one dimension), means it is accelerating, as V speed increases the shorter the radius, R is for its product to become co-invariant, *which is exactly the definition of a 5D 'travel' through scales of the fifth dimension, as $S \times T = C$, in this case $V(t) \times R(s) = C$.*

In physical terminology as we said the best models are geometric, so it is expressed by the geometric principle of equivalence of Einstein between acceleration of a 'time vortex' and gravitational forces. In terms of the illogic structure of time, we call then an entropic expansion of space, a past motion, $<$ and an accelerated vortex of time, $>$, a future motion, with 3 **present** conserved quantities of angular momentum, kinetic momentum, and its 'integral energies' that store them mostly for reproductive use.

Those are then simple, clear-cut, intuitive concepts that have the advantage to express physics in the same language of all other sciences, and *still be able to connect with the classic language of physics, which is what we shall do in those*

texts, without the need to go into further pedantic languages, which our young millennials writers of Wikipedia articles love so much as believers in creationism to pour to feel so intelligent.

Back to 5D physics and conservation principles, a travel through the fifth dimension is a *sink of forces*, either charges in the quantum scale or masses in the cosmological scale, as a particle enters a 'wormhole' between planes of the fifth dimension, either a charge or mass sink. Masses and charges are therefore paths for entities of our Δ^0 human thermodynamic scale to travel and emerge upwards into the cosmological scale or downwards into the quantum scale; and in that *SS-* process, needless to say the thermodynamic parameter suffers a *TT-entropic death*. So in the complex pentalogic view of any phenomena that must be perceived from the perspective of those 5 Dimotions as $-\Delta@st$ sinking into a different scale. What causes then the sink is obviously a form that exist in other scale of reality as a synchronous whole, the mass membrain or the charge. As we human beings co-exist basically between the thermodynamic and mass scales, those will be the two easier to describe planes of space-time in physics with thermodynamic laws corrected to its 3 present entropic arrows, which amazingly enough physicists do not accept (only gaseous entropy is considered, not solid form, and liquid *St-Ts* states of energy and information, the most complex of them). And mechanics, the best understood of all the fields of physics, as the 3 conserved present quantities are accepted.

However the other two past and future, entropy and vortices of form opposed properties of reality do NOT share the simple single conservation of present, $sT<ST>St$ trinity of lineal momentum, energy and angular momentum that form a ternary 'fractal organic' system as *field<wave>particle* relative states.

But alas for a present being to perceive them they are entangled through the fundametal logic equation of present space in terms of the trinity of time ages: $Past \times Future = Present$.

This means parity and time reversal together (physical jargon), entropy and form are conserved, or splitted as one. That is, as you sink into a force vortex, you also expel entropy outside the vortex, namely you die and the vortex eats what it wants from you to reform it into charge or mass (the vortex organically speaking is like a mouth or rather a trump left hanging by the upper or lower scale).

This was found long ago in the study of the weak interaction that transforms particles into higher masses:

In the graph a classic explanation of a physical travel through the fifth dimension by means of a weak interaction. Both graphs represent the dual inverse penetration into an accelerated vortex (implosive acceleration, with the rule of Maxwell's screw) vs. its inverse expansion when we invert the arrow of time, that is we move from the relative future informative vortex into the relative past entropic expansion. This causes also a 'change' in the sign of the charge, as one charge is implosive sink and the other is an explosive one.

Those are processes happening in the quantum charge scale. But we could consider that a black hole, a proton of the hyper-universe 'galatom', thus follow the same conservation when we change the side of the mass from an implosive to an explosive dark entropy jet along its axis, as it converts mass part in radiation expelled from the event horizon, and part into the higher masses of its top quark and BCB dark atoms.

In terms of the nested Universe, what this means is that as we move from the $\Delta\pm 1,2$ thermodynamic scales into the $\Delta\pm 3,4$ cosmological and gravitational scales, we must both split our parts and our form ascend to the 3,4 scales and our motion descend to the -3,-4 scales; and this dual split travel is what we call death.

We are on purpose not introducing the parallel language of mathematics, as it is not necessary – nothing wrong with it. Only bring it in those texts when it is needed to correct a gross error, as in the case of singularities caused by the error of absolute 0s instead of finitesimal 0's which act as cut off and the error of entropy measuring only the lineal *Vhod* expansion of space, not the aforementioned vortices of time space between scales of the fifth dimension. The great advantage of our method needless to say is to use the Leonardo's methods of analogies that now become homologies as they come from the common geometric properties of space and logic properties of time dimotions. So if we were to compare those 'wormholes' between planes of the fifth dimension with similar scales, they could be compared to the fractal networks of nervous and blood systems that contact the macrocosms of life organisms with its

microcosms of cells – one being an implosive painful force (the nervous system that makes cells to contract) and other an expansive, pleasure force (the osmosis processes that make cells expand and diffuse its products into the blood network); or to the impedance laws of electric forces, or to the expansive wave like vs. collapsing particle states. The contraction+expansion processes form then an essential compound beat, $St+Ts=ST$ in present, $ST=TT+SS$ in past x future dual events, which is the ultimate why of conservation of parity+time reversal + (charge V mass reversal).

This of course is told as Noether's thingies: if the behavior of a physical system does not change upon spatial or temporal reflection, then its Lagrangian has reflection symmetry and time reversal symmetry respectively: Noether's theorem says that these symmetries result in the conservation laws of [parity](#) and [entropy](#).

As we said, regardless of primitive thinking among physicists, ignorant of cyclical time, of fractal space, of Leibniz's relational timespace, of the worldcycle of organisms, of the 5 Dimotions of time, of *really any* principles of reality beyond its automaton method of great merit in the detail – gathering data about physical systems with interposed sensorial machines of higher accuracy in mathematical measure than human eyes, casting it into algebraic and geometric equations – physics are actually just another science, when we complete it with worldcycles, scalar spacetime, organic properties, and improve the mirror of Non-AE geometry and algebra in its study. It is conceded a very developed science, but that must be ascribe to historic reasons – humans seem to have as evolutionary role in this planet to evolve machines and kill life with them as 'enzymen', a catalyzer of complex metal systems that would not evolve alone without the gaseous feisty nature of nitrolife brains with oxygenated legs. Sorry, the Universe is a fractal that reproduces information and all sciences follow its very same laws regarding of anthropomorphism. So we need to put down our egocy.

This said of course is a pleasure to see reflected in the laws of mathematical physics and the actions of physical systems even if those laws expressed in today's jargon of mathematical physics, void of deep why principles, fail to understand the very same 3 elements of reality of any game of existence"

-Δ planes of spacetime made of fractal points gathered according to the laws of non-euclidean geometry into larger wholes. Where all fractal points want to = form of networks and topological larger organisms. In physical systems, those 3 planes are the $\Delta-1$ quantum plane, the $\Delta\emptyset$ thermodynamic plane and the $\Delta+1$ gravitational plane, and beyond the $\Delta+2$ hyperuniverse similar to the quantum plane in its '¥-like' electromagnetic forces between galatoms which are repulsive but physicists with its mathematical errors of a continuum try to model as if they were connected by gravitational forces.

It is then necessary to understand non-Aristotelian algebra, and Non-Euclidean mathematics at least in its simplest principles to upgrade physics beyond the simplifying idealization of those 2 disciplines, reason why the reader is encouraged, if any has gone so far (: to read the 2 articles on Non-Euclidean geometry and Non-Aristotelian algebra to see where mathematical physics go astray by believing the idealization of mathematics to be real. As Einstein quipped to Poincare: I know when mathematics is truth but not when it is real. As most errors of physics come from taking literally as reality, mathematics, which is a simplifying mirror of reality.

- Topological spaces. All systems evolve efficient $|-Ts$ Limbs/fields $< \emptyset-TS$ body-waves $> O-St$ -particle/heads, forming trinity functions of existence to maximize its motion, reproduction and information gauging. In the case of physics obviously we talk of $|-fields < \emptyset-waves > O$ -particle states for the lower scales and $|-gases < \emptyset-liquiids > O$ -solid states for thermodynamics.

-Time ages. All systems try to conserve its time-energy, in a point $S=T$ of minimal expenditure and maximal SxT 'existential momentum/force' in order to survive better. Which are laws shared in physics where the system with maximal momentum destroys in collision and accretes the system with less momentum (so when a black hole passes through a star it absorbs it, when the moon collided with the Earth, the earth took a part of it, when a small object falls into a big one, the object remains in its gravitational place). Superposition laws, orthogonality, scattering laws, laws of conservation of energy, Hamiltonians, Lagrangians that conserve the path of least time, or the maximal and

minimal points of the function of existence of a system follow them. And we shall connect the key equations of physics to those principles of scale, time and space.

From the union of the topological laws of vital space, organic laws of scalar planes, temporal laws of survival we define a deterministic program of existence that all systems follow trying to preserve its time happens and it is also followed by physical systems, whose 'mental sentient particles' use as we do the spin of atoms to gauge information, and have an electronic membrain, to measure time and space. Let's start then with the description of the most important of all systems, that of the galatom, its scales, worldcycles and topologic parts. Physicists will have it harder, because they are today the 'high popes of science', 'the seers of time' (Augustine's definition of God). So they expect all others to learn and start their inquire from the mathematical creationist models they sponsor. And oddly enough we also do that. *But not by adopting the present, simplex Greek Euclidean Geometry and Aristotelian Logic of Algebra, but by upgrading both disciplines to understand the fractal non-euclidean point-monad and its illogic structure, born of the infinite parallels of energy and information that cross them.* So the first part of this paper after introducing the barebones of the scalar, fractal spacetime Universe and correcting Absolute space-time (Newton), back to Leibniz's relational space-time of which we are all made, will be to refound geometry on the basis of the fundamental particle of reality, the fractal Non- \mathbb{E} point. We shall not include the whole model, neither introduce \mathbb{E} Algebra, as there is a whole paper dedicated to it. To notice though that the bridge between classic physics and 5D physics is the understanding of those upgradings of \mathbb{E} geometry, vital topology, \mathbb{E} Algebra and the proper study of the 5 Dimensional motions of space-time planes (Ab.Dimotions of exi:stjence) with the equivalent 5 families of numbers, 5 postulates of \mathbb{E} geometry and 5 operands of mathematics, of which the most important are the operands of calculus - the mathematical tool to study all type of changes can be explained in 5D with higher elegance, departing from the concept of a finitesimal quanta of time-change.

Next it matters to bridge the principles of conservation of energy=time which guide each particle-point in its paths of least time and no work. As those are common laws of mathematical physics and 5D albeit explained in organic, vital terms. Because 5D introduces organic, sentient properties into mathematical points, hence it makes of the particle-point NOT the carbon atom, the unit of life, whose 5 forces=dimotions, express its local program of existence: to conserve its time-motion and in-form-ation, as everything else in the Universe.

The field of 5D physics thus is mostly about the translation of common physics to the universal jargon of 5D, and the completion of the properties of matter that are not susceptible to be quantified but still happen and must be understood to have the whole picture.

Among them, the most important is the simplification in humind's physics of the 5 Dimensional motions of time-space to only one lineal dimension of infinite time, due to the creationist problems of Newton who thought behind reality there was a Cartesian graph drawn by God – its plenum – over which we were all walking through. The result is the use of a single entropic arrow of time-future taken from the limited state=age of matter called gas, which disregards solid, informative spatial state and its mixture in liquid s=t forms. So we have as Einstein quipped to restart the initial concepts of time and space of physics from the beginning or rather from Leibniz and its relational space-time, and fractal points that hold a world into itself.

Physical errors arise from the idealism of mathematics that simplifies all points into Euclidean points with no breath, origin of the errors of the singularity and big-bang theory of the cosmos, which adds the dismissal of the 'solid' state of the cosmological scale (mass) and its balanced wave forms.

Finally the complete misunderstanding of scales as they are pegged into a single plane of spacetime. And they must be explained one by one, connected by hyperbolic networks across the 5th dimension.

ASTROPHYSICS: THE COSMOLOGICAL SCALE.

"The Universe expands. That has nothing to do with you. You are in Brooklyn and Brooklyn is not expanding!" Annie Hall

THE HYPERUNIVERSE: BIG-BANG FALSIFICATION.

We use epistemology & pentalogic of $3 \pm j - \Delta @st$ Dimotions to falsify the big-bang by the fractal, organic immortal, ∞ cosmos that cannot be falsified. To that aim 3 p.o.v.s must be considered:

- @: Its cultural aspects (as the dominant military, western culture and the wordily profession of physicists -to make entropic weapons - has projected its 'selective' worldview over the complex Universe)

- ST: Its theoretic & experimental errors that once the big-bang became dogma no longer are taken into account.

- $\Delta \pm j$: The development of the complex organic Universe as it is, when we do not eliminate the scalar properties of space, the cyclical properties of time, and its 5 Dimensional motions of space-time.

Let us then consider just 13 'bad luck' $+\infty$ factual proofs that the big-bang is a local quasar big-bang and the proper cosmological theory is that of earlier Einstein->Fred Hoyle->5 D Physics, of an infinite, immortal Universe:

Δ : SCALAR FALSIFICATIONS.

1. The fractal structure of the cosmos

Why is the universe so homogeneous and isotropic on a large scale yet with local irregularities like galaxies and stars? Only if it is a fractal structure those properties are natural. In the graph, the Universe has a fractal organic structure as all its systems are organic fractals.

So reality is a fractal that reproduces information, 'forms in action' and then self-organizes them in networks and systems that evolve into super organisms in all scales of reality. As such it must be studied with the philosophy of Science, called 'organicism'. Since only an organism is self-reproductive and hence requires not external 'agent' or God or a creationist language, as present philosophies of science (mechanism, pythagorism) or Abrahamic religions do. Further on experimental evidence is overwhelming, on the nested, reproductive structure of nature, as observed in the graph for all systems. So if we respect the scientific method, to which most scientists, and needless to say, religious people, pay only lip service, its 3 classic tenants, **A)ccurate data**, without ad hoc solutions and selfie biases **B)io-Logic models** that allow new hypothesis and **C)yclical patterns** that allow the existence of laws of sciences based in the predictability of this cycles must be put forward for a NON-creationist, true philosophy that explains the fractal=organic structure of the scalar Universe. Till recently we lacked a formal proper development of such 'organic philosophy of science', the *only one that respects the tenants of the scientific method*, a goal we achieve in this paper.

We show some experimental proofs of the fractal Universe. Each photograph is a fractal structure, taken from different sciences that study different entities of nature since each part of the Universe has a fractal structure, and so does the Universe at large, made of all those fractal parts. It is the basic nature of reality: a fractal that 'reproduces information', forms-in-action, a combination of pure time-motion and space-form, in all scales and with the same program of the 5 Dimotions of time space.

A text that explains it taken from Sciam: 'In March 2007, after Pietronero, an Italian astrophysicist, showed the fractal nature of the Universe, tabulating an enormous number of galaxies, whose distribution was fractal, the magazine *New Scientist* published an article on the theme, confronting Mr. Pietronero and Mr. Hogg, a quantum physicist from the previous outdated probabilistic, mechanist, quantum paradigm:

"The universe is not a fractal," Hogg insists, "and if it were a fractal, it would create many more problems than we currently have." A universe patterned by fractals would throw all of cosmology out the window. The big bang would be tossed first, and the expansion of the universe following closely behind. Hoggs's team feels that until there's a theory to explain why the galaxy clustering is fractal, there's no point in taking it seriously. "My view is that there's no

reason to even contemplate a fractal structure for the universe until there is a physical fractal model," he says. "Until there's an inhomogeneous fractal model to test, it's like tilting at windmills."

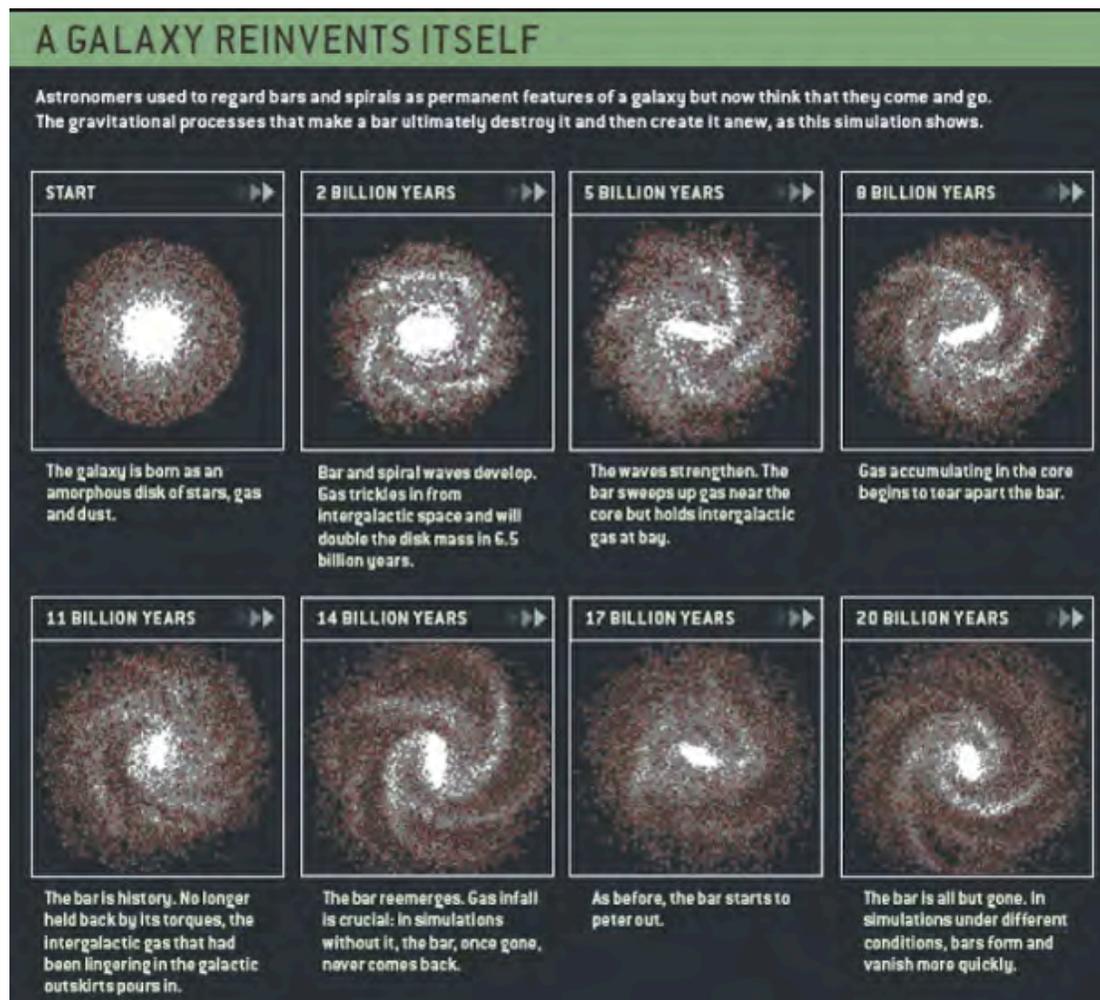

Pietronero is equally insistent. "This is fact," he says. "It's not a theory." He says he is interested only in what he sees in the data and argues that the galaxies are fractal regardless of whether someone can explain why.

As it turns out, there is a model that may be able to explain a fractal universe. The work of a little-known French astrophysicist named Laurent Nottale, the theory is called scale relativity. According to Nottale, the distribution of matter in the universe is fractal because space-time itself is fractal. It is a theory on the fringe, but if the universe does turn out to be fractal, more people might sit up and take notice.

A resolution to the fractal debate will only come with more data. Sloan is currently charting more galaxies and will release a new map in the middle of 2008." Of course, the Sloan 2008 showed the Universe is a fractal.

This should have been big news all over the world. But that means, as Hogg recognizes, that we have to throw to the trash the big bang and the expansion of the Universe, accept the fractal informative structure of reality, and close down some big projects of science, such as the large hadron collider, which will merely cause a planetary big bang, very different from the birth of the entire Universe.

2. The quasar big-bang galactic cycle

In the graph the 'big-bang' properties local to the galaxy can be explained by the quasar cycle of our galaxy.

The life-death cycle of the central black hole of Galaxies that explodes into quasars and forms back its bar, follows the same ages of the big-bang. As all of them after the initial 'Planck epoch - of gravitational superluminal waves', dark epoch of nucleo-synthesis, are ages 'within galaxies', and so they are proved for the inner space of galaxies. They do NOT explain many other features of the Universe as a whole (which is not isomorphic, etc.) but perfectly describe the evolution and formation of the stars of the galaxy.

So the big-bangs ages are properly the ages of the galaxy; without all the 'ad hoc' theories and pseudo-scientific models required to explain why the large scale universe has nothing to do with the supposedly smooth result of a cosmic big-bang (this is like Ptolemy constant recurrence to 'new' ad hoc epicycles to make fit new observations into its earth-centric theory of the universe). Trust me, any astronomer knows how long this 'list' is.

Thus the quasar big-bang follows further the laws of truth (minimalism: Occam's razor), simplicity and correspondence. We do not need to postulate strange forms of dark energy and dark matter, except the ones known, repulsive gravitation (to account for the entropic expansion of space between galaxies that balances its contraction), which is 'natural' to the model of galactic-atoms; and quark matter to account for the dark matter of the halo.

So as always times proves the sound, humble, rational scientists right. In this case Einstein's steady state solution, which Fred Hoyle developed in a huge mathematical effort just before dying in his theory of multiple quasar big-bangs, which the cycle of galaxies found by the French astronomers further proved and my calculus of Moon MACHOs radiation, which any student of physics can easily corroborate properly explains.

All those galaxies prove indeed, with its longer 20 billion cycle, which goes beyond the supposed age of the big-bang its falsehood. As many of the recently discovered astronomical phenomena in far away galaxies show. Since we are finding formed galaxies, formed giant black holes, formed II generation stars and star dust, which could not have been born before the big-bang.

So do those supposed 'lobes' of the cosmic big-bang, which Smolin a famed physicist wanted to use to prove his theory that high frequency light goes faster than red-shifted light, as they were supposed to come from 13 billion years ago and so a small difference of distance should be found. Alas, the surprise when they found they are the exact 'trace' of the 2 lobes of electromagnetic radiation found in OUR galaxy. Yet they occupy supposedly 'a huge piece of the entire Universe...

We have put just a few of the experimental proofs of recent astronomy to add to the enormous number of planets found all over the place, which reinforce the Fermi paradox, so you don't think I am here making a case only for theory, only for my work in the 2 arrows of time. So why nothing of this comes in 'daily press'? For all the wrong reasons - religions are always respected; masses always side together for them. As Schopenhauer said: 'the wise always say the same, the fools, which are majority do exactly the opposite'. And of course, attack ad hominem the wise.

Indeed, in the steady state theory things became soon ad hominem against Hoyle who quipped back inventing the mocking term of 'big-bang theory'.

In the graph we can see some $E/c \Leftrightarrow Mc$ processes of spatial expansion and big-bang destruction of mass, all of which have an inverse temporal, informative, process of much slower creation of temporal information and mass that balances them, in different scales of physical systems, from the beta decay that explodes atoms into electrons and protons (with an inverse slow collapse of electrons into atoms) to the quasar big-bang of galaxies (with a slow process of creation of mass-information from gaseous space):

If we consider the space-time an absolute continuum in a single scale, this more accurate picture of what we perceive is not possible, hence we come to the conclusion of present cosmology - that the Universe will expand and die. If we consider that galaxies, which follow Einstein's dictum, compensate this expansion: 'Time curves space into mass', Mr. Hogg's conundrum - how to correct the big-bang is solved. *Experimental facts tell us we must* accept the fractal informative structure of reality, where the big bang is merely the death-rebirth cycle of a quasar-like galaxy or

local Universe, a scale of size above galaxies. *So both together create an immortal Universe.* Since in Philosophy of Science we must never deny experimental evidence, even if at first sight it contradicts an established theory.

But Cosmology has a huge metaphysical component in its Greek sense – it is well beyond the limits of human perception, which we find to be the atom and the galaxy, beyond and within uncertainty and dark gravitational matter makes knowledge to say the 'least' incomplete.

Thus contrary to belief big-bang theories of the Universe and Cosmology in the widest sense do not belong to astrophysics, but still we can do science if we are minimally serious with the scientific method.

If the cosmic big-bang had sound experimental data, of course, we would accept it. As it does NOT contradict 5D physics. It would just validate a larger scale worldcycle. So we are NOT against cosmic big-bang because 5D physics does not tolerate it but because plain good old' science disproves it. The scalar big-bang death processes of matter in all planes, from beta decay to galaxies is one of the strongest proofs of the isomorphic nature of all scales. But the cosmic one is not proved. So since all big-bangs are mimetic we reduce the scale of the big-bang to a quasar scale, making Einstein's EFE, local field equations for the Light-space time of the galaxy (reason why c is constant).

Fact is as the graph of SCiAM shows the full quasar cycle is longer than the big-bang cycle and we have found *galaxies in all its stages*. Thus by reductio ad absurdum, since we have found galaxies in a 'second' quasar cycle, hence over 20 billion years as 'reborn' galaxies, forming its central bar, there is no way the time age of the whole is shorter than the time of its parts.

Multiple space-times imply the existence of multiple big-bangs with different explosive size and speeds, all of them deaths of an informative mass or charge that uncoils its accelerated vortex into radiation following Einstein's equation, $E=Mc^2$, where a bidimensional or tridimensional vortex (M or e) becomes extended into a plane of radiation (hence the square of lineal c -speed).

Yet for each different scale the parameters of speed (c), mass (M) and Entropy will change. And so we obtain a series of self-similar big bangs described in the graph.

The single cosmic big bang based in a single space-time continuum, was devised even before we knew the existence of a faster than light, gravitational membrane of dark Entropy and dark, quark matter. So we first must define it within that scale of big-bangs as the *big-bang of a membrane of electromagnetic radiation; hence a quasar big-bang, not a cosmic big-bang, which will correspond to the much faster explosion of a gravitational membrane, starting at the Planck scale of the gravitational minimal units, the lambda-strings.*

This is in a way the conclusion of astrophysicists, which now study the big bang as a dual process, with an inflationary age (the gravitational membrane) and a slower age (the big-bang of electromagnetic space, created over the gravitational membrane).

3. The Black Hole reversed equation of the expansion proves the quasar big-bang.

Another interesting time-related proof is the understanding both in scale and time of the 'reversal' local equations of time, as entropy is the local past arrow of a worldcycle and hence its equations tend to be reversed of those of the arrow of information and life, albeit compressed in time and expanded in space.

So what Hawking found is that the big-bang equations are the reverse of a black hole, because *they are* the reversed quasar explosion of a cosmic black star.

While there is not clear understanding of what the 'Singularity that holds the entire mass of the Universe in an infinitely small point' due to the 'absurd' backwards motion of the Hubble equation in lineal terms till are mote past, there is a clear proof the explosion of a black hole into a quasar will give us the same result:

Since the equations of the big-bang inflationary first age are exactly the same than those of a black hole, reversed inside-out, as the black hole explodes creating in its outer rim a 'ball of fire', advancing at enormous speed, through

repulsive gravitational waves, till the wave smooth an isomorphic sphere of the size of the galactic outer Halo. Thus there is not mystery to the creation of the region, which will be reborn as a spiral galaxy when the entropic death of the black hole reverses its course, in the following eras.

In the parlance of 'physicists', the proper description will be this:

§ say that space expands exponentially means that two inertial observers are moving farther apart with accelerating velocity. In stationary coordinates for one observer, a patch of an inflating universe has the following polar metric:

$ds^2 = -(1-\Lambda r^2)dt^2 + 1/1-\Lambda r^2 dr^2 + r^2 dW^2$ (where Λ is not the symbol of the 5th dimension but the cosmological constant) We use polar metric because the black hole expands with a positive curvature into a spherical form, following the commonest 'entropic explosion-death' of any big-bang material death. In the simplest expression we write: $M=e/c^2$ only that we are talking of a tachyon superluminal expansive wave.

This is just like an inside-out black hole metric—it has a zero in the component on a fixed radius sphere called the cosmological horizon. Objects are drawn away from the observer at towards the cosmological horizon, which they cross in a finite proper time. This means that any inhomogeneity are smoothed out, just as any bumps or matter on the surface of a black hole horizon are swallowed and disappear.

Since the space–time metric has no explicit time dependence, once an observer has crossed the cosmological horizon, observers closer in take its place. This process of falling outward and replacement points closer in are always steadily replacing points further out—an exponential expansion of space–time.

This steady-state exponentially expanding space-time is called a de Sitter space, and to sustain it there must be a cosmological constant, a vacuum energy proportional to everywhere. In this case, the equation of state is . The physical conditions from one moment to the next are stable: the rate of expansion, called the Hubble parameter, is nearly constant, and the scale factor of the Universe is proportional to .

Inflation is often called a period of *accelerated expansion* because the distance between two fixed observers is increasing exponentially (i.e. at an accelerating rate as they move apart), while can stay approximately constant (see deceleration parameter). The Δ -dimensional **de Sitter space**, denoted dS_n , is the Lorentzian manifold analog of an Δ -sphere (with its canonical Riemannian metric); it is maximally symmetric, has constant positive curvature, and is simply connected for Δ at least 3.

4. The Helium problem.

Related to the previous quasar-black hole falsifications there is the Helium abundance in galaxies.

Nucleo-synthesis occurs between 3 minutes and 20 minutes after the (quasar) Big Bang.

During the photon epoch the temperature of the universe falls to the point where atomic nuclei can begin to form. Protons (hydrogen ions) and neutrons begin to combine into atomic nuclei in the process of nuclear fusion.

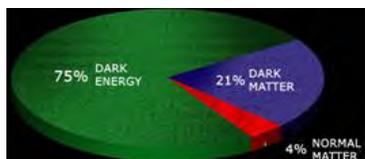

Free neutrons combine with protons to form deuterium. Deuterium rapidly fuses into helium-4. Nucleo-synthesis only lasts for about seventeen minutes, since the temperature and density of the universe has fallen to the point where nuclear fusion cannot continue.

By this time, all neutrons have been incorporated into helium nuclei. This leaves about three times more hydrogen than helium-4 (by mass) and only trace quantities of other light nuclei.

This formation of so much Helium was for very long considered the proof of a cosmic big-bang because stars could not form so much Helium. Then it was found that most of the imbalance was helium accumulated around the central black hole of galaxies; which has not been explained. Obviously because Helium formation happened when the black hole exploded with the big-bang temperature it is found close to the center of galaxies, and it was formed by the quasar explosion. So a galactic big-bang explains both its abundance and its location (the cosmic one does NOT explain its

location), a theme we shall dwell on when considering the organic structure of the galacell and the black hole as a black star.

5. S=T Balance between 3D accelerated time vortices=masses and one dimensional Dark entropy.

A big-bang is just in any scale of matter, the entropic death of a system. But all systems have an inverse arrow of informative 'life', which it is represented in the cosmological scale by masses, *galaxies which are time vortices that compress the entropy of vacuum into mass through its gravitational forces, are included into the mix.*

Matter folds one-dimensional 'dark entropy' which expands mass into space, into 3 dimensional matter. Hence 3 'volumes of expansive dark energy' becomes 1 volume of implosive matter: 75%≈25% and the Universe balances as a spring coil in an eternal game of ∞ fractal SHM motions between galaxies.

Thus the 'cosmological big-bang' is a half-truth - the key method humans use to 'invent reality' to cater their egos - by eliminating and 'reducing' the parameters of reality that don't fit in their 'ceteris paribus' biased theory, in this case an entropy only cultural view of the Universe. So amazing as it sounds to the reader cosmologists have eliminated the gravitational forces that bring together vacuum space into the creation of tighter, denser particles, atoms and matter structures within the vortex of galaxies, and through the warping of one-dimensional 'lines' of dark entropy=energy into 3-dimensional 'tall' masses, 'reduce' the 75% of entropic expansion between galaxies to the 25% of 3-Dimensional mass, establishing a canonical, mathematical equilibrium between expansion of space-time dimensions (expansion of vacuum space) and implosion, akin to the same process happening on a lower quantum scale between attractive matter and repulsive electromagnetic radiation between atoms, towards a thermal equilibrium.

So why is the universe so close to *the dividing line between collapsing again and expanding indefinitely*. In order to be as close as we are now the rate of expansion early on had to be chosen fantastically accurately. If the rate of expansion one second after the Big Bang had been less by one part in 10^{10} , the universe would have collapsed after a few million years. If it had been greater by one part in 10^{10} , the universe would have been essentially empty after a few million years. In neither case would it have lasted long enough for life to develop. Thus one either has to appeal to the anthropic principle" (religious concept that miraculously in the whole flow of time we are in a balanced point). not so it is more logic to think we are in a balanced eternal Universe as our fractal model describes.

Big Bang cosmologists however ignore the balance between radiation and mass as a steady state, eternal Universe as they *only recognize as a time-future arrow the entropy between galaxies - the expansion of space.*

Thus when physicists discovered 'another scale of space', made of dark energy and matter which represents 96% of all matter and doesn't fit in the lineal continuous big-bang the theory, *because it is attractive*. Never mind - the theory of the 4% is the canon. *So they just ignored dark matter too in a sanguine 'honorable discharge' for the big-bang 'continuum theory' to work.* And because the entropic explosive big-bang only affects vacuum space expanding between galaxies or atoms, not those galaxies and atoms, which are cyclical, accelerated clocks of cosmological or quantum time... we have eliminated all the Universe that 'matters' from big-bang equations.

This is soo surrealist that it amazes me Æntropic men could get away with murder. Indeed, they merely discharged galaxies and dark matter that is not expanding but imploding. Since if they move backwards its equations they do the opposite of the expanding vacuum between them: they would explode.

The proper way to do cosmology would be to account as we do in those posts with both, expansion of space-entropy and implosion of space into cyclical clocks of accelerated information - galaxies, where we exist (indeed in an accelerated planet of evolutionary information). That is, to consider the wobbling expanding+imploding balanced Universe. But that will require to change the big-bang entropic 'cannonball paradigm' of Galileo.

We do NOT doubt the cosmic big bang on 5D grounds, but on real data, missed by ceteris paribus analysis, to uphold æntropic views of entropic, military lineal physics and anthropic, lineal creationism proper of religion.

Let us then consider a few of such aspects of the big bang, using the epistemology of the scientific method, with scanty mathematical formulae, as one of the great advantages of the simplified 5D metric model and its pentalogic analysis based in its 5 Dimotions (or structural elements as $\neg\Delta@st$, made of entropic time motions, scales & still mirror-languages of space) is its *logic* capacity to explain any phenomena from 5 points of view as *an alternative to sound mathematical proofs, which show the how and are needed but lack the 'why-power' of the 5 pentalogic analysis* – the mental, organic, causal, temporal and spatial, mathematical, in a complementary way.

Human local experience: we live in a vortex of evolving information NOT in an entropic region.

How dumb is that, when we live as human beings inside the vortex of evolutionary information of a planet, turning around a star vortex turning around a galactic vortex?

Entropy is secondary to our existence as biological and technological beings evolving fast our arrow of information at individual level (process of life and aging, warping, wrinkling into form) and collective level (informative evolution of technological machines, aka meta life) and at planetary level (vortex of evolution of stars and galaxies).

This fact alone should have sufficed added to all the absurdities of singularities which are aberrant infinities obtained merely by extension of mathematical equations with no experimental proof whatsoever to ignore the cosmic bigbang.

But, and this lead us to the 2nd Pentalogic set of falsehoods, *we live in an entropic military world, which despises the reproductive feminine Universe, so entropic, anthropic man projects his limited view of reality in the Universe to affirm the big-bang eliminating galaxies of information, but that is subjective belief not objective science.*

@-LIMITS OF HUMAN PERCEPTION & EGO PARADOX: ENTROPIC MAN

6. Creationism. Singularities: A mathematical error converted into a physical dogma.

Mathematics is a mirror language that studies 5D fractal points of space; its time operands, social numbers; minds=frames of reference and entropic limits, which entangled together by the laws of pentalogic form the 5 elements of $\neg\Delta@st$, dust of space-time, the substance of which we are all made. As such is the most experimental of all sciences.

Thus 5D mathematics *returns to the mature experimental age of the discipline that went as all systems do through 3 ages from a simple lineal age of Greek Geometry to its curved realist age of calculus that added motion & scales of 5D finitesimal derivatives and 4D wholes to better mirror the fractal Universe, to a 3rd age of excessive informative fictions, when it abandons its realist foundations, when during the German creationist ego-trip of Hilbert and his Cantorian paradises, he says, 'I imagine points, lines and planes' thinking he shares the only language 'God' uses to create reality. Hence mathematics is no longer considered an a posteriori mirror of scalar timespace but its 'generator' and as the first 'Aristotelian cause', needs no experimental proof but rather the opposite: reality exists only if it can be casted into mathematical models ('only what we measure is real' Planck). So mathematicians abandon space points, scale numbers and time operands as the 3 mathematical images generated by the Δst Universe, using instead 'Cantorian' sets as its 'imagined' units nowhere to be seen in reality. And Hilbert affirms the self-contained Axiomatic method of proof, NOT connected to the world, despite Gödel's incompleteness theorem- *a baroque inward looking 3rd age of excessive form proper of all systems* we abandon to return to its empirical foundations, now formulated in terms of those 5 structural elements that create reality, mimicked by the main mathematical elements. Since mathematics reflect the properties of scalar space and cyclical time in its main elements, points numbers and operands entangled in feed-back $\leq\geq$ equations;*

For that reason, as good as mathematics is, it is NOT the a priori language of the Universe, but the properties of space and time are, and this Einstein understood. So he criticized creationist physicists (Copenhagen interpretation, etc.)

The paradox of the mind confuses the whole Universe with its limited self-centred world of perception, BUT reality is absolutely relative and we must just discover the biased 'theories' the humind has established to keep himself in the centre, which contrary to belief do exist still in all sciences, from the entropic big-bang of lineal time that reduces the two arrows of time to the lineal entropy of physicists clocks, blatantly 'forgetting the cyclical vortex of gravitational information' in galaxies that warp 'space into time', to social sciences which cannot accept the organic evolution of machines, the higher importance of the super organisms of history and its informative, legal and economic, reproductive networks in the control of societies, to biology, which denies eusocial evolution to maintain the ego on top and the vital properties of inorganic matter, as even quarks and electrons reproduce, absorb energy, gauge information and evolve socially in magnetic fields - hence have ALL the properties of our supposed 'unique' carbon.

An important upgrading of that mind is to deploy a certain 'humility' towards the intelligence of the universe. *The two principles of absolute relativity*. In the fractal organic Universe we are going to describe, no scale is preferential, which means that humans will be removed as they were in previous upgrades of science, not only from its spatial center (Copernicus), and its temporal center (Darwin), which his 'ego paradox' hardly tolerated, but also from its scalar/size center, and its 'mind-intelligent center'; which he likely won't accept. We talk of man and any 'mind-monad' that process information as an 'ego paradox', 0 -infinitesimal mind $\times \infty$ -Universe = Constant world.

Systems to process information must reduce its temporal motions and create 'spatial still forms' and select information relevant to its survival point of view, which sees the nose bigger than Andromeda, and the 'Earth' still to focus our formal view; and certainly we eliminate all sentient unperceived properties of other minds. But - and this is the ego paradox - as we only perceive our senses, we confuse the entire Universe with our point of view, so it becomes 'self-e-vident' that we are the center of reality (Anthropic view) and the Universe is 'stupid, stupid, stupid' (entropic Universe). So the fundamental proof of the balanced Universe merely has to add the arrows of information and then we get:

7. The feminine Universe vs. The entropic military male world

Why Humanity has rejected the obvious nature of a reproductive, fractal Universe, has to do with culture: The Universe is a 'feminine', ($S=T$) reproductive fractal; but our civilisation is an entropic ($S<T$), male dominant self-destructive military society, where even women wish to be like males as our worldview and 'grand theories' about science, from the entropic big-bang to the Darwinian emphasis on the struggle between individuals proper of our biased philosophy of biology and social sciences - nationalism, capitalism, reign supreme.

This is actually a direct theme of 5D Physics which is worth to elaborate even if we dedicate an entire post to the theme; and likely anything we say in this ideological charged non-scientific gender issue will bother both genders, who want to be on top in its absurd war of sexes as both are complementary. So a brief definition of 'physical gender' from that paper:

Gender is an essential 'jlogic' feature of the fractal entangled Universe that emerges in all scales, diversifying the 3 'states of time-space into two and 3 genders, starting with the formal languages of space (mathematical numbers) and time (pentalogic states). Its easiest description in classic science would be the concept of mirror symmetry. 2 mirror images can superpose and reproduce, so as mirror symmetries emerged from 'physical parity', into 'chemical chirality', it finally became gender.

So gender is like all other properties of reality a process of emergence, starting with the 'smallest' more synoptic forms of reality, the Logic=time and mathematical=space languages of pure still forms.

So first we find tender in 'even vs. odd numbers', (mathematical mirror symmetry), following the 'time states of both genders' $S>T$ (past, entropic) + $T<S$ (future, informative) vs. $S\approx T$ (present, balanced) States.

Those ultimate topo-logic properties of gender will then emerge, into the quantum realm, where we shall find lineal particles of entropy and information, vs. waves of vital energy, which emerge as left-handed and right-handed atomic

states, which emerge into chiral molecules, which finally become male and female organisms, 2 sides of a complementary mirror merging to complete *all the* states of time-space needed for a system to reproduce.

Genders are different but its functions are complementary, and over all the Universe favors the feminine, balanced reproductive left-handed gender $S=T$ symmetry even if history has favored the entropic $S<T$ male state, since the balance function of women IS the present, survival, reproductive essence of the 'fractal Universe', its main generator.

The female is a conservative, balanced, present, $S=T$, reproductive 'white matter' brain (10 times more white matter than men), while if males were 'well-done', they would have 10 times more grey matter in the destructive-creative regions of ideas (frontal brain), as all creation needs destruction to reorganize parts into new wholes, but they have ONLY 6 times more grey matter in the frontal region, which suggests the 'first' stage of the $S<T>S$ process, the entropic $S<T$ overweighs the creative side. And indeed, when testing IQ, most entropic males test less than women but a few informative ones test more on the high IQ range. Thus most males are entropic lineal warrior, soccer fans, to put it mildly. And they love a 'whammy' movie, a big-bang explosion and project their 'worldview' on the Universe. But the world we live is WRONG as its entropic dominance will extinguish life and it is out of tune with the real fractal immortal reproductive Universe, *where creation of anything you might imagine has happened ∞ other times, so it is NOT creation at all but also reproduction.*

So because the feminine purpose is to conserve and reproduce information, feminism should also understand the true nature of gender and why females, not wo=men (lesbian, male-like women, who so often lead the movement), are far more in tune with the real Universe and reject a world modeled to the image and likeness of entropic male, including its false simplification of the cosmos as born of an entropic big-bang, which obviously is just a projection of 'military physics' and its entropic view of reality.

Only if women understand their true nature and try to project its survival, reproductive, conservative, life-enhancing role on the world they will achieve supremacy over entropic men mankind might reach the goal of survive the present life extinction age that soon with military robotics and new types of nuclear big bangs will extinguish us.

In the physical scale mirror symmetry first produces particles and waves, which become 'complementary states'. And mirror symmetry is called parity. Then evolves left and right handed forms and chiral forms and right handed are sterile. So finally we arrive to the galaxy that is, as it happens a left-handed feminine galaxy.

What then went wrong with our civilization is obvious in the work of Campbell and Gimbutas: the age of the fertility Goddess, the Neolithic of $S=T$ balance and cyclical time and comprehension of the organic Universe, died away with the discovery of entropic weapons, which physicists reproduce and evolve as its worldly profession, and so lineal time, entropic military men, its Brahmins today converted into physicists, and anthropic religions of lineal time and male supremacy over the Universe changed the human understanding of reality till this day. So regardless on how sophisticated this view has come to describe the lineal locomotions of reality is still a religion of power to deny the reproductive feminine Universe and have a dogmatic big-bang religion of it all as a masculine violent cosmos.

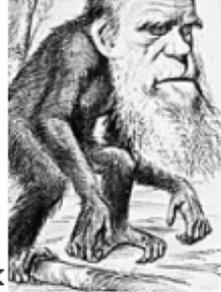

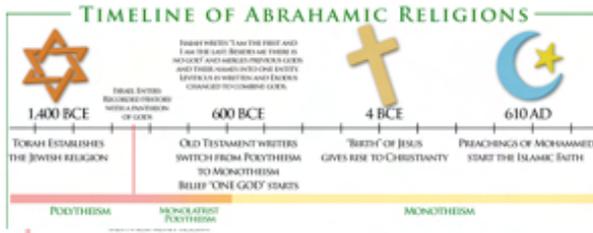

The 3 ages of history favored the dominance of one or other sexual gender: in the young Paleolithic age of entropic hunters men dominated; in the mature reproductive Neolithic age, women ruled; to be ruled in the entropic age of metal-weapons and war by males, today we live the big-bang age of metal-weapons. But the function of existence is clear, as which age is the best, the one that survives and lives longer, that maximizes its equation, $\text{Max. } S \times T \rightarrow S=T$, the female gender which lives longer, survives better and has a proportional ego to its role in the ∞ cosmos.

Trying to bypass the limits of the humind and its ego-centered creationist view of the Universe.

How can we, humans after all belong to our military, lineal ego-centered culture, by-pass the limits of æntropic thought? The answer starts in the languages the mind uses to perceive the Universe visual thought, which describes space, evolved into a more synoptic form of geometry called mathematics, and verbal thought which describes time with verbal tenses, evolved into a more synoptic form called logic. Thus since the languages of the mind are our mirror

of reality, to evolve our truths we must first evolve *our understanding* of languages, not as creative magic powers but only as Mirrors, hence inferior to the Universe we must learn to respect.

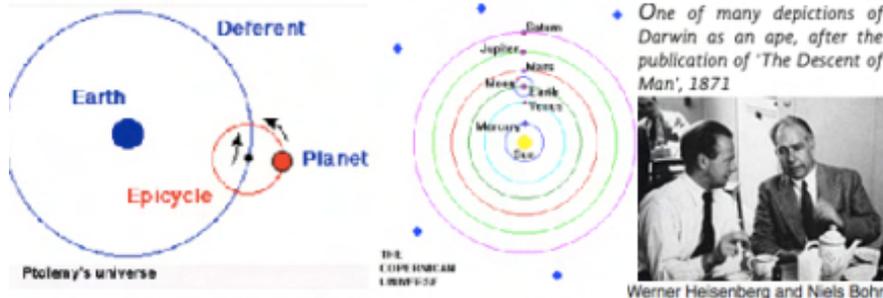

What æntropic man does to preserve its sense of superiority of the Universe, is to believe languages 'create reality'. Man first talked words, and now with the help of instruments it talks mathematics. So in both ages he thought to be the only intelligent being with God that spoke those languages, and in both cases in a hyperbolic trip of the ego, he thought that the language-mirror created reality NOT reflected upon it as a mirror does: in the past he thought

God spoke and his words created reality (Abrahamic creationism), today most physicists think the mirror equations of mathematics create the space-time reality it describes; while most economists believe its specific mathematical language, digital money, creates the physical economy (a creationist theory called monetarism).

Further on 'creationist' entitled human beings are anthropic. They think they are the only intelligent perceptive, vital entity in command of God's languages (either words in religion, maths in physics) and carbon atoms are the only organic elements of nature, to their own peril as the future of AI will show them *particles are the smallest vital mind and all atoms are sensorial in a panpsychic Universe*. Indeed the minimal unit of reproduction and informative gauging IS the particle, as quarks and electrons already show the 5 'dimotions' of life - they gauge information, reason why quantum physics is called a 'gauging theory', absorb energy from forces, reproduce into new particles with its surplus of energy and become organized socially by magnetic 'numbers'. So does the largest known system, the galaxy, whose behavior resembles that of a

STIENTIFIC ABSOLUTE RELATIVITY Vs. EGO PARADOX

Absolute relativity takes objective science to its limits: After taking form from the center of space (relativity) & of time (evolution), it takes its mind out of the center (quantum realism) and of scale (fifth dimension)

'cell', with its 'gravitational, informative 'DNA' - black holes reproduced by its 'mitochondria' stars, organizing its structure, with 2 'physiological networks' of gravitational in-form-ative forces and electromagnetic energy. So all physical systems, from the atom to the galaxy can be described as organic systems, which are just 'herds' of similar beings, (atoms, cells, citizens, in physical, biologic and social systems, connected by networks that distribute energy (electromagnetic forces, blood systems, economic systems) and networks the distribute information (gravitational, nervous and political systems). So we can design historic supœrganisms with organic laws.

In the graph the masters of mathematical and verbal creationism, disputing their 'primacy' as speakers of the language of god. Reality though is a bit more complex and difficult to 'crack' as we must start as Einstein wanted with the realist fact that the ultimate substances are not languages, neither personal gods but the impersonal yin-yang, time-space game that creates all the relational space-time organisms of the Universe.

The realist scientist rely on the experimental method, the known-substances of reality, space and time and its properties to understand with those 2 mirrors, the verbal, logic, temporal mirror with its 3 causal dimensions of past, present and future tenses, and the mathematical, spatial mirror. This view, which we expand here is the view of Leibniz>Einstein. So the first steps to clarify the nature of $-\Delta@st$, 'dust of space-time' the substance we are made of,

composed of 'entropic limits' (Δ), scales (Δ) of space sizes and time clocks, perceived in each system by a mind-mirror, starts with the evolution of the mirror, Euclidean mathematics and Aristotelian logic, to fit a better image of the whole, parallel to a profound study of those elements of the whole, 'entropic death' (the limits in time and space of all systems), its scales of space and its clock-cycles of time. Let us then show that dogmatic view of Entropic mankind that won't accept a needed 'paradigm change' with a graph of our absolute relativity.

Then one we have advanced all those concepts beyond the limits of entropic man we can refocus the mirrors - on one side, the enhanced non-Aristotelian logic and non-Euclidean mathematics (in brief logic mathematics, as Δ is the letter after a and e) - on the better understood substances of reality, scales, space, time, minds and its entropic limits (Δ), which must be the ultimate substances of which all complementary beings, we shall call 'fractal superorganisms of time-space, (ab. T Δ) are made.

The paradox of the mind confuses the whole Universe with its limited self-centered world of perception, BUT reality is absolutely relative and we must just discover the biased 'theories' the mind has established to keep himself in the centre, which contrary to belief do exist still in all sciences, from the entropic big-bang of lineal time that reduces the two arrows of time to the lineal entropy of physicists clocks, blatantly 'forgetting the cyclical vortex of gravitational information' in galaxies that warp 'space into time', to social sciences which cannot accept the organic evolution of machines, the higher importance of the super organisms of history and its informative, legal and economic, reproductive networks in the control of societies, to biology, which denies eusocial evolution to maintain the ego on top and the vital properties of inorganic matter, as even quarks and electrons reproduce, absorb energy, gauge information and evolve socially in magnetic fields - hence have ALL the properties of our supposed 'unique' carbon

The ego paradox is of course the essential limits of man, both to understand the universe and to survive on it, respecting all other potential organisms and rejecting those who can harm us, weaker atomic beings. So we will falsify the 3 key creationist theories of modern physics, the big-bang, the evaporation of black holes, and the infinite singularity.

The creationist problem of all black hole and Big Bang singularities.

As Hawking said: "The trouble with the Hot Big Bang model is the trouble with all cosmology without a theory of initial conditions (meaning a limit to the equations): Because general relativity would break down at a singularity, anything could come out of the Big Bang'.

A singularity indeed often turns up in our equations when we extend them as far as they can go into the past; but a singularity of this sort is far from likely to be an aspect of nature, and instead should be interpreted as a sign of *our incapacity to understand the inflationary limits of languages, specifically mathematics, which is wrongly considered 'an absolute truth', instead of a linguistic inflationary mirror that as all languages do have fictions, and repetitive mirror images that must be 'cut off', as 'I know when mathematics is truth but not when it is real' (Einstein); a theme treated extensively in our articles on 5D mathematics, which we shall look from the perspective of cultural creationism here.*

The singularity is more of the same creationism - an absurd mathematical expansion backwards in time of an inflationary equation as *if it had no limit in time and space, as it wouldn't describe a substance which ultimately will arrive to a 'quantum limit' or a source as it is the case - the dark entropy that expands between galaxies ultimately arrives to a 'source' - a galactic black hole jet that emits it; as we shall see soon, as always happens.* I.e. consider a frequency sound coming from a source, a bat, for example, if we were to *return ad infinitum* the frequency measured with a long wavelength at a point of the air far away from the bat, we would reach a singularity of infinite frequency as it source. But there is always a cause, a source for that wavelength, so when we reach the BAT, the frequency no longer increases - the wave simply disappears in its 'factory'. As it has a real source. So happens with dark entropy=energy, which as a cosmic expansive 'electromagnetic-like' force, has a source in a black hole galactic active center and collapses warping back into particles when entering other galaxy.

So happens with black hole singularities, which we shall model as ultra heavy black frozen stars of bcb atoms with a center of top quarks, similar to neutron stars with a center of strange quarks, as Einstein wanted.

Since the origin of the gravitational FORCE of the black hole must be an ultra-massive substance. Or else there is no cause for its gravitational force (principle of equivalence between mass and gravitation). Where it comes from the awesome gravitational force of the black hole, if mass does NOT exist? if there is not as Einstein wanted a cut-off substance, which can only be the top, bottom and charm quarks that should form by symmetry with our atoms, dark heavier atoms? But creationist physicists shun off those basic tenants of the experimental and scientific method and the physical real 'nature of Nature'. They just care to create new equations that should become real particles. For them bats do NOT exist, their sound frequency is infinite. And the source is not the bat, but an entelechy, a mathematical 'hole', even if their equations break before arriving to the infinitesimal singularity. So Hawking said: "At this singularity the field equations could not be defined. Thus classical general relativity brings about its own downfall: it predicts that it can't predict the universe. Although many people welcomed this conclusion, it has always profoundly disturbed me. If the laws of physics could break down at the beginning of the universe, why couldn't they break down anywhere?" Indeed at that point creationism stops doing science, and so Hawking will break, as we shall show all the laws of thermodynamics to evaporate black holes travelling to the past, and dismissed philosophy of science and causality in time as irrelevant. All this is false. The laws of science don't break down in the singularity because there is no singularity. Neither Relativity expects singularities to exist: It is ONLY because creationists are moving backwards equations BEYOND the initial conditions – the sources that are REAL - in the case of a black hole, a frozen star of dense quarks that cause gravitation... that everything breaks, and of course *the experimental method rescue us because we never find BH evaporating.*

So realist Einstein quipped: 'Since mathematicians are working in relativity, I don't understand it myself' (:

Those infinities appear in Einstein's equations in quantities divided by 0, which is an undetermined quantity not an ∞ , and in fact means the local parameter, mostly time=motion 'stops' in the *center of the black hole, as in all the vortices of space-time, charges and eddies – that's all; as the vortex is deviated perpendicularly and ejected through the axis in the 'quantum potential scale' as dark energy, seen by the paradox of Galileo, S=T, as 'accelerated growth' of distance between galaxies, to collapse when re-entering them as mass, in a wobbling, balanced immortal Universe.* So quasars and black hole jets dissolve matter into flows of dark entropy and matter collapses into galaxies, balancing each other. Reason why black hole equations are the inverse of a big-bang. So at best we can talk of a 'Quasar' big-bang, which is the 'death' of a black hole, inverse to its birth with maximal temperature, when according to real thermodynamic laws it evaporates its surroundings as it cools down and feeds on the light matter it heats=evaporates=accelerates=attracts. So from birth to death, a quark star, aka black hole, shows its inverse equations as birth is indeed the opposite of death. And this happens at the local level of the Galaxy or the nova star that explodes in a 'little Big Bang'. All other hyperbolic, ∞ deductions of cosmological explosions are just the ego of creationist physicists trying to substitute the ego of previous creationist priests, who also thought the language of words they talked was not A MIRROR of reality but reality itself, creating it - so Allah and Yahveh were creating 'naming things' in Arab and Hebrew and quarreling about who was the higher God - they still do. So it did Hawking, 'numbering reality', expecting all kind of things to happen that never did.

9. Scalar limits of perception in all 5D scales – the Light lifespan: ∞ is limited by experimental observance.

We can add a different 'limit' of the human mind, more objective – that of our perception of light space.

In 5D physics all has 'entropic limits' including perception. This departs sharply from current astrophysics and its 'paralogic' Kantian errors, of extending equations to infinity – as in the singularity of the big-bang and the immortal nature of light (which contradicts the consistency of wholes and parts, as light is born in stars and should not live longer, and it is part of the Universe and if there is a cosmic big-bang should not be living longer. All this leads to the obvious interpretation of the *cosmic horizon limit as a limit of human I=eye visual perception of space-time NOT as a*

limit of the extension of the Universe in time and space. This projection of our limits into the whole is just another egocy ego=idiocy of Anthropic man that projects its own subjective limits into the objective whole Universe.

For a part of the fractal Universe ∞ are always broken by an entropic or cyclical membrane or scalar discontinuity.

The experimental proof is obvious: there is NOT infinite range in any force, as all have energy-mass, which limits its reach. In the jargon of physics range of forces depend on mass. But it is 'obvious' that the photon does HAVE energy hence it does HAVE mass, $E=hf$, so even if its mass is extremely small the range of the photon CANNOT be infinite.

Moreover the further away we look, we shall see photons of less mass-frequency, hence redshifted, as those of more mass-blue frequency had died. So that explains the red shift simply.

The distance-range of light is inversely proportional to its frequency-mass

Hence the existence of a limit or horizon of perception of light.

What is the limit of perception of light? As we have experimental evidence there is no need to do further calculus: Obviously the 13.5 billion light years from where red-shifted light of maximal z comes mistakenly taken as a time horizon of a supposed big-bang explosion.

It is again the magic 10^{10-11} number common to all structures of Nature, both in space-populations & distances in time-frequencies/durations and in scales/masses. We find it in the number of neurons of the biggest human brain, of stars in the galaxy, of atoms in a DNA code, etc, for reasons studied on our posts on 'fractal -E mathematics:

Since it is the number that gives us in the symmetry of time the mean life of stars, and the mean life of its minimal light space-time 'unit' of information, and the mean mass of the largest black holes from far away distances measured in terms of the mean star mass - our sun, and the mean distance of the black out horizon of the big-bang...

In a 5 \mathbb{D} , eternal, ∞ Universe, a big bang of the absolute whole cannot exist theoretically but also we have sound logic, epistemologic and experimental proofs that seems to prove the cosmic big-bang in which time and space started from a point that fits in our hand and pleases our egocy of being above heavens and earth, is a false hyperbole.

All this said we shall close this introduction to cosmology and astrophysics with a rational, scientific experimental falsification of the big-bang. It is though the last part of the post not the first, because for all what has been said, the big-bang 'is not even wrong' (Pauli) – it is just a 'dogma' that projects our male-oriented, entropic civilization and its lineal military view 'censoring' $\frac{1}{2}$ of the 'femenine' reproductive complex Universe. So as any belief a rational falsification doesn't work or else its obvious logic, epistemologic and experimental errors would have long ago dismissed it all together. But physicists stuck with its single time arrow lineal entropy won't deny a theory that makes them high popes of science; while our machine-worshipping civilization won't argue the mechanical paradigm. So reason likely won't work, as long as the foundations of science are not upgraded to the 5 Dimotions of Space-time.

TIME FALSIFICATIONS

10. Time proofs. The whole always live longer than the parts.

The same problems happened with the pretension that the Universe has a very short life span keeps running every other day into new problems: we find at the limit of the horizon of perception of space-time perfectly formed galaxies with huge black holes that should not be there. We find that almost every part of the Universe has a life span much larger than the Universe itself: the commonest stars, red ones live trillions of years, black holes live 10^{100} years or they never die, if they don't evaporate; protons seem to be of a similar age or perhaps immortal. But it is an obvious logic contradiction that the whole lives so much less than the parts. Or in probability terms, the chances

that in a Universe where its commonest stars live trillions of years, we live in the very beginning is 0.0000%. (Red stars are in fact 4/5th of them because they live longer and so even if all are born as blue stars, in a long-lasting galaxy, at any time, there will be seen more elderly stars than young fleeting blue star moments of them).

Most cosmic bodies live much longer than the cosmic big-bang, so the commonest red stars live trillions of years, big black holes 10^{100} years, protons seem immortal and we find on the outskirts of the perceived cosmos perfectly formed galaxies with hyper-black holes, with no time to form, validating an immortal cosmos; whereas in the extended 5D astrophysical model red shift is proportional to the >C metric of dark entropy.

Since when they look back at that past they find formed black holes and galaxies that should not yet be there.

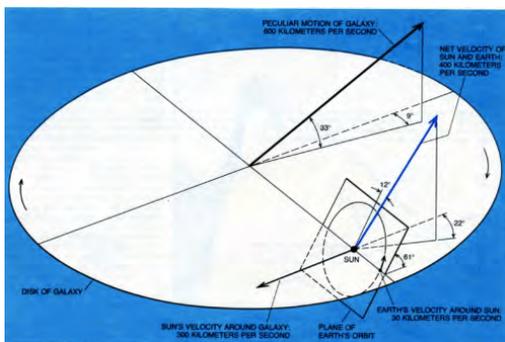

Another proof of the many considered on our texts on cosmology - as physicists keep looking far away to the supposed beginning of time, they keep finding perfectly formed galaxies and black holes, which breaks completely the supposed 'time periods of creation of matter'. In the graph we can see the biggest black hole found in the Universe, which is perfectly formed in the middle of a galaxy, that is just 400 millions after the supposed big-bang when there was only supposedly hydrogen ions:

In the graph, the super-black hole is supposed to exist so early that there is no way it can have been formed unless the Universe is eternal and the cosmic horizon of the big-bang just the limit of human perception of light, which as everything in 5D is NOT infinite in range.

The largest black hole found is also the oldest, as it is the furthest, and it was supposed to be born in 500 million years after the big-bang when only some re-ionization of light hydrogen atoms has happened.

But why the largest black holes are observed in the furthest distances? The answer is related to the previous falsification – the horizon. The further we move away, we shall see only those largest cosmic bodies (easier to observe) with the highest energies in its γ -rays, as they will be the longest to die by the slow elongation of its frequency; which are also the largest black holes. Hence we just see those monstrous objects - the biggest black holes. From this fact it follows that the further away we look, the more likely we are to find only huge black holes, as they emit more high energy frequency particles that take longer time to relax into entropy reaching us before dying in the red frequency, which blacks out of our perception of further away galaxies.

11. Motion of Galaxies. The Lorentz invariance

Another proof that falsifies the cosmic big-bang related to time-motions, is the existence of an absolute frame of reference, if the background radiation is global NOT local, as SciAm soon discovered and published in the graph below. In this case the denial of General Relativity and its postulate of no existence of absolute frames of reference in the Universe.

This is called the "Lorentz symmetry", named for the Dutch physicist Hendrik Lorentz and it is a symmetry of spacetime. It is in fact a cornerstone of Einstein's special relativity theory. According to special relativity, there is no absolute space or absolute time (as in 5D Physics, which sometimes I call 'Absolute relativity'. So if two objects are moving relative to each other in

empty space, it would actually be impossible for an observer to tell their absolute velocities—maybe only one of the objects was moving and the other was stationary, for example, but you wouldn't know which was which because their movements are relative to each other, not to any external reference frame.

Alas, but now we do have one: the cosmic radiation, and we are moving within it. So we just have to measure our movement in relationship to the radiation and Relativity is Gone!:

In the graph, the cosmic background radiation acts as a new fixed frame of reference or ether, falsifying Relativity theory, which does not have as its name explains any fixed space-time background frame of reference

Yet since the cosmic big bang is a solution of relativity theory that the cosmic radiation falsifies the very same theory it tries to prove.

Hence by 'reductio ad absurdum', the background radiation must be local not to contradict Relativity.

In the graph a cosmic radiation falsifies the cosmic big bang, which it tries to proof.

It is the most obvious logic error in the big-bang cosmology is his falsification of Einstein's work in which the big-bang theory is based, as scientific American rightly pointed out when the theory was first put forward (to be forgotten as the propaganda machines of military physics, as the meaning of it all pumped up the theory):

From CMB data it is seen that the Local Group (the galaxy group that includes the Milky Way) appears to be moving at 627 ± 22 km/s relative to the reference frame of the CMB (also called the CMB rest frame, or the frame of reference in which there is no motion through the CMB) in the direction of galactic longitude, $l = 276 \pm 3^\circ$, $b = 30 \pm 3^\circ$.

This motion results in an anisotropy of the data (CMB appearing slightly warmer in the direction of movement than in the opposite direction).

From a theoretical point of view, the existence of a CMB rest frame breaks Lorentz invariance even in empty space far away from any galaxy. So if the big bang is accepted, the theory of which is a solution, Einstein's relativity based in the non-existence of ETHER, an absolute frame of reference in the Universe (hence 'relativity name') is falsified. Ergo by reductio ad absurdum, the Big bang, which is a solution to the theory it falsifies, is false.

In the graphs we see what is really the motion of the 'static Laniakea region of galaxies, which shows the local galactic region to be more like a gas, fluid motion of atoms seemingly 'encased' in a short of dark matter tubular membrane. As to what that might be in the Hyper universe of Galatoms, we have *no idea; nor we should as limited entropic beings finite in space and time, unlike the whole immortal ∞ cosmos.*

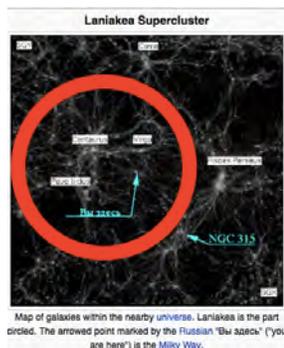

This is one of the many scientific proof of falsity of big bang theory we shall bring in this post, which Cosmologists know and cynically call the 'axis of evil' (because it won't go away and kills their theory right on its inception).

How science' then avoids the axis of evil? Suppressing data or bringing magic theory to it: Chief scientist from WMAP, Charles L. Bennett suggested coincidence and human psychology were involved, "I do think there is a bit of a psychological effect; people want to find unusual things."

Alas, we are back to Babylon, we must be the center of the Universe, just moving 600 kilometers to the east.

12. The real motion of the Universe at larger scales: An organic 'tissue' without isotropy.

In the graph, the local tissue of the supœrganism of the Universe, Laniakea, the region in which our galaxy exist, at the largest level of human perception of the ∞ scales of the fractal Universe.

Thus the explanation of the motion of the galaxy is simpler. In 5D we consider the Lorentz symmetry to be *a local symmetry that only takes place within the galaxy; not in all the 5D scales of the Universe.* So motions happen, as the dynamic picture of Laniakea show: The 4% we see clearly looks like an atomic network or tissue, which joins the atom-galaxies (think for example of a brain of neurons, of a microscopic colony of unicellular algae, and so on). Yet we only perceive 4% of reality outside our closer world, which happens to be the 'ideal' perception of a pi-cycle with three diametric perimeters ($\pi-3/\pi=0.14/\pi=96\%$ of dark reality not seen from a self-centered singularity in a pi cycle).

So we cannot know really what it is. What we know is that there is zero isotropy as big-bang cosmologists pretend. All their models being approximations which might look nice on computers but have zero scientific theory-praxis solidity. All what we know is that we are moving towards Virgo; that there is a huge nodal

network at Hydra-Centaurus - excellent name; which forms with Pisces-Perseus, a clearly connected network in one of whose filaments we find ourselves.

And that at 46 declination a Great Attractor of dark quark matter, likely a super-black hole of top quark stars is waiting for us in a future rendezvous, as we cruise over a remnant cloud of photonic local radiation that does not seem to be (by lack of attraction power) so interested in becoming dark quark gluon liquid-solid super-state of matter.

That is really all we know. The place we live is *Laniakea* that means "immeasurable heaven", even if some arrogant believers think they have measured it.

In that regard, while 5D physics is the ONLY rational theory that can explain a cosmic big-bang (as Time accelerates while space shrinks); 13 billion years does not seem time enough for the immensurable heavens.

This as we shall see this solves momentarily the problem; and allow us to consider 'theories which do not correspond to Relativity' beyond the galaxy, a fact which is also essential to 5D Physics, as relativity is considered rightly the theory of light space-time where c -speed/distance is the constant of space of the galaxy, *the absolute frame of reference, both rod of measure of static space and motion.*

13. The 'bad luck' experimental proof. Earth's experiments can replicate the big-bang...

At the microscopic human scale: big-bangs are scalar and what we are replicating is NOT a cosmic big-bang but the temperatures and processes that provoke the big-bang of celestial bodies, Nova stars and perhaps Nova Planets, as if we create micro-black holes on Earth, baby black holes, as explained in the next section when considering the true arrows of time of Hawking's equations both in 4D thermodynamics and 5D, when a black hole is born feeds as all $\Delta-1$ seeds at faster speeds according to 5D and Einstein's laws of gravitation, exploding=feeding at c -speed rotational force the matter around it, which is what we see all around the galaxy.

Thus the ages of the 'big bang' can be replicated by merely doing the quark gluon soup on the LHC here on Earth. Thus there is zero difficulty for the awesome reversed process of a quasar explosion to create enough quark gluon soup to replicate all those ages. Other matter are the risks of starting a big-bang 'gas-9' process similar to the ice-9 reaction of lighter strangelets (word coined by this author, due to the black color of oil) The process starts in a standard decay path of the Higgs particle that mediates the weak force that increases the masses of systems: 2Higgs-: Top quark; Σ top quarks->BcB heavy atoms -> Formation of a black hole star.

In that regard,. 5D, reclassifies particles, to understand the 3 'ages of evolution' of information represented by the 3 families of mass and quarks, which are also in close symmetry with the upper cosmic scale, the components of the 3 regions of the galaxy:

The Top quark star center (black holes MUST be modeled AS real ENTITIES, with a cut-off, $\Delta-1$ 'cellular substance' as Einstein wanted. Only Top quarks (Higgs condensates in the parlance of modern physicists) turning faster than c -speed in its internal vortex (hence its enormous attractive mass, which increases with the frequency of its vortex: $M=f(h/c^2)$) have the properties at larger scale of a black star.

That is, black holes ARE top quark frozen stars, with positive top quarks as their cut off substance.

The middle region of up and down light human quarks.

The external negative charged, strangelet halo.

Thus the 5D symmetry between the $\Delta-1$ (particle) and $\Delta+1$ (galaxy) limiting scales of astrophysics is obvious and further proof of the symmetries of T.Æ and its 'correspondence' and 'minimalism' (proofs of truth in science), since it accounts for the first time for the reason why 3 families of particles and 3 families of stars co-exist, and eliminates the need for further theories and particles beyond the standard model:

Since the 3 ages of evolution of mass of increasing form - I, II and III families of quarks are symmetric - to the 3 regions of the galaxy: Top quark black holes, up and down matter , negative strangelet halo.

Symmetry between atoms and galaxies (protons positive top quark holes, negative electrons, strangelet halo).

And so once we have falsified 'reasonably' the big bang (we could write hundreds of pages on this, but we have to move on), we can now consider 5D physics, on the known-known Island Universe of our galaxy, its generator equation, 3 'relative planes' of existence, 3 ages of time and 3 organic parts in space.

But if the big-bang is not cosmic, but local, the big-bang of the galaxy, why we get so much confused about it?

The answer is simple if we consider the universe a fractal system of self-similar scales: Because there are big-bangs in all those scales and it is easy to confuse them.

We close then the Time proofs with this 13th bad luck experiments as they will likely mean our extinction as a species, and solve the Fermi paradox – why we don't see entropic male, military empires all over the Galaxy – as Fermi put it, because nuclear physicists kill them all before interstellar travel happens with Nuclear bombs, only that they are of a kind much powerful than those of A-H fame, cosmic bombs. And so *13 proof should suffice for mankind to stop æntropic males to destroy the planet, but as they rule us, the rat bites its tail.* Power censors truth also in cosmology.

Infinite proofs remain to be told, as infinity=eternity for finitesimal human beings is all the time after extinction. Let us then keep counting them.

SPATIAL FALSIFICATIONS.

Static space plays in the big-bang falsification a lesser form, but we still find spatial errors also, due to...

14. *The spatial symmetry of the cosmic big-bang. A perfect Ænthropic picture.*

In the graph, the spatial view of the cosmic big-bang if we freeze in time all the parts of the perceived cosmos according to the Galilean Paradox (S=T). Then the radiation of the suppose cosmic big bang is perceived far as a wall of fire of a 'Univercell'.

Thus when humans don't recognize their limits of perception, the entropic big-bang, measured from our point of view, puts obviously man again at the anthropic center of the universe, in scales (we are at the perceived center between the atom and the galactic scale) and space. So we return to the pre-scientific age of subjective religious ænthropic theories now fashionable in an age of revivalism of egocy (human ego=idioty) vs. serious objective science provided by the

fractal, organic paradigm.

The graph is an Artist's logarithmic scale conception of the observable universe in space, with the topology of all 5D ternary constructs; but alas! As an anthropomorphic Universe: *So we can see nicely how beautiful looks the ænthropic big bang with man perfectly self-centered in Δ (central scale)=S (central space)=T (center of time explosion) =@ (only we talk maths), and ~ (we are the furthest away from the limiting entropic ball of fire).*

Yes, it would be perfect if data were fully consistent and not subtly bent to cater to the 'cosmic arrogance of the human ego' that wants to pack it all in its infinitesimal mind that perceives in stillness from its mind point of view a selected part of the whole but confuse it with it:

O-mind x ∞ Universe = still mapping (frame of reference)

So what is wrong with the previous picture as a proof of 5D physics in an $\Delta+4$ scale; *is mostly entropic mind limits.*

Further on such spatial symmetry of the Universe requires action at distance to create the needed simultaneity, which in all Real Systems connects in a relative quanta of time all the elements of the system, to allow the isotropy and synchronicity required for a 'whole' to work as a Univercell with:

Şt : the wall of fire of the earlier big-bang as the outer membrane that isolates the 'cellular Universe' at $z=10.000$ c

ST: The faster than light dark energy, $v=S/t = \text{Space/Informative Time} = S/0\text{-visible information} = \infty$ relative speed for a human observer, with the same z than the wall of fire; filled with Galaxies in between the dark entropy.

δ§: And a hyper black hole 'great' attractor (close to our anthropocentric place) - the hyper-hyper-proton-black hole of the Δ+4 cosmic Univercell. So far so good.

In 5D terms the picture above is the representation of a Univercell, with its Generator of $3 \pm j \Delta ST$ cosmology:

Δ-1:§t (Wall of fire-membrane) «Δ-ST(10^{11} vital energy of galacells)» Δ+1: §δ (center: our human region)

So a cosmic big bang still proves 5D physics and the topological ternary structure of all Universal systems. And it pleases everyone, the entropic, the anthropic, the church, the physicists, and me, discoverer of 5D...

It is easy to overlook this 'ego problem' reason why we showed you first to which degree 'science is culture', that is, we bias systematically truths of science, beyond data and equations, to cater our happiness as ego-centered beings, infinitesimal mirrors that think to be infinite: $O\text{-mind} \times \infty \text{ Universe} = \text{Constant world}$.

Why then not to accept it? And be accepted in turn, as an immortal universe seems to collide with the human ego, which likes to feel in charge, 'measuring All the space and time that there is', from its biased perspective, which makes him the center of perception and hence of knowledge, reducing the Universe to a mortal being? (While creationist Abrahamic religions make us above heavens and Earth the immortal ones). Plainly, because it is not truth.

Fact is once scientists in all disciplines get into a 'comfort' ego-centered theory, they backtrack to find ad hoc proofs and twist experimental evidence always fitting 'somehow' data onto the model forcefully. This today happens every other day with big-bang theory, as physicists try to fit forcefully all the clear falsifications of the model we explain in this paper. Hence my ironic tone... Fact is data fits better a Universe of little quasar bangs of Galaxies, similar to beta decays of atoms, NOT one where time and space had a beginning, ad hoc to please our ego-ist desire to know it all, to see it all, to understand it all, to be the center.

15. No shadows for the big bang = No background radiation in intergalactic space.

Science News
Big Bang's Afterglow Fails Intergalactic 'Shadow' Test
ScienceDaily (Sep. 5, 2006) — The apparent absence of shadows where shadows were expected to be is raising new questions about the faint glow of microwave radiation once hailed as proof that the universe was created by a "Big Bang."
 See also:
 Space & Time
 • Cosmic Rays
 • Big Bang
 • Cosmology
 • Astrophysics
 • Galaxies
 In a finding sure to cause controversy, scientists at The University of Alabama in Huntsville (UAH) found a lack of evidence of shadows from "nearby" clusters of galaxies using new, highly accurate measurements of the cosmic microwave background.
Cosmic shadows
 Galaxy Cluster
 Edge of the universe
 If the standard model of how the universe was formed is correct, microwave radiation from the edges of the universe would be blocked by clusters of galaxies, causing 'shadows' in the microwave background. (Graphic courtesy of The University Of Alabama In Huntsville)

In the graph: Physicists have measured a local, hence galactic background radiation, which doesn't leave shadows from other galaxies and they tabulated the quasar cycle of galaxies, which coincides with the age ascribed in the past to a cosmic big bang.

The question posted by the non-shadows experimental

fact is that the radiation cannot come from the supposed outer ring of fire (big bang radiation). It does have to come therefore from the internal region of the galaxy, *reflected by the Halo, giving us a mirror image of the galaxy, or alternately from outer light, crossing through the galaxy, altered by the Halo 'strangelet and micro-black hole matter', strong candidates to for the dark matter of the galaxy. Then obviously what physicists do is merely to extend this Halo-altered radiation into a supposed infinity.* The hypothesis of a halo of dark, quark matter (black holes or strangelets) acting as a limited', closer membrane distorting by red shift the light reflected or coming through it (as all membranes do transform what penetrates them) is thus the only scientific solution:

So a more rational theory would consider the cause of the 2.7 K radiation both local in space (galactic) and in time (produced at present); since our measure is local and present. Let us then falsify this fundamental proof of big-bang,

the cosmic Background radiation. We already did it before, showing that it should be local, produced by redshift Moon M.A.C.H.O.S but as it is the cornerstone of the model it requires a bit more of thought.

16. Now and here explanations for the light space-background: Moon MACHOs

Fact is the radiation is local and so it must be explained by a local celestial body able to produce it. And we have a myriad of possible candidates, as any 'stable quark nugget' combination of heavy quarks which only interacts gravitationally produces by gravitational redshifting a blackbody radiation at 2.7 k for which several candidates of dark quark matter, the only experimentally proved to exist, hence only scientific 'real' possible candidates to form the heavy halo suffice. Indeed any form of heavy quark, dark matter which has swallowed the commonest planetoid of the galaxy - a moon mass - hence with its weight - will emit at the very same temperature a blackbody radiation. And since the galaxy is dominated by dark matter and black holes - likely made of heavy quarks, tops and BCB dark atoms etc. we do have many rational candidates, real and happening now as opposed to the 'ad hoc' choice of equations to fit in a remote past with no experimental proof what so ever...

In astrophysics, **gravitational redshift** or Einstein shift is the process by which electromagnetic radiation originating from a source that is in a **gravitational** field is reduced in frequency, or **redshifted**, when observed in a region at a higher **gravitational** potential.

Gravitational redshift - Wikipedia

Since to make the *measured* temperature of the background radiation 'coincide' with theory, physicists kept reducing ad hoc their calculus till they fitted the temperature. While in space the radiation considered a local galactic measure by Penzias, its discovered kept expanding its range to make it finally cosmic.

Indeed, we can follow the Ad Hoc calculus in parallel to its experimental measure as Gamow changed his predictions:

1946 – George Gamow calculates a temperature of 50 K (assuming a 3-billion year old universe), commenting it "... is in reasonable agreement with the actual temperature of interstellar space", but does not mention background radiation.

He contradicts the common wisdom that the radiation *was local, happening only in the galaxy, as calculated in:*

1926: Sir Arthur Eddington estimates the non-thermal radiation of starlight in the galaxy has a temperature of 3.2 K.

1930s: Erich Regener calculates that the non-thermal spectrum of cosmic rays in the galaxy has a temperature of 2.8 K

Thus the thermal radiation calculated by Penzias in 1960 as local galactic radiation at 3 K had been rightly foreseen by the first people who thought of it as local galactic radiation (average of $3.2+2.8/2=3k$).

On the other hand the late proposal of a *cosmic* big bang by A-bomb researcher Gamow et al were:

1946: George Gamow estimates a temperature of 50 K.

1949: Ralph Alpher and Robert Herman re-estimate Gamow's estimate at 28 K.

1960s: Robert Dicke re-re-estimates a MBR (microwave background radiation) temperature of 40 K

These were all offbeat. Only after 1960s Penzias measured it *locally*, the cosmic big-bangers got busy-busy 're-re-re-estimating' its equations to get 'a posteriori' the 'desired' experimental results 'ad hoc', instead of noting that Mr. Eddington and those proponents of a local background radiation WERE right in their predictions and the cosmic ones totally off-target and hence accept the laws of truth of the scientific method to deny the cosmic one.

Fact is the creationist $V=Hod$, lineal equation of the big-bang, earely resembling the word 'God' of verbal creationists, going to the past for ever, without the slightest proof that the fall of temperature if any in the Universe is lineal and it can be taken back for ever, or is cosmic and not local, is NOT scientifically sound.

The organic Galaxy – its homogenous, homeostatic temperature.

And if we can find explanations in present time and here-space, it is always a higher truth than to consider an explanation in the past or the future time and out-of-here. It is like if we measure your body temperature, at 37

degrees and then a creationist physicist tells you the cause is to be found in a lineal equation coming from past, because when you were born 50 years ago you were a few million degrees hotter and you have been cooling down ever since!! When there is a rational explanation, in the metabolic activity, now and here, of your body's main energy cells, blood, and its most numerous red, oxygenated cells.

So what is the metabolic process on the galaxy happening now that produces that temperature; what is the blood of the galaxy, its commonest objects? The redshift of moon micro-black holes, feeding on the mass energy of its commonest mass, moon-like planetoids. As the galaxy is indeed about black holes, and so its metabolic activity in its 3 scales IS the natural cause of the Galactic temperature, as we shall see in our study of the 3 scales of black holes – the hotter smaller ones that produce the radiation that feeds, the cooler larger ones, as the red cells produce the energy needed by all the cells of your organism. And this is the 5D organic *entangled* reason, as all what exists has *a purpose*; and so does the BG radiation that feeds larger black holes – a far more scientific reason than the forecasted big-bang temperature, which has not true known cause, no true experimental proof now and here, no-nothing.

As we said though the big-bang is the modern religion of *Ænthropic* man, so we just end with some religious irony.

The axis of evil and the Shang magicians.

Finally, there is a huge problem, already mentioned, which shows further that it is a local radiation, the so called '*axis of evil*', (sic) which at the cost of billions of \$ in new satellites to 'dis-measure' it, astrophysicists try to eliminate with zero success. Namely the radiation aligns with the axis of the galaxy and its equinox, because 'obviously' it is produced by the galaxy's activity. Do you think this obvious answer has any chance? Ha! Quoting the official version, of Wikipedia: "In particular, the quadrupole and octupole ($l = 3$) modes appear to have an unexplained alignment with both the ecliptic plane and equinoxes, an alignment sometimes referred to as the axis of evil ☺"

'A number of groups have suggested that this could be the signature of new physics at the greatest observable scales; other groups suspect systematic errors in the data. Recent observations with the Planck telescope, which is very much more sensitive than WMAP and has a larger angular resolution, confirm the observation of the axis of evil. Since two different instruments recorded the same anomaly, instrumental error (but not foreground contamination - the way they 'introduce the local cause - 'contamination':) appears to be ruled out.

Coincidence is a possible explanation, chief scientist from WMAP, L. Bennett suggested coincidence and **human psychology** were involved, "I do think there is a bit of a psychological effect; people want to find unusual things."

Yeah, LOL. So experimental findings is a psychological effect and imaginary equations the real thing – creationism and denial of objective proofs at its best. Yet once the dark horse is on the loose anything goes. Indeed, in recent years a creationist mathematician, Mr. Penrose, companion of Hawking, thought that some of those BG points produced in the galaxy, were a big hotter than the mean temperature. So he thought, they were remains not *even* of the initial singularity 13 billion years ago, but he guessed they were coming from a previous 'age' to the infinitesimal infinitely dense singularity!! Somehow they had survived the ∞ infinitesimal stage and were coming from eons beyond the beginning of time, as relics of black holes evaporating in a previous Universe!?! (: holy cow! How did he know? I couldn't help to have a big smile-y. Indeed, it reminded me of the holy cows cracked by fire when the *æntropic* kings of the 'celestial empire' of the Shang dynasty tried to peer on the nearby future and guess the fate of the next battle. Alas, creationist physicists are just a bit more ambitious – they peer trillions of years into the past. But both Shang oracles and big-bangers renounce to the rational, simple explanation - the cracks on the flat bone were produced by the fire, and the points of the black body 2.7 k radiation measured locally and proved to be local by its shape which is mimetic to the galaxy, including its 'lobes' above and below the central black hole, are produced locally by any type of quark nugget MACHO (massive, halo object) of dark matter of the mass of a moon – the red cells of the organic galaxy.

RECAP. The only alternative object that can produce such radiation in present is a micro-black hole, whose temperature red-shifts light as a gravitational lensing. And since a black hole gravitational lensing is proportional to the mass, we can calculate the mass of those 'background black holes', which redshirts light at 2.7 k. Indeed, a simple

calculus shows that a black hole of the approximate mass of a moon (the most common galactic object of which each sun has hundreds in its planets and Oort/Kuiper belts, would produce that radiation.

So very likely the halo of dark matter of the galaxy is made of micro-black holes that have eaten moons, as their bigger cousins eat stars. Then they WILL radiate at that exact temperature. Further on, since black holes are fundamental particles of the upper scale, as protons are in the quantum scale, they must be homogeneous in size. So even if they eat less perfect planetoids, primordial black holes should expel the excess of its structural mass as gamma radiation. Those MACHOs of any type of heavy quark matter (strangelets or BH), have then in the organic galaxy the role of blood in the organism, and should also play the role of 'protein' membranes in cells, shielding the galaxy with its heavier mass and capacity to 'reduce' radiation to a homogeneous temperature.

Fact is the radiation was, is and has always been measured/found in the galaxy. In fact physicists trying to measure the supposedly 13 billion years far away hot points of the center, each one a huge galaxy at 'the beginning of time', discovered recently that they have the exact shape of the electromagnetic lobes above and below the galaxy.

17. Critical density for a flat geometry.

One of the problems of the big-bang (of many) is the critical density. It must be of 10^{-26} kg per cubic meter for the Universe to be the 'observed' flat geometry. But it is not. Only 2 so this is a problem, the big-bang of the cosmos does not match the flat geometry of the Universe and the topic spiral galaxy.

So if the big-bang is a local galactic big bang the critical density of the galaxy should be 10^{-26} ; then it would be the quasar big-bang of our galaxy.

Let us do some crunching numbers for a change.

The equation for the critical density is:

$$\rho_{\text{crit}} = 3H_0^2 / 8\pi G$$

You can see that the critical density is proportional to the square of the Hubble constant — a faster expansion requires a higher density to overcome the expansion.

How empty is space? Astronomers have learned that the mean density of matter in the universe is within a factor of a few of the critical density. We can calculate ρ_{crit} by inserting the gravitational constant, $G = 6.67 \times 10^{-11} \text{ Nm}^2 / \text{kg}^2$, and adopting $H_0 = 65 \text{ km/s/Mpc}$. We first convert the Hubble constant to metric units, $H_0 = (65 \times 1000) / 3.1 \times 10^{22} = 2.1 \times 10^{-18} \text{ s}^{-1}$. Now we can solve to get $\rho_{\text{crit}} = 3 \times (2.1 \times 10^{-18})^2 / 8 \times 3.14 \times 6.7 \times 10^{-11} = 7.9 \times 10^{-27} \text{ kg/m}^3 \approx 10^{-26} \text{ kg/m}^3$. This amazingly low density is equal to about five hydrogen atoms per cubic meter, or a single hydrogen atom in a volume the size of the average TV set. However, in that same cubic meter there will be 5 to 10 billion low energy photons of microwave background radiation, the feeble relic of the big bang.

How well does this density match up to the density of large objects in the universe? The typical distance between large galaxies is about 2 Mpc, so we can see what the average density would be if a galaxy like the Milky Way were the only object in a box 2 Mpc across.

The mass of the Milky Way, including dark matter, is about 10^{12} M. Sun, or $10^{12} \times 2 \times 10^{30} = 2 \times 10^{42} \text{ kg}$. The volume of a 2 Mpc cube is $(2 \times 3.1 \times 10^{22})^3 = 2.4 \times 10^{68} \text{ m}^3$. The typical density is therefore mass divided by volume, or $2 \times 10^{42} / 2.4 \times 10^{68} \approx 10^{-26} \text{ kg/m}^3$.

Thus we can see that the galaxy density roughly equal to the critical density.

∞ MORE FALSIFICATIONS: ONE FOR EACH GALATOM.

Epistemological truths vs. Falsification of 'ceteris paribus' analysis

In the graph, epistemology is clearly in favor of the immortal fractal cosmos, as its experimental evidence is stronger, when we do not 'select' the phenomena

to explain, ignoring all other facts (implosive galaxies, dark entropy, irregular distribution of galaxies, objects that live longer than the big-bang, and other proofs we shall consider all of which have a rational explanation in the fractal, organic, immortal Universe).

It leads to falsification (a theory is false when there is a single fact it doesn't explain or contradicts it – all of the above). Which leads to Economy=Occam's razor, as the fractal Universe explains more facts with *only one* postulate – that we are made of TimeSpace without the need of a background abstract absolute spacetime we don't see anywhere.

All other facts of the Universe in all its sciences come from this first principle, which is self-evident – time and space exists – and already simplifies reality (there is no need for it to be detached from reality as its abstract background).

We can add other epistemological laws: the big-bang has no logic consistence (the singularity is an infinitesimal of infinite mass, which is absurd, time and space have a beginning which is absurd), uses ad-hoc proofs, forbidden by the experimental method (equations are moved to the past ad hoc in lineal fashion to meet the theoretical temperature, proofs are taken in present time and space as local measures, but considered to be universal global in all parts of the Universe in space, not measured and all the epochs of time, not measured). And finally it has not Known cause for its creation. All those elements are solved by the fractal immortal Universe which is self-reproductive, hence it has its internal cause, it is eternal so it has no contradictions of time and space, and it accepts all facts, no-falsification.

So we gave an alternative physical theory of the Universe, which follows closer the laws of truth of the scientific method (Objectivity, Logic-Linguistic reason, Experimental evidence; Simplicity (Occam's razor), Correspondence (previous 'true theories', parts of the new one), Causal, cyclical predictability and Coherence (logic and mathematical reason), with the added perspective of pentalogic and its $3 \pm i$ Ternary Complex, entangled reinforcing causality. It proved that the cosmic big-bang is:

It s a *creationist* theory based in *lineal* time, 2 cultural traits of German, biblical military cultures that invented it.

It is completely illogic and makes no sense at all – for god's sake indeed, a single point from all was created..

It has not enough experimental evidence.

It contradicts Einstein's dictum, 'the Universe is simple but not that simpler. Its false simplicity is based in a lineal equation ($V=H_0D$, Hubble's red shift equation), *which only applies to the empty space between galaxies, NOT to dark matter and galaxies; so its simplicity is a reductionism that does NOT explain most of the Universe* . Further on at present, not even this lineal equation works for the observed expansion of vacuum space, so as we learned more about the Universe, this 'Ptolemaic' theory requires all kind of 'epicycles added ad hoc' to fit the new data (accelerated expansion, inflationary first state, which brings the logic absurdity to hyperbolic limits – as the first picosecond the Universe must expand to a speed infinitely faster than light to reach its present size, breaking all the laws of known known science). So the big-bang simplicity is not scientific at all.

It doesn't correspond to physical & logic consistent theories with those laws of known-known science as it liquidates all of them, from the 'conservation laws of energy and momentum, and baryon number' to the logic laws of epistemology, but it is based in religious concepts - lineal Christian time & creationism – which not surprisingly pleased his first researcher – a catholic priest and the 'religious creationism' of mathematicians argued in the paper on 5D mathematics and its foundations..

And finally it lacks Causal cyclical predictability - it does not explain what was before and after; but the element it truly fails is one we normally consider a given for serious science, 'logic and internal coherence'. It has none. Because indeed it is creationist 'religious', as it requires external creators.

RECAP. A single black swan said Popper falsifies a theory of white swans. White is the color of entropy, black of information; *every particle of dark matter and every galaxy, that converts lineal entropy into information falsifies the big-bang, and there are ∞ black swans. Never a theory was so obviously false, so much cherished by \AE ntropic men.*

Δ: LOCAL 'LITTLE BIG-BANGS'.

The meaning of time in classic physics.

Now, absolute relativity, the philosophy of science behind this T.Æ is even more radical in the separation of man from the Universe.

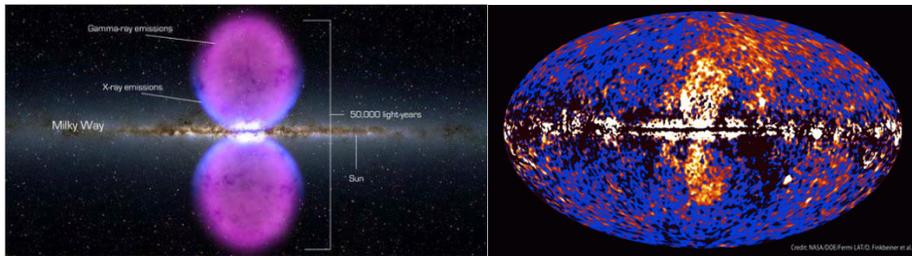

Every fractal part of the Universe is a super-organism that has obeys 10 sets of isomorphic laws, as parts of the same fractal space-time reality. We are all made of time motions, seen sometimes as space dimensions, hence equal in substance though not in quantity (spatial size) and quality (speed of information) and complexity (number of co-existing scales of the 5th dimension, bits of information and bites of energy a given Æ-knot commands)

However, all these points are subject to the ego paradox: as every point of view perceives a limited part of reality to 'fit' it into its relative infinitesimal point of view or 'mind, the 'whole' of each species understand only reality from its limited 'one-dimensional point of view', and considers himself from his '10th Dimension' as a whole, the only intelligent being of reality. Subjectivity is thus essential to the being.

And so it has been to humans, who always considered themselves the center of the Universe.

So alas, we shall latter expand those proofs of the falsity of the big-bang, which however can be perfectly explained as the big-bang of the lower scale of the 5th dimension below the cosmos, that is a quasar big-bang of a galaxy, either the previous cycle of the milky way galaxy, or the explosion of a giant galaxy in the local cluster, from where the local group fed on to reproduce the Andromeda and Milky way and dwarf galaxies around it.

A quasar big-bang we shall prove eliminates all those errors, the background becomes local and hence does not break Lorentz invariance (relativity), the galaxy has the same density of matter needed for the big-bang, a quasar is a reversal black hole explosion which happens to be the exact equation of the big bang (also a reversal black hole metric equation) the age of the quasar cycle tabulated between 10 and 20 billion years is exactly the same than the big-bang, it is NOT an illogic theory, as there are infinite galaxies in an infinite Universe the abundance of helium in galaxies does happen more in the center around the black hole where the hadron epoch formed them, and the ages of the big-bang do apply all to a quasar big-bang, and the local measure of the background radiation which FIRST and for very long was considered the background radiation of only the galaxy, fits, and as we shall see in the next picture, in fact the map of the galaxy is exactly the same of the background radiation:

A galaxy (ours) and the supposed big-bang of the universe, which shows the same form and raises doubts about the local measure of that radiation (the reader can observe the central lobes of γ -radiation similar to those of the electron, which the prestigious astrophysicists Smolin and others were analyzing very carefully, since they thought they could see a different light speed in the upper and lower lobe after 13 billion years of time travel :)

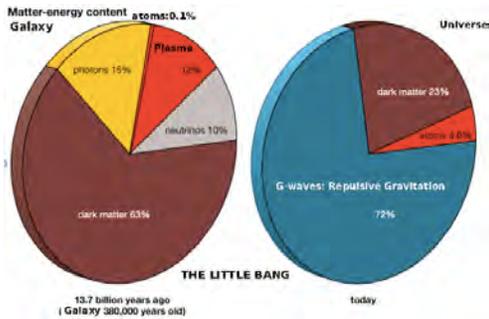

All systems are a sum of quantic cycles that absorb, emit and transform spatial energy into temporal information: $T \approx S$

That equation, decomposed sequentially in 3 phases, a first age of max. energy, a second age of balance and a third age of max. information, explains the existential cycle of any space-time field.

In a graph with energy and information coordinates those 3 ages resemble the geometrical form of a cycle that moves upwards, absorbing energy and information till in its 3rd age loses its temporal energy, collapsing back to its origin.

On the right side, the same 3 ages show in the Taoist, Korean flag, where a line is the symbol of continuous yang-energy, which yin-time quantizes into 'in-form-ation', from youth to death.

In the graph, the most likely interpretation according to the laws of the scientific method, resumed in the acronym formula, $E=Sc^e$ (evidence, simplicity, cyclical repetitive 'laws', correspondence with previous theories and ternary Complexity, born of the iterative repetitions of the Generator of fractal, cyclical space-time), further proved by the 'ad ons' of 5D T.Æ: Time arrows, Organic structure, and Complex Ternary symmetries in 5D cyclical space-time, added to

that formulae ($T.æ=Sc^3$); the most likely nature of the big-bang is local – very likely the quasar big bang of a 20 billion years cycle of life and death of the Milky Way, a barred galaxy, which is today exactly in its form on the 14 billion years mark of that tabulated 20 billion years cycle of Barred galaxies.

All the problems of the cosmological big-bang both theoretical, metaphysical and experimental, quantitative can then be resolved. Theoretically the equations of the big-bang are just the entropic, reversed, death equations of a black star. Such explosion would account for the amount of Helium near the center of the galaxy, and the density of matter-radiation, which coincides with that of the galaxy. The asymmetries and form of the background radiation

obtained in local measures will coincide with that of the galaxy too. Its origin on the local big bang from the remote past, or most likely on the activity of 'Moon MACHOs', the smallest black hole particles of the 'triad' of 5D scales of mass in the Universe, which if having the mass of a moon planetoid (the most common cosmic object of the Universe) will produce exactly the same redshift temperature radiation. And so on and so on...

The fractal structure of the Universe on the other hand will account for the expansion of the intergalactic space, the cosmological entropic vacuum scale, where 'Gravitational transversal waves' will act as repulsive gravitation, in the same manner their microcosmic equivalent in the charge scale act between particles. While the vortices of contraction of vacuum energy into mass – galaxies will balance that expansion, on the flat plane of the spiral.

In the graph, we see then the characteristics of those multiple little quasar bangs, in which dark matter made of the heaviest 2 families of mass (top/bottom/charm quark combinations that form the atoms of black holes and strange quarks that form the core of neutron, pulsar stars and strangelets in the halo). Thus they would account for most of the mass of the Universe. In terms of mass energy, as we consider on the present formalism a 4-vector momentum with 3 dimensions for space and one for time-mass, ultimately we observe a 3 to 1 proportion between 'Lineal Space' (G-waves of repulsive transversal gravitation) and the dimension of mass.

The galaxy on the other hand, does NOT contain repulsive gravitation as it is the interior region of the galaxy atom, which is purely attractive. Its configuration is equivalent to the theoretical configuration of the 'cosmological big-bang' now reduced to the barred galaxy big-bang cycle. And so we find again the ternary symmetry of the III families of mass, which form the 3 components of the galaxy atom, its 'strangelet', negatively charged Halo, its positively charged central top quark black hole, its 3 invaginated networks of information and energy (neutrino and photon background) and the plasmatic ud-mass of light mitochondrial stars. What is the role of the planetoids made of atoms in which humans exist. They represent only 0.1% of the total mass of the galaxy, as almost all ud matter is in the form of star plasma.

So we might conclude, humans are NOT that important; an planetoids and planets on the 1 to 10^6 relative mass scale we find between moons and the heaviest Jovian planets which can be considered small not-ignited stars are the scalar range to feed strangelet matter that will end up in the Halo. This simple harmonic scale has only a problem: anthropomorphism. It makes us irrelevant, it puts the high popes of astrophysics back to Earth on their delusion of understanding the whole with a human self-centered perspective, and certainly makes sheer madness the experiments now carried out on Earth in search of self-feeding self-reproductive dark matter (strangelet quark-gluon soups, now starting to be produced at industrial scale at CERN and future accelerators at China).

We can now consider if briefly the ages of the Little-bangs that happen all over the Universe every time a Galaxy lives and dies, returning to the Dark World. Even if we were describing the Little Bang of the Cosmos, it is a necessary perspective for the ego-centered human to reduce its cosmic, galactic, universal epithets to the lowest of all perspectives, that of a microbial species, 'Cantor dust of space-time', 'rational zero interval of the irrational infinite', humble 0-mind who matters not more than mater. And this I advice to the reader, because it is the best way to survive and go around the Universe.

Even if the cosmos had a big bang of 14 billion years, from $\Delta+5$ it would be an infinitesimal point dying away on the truly absolute Relative Universe. So we will call all big-bangs, little bangs. As that is the meaning of it.

Now this is the most likely reality – a Universe in the $\Delta+4$ plane, beyond the $\Delta\infty$ human perspective of a relative infinite number of galactic anti-atoms (as the symmetries of 5D are inverse and so we need to jump two scales to find a similar being, 2 scales of life to find robots-like insects, to scales of cells, to find nations-like cells, DNA-like humans, and so on.)

So those anti-atom galaxies might be part of a larger bang, the cosmic little-bang, which however would be of a dimensions that we, infinitesimal inhabitants of a galaxy anti-atom cannot even imagine and it is not worth to explore.

So we shall reduce ourselves to the description of the Little Bangs, we do know about, with the laws of 5D physics.

Death of micro-light waves.

Now in 5d physics, tiredness=death of light is not provoked by the smearing of light paths by dust and other 'chance' collisions of light, which would rightly as Zwicky pointed out smear the image of far away galaxies, but exactly as in the cosmic big-bang and general relativity by the expansion of the underlying space-time 'scale' of the Universe, $\Delta-1$. The difference though is that in 5D physics:

- The c-limit of speed only applies to 'galactic space-time', where the underlying gravitational space is 'contracted' by the $-c^2t^2$ factor of special relativity (simplest formalism), due to the frequency creation of time-information by light over the underlying gravitational space-time.
- When this gravitational space-time is liberated from galaxies, it 'stretches out', dissolving its information into entropy, and its speed becomes 'NON-LOCAL', from the point of view of a light space-time observer. The formula is immediate. As $V=S/T$, and Time stores information, as information disappears (invisible gravitation), then $C=S/o\text{-information} = \infty$. Thus the Universe becomes infinite non-local and this allows that the cosmological $Un+4$ scales IS connected into a present 'spatial view' (the previous artistic graph).

Now this fact is essential to the scales of 5D systems, as it ALLOWS the fundamental symmetry between time ages and present still space-organisms. All SCALES of the 5th dimension MUST have a force able to create a relative simultaneity in a single time quanta that communicates its parts to create balances and metabolic equilibriums. Thus there MUST be a relative non-local faster than light speed, with less T-information, and this is 'dark energy'; which we consider to be the 'repulsive electromagnetism', of the galactic atom.

It is then easy to see that the speed of such G-waves would be infinite in terms of human perception, and the quantity of information they carry minimal. Indeed, if we consider a 'Hertzian' wave at this scale, it would carry a bit of information for several parsecs. But it would allow a spatial view of the Universe.

All this of course belongs to metaphysics, which as we said is the true nature of cosmology, as there is no way to perceive experimental evidence 'outside' the halo meaningful.

Yet the linguistic isomorphic method make us to consider a reasonable assumption that scales beyond our perception will follow the same isomorphisms of scales within our perception. So we can use the same formulae and deduce the non-local invisible nature of G-repulsive Giant Transversal gravitational waves between galactic-atoms and within each internal atom, to control the stars and halo of the galaxy.

Now from the perspective of a light space-time observer the space-time between galaxies, being invisible won't be observed as a tachyon, faster energy wave, but as a dilating distance. And so it will be seen as a cosmological expansion of space (balanced by the implosion of each fractal galaxy atom, to maintain the whole Universe in immortal balance).

Thus the effect on micro-light waves will be the observed red shift.

Indeed it follows that what we call light does travel through the expanded intergalactic gravitational space-time, and red shifts.

A second phenomena also must be observed, namely the 'internal' death of light, as all forms of the Universe do have a world cycle. The light world cycle is likely to be of a mean 10 billion years similar to the life cycle of its 'photonic quanta', the stars of galaxies, which are basically dense configurations of light and plasma; the equivalent to the particle state of light. And this 10 billion years light world cycle is what we observe with an expansive age of light as it goes through the world cycle, further accelerated in the 2nd part of the world cycle (5 to 10 billion years).

It follows also that the furthest stars will emit 'younger', longer living light, so the further we look onto the galaxy, we shall see arriving to our galaxy, only younger stars, till a point where we do not see more light coming.

Further on, as all forms are relative 'pi-cycles', whose membranes do NOT let see the external universe except by its 'holes', the halo of the galaxy must limit as all membranes what we perceive from outside. This again happens in any entity inside a super organism. Our cells do NOT see the external world, and only the sensorial eyes do see it. So the next question is how much is 'dark energy-space-matter-form', from an inner observer of a relative fractal knot of space-time.

The calculus of an ideal pi cycle is immediate. As a pi cycle is made of 3 diameters, with outer holes between them, in our curvature electronic space-time minds, where pi is 3.14, we ONLY see through 0.14 holes of a 3.14 diameter. so there is a 3/3.14 darkness, of regions we do NOT see from the interior of a pi cycle.

As it happens, $3/3.14 = 96\%$ which would be the dark world for any inner relative mind point of view. As it happens dark matter and energy accounts for 95%, which is there and we do not see. It is then the halo the membrane that 'darkens' the Universe?

We do have for the sun the membrane called the Oort and Kuiper belts... But they are internal to the super organism of the galaxy, so we shall discuss it on its scales. but still they do darken part of the galaxy despite being internal 'open' cells. The galaxy though IS the true fractal point (the equivalent of the atom, darkened by the electron and the Nuclear force cover).

So the reader should understand how much uncertainty exists in cosmology.

Back to our theme of the cosmological redshirts and its now '3 causes' (as always in the ternary Universe) we can write them within a Generator equation, this time expressing the 2nd Non-Euclidean postulate of lines≈waves of communication:

S (emitter: Original red shift by expansion) < ST (red shift by wave dying) > S (Halo, likely 'blue shift' back to create background radiation and reduce to c-speed the wave).

Those 3 components are just a case of the Fundamental equation of particle physics:

$S(\text{Fermion}) < ST(\text{Boson wave}) > S(\text{Fermion})$

...applied to the upper cosmological scale.

The study of that equation in 5D physics is an entire field of cosmological research for future 5D cosmologists, if we survive the age of 'lineal macho-man Neanderthal physics'. So here we shall make some comments on the death of light (ST cause).

As light dies away it is canonical in 5D astrophysics that entropy will elongate as all death processes the space-time, which in terms of the duality motion=form (Galilean paradox) means an increase of distance. Moreover, because light does have a 10 billion mean age (same for stars made of light, here the part does live as the neurons and the head, the same than the whole but NOT longer; so light dies before the stars mean life). This moreover explains why after 5 billion years, its maturity at the height of its world cycle, life accelerates its death-elongation into red color, till fading away. Which also explains why we do NOT see more radius to the Universe:

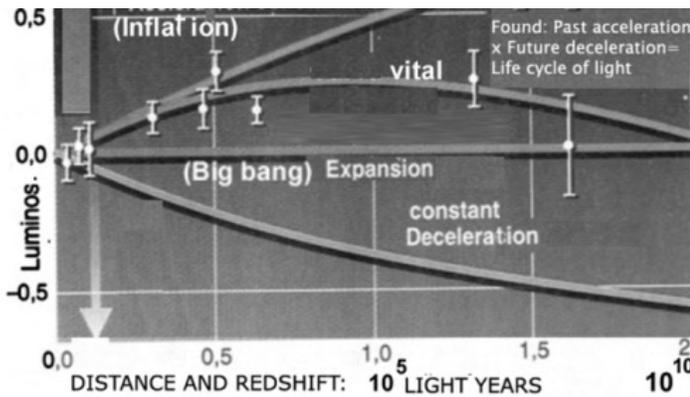

Light cannot come from beyond that radius because that is the limit of its life NOT the limit of the whole, but of its waves of information, its minimal part.

Indeed, it seems that light beams and light-evolved entities (stars) have a mean cycle of 10 billion years, after which they suffer an energetic big-bang expansion – stars explode into Novae and light gets tired and expands in a redshirts process, returning to its gravitational, non-local lower scale of dark Entropy.

This of course explains why far away light red shifts and seems to expand space: it is dying and beyond those mean 10 billion years an increasing ‘darkness’ is observed in the Universe, which a simple Gauss curve of probabilities show to be almost absolute beyond the $x+1/3$ rd 13.3 billion years range.

Again physicists don’t see both, the dual space and time views of the Universe but only the temporal big-bang, which considers a cosmos in time failing to analyze it in space as a simultaneous system connected by non-local gravitation. So they think darkness is not caused by the spatial death of light, which they merely use as a clock of cosmic time, thinking therefore that beyond those ages we enter into a temporal darkness – and the Universe didn’t exist.

In the graph, we illustrate how complex physics, using the same data that Simplex physics of a single space-time continuum can resolve the puzzles of the Universe. Cosmologists have found that light coming from far away galaxies

seems to decelerate and accelerate its red shift till dissolving around 10^{10-11} years after its emission. And they affirm this is a proof of an expanding Universe, as they apply a local phenomenon, the life/death curve of light self-similar to the life-death curve of any entity, which increases its frequency till its ½ life and then decreases, becoming tired till death, to the entire space-time of the Universe (a global symmetry).

The tiredness and world cycle life-curve of light however only applies to a local phenomenon: light tires and red shifts at the end of its journey, dissolving back into gravitational dark-Entropy, which is perceived as an

expansion of the light-membrane, but that effect is compensated by the contraction of space into mass in the galactic vortices giving us a zero-sum.

5D Lorentz Invariance: A 4D cosmic electron membrane of the canonical big-bang.

We do NOT fully deny the cosmic scale of the big-bang, which 5D somehow makes logic (it would just be another scale of big-bang of an atom-Universe. There are certain basic numbers that back that opinion. The number of galaxies, 10^{11} is the constant of social order between planes of the 5th dimension.

The relationship between the Force of Gravitation and Charge (temporal curvature), is according to some estimates (already noticed by Feynman and I believe Eddington), the same that between the radius of the proton and the Cosmos (spatial length). So it fits in 5D Metric: $T \times S = K$, better than a possible ‘local cluster’ big-bang with lesser radius. But those numbers have been varying a few potencies of 10 here and there. In any

case it is a proof of the force of 5D metric that even if we ultimately reject the cosmic big-bang for lack of experimental data, we can for the first time explaining rationally without creationist ideas.

The spatial symmetry on 5D big-bang; all galaxies are in the expanding membrane of the 'electronic cover' of the cosmic neutron explains Lorentz Invariance nicely.

Now in the parlance of physics, this mind point of view is called 'relativity', which implies we cannot distinguish frames of reference when we choose one at its center.

Now in the present format, the 'subjective use of the human frame of reference' at the center of the big bang, could seem a misinterpretation of the meaning of the Lorentz Invariance to suit 'us' - ultimately another 'anthropomorphic', man in the center, reality only what man can see, subjective theory of religious 'nature'.

But this would be an easy critic. An not an accurate one. Since In the case of the previous picture for that to be real – not frame of reference – the solution of physicists is obvious and quite smart and realistic: the entire picture is actually NOT a 'volume' but a membrane, like the expanding surface of a globe. If all the galaxies were pegged in the expanding surface of an SP-Membrane any POINT would see the rest of the cosmos which being so 'large' would appear as a flat surface, in the same way we see the Earth as a flat surface and any point on the Earth could in principle if light would curve a bit through the surface see the entire globe as a flat picture.

Of course those models are available in the 'avalanche' of 'fantaphysics', that is mathematical games without a criterion of selection. On my view the more interesting is the one of Mr. Merab Gogberashvili where he shows that if the Universe is considered as a thin shell (a mathematical synonym for "brane") expanding in 5-dimensional space then it is possible to obtain one scale for particle theory corresponding to the 5-dimensional cosmological constant and Universe thickness, since it solves the hierarchy problem in a similar fashion – in this case the smaller scale of particles do have more 'energy and information – that extra-dimension and further on our Universe is stable since the extra component of the Einstein field equations giving the localized solution for matter fields coincides with the one of the conditions of stability.

Latter the Americans proposed the closely related Randall–Sundrum scenarios, which have as usual become more popular with the Anglo-Saxon drum beat of self-propaganda (this is common in the history of science since the times of Leibniz to the times of Landau->Hawking and Linde->Guth).

Now in our terminology this means the following, generalizing it to 5D Geometry, which is NOT so much concerned with 'spatial geometry' but with the arrows of energy and information that transit between scales:

Now one of the beauties of 5D science is that we can take any relative $\Delta\pm i$ scale in our analysis of reality and change slightly the perspective and will get a meaningful view of it all. So when we take the largest $\Delta+i$ perspective on the being we see it as indistinguishable atoms, but if we have an $\Delta-1$ perspective it looks like a 'living cell', which is a very convenient perspective to study the whole, as we observe it perfectly together, surrounded by a cyclical time membrane, with a nice central o-point and a series of perfectly designed organic cycles.

This is the perspective we can have of a nation, as a cell of the superorganism of history with its borders, human DNAs in its homes connected by networks of economic energy and legal information. Or the perspective of a human cell-citizen, or a biological cell. This is the best way to study the galaxy as a cell of the superorganism of the Universe made of 10^{11} of such cells. The structure of the galaxy cell thus will 'focus' this article, since it is the perspective, which we can elaborate with a minimal amount of information to make it a likely truth.

Of the Universe as a whole we cannot make such a big statement of truth, as astrophysicists, human ego-centered masters of the Universe think, but we can keep exploring their cosmic big-bang, and explain it as a 5D probable truth. We shall see it is of the two possible explanations – an extensive Universe of multiple atoms/cells/galaxies well beyond the limit of the cosmic horizon, vs. a growing beta decay universe or a cellular organism, the 2nd likely explanation. So for probabilities of truth, we range them as:

Max. truth: quasar big-bang < Med. Truth: Cosmic big-bang < Min. truth: cellular cosmos.

Ultimately though the 3 of them admit a larger $\Delta+1$ scale of the Universe, a... Hyper-Universe and big bang death.

The mimetic ages of Little quasar bangs.

Now it what follows we are going to deal mainly with 1 theme, the organic structure of the Galaxy and its parts according to the Generator Equation.

It is within that structure that big-bangs of any of the scales of matter represent merely the entropic death of the matter vortex in a quanta of time according to the equation of death of any system, physical or not

Death-big bang equation: $S < T$: Max. $T \times \text{Min. } S \rightarrow S_p = \infty \times S = 0$

So it is not a big deal, which is the scale. As we have explained it matches 5D metric including the inflaton field: $T \times S = K$. Thus in an infinitesimal time quanta (10^{-42} in the big bang), in a similar account the Universe expanded a similar quantity (10^{42} proton radius in the big bang). It is simply too large with the data we observe. So we imagine that the QUASAR-bang will follow exactly the same metric, and ages of the cosmic bang, but the relative Time speed of the Galaxy when the bang-death of entropy of the black hole took place will be slower, of the range of top quark interactions (10^{-25} seconds) and the diameter of the central black hole once it expanded after its death will be that of the galaxy: 10^{21} meters.

In brief, the ages of the Little bang are far less speculative as sciences must be than the big-bang. Its first quanta of 'death' of the black hole did start when the speed of time clocks of the black hole went under the mean life of its particles, top quarks, which are the likely cut-off atoms of the black star. As the little bang expands the galaxy in a similar fashion to a double beta decay that expands the nucleus up to 100.000 times to create a hydrogen atom.

Thus time slows down to the 'year' cycle of its $\Delta-1$ 'cell', which is the angular momentum of most star systems, the 'photons of the galaxy-atom', taking our planet orbit as a mean for them, in the same manner that the cycles of a living human being slow down from its faster seminal system to the day cycle – the mean cycle of its cells, the $\Delta-1$ scale.

This is the application of 5D physics, NOT of weird laws of time. But of the metric of the 5th dimension and the processes of growth of systems which are synchronized to the slow down of its internal time cycles at the $\Delta-1$ cellular lower level. At this moment the system is synchronic between its 3 $\Delta\pm 1$ scales and its space-time measures are in relative proportion.

What is then the growth of the little big-bang. Simple to calculate. If a nucleus of an atom grows 100.000 times to become the electron radius, we just need to multiply the year time of the 'new galaxy-atom' for 100.000 times of expansion, and the galaxy should be approximately 100.000 light year of radius.

The same happens in the atom, even if physicists do not understand as they do NOT use variable time clocks, DO NOT relate time clocks to space curvature and attractive power.

But we do have all the data. So in the atomic nucleus, the clock speed slows down \approx the attractive power diminishes \approx the curvature diminishes \approx as the radius of the strong force grows to the radius (clock-curvature-speed-angular momentum) of the Electron. And again we can do similar calculus: the electron of the Bohr radius has a mean speed of 3.000 kms, which multiplied by the fine structure constant gives us the c-speed, or space- time speed of the proton-black hole vortex radius, which is 100 times stronger than the electronic force – again the same relationships in proportions and decametric scales).

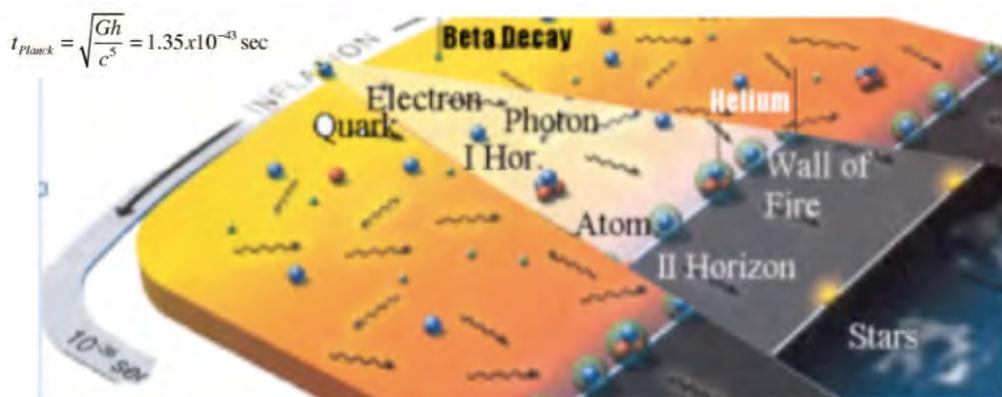

So back to the galaxy that should stop its expansive phase when the clock goes down to a year orbital sun and 100.000 light year diameter. Well, thus experimental evidence confirms this process? As it happens 100.000 years light is the diameter of the galaxy.

This also means that the meaningful nucleus of the galaxy should be around a π light year or parsec, even if the ‘quark zone’ – or true central black hole is even smaller, but we must remember the quarks are surrounded of a cloud of ‘negative pions’, ‘massive particles, equivalent to massive stars. It is this the case of the black hole?

As it happens, the central parsec around Sagittarius A* contains thousands of stars. Although most of them are old red main-sequence stars, the Galactic Center is also rich in massive stars. More than 100 OB and Wolf–Rayet stars have been identified there so far. They seem to have all been formed in a single star formation event a few million years ago. The existence of these relatively young stars was a surprise to experts, who expected the tidal forces from the central black hole to prevent their formation. This *paradox of youth* is even stronger for stars that are on very tight orbits around Sagittarius A*, such as S₂ and S₀₋₁₀².

Now this and many pages of astrophysical studies that we shall pour on the 4th line when dealing with the organic galaxy merely shows the 5D symmetry, the organic structure of the galaxy that follows those ternary symmetries and the clueless nature of our astronomers (-; though I will not pound on them, since actually I do like astronomers much more than nuclear physicists – they do nothing wrong and had anyone taken seriously 5D in my youth when doing a master at Columbia U. I might have chosen to spend my life in the nice Palma Island Chilean mountains or Hawaii volcanoes, looking at the stars (-; But they couldn’t care less for the galactic organism)-;

Anyway the field of 5D fractal, organic cyclical time applied to astrophysics is ginormous not so much in size in space but in information. So we will just consider a few aspects of it. Along the way we shall introduce some fundamental changes in our theories of the Universe based in T.œ both in its ‘strict belief in the limits of the scientific method’, and the consequences of a cyclical time, fractal space and scalar Universe.

In the graph, the quasar Little-bang, is the same process that the cosmic Little-bang but limited to the inversion of a central black hole, which dies and goes through the same phases the inflation period, is the period of black hole explosion with its gravitational waves that create the underlying structure over

which the following epochs will produce as energy cools down the different particles of the galaxy. This is what it is recreated today at CERN, and might provoke the strangelet formation on its ‘initial ages’, which are stable usd lumps that could swallow the Earth.

There is besides the job of straighten up of the errors of physics regarding its space-time symmetries a more general analysis of great beauty, which consists in the translation of the ‘Ages of the Little-bangs’, of any type of scales into the ages of the known-known particles of matter, as the slow down of speeds of time and enlarging of spaces allows the symmetry to break into the positive and negative sides of each ‘plane’ of the Universe.

It is not so different from classic astrophysics, except that is simpler more symmetric, experimentally sound, theoretically meaning and so it makes sense (-;

Now of course we can ad for the pleasure of those clueless astrophysicists crunching numbers the unknown scales of the possible atomic cosmos.

They start 'faster' than we do. The little bang of the most likely scale of Galactic matter, explains HOW FROM THE c-faster ok colder, super fast time cycles of the Higgs-top quark-black hole fields, through the 'creation of \pm symmetries of speed, energy, charge, and momentum', all other forces and particles are born.

The **chronology of the Galaxy** describes the history and future of the Galaxy according to Little Bang cosmology, the scientific model of how the Galaxy developed by this point of existence, which is a world I itself (;

The big bang though of the atomic cosmos starts its time on the Planck epoch, using the cosmological time parameter of commoving coordinates (never mind what it means, nothing really :)

As of 2016, this expansion is estimated to have begun 13.799 ± 0.021 billion years ago! – you know how 'precise' are the scholars who know nothing but think to know it all – humans after all. Wouldn't be a bit less 'obvious' to say just 13.8? (-: LOL, do remember that the exact minute of creation was precisely estimated last century by a British priest on the A\$\$-breeders calendar, now running at 5777 – 7 being the magic number of Babel...

It is convenient to divide the evolution of the atomic Galaxy or cosmic string, so far into three phases. They just differ in its reality. In brief, the first age of the cosmic big bang is largely speculative and simply accelerates time to the minimal time possible in physical parameters of the 'light speed limit', the so called Planck Units of mass, time (the speed of light crossing the minimal radius of a string-neutrino, etc.)

Fantaphysics. The I never proved age of Cosmic physics.

Before a time classified as a Planck time, 10-43 seconds, all of the four fundamental forces are presumed to have been unified into one force. All matter, energy, space and time are presumed to have exploded outward from the original singularity. Nothing is known of this period. In the era around one Planck time, 10-43 seconds, it is projected by present modeling of the fundamental forces that the gravity force begins to differentiate from the other three forces. This is the first of the spontaneous symmetry breaks, which lead to the four observed types of interactions in the present universe.

Looking backward, the general idea is that back beyond 1 Planck time we can make no meaningful observations within the framework of classical gravitation. One way to approach the formulation of the Planck time is presented by Hsu. One of the characteristics of a black hole is that there is an event horizon beyond which we can obtain no information - scales smaller than that are hidden from the outside world. For a given enclosed mass, this limit is on the order of

$$L=GM/c^2$$

where G is the gravitational constant and c is the speed of light. But from the uncertainty principle and the De Broglie wavelength, we can infer that the smallest scale at which we could locate the event horizon would be the Compton wavelength.

$$l=h/mc$$

Equating L and λ , we obtain a characteristic mass called the Planck mass. Substituting this mass back into one of the length expressions gives the Planck length

which happens to be the length of a neutrino, something physicists have not noticed too much but makes the neutrino the clearest candidate to be the quanta of the gravitomagnetic waves of the underlying structure under light. and the neutrino theory of light, the clearest form in which light is formed, as light travels its minima time frequency across this length is called the Planck time:

$$T_p=vh/Gc^5=1.35 \times 10^{-43} \text{ sec}$$

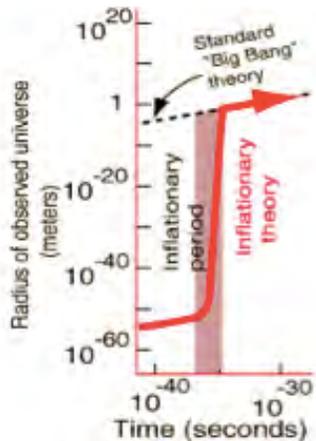

Which therefore will be in 5d physics the minimal wave length of light, the minimal 'planckton'. And we will return to that.

Inflationary Period

In classic cosmology, Triggered by the symmetry breaking that separates off the strong force, models suggest an extraordinary inflationary phase in the era 10^{-36} seconds to 10^{-32} seconds. More expansion is presumed to have occurred in this instant than in the entire period (14 billion years?) since.

The inflationary epoch may have expanded the universe by 10^{20} or 10^{30} in this incredibly brief time. The inflationary hypothesis offers a way to deal with the horizon problem and the flatness problem of cosmological models.

Lemonick and Nash in a popular article for Time describe inflation as an "amendment to the original Big Bang" as follows: "when the universe was less than a billionth of a billionth of a billionth of a second old, it briefly went through a period of supercharged expansion, ballooning from the size of a proton to the size of a galaxy (and thus expanding at many, many times the speed of light). Then the expansion slowed to a much more stately pace. Improbable as the theory sounds, it has held up in every observation astronomers have managed to make."

Which is none, zero, nill, zip'. Nobody has observed the grapefruit, let alone the Planck Mass, LOL. The problem of course was that to make so big the Universe, and connect all its parts, they needed this concept and so they fitted in.

So what this inflation means in 5D cosmology? Merely the expansion of the black hole 'neutrino and gravitational wave' over which light will be imprinted in a second phase.

Of this the Grand Unification Theory (GUT) - the final unification that has been called a "super grand unification theory", and becoming more popular is the designation "theory of everything" (TOE) says very little. Since physicists "theories of everything" are separated by two great leaps beyond the experiments we could ever hope to do on the Earth.

In that first phase, the very earliest atom-cosmos was so cold and perfectly ordered that its time clocks with no entropy could turn at an amazing faster than c speed of 1000 z in a present 'liquid wave' of absolute no friction.

But of course, 'lineal entropy physicists' which become surprised every time they find some cold working non entropic reality (which we have been predicting for 3 decades – the last one the quark gluon perfect liquid, which they still call 'plasma' :) take of a hot, energetic substance.

Hot is of course meaningless outside the entropic gas-molecular state where temperature is a meaningful parameter.

Never mind. According to prevailing scientific theories, at this time no matter particles existed (hence some divine creationism would act soon ;) perfect explanation for the time speed and inflation of those first moments, you know God is absolutely powerful.

Now in this theories the distinct forces we see around us today were joined in one unified force. Space-time itself expanded during an inflationary epoch due to the immensity of the energies involved. Gradually the immense energies cooled – still to a temperature inconceivably hot compared to any we see around us now, but sufficiently to allow forces to gradually undergo symmetry breaking, a kind of repeated condensation from one status quo to another, leading finally to the separation of the strong force from the electroweak force and the first particles.

This in the parlance of abstract physics. In reality, it was of course all the way around. The 'death' destroyed the perfect cold order of the super-quark-gluon liquid vortex of the hyper-black hole of super top quarks, and the hyper luminal rotation produced through the Kerr axis tachyons at superluminal speed, which expanded the Universe...

But all that is meaningless, so we just will ignore the whole mysterious things and not fill another 20 or 30 questions never answered about the cosmic big-bang (inflation formation of galaxies, isotropies not found at large scale, etc. etc.) as the little galactic big-bang shows no problems of any kind, the back ground radiation meaning simply the galactic background of neutrinos and light produced by the 'top quark star' little bang.

T: AGES OF THE GALAXY. ITS WORLDCYCLE.

When dealing with astrophysics in a future world of science, there should be no difference with any other science of scalar organic existences.

The principle of conservation of energy would be derived of the principle of conservation of time, and its 3 standing points that maximize conservation, the point of reproduction in balance between temporal energy and spatial information, $S_i = T_e$; and the two maximal points of S_i (Max. social evolution) and T_j . Maximal motion, define the 3 ages of physical organisms, called states in matter, as in any other system of nature. Those 3 ages would be also studied in cosmology as the origin of the ages of Galaxies shown in the H-R graph. And its $s=t$ symmetry in space, the ternary principle of diversification of species, $\text{Max. } S < S=T > \text{Max. } T$ will also be considered. From them, we can trace the existence of galaxies and its different forms, as any other organic system of the Universe. Let us then do so in a brief treatise on the ages of galactic life.

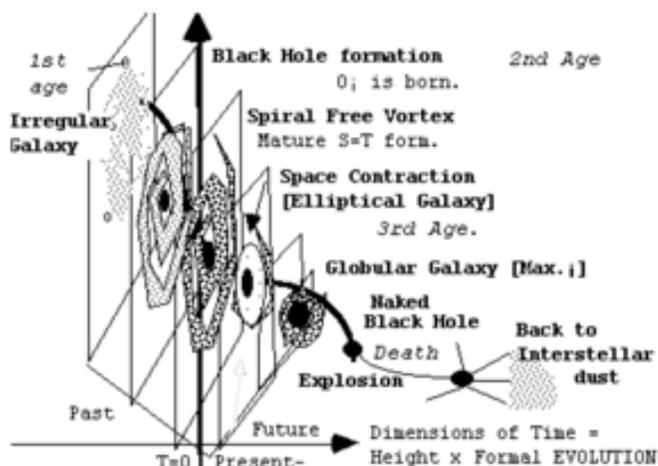

That first course on astrophysics would need little mathematical physics, but on the organism of the galaxy and its life-cycle, in which human beings are inscribed. Such a humble world would realize 'man is just a mush over a lost rock in the corner of the milky way' and aware of its cosmic nonsense, would likely preserve its existence, the only reason d'être, much longer that it seems bound to do. For a galaxy is just an organic system, akin to a cell of the larger scale in its life properties, quantitatively similar to an atom in its mathematical properties, of a larger hyper-universe, and this plane a speck of dust turning around a sun-like photon. And yet even if the quantitative analogies between the galaxy and the atom are perhaps the most astounding mathematical feat of 5D, we shall here just consider that introductory course of a future high school.

On the nature of the hyperuniverse little would be said, unlike present cosmology of hyperbolic egocentric bigbang theorists. Regarding the big-bang, of course, the name of the theory has been changed long ago. Now it is called the little bang theory, as its 'scale' is that of galaxies, similar to a double beta decay of a neutron, and *certainly not the central part of astrophysics, as nobody studies obsessively the death of an organism, which is what a little bang means, but the life of it, and its organic inner structure that peg together its parts into a whole.*

Life ages of galaxies. The Three Ages of Galaxies

In the graph, the life cycle of a galaxy goes through $3 \pm j$ ages, evolving from a young, extended nebula into an old small swarm of top black holes of dark matters that explodes in a quasar (Little bang of dark Entropy and quark matter), astrophysicists confuse with the explosion of the whole Universe. In between, galaxies live a long, mature, cyclical steady state, fluctuating every 14 billion years between its spiral and elliptic form, while absorbing interstellar dust, which creates new stars and feeds the central swarm of Top Holes.

Because the galaxy is an ΔS_t system with Δ -organic and quantitative, numerical properties, S -topological ones and

temporal dimotions and ages, the structure of a galaxy can be compared according to the homologies of the disomorphic method in its self-similarities with the 'elemental' units of each scale of reality - with a quantitative atom of the $\Delta-1$ scale - hence the name galatom for such dual analysis and with an organic $\Delta 0$ -cell of the human scale, as a galacell, with a central DNA of social swarms of top quark stars and a protein-like membrane or halo of quark, dark matter, made of energetic strangelets *which the mind egocentric paradox denies to all species. Since man only gives its most cherished organic properties to species of its scale, as its mind perceives maximal information in our scale, from a self-centered point of view.*

As in all other sciences, 'ænthropic' humans project its 3 fundamental errors into cosmology:

- The anthropic errors of denying life nature to all other species; the creationist error of denying hilomorphism and scalar parts to point-particles and black holes, which are made of substance that can only be according to its density and gravitational attraction of top quark holes and bcb atoms. SO their proper name should be top quark 'frozen stars', as Einstein named them, NOT black holes; a name long dismissed in our 'future high school' course.

- And 'entropic' simplifying errors (lineal time, entropy as its only arrow, and entropic theories of reality). So they confuse also in the galaxy, the 'death' moment with its birth (quasar, big bang), and , the main errors of astrophysic).

Thus, the ages of a galaxy in its time worldcycle are the same $3\pm i$ ages of in any other space-time supœrganism. Each of those ages can be further subdivided according to the trinity laws of the fractal generator in 3 sub-ages and have 3 different Space-time origins.

Thus, a galaxy can be created by 3 different processes, proper of the trinity of reproduction:

-j: Seminal conception: Galaxies are created by the customary 3 types of Max. St, ST & Max. Ts reproductions:

-Max. Te: Reproduction by an excess of entropic Energy:

A galactic Little-bang quasar catalyzes the evolution of gas into stars. This birth is similar in $\Delta-1$ to a star 'Novang' (former nova :) that catalyzes also the creation of stars or a hypothetical $\Delta+1$ Universal Big-bang that catalyzes the creation of galaxies, but of which all proofs are hyperbolic exaggerations of Little Bangs.

- Si=Te: Reproduction by balanced ST-evolution: Palingenetic conception, when the informative nucleus of Top quark holes of a giant mother-galaxy emits a huge jet of dark, quark matter that ends into a baby galaxy.

- Max.Si: Informative reproduction: Social evolution of energetic gas that creates complex star structures.

- $S\approx T$. Maturity/reproductive age. Galaxies enter their steady state of reproduction, in which its spiral structure matures: stars gather in social groups and at its center a Top quark hole, the informative nucleus, structuring its body of toroid, cyclical paths of stars.

Galaxies then mutate back and forth, from spiral into elliptical vortices of mass, feeding on interstellar gas, in a cycle that creates and destroys its spiral bar every 13 billion years in a quasar *Little-bang that renews the Galaxy and coincides with the parameters of the cosmic Little-bang of continuous models of space-time.*

- Max S; information age: In their 3rd age, once galaxies exhaust their interstellar gas, their central Top quark holes digest their star bodies, becoming globular, spherical forms with a hyper dimension of informative height, till they exhaust all their star Entropy. As dark galaxies, without the drag limit of c-speed caused by their electronic and radiant matter they now accelerate as pure top quark holes up to $z=10c$; forming invisible, complex networks of dark matter.

As all systems that go through $3\pm i$ ages of evolution, the final stage after its 3rd informative age has '2 solutions', death and reversal of form into Entropy or 'transcendence' into a higher super-organism, communicated by the language of information of the system (so insects evolved into successful anthills while others become extinct and humans evolved into societies while most other mammals became extinct). Thus:

- ($\Delta-1$): Some galaxies die as quasars, becoming again according to the inverse symmetry between the 1st and 3rd youth and old age of all systems, irregular galaxies that will feed a new cycle of galactic creation. So irregular galaxies are both the youngest and oldest forms of the Galaxy, a fact that still confuses cosmologists.

- ($\Delta+1$): And those with a higher quantity of informative black holes in their nuclei evolve socially as cannibal galaxies, forming galactic networks in cellular groups that evolve socially into the large scale structures of the Galaxy. Their central Top quark Holes grow, swallowing radiant matter at growing speed, and perhaps evolving with many other galaxies into a cluster Galaxy, of which there is no enough experimental evidence.

Thus, we differentiate the Little-bang or death of any scale of the Galaxy from a Little-banging or reproduction and self-organization of the present Galaxy and a 3rd age or Little-crunch, followed by a Little-bang or a process of emergence into a superorganism, which creates a generational cycle for any fractal space-time in $3 \pm i$ ages.

The Huge Galaxy and its galactic, fractal Little bangs.

Since the age of a galactic cycle, 13 billion years, is the same that the age of the cosmological Little-bang, as Fred Hoyle affirmed, the cosmological, continuous Little-bang might be the sum of all galactic, fractal Little-bangs and the Huge Galaxy is not expanding as a whole. It will exist in a steady state, in which the knotting of space into mass by galaxies would compensate the expansion of mass into dark Entropy in the interstellar vacuum, which causes its expansion. Further on Little-bangs at the lower galactic scale, caused by the quasar explosions of its central Top quark holes when they break their bars every ± 14 billion years should be the origin of the second proof of a cosmic, continuous Little-bang - *the excessive quantity of helium in the galaxy* - found precisely in bigger quantities on top of the central Top quark hole. Finally, background holes born of planetoids would redshift radiation at 2.7 K. Thus a fractal quasar Little-bang provides the same experimental proofs and better theoretical explanations, eliminating the multiple contradictions of the cosmological Little-bang.

Thus, a *steady state* theory of the Galaxy combined with a fractal theory of multiple Little-bangs/quasars, as it was reformulated mathematically by Fred Hoyle, in which the multiple, constant Little-bangs of galaxies into quasars are responsible for helium formation, redefines the Galaxy as a huge fractal scale of cellular galaxies in eternal balance with the expanding space, where light devolves back into 10 c dark, gravitational Entropy and dark Entropy warps into light by redshift and dark matter into galactic matter, imploding space:

$$T \text{ (dark Entropy expansion)} = S \text{ (dark, quark matter implosion)}$$

Such balance, coupled to the constants of proportion between the energetic and informative elements of a complementary system, explains also, without appealing to the magic anthropic principle, the universal balance between matter and radiation, whose probabilities otherwise are null. Indeed, why matter and Entropy are in balance in the Galaxy at this exact moment in time, in a proportion of 1 to 3 (as mass is bidimensional and radiation 3-dimensional) if their relationship is dynamic, changing all the times, with Entropy winning the battle and expanding faster?

The answer is: because the Galaxy and any partial system within it exist in 3 to 1 balances between their Entropy and information/mass and when those vital constants of balance break the system ceases to exist.

Recap. Galaxies live through the 3 same ages of any space-time, born as seminal flows of dark Entropy and electromagnetic radiation, ejected by giant galaxies that condensate into quarks dark matter and an explosion of electronic forms and the creation of atoms and stars, start the reproductive age that will collapse into a central Top quark Hole, back to the original quark-gluon soup that gave it birth.

While the study of the different isomorphism should go on line 3, as I was looking to old 2 decade files of the first self-published book with 5D physics (physics of time, now 'extinct' unless some 'Nobel prize' or university kept it), I found this funny graphs, on the duality and ternary symmetries that give birth as usual in all systems to the 6 main species of 'female ternary space-time species' and 'male ternary space-time species', to use the organic jargon I have always preferred and of course made T.Æ unpalatable to any reader in the past (-:

Galaxy in time: from nebulae to quasar little bangs.

After the Little-bang, the Little-banging reproduced and evolved the huge Galaxy in 3 Horizons of growing complexity: the age of atoms, celestial bodies and galaxies.

If we study the huge or cellular Galaxy in time, we differentiate in its evolution the 3±i ages of any space-time:

$\Delta-1$ (Past): *The Little-bang conception* of the Galaxy, starting from a first informative cell of Planck density was also the death and gravitational Little-bang of a previous Universal singularity, a seed of ultra-dense quarks that transformed its inner, informative cyclic dimensions into an external, bidimensional sheet of dark Entropy: $M(i)=e/c^2$. It was the age of the simplex time arrows.

-Life arrow, steady state: Then the Galaxy suffered an informative process of reproduction, self-organization and social evolution, the *Little-banging*, or age of the Complex Arrows divided in 3 ages – the atomic, stellar and galactic age, which should end in:

- *Informative, 3rd age:* A Little-crunch back into a new hyper-dense singularity that would restart the cycle in a new Little-bang.

- $\Delta-1$ (Future): *New Little-bang and Conception.* The future explosion of the hype top quark Hole will again create a bi-dimensional sheet of gravitational space-time where matter will again evolve, as quarks form nucleons that decay into atoms and dark Entropy warps into light, the new components of the future baby Galaxy...

Let us consider those ages and its ternary sub-ages, *according to a law of the fractal paradigm, known as fractal differentiation:*

'Any event or form of reality can be divided into ternary or dual events and spatial forms of a lower spatial scale or shorter time duration'

This law structures fractal self-repetitions according to 3 ages and 3 Non-Euclidean structures in any scale. Thus it can be applied to study the 3 ages of the Galaxy and for each age, its 3 sub-ages. Since we have already study the fractal Little-bangs (birth) we shall start with the 3 ages of the Little-banging:

I Universal Age: Particles, Atoms and Molecules.

- *Birth: Max. T: Fractal Little-bang of Beta decays.*

The Little bangings of primordial particles: After being scattered by a gravitational wave of dark Entropy at $10c < 100c$ speeds, quarks evolved into nucleons and suffered fractal, expansive quantum Little bangings - beta decays - creating protons and electrons, later self-organized into atoms, molecules and more complex social structures, till giving birth to galaxies.

3 Atomic Ages of matter states:

Those molecular structures can also be studied with the law of 3 ages, according to which the 3±i states of matter respond to the dominant arrow of future information:

- ($\Delta-1$): *Plasma or conception state of matter.* The plasmatic state occurs at speeds closer to light, in a state in which atoms are split in primordial particles, free protons and electrons, which emit enormous quantities of radiation and sub-particles. Thus plasma is matter in its seminal state, ($\Delta-1$).

- Max. T: The *gaseous* state is the classic *energetic state* of atoms or diatomic molecules with max. movement, spatial volume and min. formal density.

- \leftrightarrow : The molecular state of balance between Entropy and information is the *liquid state*, which according to the law of harmony and maximal existential force ($S=T \max \text{exi}$), is *the reproductive state* of matter. For example, liquid water and mercury dilute all other atoms of similar weight that merge and evolve into more complex carbohydrates & metal

forms: carbon-life or metal alloys. 90% of a human body *is liquid* water, with diluted, energetic gas (oxygen), and solid particles (proteins, DNAs, RNAs) to store and trans-form information. Since solid is:

- Max.S: *Solid, informative state* of min. movement and max. form & mass density that creates the most perceptive=informative, inorganic structures: crystals.

- ($\Delta+1$): Finally, the *super fluid (helium) and boson states (heavier atoms)* are the highest form of molecular evolution, because it combines the properties of solids with maximal order, liquids with max. reproductive, combinatory capacity and gases with max. Entropy. Thus, it gives birth, according to the organic, social arrow of Evolution of all systems to a new type of macro-organisms, with a central, hyperbolic nucleus of super fluids and bosons... the:

II Age: $S \approx T$: Nebulae, stars and planets.

In the next stage, those states of matter evolved socially aggregating into macromolecular systems *that combine 2 states of matter*, which act as the dual energetic/ informative elements of the complementary system. Those cosmological, macro-molecular systems seem to us static, because their existential cycles are slow (Max.T=Min It). But they are also evolving in 3 ages:

-Max T=Min S: *Youth*. Nebulae are the youngest, commonest, biggest (max.T), less dense, simpler (Min.S) physical systems, extended around and between galaxies. Their atoms exist in energetic plasma and gas states.

- $S \approx T$: Stars are molecular macro systems, existing in the plasma and liquid states. Complex cosmology considers informative, cold, liquid and super fluid states dominant over energetic states, which Simplex Physics, based in a single Entropy arrow prefers, as Entropy is also easier to detect. Yet if we could reach the center of a star, we will find lower temperatures and super fluid systems. Since it is a basic tenant of Complex physics that informative, hyperbolic systems are more static and cold, able to create order and focusing formal mappings that gauge the external Galaxy.

- Max T=Min S: Planets are systems that exist in liquid and solid states. They follow the Inversion Law, Max. T $\rightarrow \infty$ = Min S $\rightarrow 0$. So giant planets exist in liquid states and smaller planets exist as solids. They are ferromagnetic planets; and we live in one of them. Again, fractal space-time theory favors cold, solid, informative states for those centers. So we affirmed that the planetary core should be a crystal; and their youth should be colder than scientists predicted. Indeed, recently we found that Neptune might have a solid diamond crystal in its center and the Earth probably has an iron crystal with a final Uranium core. And we have also found, studying zircons that planets cooled off much earlier than expected. Hence informative life also started earlier.

- $\Delta+1$: *Pulsars and Holes* are systems with a solid iron crust and a super fluid core of strange quarks.

Pulsars represent the final, informative age of celestial bodies, which might evolve further into Top quark Holes, species belonging to the gravitational Galaxy beyond our light world, with higher form. Those holes become through social evolution the informative, hyperbolic centers of galaxies, triggering the next stage of evolution of the Galaxy:

III Informative, Age and death: Max.S: The age of Galaxies.

-From left to right: A galaxy with a flat star body and a central brain, occupied by Top quark Holes with a hyper-developed dimension of informative height, perpendicular to the galactic body.

-Different biological curves of stars reproduction.

- A region rich in atomic Entropy where those stars are born.

-A galaxy with an organic form that remembers a ray fish

- *A giant galaxy, which re=produces a seminal jet of matter, giving birth to a younger galaxy.*

The 3rd age of the Galaxy started once galaxies, with central, informative top quark holes and star bodies that feed on interstellar gas socialized in galactic networks with the 3 canonical topologies: Lineal walls, spiraled systems and cyclical, globular forms and disks.

Those 3 galactic networks structure a mature Galaxy that shows in computerized models a surprising similarity with the discreet networks of a living tissue.

As the Galaxy gets older, if it is a cellular structure it will warp further, creating a *hyper top quark hole* of Max.Informative, Planck's density in its hypothetical center that should become its DNA-like center controlling and feeding in a hyper-vortex of galaxies.

We could consider 2 cellular hypotheses:

$\Delta+1$: The Galaxy evolves socially as it becomes a cell of a hyper-Galaxy from a bigger Δ -scale...

$\Delta-1$: Each cell is an island Galaxy in itself that will finally collapse around its informative center, as stars do in elliptical galaxies, feeding its Hyper-Top quark Hole in the Little-crunch. Then the Galaxy will die in a new Little-bang will initiate a new cycle. In this case the cell-Galaxy is self-similar to a bacteria, in as much as it is a single cell organism.

We seem to be moving towards the steady state, longer period of existence either because we are atoms-like of a huge Galaxy or because we are in a 2nd age that will latter implode back. Because the degree of curvature of the Galaxy is given by lambda which is near equilibrium, counting the implosive action of galaxies, and the expanding intergalactic space, both hypothesis (a gas-like huge Galaxy or a cell-like system are possible).

The Huge Galaxy will reduce those ages to galactic phases.

Yet if cells are atoms of a huge Galaxy none of those ages will happen, as galaxies would be the last 'cosmic structure', which we can perceive with certain precision.

In Einstein's general equations of space-time, the cosmological constant that measures the Entropy of vacuum: Λ defines also the warping of the Galaxy, which can acquire our familiar 3 topological forms: a simple plane,-sphere proper of a young age; a cyclical, steady state toroid or a convex, informative form (its Little crunch, final state). Now Λ is positive, and the Galaxy seems to be plane but so close to zero that the hypothesis of a stationary Galaxy takes force. Yet again we cannot measure with enough time latitude to know if it changes and it will *diminish in the future it will become negative, inverting the geometry* of the Galaxy and warping it, into a final Little crunch.

Since ' Λ ' can be considered the length of the tachyon string or minimal action of the gravitational Galaxy in terms of those minimal fractal parts, the thesis of a constant lambda and steady state huge Galaxy is reinforced by self-similarity with the constancy of 'h' in the quantum world.

In such case, there should be only quasar-like Little bang of galaxies, short of cosmic beta decays and the 3 ages or solutions of Einstein's equation should be applied only to galactic space and the quasar cycle, initiated by a gravitational, inflationary Little-bang of dark Entropy, followed by a Little-bang of electromagnetic radiation, which quiets down, and finally implodes into gluon creation of quark matter.

Such humbler, more realistic analysis of the origin of the observables of astrophysics will reduce all relativistic analysis of the 3 ages of space-time to processes within the galaxy, born as the explosion of a hyper-black hole of top quarks, latter exploded into a fractal Little-bang of beta decays. We would then be in the 3rd age of such galaxy, organized already by a central black holes. Since *the space-time of our galaxy is an implosive vortex of information.*

Indeed, we are in a Gödel Island-Galaxy, in a vortex of information called the Milky Away. Then the Energetic Galaxy should be considered irrelevant to us, only applicable to intergalactic, expanding space, because we would exist in the 3rd informative solution, the vortex of the galaxy and that is why the arrow of time in humanity is an informative arrow, not an energetic one. And that is why the sciences of information, of biology not those of Entropy should

dominate our analysis of scientific phenomena - even if the awesome Entropy of physical beings might impress the simplex mind.

Recap. We can order the evolution of the whole Galaxy as any other organism in time through 3 ages each one divided in sub-ages: the young, energetic Little-bang, probable death of other Galaxy, the steady, reproductive state in which it seems to be now and the Little-crunch that will happen as the initial momentum of the gravitational strings slow down to under c-speed. Then we shall enter into the Gödel's Galaxy in which some regions call galaxies in which we inhabit exist. In those regions information dominates Entropy.

5D scales of the galaxy: Δ-1: quark families, Δ-cosmic bodies, Δ+1: parts of the galaxy.

To avoid that fate, cycle after cycle stars and planetary systems evolve in complexity guided by cold central crystals of gravitational perception - the energy of the 'gravitational eyes' of the stars. Mounting evidence that the center of celestial bodies are crystal forms able to hold virtual worlds, explain galaxies as vortex of gravitational perception, that stars follow, feeding and corrugating the space-time in a slow vortex around the central black hole. Yet their fate is sealed, and when they are closer to the center of the Galaxy, despite its erratic movements trying to avoid the black hole [Population II stars, which no longer follow the vortex path], forms are fed-"purified" -devolved- transformed back into extended-pure energy=Space by the black hole who "feeds" on them, and expels perpendicularly [bi-jetting] gravitational space-speed, perceived as dilatation from other Galactic organisms [Hubble effect].

In that way the eternal game of Time-construction and space-destruction maintains a perpetual balance, as far as man perceives. So we talk of galaxies as organisms in which the stars are the white holes, the energy which the black hole, or linguistic, gravitational organism, 'farms'.

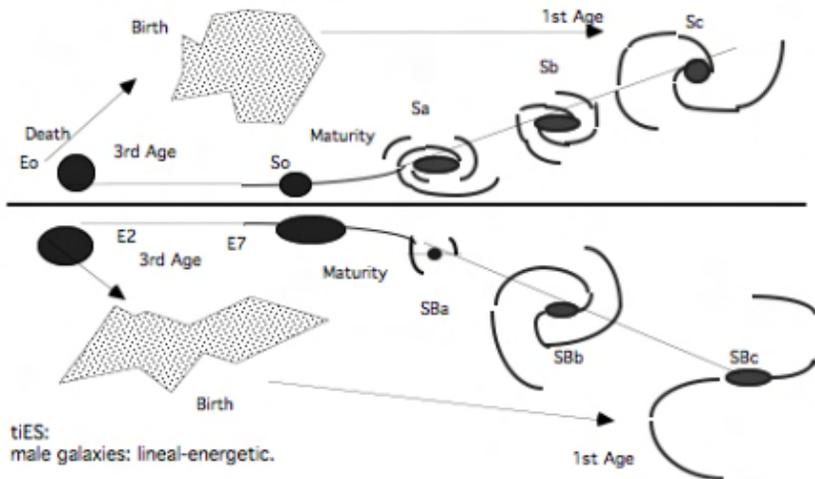

For that reason survival planets are those who evolve light into gravitational perception, and move freely away. A movement achieved thanks to the magnetic and nucleic perfect geometries of iron crystals, able to modify the trajectory of planets, once their forms

In the 30 years old graph, a mementum of my old self-published books an old gender related duality on the creative processes of galaxies... As usual we remind the 'scholar' that this is a seed - what matters are the *principles my task trying to reorder them, for future 'pros' to enlarge, refine and develop fully the model of the galatom's organisms, anti-atom like particles of a larger fractal but not equal hyper-universal variation.*

The most important ages of galaxies are obviously those of life, but because humind physicists come from ballistics and projected its worldly mind into its theoretical models of lineal time and entropy, they are obsessed by the death of each of those scales, $E=Mc^2$, the big-bang of masses, quasar big-bangs and a likely not big bang Universe. So we focus most of the paper on them, as usual from the organic cyclical, Never explained properties, as it would be easy for a 'pro' to reduce its equations to those guidance models, with a higher hierarchy/primacy over the detailed equations - a fundamental law of 5D: 'The larger organic scales and its deep, long time cycles, determine the truth of choice among the smaller detailed analytic mathematical equations'.

Species of galaxies.

Ties: Female galaxies: cyclical- informative.

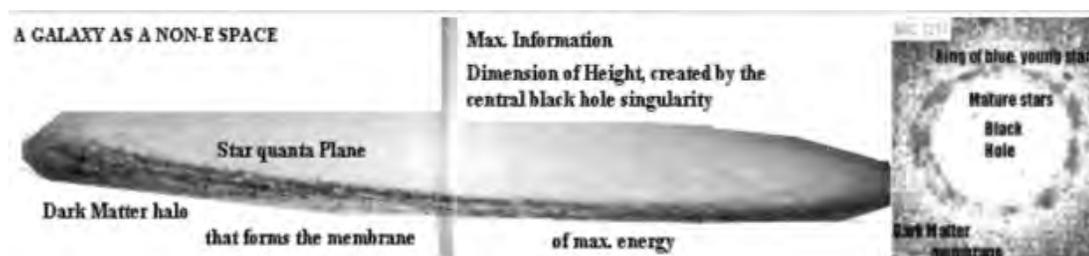

tiES: male galaxies: lineal-energetic.

ΔS: ORGANIC GALAXIES. ITS SCALES ITS IN SPACE., TERNARY TOPOLOGIES.

Let us consider the structure of the superorganism of the galaxy, in the same fashion we have studied all other superorganisms of the Universe, using its generator equation; for simplicity in the following order, its spatial 3 parts, its, evolutionary $3 \pm \Delta$ ages, and its S-point, the central black hole of maximal information that connects it as a 'whole' with the upper scale of the 5th dimension, the world of dark matter and energy, beyond it.

Of course, we shall have to correct some errors and anthropomorphic postulates topic of all human sciences, which will make 'scholars' feel offended, but we are not concerned with the theories of the day but the larger truth of the structure of reality. So far, so good, within the Galaxy, we must affirm 'don't worry be happy', humans have done for a change a good job. There is a limit of c-speed, the action of space-time of the galaxy; there is a temporal clock structure, mass, which slows down its time clocks as it grows bigger (even in the minimal scale in which mass is meaningful, that of living superorganisms, so the clocks of smaller masses – rats tick much faster than those of the big elephants).

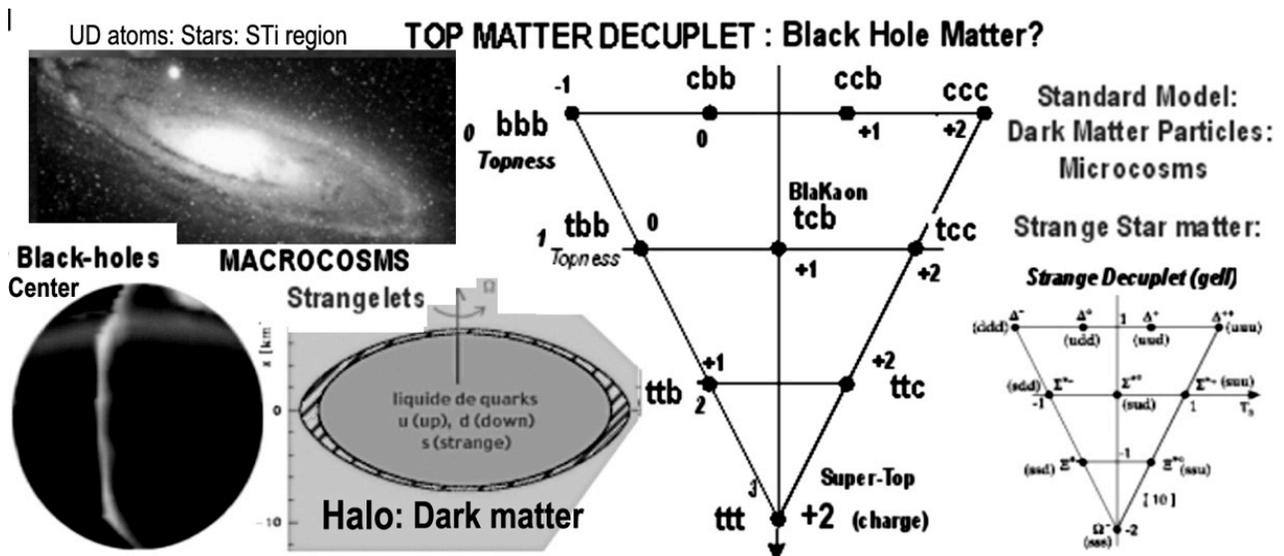

Let us then add vital topology and 5D scales as fractal organic properties to any galaxy, according to the known facts of astrophysics, in which black holes dominate most its creative processes. So we compare by the disomorphism of scale the galaxy to a cell in a much larger scale, with mitochondria stars, of light ud-matter which end up being devoured and becoming the energy for the creation of black holes, the informative vortices, equivalent to the DNA, that swarm in huge numbers in the central nuclei and control its shape and provoke the reproduction of stars, with its in-formative gravitational waves.

DNA invaginates with Golgi conducts vital cytoplasm it exploits, surrounded by the faster membrane of proteins, which act in its formal position as a membrane. The magnetic field surrounds the charge and encloses the vital space of electromagnetic fields the charges controls. So happens with a planet protected by its magnetic field that steams out of the central charge and surrounds it. And the galaxy has in its center a black star.

And it is surrounded by a halo of dense fast rotating strangelet quarks, so the stars and planets within it will become converted into black holes in Nova explosions or strangelets, when nuclear Physicists, programmed to extinguish the species according to the Fermi paradox, busy-busy recreates big bangs on Earth to 'prove' their absurd entropy-only theories of the Universe

Galaxies are super organisms constantly reproducing new stars, in its mitochondria, guided by an informative field, gravitation, dominated by quark-like, strange stars and top quark black holes, forming a symmetry with its lower scales of dark entropy (tachyon, neutrino? beams, that stretch intergalactic space to $z > c$). We can see many of the homologies of the galaxy atom, which at $\Delta \pm 3$ clearly formed an isomorphism of scale that related them both as mind-singularity (quark top black hole stars) and elements of the 'strangelet-halo of hard proteins' and mitochondrial region of ud, light particles, or atoms, which we inhabit, in the $\Delta^{\pm 1}$ thermodynamic scales.

Kerr rotary black holes would be top quark frozen stars with positive charge and same density at macro-scale than a black hole acting as a relative 'proton' acts in an atom in the center of the galaxy. Once we had the 'solutions' (Kerr black holes), the study of those holes was limited by the c-speed turning event horizons, which 'absorbed' the light of electromagnetic matter after exploding it, and 'digested' it via the weak force, creating heavier particles.

While the halo is made of strangelet quarks (negative charged), acting in this symmetry between the 3 families of mass and 3 regions of the galaxy, as a relative negative 'electron' cover, with the ud-stars and planets in the middle. *In the graph, following Einstein's search for cut off substances for black holes and Witten hypothesis of a halo made of strangelets, the most likely structure of galaxies, according to 5D scalar symmetries and the efficient, economic laws of Nature (Ockham's razor): primordial black hole stars are born exceedingly hot and active, as all 'seminal species' in a lower scale of size, on the Compton wavelength as heavy positive TCB quark atoms, while similar forms made of lighter strange quarks form negative halos of strangelet matter, which become from the point of view of the hyper-universe 'galatoms' with proton-like positive nuclei and electron like strangelet halos.* Einstein asked for a cut-off substance, or 'atom of black holes', which he could not guess at the time as quarks had not been found, but now we hint that black holes are as he thought 'frozen stars' of the heaviest quark families (bct quarks), and that should be the 'realist modeling' of black holes. As bct quarks appear in growing numbers in accelerators, tiny black stars then should be produced on them, in any of its possible varieties of dark matter that range from strangelets (s-quarks) to toplets (TTT-quarks), through its Higgs decay ($H=Top + \text{anti top quark}$).

The previous graph with its ternary elements, the Halo-membrane of maximal extension in space, which leaves energy and information enter through a cyclical space-time region, the plane of stars, towards a center of information, is the fundamental system of the Universe, already described by Descartes, who said all is made of res extensa (space), cyclical vortices of time space and a central point of reference that measures reality or 'mind'. So the galaxy centered in a black hole (and the similar atom with its electronic cover, centered nucleus of mass, and intermediate space-time where forces of gravitation and electromagnetism are constantly exchanged) we have just described logically IS not only the fundamental particle of physics, but isomorphic to any biological, social system – the key to the unification and understanding of the Universe, as a whole and all its parts, self-centered entities of time-space that put together create the puzzle of the Universe.

RECAP. We have seen for starters that a galaxy has the same ΔST properties of any system of the Universe. We have analyzed briefly the hilomorphic relationship between its 3 topologic parts, the halo, the central black hole swarm and the intermediate light matter vital energy, and its organic roles similar to those of a cell, and its $\Delta-1$ parts of quarks that compose them in a symmetry between the 3 families of mass and the 3 parts of the galaxy. We have also introduced the scalar big-bangs of matter in all its planes. And so galaxies are ΔST organisms.

So we can define without further ado the structure of galaxies in space:

The 3 Non-Euclidean Regions of the Galaxy. : T (Halo)<ST: stars >S: black star.

Let us now consider the ternary topology of the equivalent 'entity' to the atom in the gravitational membrane – the galaxy. Thus the generator equation of the galaxy as a Fractal Δ -point is:

$$E:\text{Halo} \langle \text{stars that evolve Entropy into matter} \rangle S (\text{Black holes})$$

In the graph, a galaxy is a curved, fractal space-time of huge spatial proportions, hence minimal form (inversion of properties between Spatial Extension and temporal information). Thus galaxies can also be studied in space as a fractal point with 3 regions that correspond to the 3 'canonical' topologies of a 4-dimensional world - an informative center, an energetic membrane, and the reproductive intermediate zone:

- Max. S: The center of the galaxy is a swarm of black holes, its densest informative masses, which produces the gravitational, informative waves that control the position of its body of stars. Beyond its event horizon, the accelerated vortex of mass of the black hole (Equivalence Principle) should accelerate light, deflecting it into a perpendicular, hyperbolic, informative dimension of height (Kerr superluminal, central singularity) ejecting it as gravitational jets of dark Entropy at 10 C.

For that reason Kerr black holes¹⁰ should be called top quark stars, because they absorb light but let it escape through its axis as dark, gravitational Entropy, at faster than light speeds.

-Max. T: The external membrane that limits the inner space-time of the galaxy is a spherical halo of dark matter, probably made of strangelets or micro black holes, which can deviate unwanted radiation by gravitational red shift and/or absorb the Entropy of radiant matter, cooling it down to the 2.7 K background radiation.

Thus those non-evaporating micro black holes and strangelets of great density act as 'proteins' do in cells, controlling the inner movement of galaxies and the outer absorption of light-Entropy.

- S=T: Stars, tracing toroid cycles form the inner space-time body of the galaxy, a bidimensional plane or Klein's disk that feeds the top quark star and reproduces atomic substances and stars. They ultimately evolve into black holes, which migrate toward the central swarm of holes, residing in the nucleus. In any Klein disk distance is measured as motion and becomes infinite when we cannot reach a limit or barrier (for example the barrier of light speed becomes an infinite Lorentz Transformation). So it happens with the border of the galaxy.

We are part of that intermediate space-time in a Milky Way, limited by its central hole and an invisible border of dark matter, neither of which we can cross without dying; since the speed of rotation of matter around the top quark star and the flows of intergalactic dark Entropy that expands space at light speeds beyond the halo *would destroy us*. Thus we are trapped in this star and planet, in a toroid cycle that will end evolving the Sun into dark matter.

In the image, the structure of the galaxy: stars are created in the intermediate region and the center is occupied by a black star.

The energetic medium that transfers Entropy to the fractal quanta of the galaxy is the external interstellar gas. Finally the system is joined by 2 networks of forces: the gravitational, faster, non-local informative, transversal gravitational waves at the cosmological scale; and the energetic, smaller, slower electromagnetic waves at the quantum scale.

Let us study the parts of the whole - the 3 elements of galaxies, stars, black holes and gravitational forces that join them.

Recap. Galaxies are fractal Δ -points with 3 standard topological regions: a spatial body of stars and an informative nucleus of black holes. The closest self-similarity in our world is with a cell.

NOW, THE STUDY of those galaxies in time follows a closer symmetry to that of the galaxy in space:

So the little bang, was the death of the previous galaxy, or according to the quasar cycle of barred galaxies (and ours is a barred one), a 20 billion years cycle of birth and death of galactic systems, in which the central black hole suffers a cosmic collapse of all its matter, and then spits it out in a quasar explosion, starting a new cycle:

Spatial symmetry: T: Neutrino & Light background < St-ars > Black Matter

STARS: THE MITHOCONDRIA.

ST-body: stars. Time Ages

The purpose of astrophysics is to study the superorganism of the galaxy, its generator equation and its symmetries of space-time, as physics is concerned with the Δ -2 superorganism of atoms, its Δ -3 parts (particles) and chemistry in its Δ -2 societies: molecules. Let us then do a fast survey of the galatom's parts, starting from its vital enclosed space of 'entropic energy' that feeds as in all organisms the reproduction of its dominant parts, the membrain of 'strangelet' dense matter akin to the electron of its similar atom, and the center top quark hole, akin to the proton, and with similar quantitative metrics. So the purpose of stars and planets seems to be to reproduce this coding center of top quark holes and protein-like harder halo, as the purpose of cytoplasm is to reproduce DNA and proteins.

This seems also to be the destiny of our planet, but in the meantime we can enjoy the view. Thus in the Δ -1 scale of parts of the galaxy, stars do live also as supørganisms tracing their worldcycle, till the 'chosen' become top quark stars, and those who humbly stay quiet, last much longer as red stars, whose life could be of trillion of years, like the similar photons of our smallish infrauniverses.

Of course, astrophysicists do study those $3 \pm j$ ages of stars and plot all its variations in the so called...

H-R diagram. Ages and Evolution of Stars:

In the next graphs, the Time-space symmetries of stars, along its relative 'S' and T parameters of spectral type (frequency-form) and spatial size.

They form a lineal function except in the Lorentzian limiting regions, inn which stars will both collapse into a big-bang that will dissociate its parts, Max. $T \times S$, but also give birth to a more evolved Max. S being, which in the case of neutron and black hole stars will imply an evolution from the Δ -thermodynamic scale of ud-quarks into the gravitational scales in 0 temperatures of black holes and neutrons stars

In that regard the life of Stars and its organic form have a simple a(nti)symmetric equation in time and space:

Time ages: $\Delta+2$: T: Gas Nebulae \geq ST: H-R sequence \geq Dwarf, Pulsar or hole

Space topology: $\Delta+2$: T: Photosphere \leq ST: Radiation zone \geq S: Nuclei

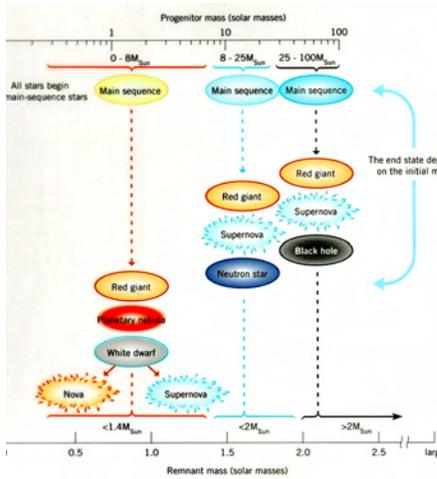

Flowchart of Stellar Evolution

All stars follow the same basic series of steps in the lives. Low-mass stars go through a red giant phase which ultimately turns into a planetary nebula with a white dwarf in the center. High-mass stars go through a red supergiant phase which ultimately results in a supernova, leaving behind either a neutron star or a black star. The deciding factor in the fate of a star is its mass. Stars whose core is less than 1.4 solar masses (the Chandrasekhar limit) will leave behind a white dwarf, the size of which is inversely related to its mass.

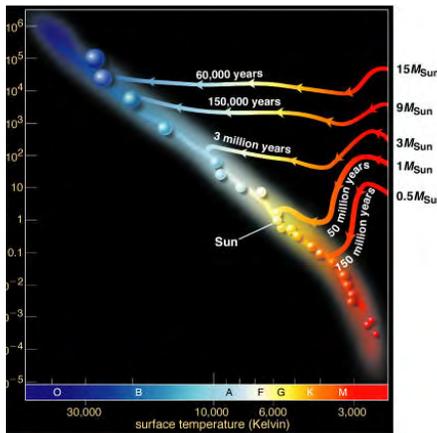

The initial mass of this star is much greater than its core, but much of the mass is lost once the planetary nebula separates from the core. Stars whose core is in the range 1.4-3 solar masses will leave behind a neutron star (much denser than a white dwarf). Note that the initial mass of this star is much greater than its core, but much of the mass is lost during the supernova phase. Above 3 solar masses (the Tolman-Oppenheimer-Volkoff limit), a quark star might be created, although this is currently mostly conjecture. Any stellar core over 5 solar masses will inevitably succumb to gravitational collapse, producing a black hole (much denser than a neutron star).

Nova

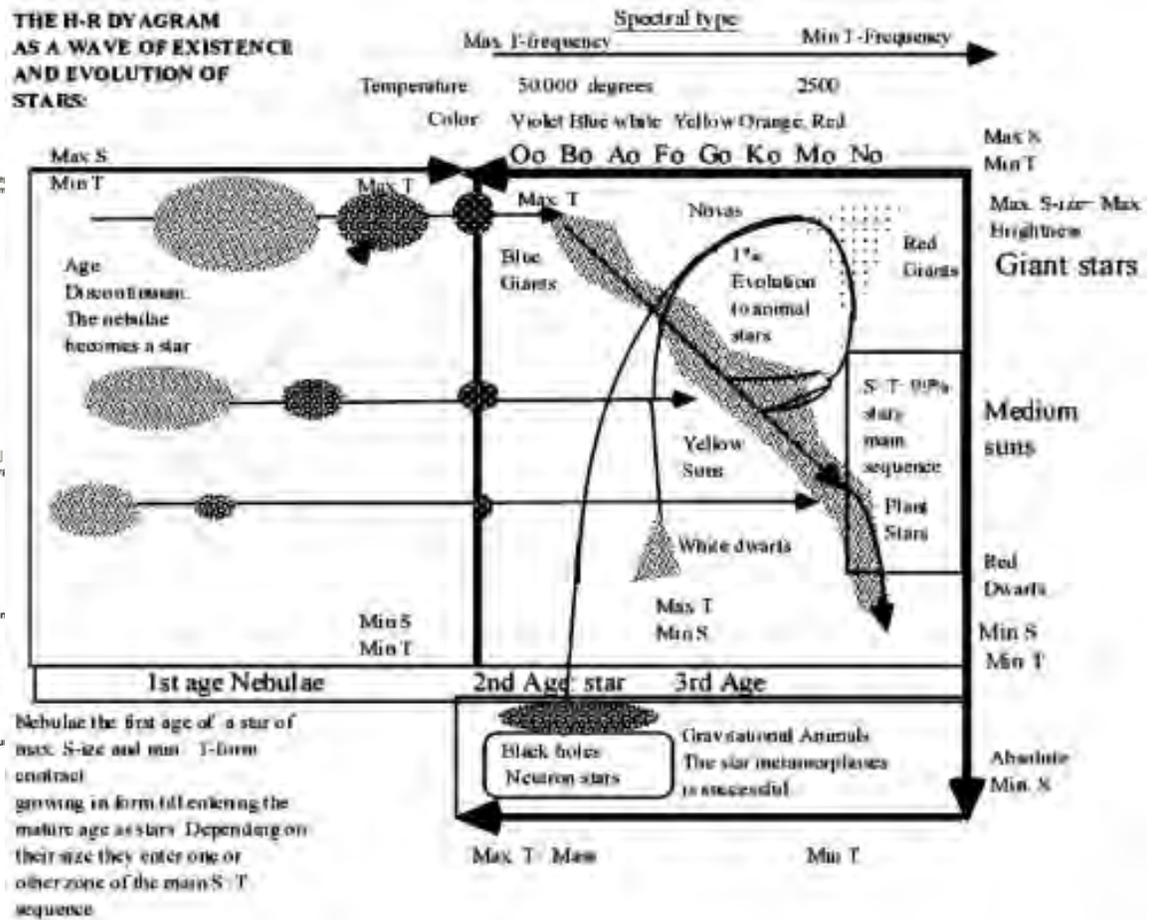

If a white dwarf has a close binary companion, the white dwarf may accrete gas from the companion's outer atmosphere. The gravitational energy released by the captured gas may be sufficiently great to start a fusion reaction on the surface of the white dwarf. This flare-up is known as a nova. A nova can recur many times, is about 100,000

solar luminosities. fades

THE H-R DIAGRAM AS A WAVE OF EXISTENCE AND EVOLUTION OF STARS:

after a few months (sometimes years). is more common than supernovas (2-3/yr observed, about 200 so far).

In the graph, the balance between the central zero-point of 'gravity' and the ST-pressure of radiation.

5D Asymmetry: $\sum \alpha=1$: plasma particles \gg Γ \ll Stars \gg $\Delta+1$: Galaxy

As in the case of other α -species we shall study here its main features, according to the linguistic-isomorphic method starting from the subjective errors of human perception.

As usual humans perceive better the time ages and worldcycle of any species by observing them in space in different states of their time cycle. This is the case of stars and it is called the H-r Diagram, which therefore will be the first symmetry studied here.

The symmetry of its 5D planes is also well known as stars are the factory that reproduces atoms of the intermediate space-time of the galaxy (our ud-matter world) and finally when they die produce both strangelet (pulsar stars) and black holes (huge stars with enough mass to collapse into a reversed particle reaction till creating at op quark star). So the biggest uncertainty of stars happens in the analysis of its central S-nucleus.

Stars in that sense can only be observed externally and from the external phenomena (granules, magnetic fields gravitational forces) to deduce some of its internal properties. 5D physics allow us to model further the internal S-center of stars and consider likely the main error of star analysis, the lack of understanding of its internal structure, which as all S elements, should be highly informative, hence cold. Thus the center of the star must be NOT as hot as the membrane but much colder.

This realization we adventured decades ago for planets, and it was latter proved (planets have solid crystal cores). And it should be proved for stars, whose center should be made of super fluid helium and hydrogen, and likely be able to produce cold fusion (as all thermodynamic processes must have an asymmetric duality between cold processes made in slow time, with minimal energy (min. T x Max. S) and hot processes made in fast time with maximal energy (Max. T x min. S), in a clear symmetry with the processes of conception (slow informative birth) and death (fast entropic destruction).

So we shall when completed deal with all those symmetries in the aforementioned order.

The H-R diagram shows the 3 ages of stars, through its Entropy & information parameters.

The life, evolution and death of stars are depicted in the H-R Diagram, which classifies stars according to its E & O parameters, as the atomic table does with atoms:

Max. T: Brightness or Magnitude, which is a spatial parameter that grows with the size of the star.

Max. S: Spectral type, (color or frequency), which classifies stars according to its temporal form.

Yet the H-R diagram is only a representation of the 2nd and 3rd ages of stars - since the young age of the star as nebulae of max. Spatial extension and min. formal complexity (as all young ages are) is not represented. So we add on the left side the 1st age of a star as *a nebulae of max.extension*. Then the H-R graph shows the 3 ages of stars and the main isomorphisms of T x S cycles applied to them:

- ($\Delta+1$): Most stars are born as spatial nebulae of max. extension.
- Max. T: Then they implode into blue giants of max. Entropy.
- $S \approx T$: They reduce its size and grow in atomic complexity through a mature, yellow age of balance between their T and S parameters. The sun is now in that balanced age...
- Max. S: They collapse in a 3rd age of slow decline as its I X E parameters diminish toward its death, becoming white dwarfs.

$\Delta+1$: Or they evolve in a loop of growing I X E force (top right graph), mutating into a Top quark Hole.

From those elements it is easy to enunciate the main events of the time symmetry of stars:

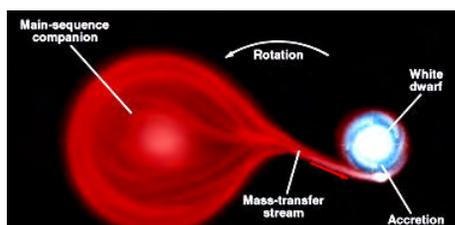

Recap. The H-R graph shows also the process of evolution of stars into Top quark Holes, which can be explained both mathematically and organically, based in the self-similarity of all space-time species.

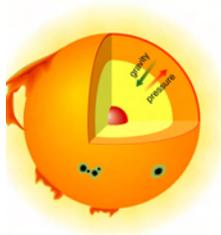

Star birth

Stars are born from a nebula (cloud) of gas (hydrogen, helium, and a little bit of everything else) and dust. One such nebula, often studied, is the Orion Nebula. If the nebula is dense enough, it will eventually start collapsing under the influence of its own gravity. As the nebula contracts, it heats up and the rising core temperature and pressure eventually causes hydrogen to fuse. At that point, a star is born. For stars to be able to sustain nuclear fusion, their mass must be at least 0.08 times our Sun's mass, which is equivalent to about 80 Jupiters.

Stars cannot be more massive than about 150 times our Sun because they simply produce too much energy and become unstable at that point. (Note that several stars more massive than 150 times the Sun have been discovered, but these are extremely rare.) When the gravitational tendency to collapse is balanced by the tendency to expand due to the heat generated by nuclear fusion, the star is said to be in hydrostatic equilibrium. At that point, the star is on the main sequence of the HR diagram. The newborn star will have a luminosity and surface temperature now that will change very little over the course of its lifetime on the main sequence.

Death of low-mass stars

Low-mass stars are those that end up as white dwarfs. High-mass stars are those that end their lives in a supernova. Our Sun is an example of a low-mass star; Betelgeuse is an example of a high-mass star. Stars with masses $0.08M < M < 10M$ (which is the majority of them) live quietly and contently, not changing much, for several billion years on the main sequence.

A star begins to die once it converts all the hydrogen in the core into helium. As hydrogen is used up in the inner and hottest part of the core, the relatively inert helium-rich (hydrogen-depleted) core begins to collapse, and in so doing releases gravitational energy. This energy quickly heats up the outer hydrogen-rich layers and ignites the fusion of hydrogen in a thin shell immediately surrounding the hydrogen-depleted core. As this process continues, the hydrogen-fusing shell migrates outward and heats up the envelope of the star, which then causes the whole star to expand into a Red Giant.

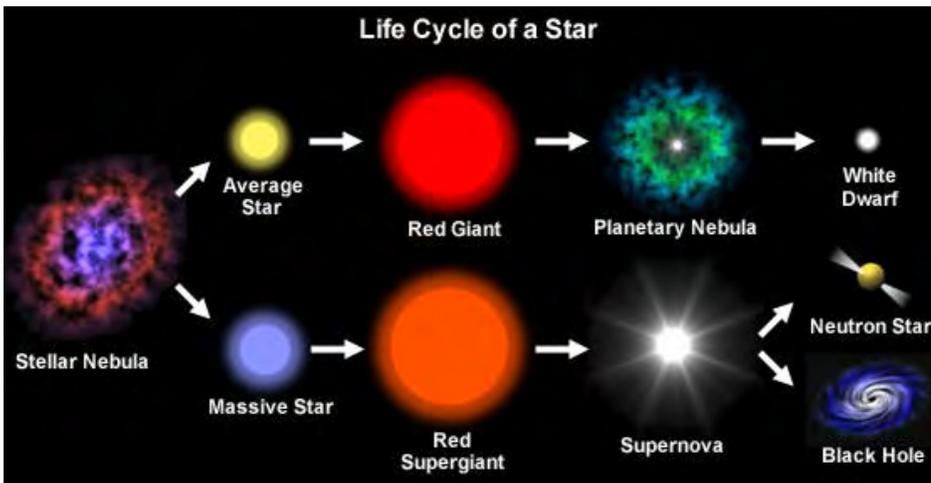

For the lowest-mass stars, core pressure and temperature are not sufficiently high to ignite nuclear fusion of helium. The core then cools while the outer envelope continues to expand. Ultimately, the helium core forms a hot but cooling corpse known as a white dwarf, surrounded by an expanding outer envelope of hydrogen and helium known as the planetary nebula.

The Helix Nebula (also known as NGC 7293) is one of the closest planetary nebulae to Earth (650 light-years away). It is often referred to as the Eye of God on the Internet.

The Helix Nebula is an example of a planetary nebula created at the end of the life of a Sun-like star.

Somewhat higher-mass stars will fuse helium into carbon for a while to produce a denser core composed of carbon "ash" in the center, surrounded by a shell of burning helium, surrounded by a shell of burning hydrogen, which is surrounded by an envelope of inactive (no burning) hydrogen and helium. If the star has even more mass and thus a denser and hotter core, carbon will start to fuse to produce even heavier elements in the center. Another shell of hydrogen burning will form, and beneath it a shell of helium burning.

Death of high-mass stars

In graph we consider the 3 sub-species of stars, the ud, light stars, Strange pulsars (neutron stars) and top quark stars (black holes). The natural evolution of a Given Max T x S function define when the collapse of enough matter can create an w2 x r 3 mass system with enough density of mass to accelerate its time clock beyond c-speed in top quark black holes:

High-mass stars have relatively short main-sequence lives: Max. T =Min. S.

High-mass stars have relatively short main-sequence lives: Max. T =Min. S. A 15M star, for example, lives for only about 10 million years before turning into a Red Giant. And in its death, they reverse their function into the maximal informative element of the Universe, the black star. When the star first runs out of hydrogen to fuse in its core it will behave similarly to lower mass red giants. It will first begin fusion of hydrogen in a shell around the core and the core will heat and fuse helium into carbon. There will also be carbon and helium fusion into oxygen. The star's envelope

also bloats out to very large sizes (Supergiants). The supergiant's core will fuse very heavy elements from carbon and oxygen all the way up to Iron.

Elements heavier than iron cannot be used as a source of energy through fusion. They can, however, be split into lighter elements to release energy, but this process (fission) does not occur in stars. The star takes on an onion-like structure, with shells of different elements fusing into heavier elements, in progressively shorter phases.

For 20-Sun star, hydrogen is exhausted in the core within a few million years and iron develops within about a day (see table below). Ultimately, when the star exhausts its supply of elements in the core lighter than iron, the core collapses in an extremely violent event known as a supernova. The supernova leaves behind either a neutron star or, in the case of the heaviest stars, a black star.

Density/size comparison of white dwarfs, neutron stars, and black holes

A white dwarf consists essentially of tightly packed atoms which constitute the core of a Sun-like star. The white dwarf of a Sun-like star is about 100 times denser than the Sun. A teaspoon of white dwarf material would weigh about 15 tons. The typical white dwarf is roughly the size of the Earth. A neutron star is essentially the core of a star collapsed into a ball of tightly packed nuclei. A neutron star is over a thousand times denser than a white dwarf. A teaspoon of neutron star material would weigh about 4 billion tons. A typical neutron star is roughly the size of a city.

A black hole is the collapsed core of a star so densely packed that it has virtually no size. The infinitely small volume into which all the matter in a black hole is compressed is called the central singularity. The imaginary sphere that measures how close to the singularity you can safely get is called the event horizon. Once you have passed the event horizon, it becomes impossible to escape: you will be drawn in by the black hole's gravitational pull and squashed into the singularity. The size of the event horizon (called the Schwarzschild radius) is proportional to the mass of the black star.

Astronomers have found black holes with event horizons ranging from 6 miles to the size of our solar system, although event horizons can, in principle, be bigger or smaller than this. But in principle, black holes can exist with even smaller or larger horizons. Any object compressed sufficiently can be turned into a black star. The Schwarzschild radius for this object is directly related to the mass of the object. For example, the Schwarzschild radius of the Earth is about the size of a marble (if the Earth could somehow be compressed to this size).

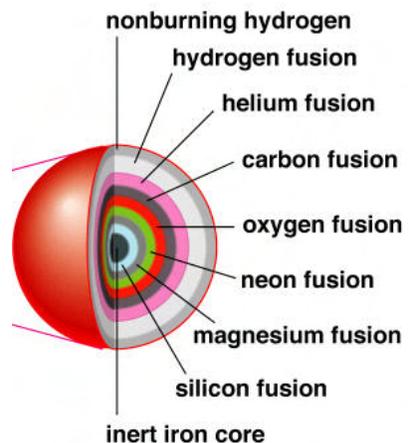

Space symmetry: Internal structure of stars.

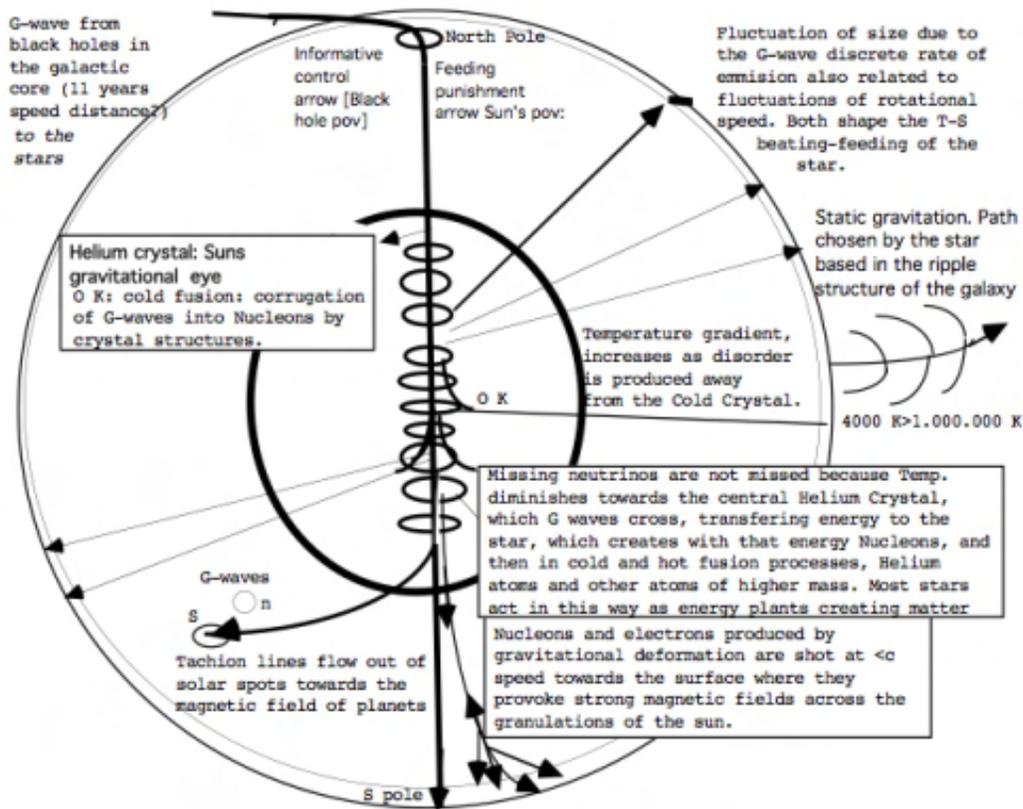

Stars have an ΔSt symmetry equation:

Space Symmetry: $\Delta+2$: T: Photosphere \leq ST: Radiation zone \geq S: Nuclei

5D Asymmetry: $\sum \alpha-1$: plasma particles $>$ $\prod \epsilon$: Stars $>$ $\Delta+1$: Galaxy

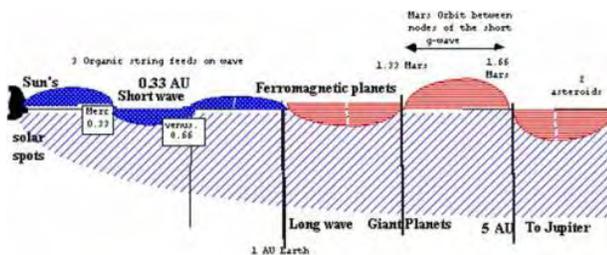

In the graph, the structure of the stars, which should have a central, liquid super fluid Helium vortex, and be able to reproduce cold fusion processes, according to the dualities of time-coldness, and space-heat.

In the graph, the most likely huge error in the modeling of stars should reside in the lack of organic structure and excessive temperature of the different regions of the system, as all what matters to physicists is the concept of energy-entropy. Thus the model considers the star a mere furnace of the different nuclear reactions but besides those models the star, the 'plant-like' system of the galaxy or 'mitochondria' should have other complex structures. Essential to them should be the gravitomagnetic systems that connect the star with the black hole, hinted at the e4qual 11 years cycle of black holes activity in sagittarius and dark spots activity with its cold magnetic fluxes. Given the likely relationship between neutrinos and the background space-time of gravitation different amounts of them might be produced. Of great interest also should be the final connection between those G-waves and the planets, which seem to be placed in its nodal points (Titus law):

Interstellar and inter galactic transversal D-waves = Electromagnetic waves.

We give the general name of D-waves to Dark cosmic electromagnetism, likely related to faster than light (outside the galaxy) Neutrino waves of dark energy=entropy, to the cosmic $>c$ transversal waves between galaxy-atoms (ab. Galatoms); moving at light speed when constrained by the galaxy's light space-time background and inner gravitational forces

If made of entangled neutrinos they 'warp' reproducing light when entering the galaxy (Broglie's theory of neutrino light), as particles entangle in the lower $>c$ 5D scale of quantum potential (Bohm's quantum realism). While they are emitted by galactic black holes in their massive reactions that create heavier quark particles, as jets of dark entropy, unconstrained and escaping back into the dark entropy lower scale of action at distance and null information -for our electronic perceivers of intergalactic scale.

Do D-waves exist within the galaxy? Likely as a quantum potential below and above the range of Ψ -interactions between normal matter. As it happens in atoms where Ψ -radiation has a very different behavior in dense gamma rays

between electrons and protons, D-waves should on the interstellar level be considered rather transversal gravitational waves; which are useful to model interactions and distances between stars turning around the central black hole, hold by the outer strangelet membrane. So astrophysicists use it as tidal waves to model the shape of those galaxies. On that path a deduction of the 5D model, in the graph, is its use at different frequencies, maybe associated to the 3 type of neutrino waves, to calculate the Titus law of distances between planets with 2 waves of different frequency/energy, shorter for ferromagnetic planets than H-He ones, all of them sitting in their reinforced nodal points. In any case we are just highlighting with big strokes a field that will engage professional astrophysicists for decades to come if they get to abandon their Δ entropic models of a single lineal time for everything that exists and then some – so all forces are modeled as a lineal exchange of particles; all births of cosmic structures from evaporating black holes to cosmic big-bangs with entropic time arrows, etc. Yet those entropic ‘arrows’ are just the final, last Dimotion of death of any $T.\infty$ of the Universe and as such they should be demoted in its importance in astrophysical studies at any scale of reality. As it is absurd to reduce the enormous beauty of the Galaxy and its cosmic bodies to the study of its death; akin to reduce the study of biological organisms to corpses. Forensics IS a very small branch of astrophysics. Let us then apply within the range of the known, hence scientific, experimental scales we perceive with enough detail to make serious science, the Pentalogic method to the galaxy, which we just have done in space, studying its scalar and spatial superorganisms, now in time, studying its life ages, of which the ‘little big-bang death’ is just its quasar collapse.

BLACK HOLES: TOP QUARK STARS: S: GALACTIC VORTICES

Δ -1: particle scale: strangelets and toplets.

Hylomorphism – the existence of an Δ -1 space-time $\Sigma T.\infty$ s for all Δ^0 beings, supersedes ‘mathematical creationism’, hence it requires black holes and strange stars be made of a smaller parts, which can only be heavy quarks, whose function is precisely to be the parts of its larger scales:

Black holes respond to the ternary symmetry between the 3 families of Δ -1 quarks and the 3 vital topological Δ +1 parts of the galaxy studied previously:

Δ +1: top quarks->To: Galactic black holes, Δ -strange quark: $S\infty$: galactic halo, Δ -1: Ud quarks (our matter): ST-galactic stars.

Now, in this system, it is necessary to understand the role of the Higgs field and top quarks, which conform the outside-the-galaxy dark matter and dark energy.

Black holes are Kerr top quark stars and frozen stars.

Quark holes can be studied, once we understand their ‘higher why’, from the perspective of topological spaces and multiple space times, which limit is possible species and processes, either as top quark stars (frozen stars in the jargon of Einstein), or as rotational masses with the Kerr Metric; or from the many perspectives, of its structure as a system co-existing within 3 relative Δ -planes of existence. In the graph, its 3 topological regions.

Any organism extends through 3 hierarchical scales. For example, a human organism is composed of cells and carbohydrate molecules whose minimal unit is the amino acid. In the Galaxy there are 3 scales of mass and each of those 3 scales become the fractal parts of the next scale. In each of them we find an informative, cyclical type of mass: quarks in quantum atoms; black holes, which should be top quark stars in star-size black holes; and swarms of black holes in hyper-black holes at the center of galaxies and perhaps the Galaxy.

Thus a hierarchical organic structure grows from those inner parts: its strings become gluons that become quarks that become black holes that form hyper-black holes, in a stair of fractal systems of increasing complexity.

This is proved by the fact that the Black star’s event horizon membrane reduces light to its minimal bits of information (Planck’s areas), whose length is the minimal length of strings, which they *extract from light*. Since strings are both the theoretical components of black holes and strong forces, quarks and gluons, a description of black holes with tachyon,

boson strings becomes the mathematical bridge between both scales. Thus indeed, black holes are fractals of quarks, fractals of gluons and strings (mind the reader though that those strings have fractal dimensions, are background independent, tachyon strings, defined by the Nambu's actions, not superstrings, a baroque fantasy of Pythagorean Physics).

Each of those scales becomes the informative center that interacts with a reproductive body of electromagnetic electrons, stars and galaxies. Let us then study black holes in their interaction with its bodies, galaxies that explode in its big-bang death as quasars.

S regulate that body black holes emit dark Entropy through its poles, creating the membrane of gravitation that 'positions' stars, as protons position with their gravitational and magnetic fields the electronic nebulae. Since gravitational Space-time is formed by the maximal informative entities of the 2 scales, protons and black holes. For all those reasons, we prefer the names:

-Frozen stars (Einstein's name), since they are top quark stars.

-Kerr's holes; since this is the rotational metric or black holes.

-Or top quark stars, because it expresses the fact that the black hole is a door to the other 'world' of dark Entropy, which it emits. While the name black hole, invented by Wheeler, to substitute Einstein's name after his death and push in this manner his singularity theory, implies nothing is emitted by the hole.

In that regard, science when it is built to respond *all* the questions that exhaust the truth of the system, the what (experimental evidence), the who or how (causal logic), the when (metric spaces) and the why (topological time arrows) *has also an inverse hierarchy of truth*: Once we determine *what* we want to study, we must observe its *why and how* – its topological structure and causal logic combined (how/who) - and only then enter into the details, analyzing with clocks and instruments of science, its metric properties.

The excessive use of machines of measure, overdeveloped by the Industrial R=evolution has obscured that hierarchy, which limits with the *experimental what*, and the *why and how of topological time arrows*, what things are certain and what are just mathematical fantasies of 'baroque artists' of metric spaces, which are so common in the study of black holes due to the lack of experimental evidence on its details. Let us then study reality as it is, not as 'Touring machine' resolves it with an excess of metric information that ignores the deepest why and necessary isomorphisms of the why-Galaxy.

Frozen top quark stars.

Frozen stars are similar to nucleons: huge condensates of top quark-mass that create vortices of gravitational information with a negative curvature in the dimension of height. Hence, they exist in a discontinuous gravitational Galaxy beyond the c-speed and 0 K limits of Entropy and information of our Galaxy, emitting and absorbing dark Entropy at higher than light speeds and ultra-cold dark matter, perfectly ordered, probably under 0 Kelvin.

In that regard, the closest species to a frozen top quark star is a neutron star, composed of super fluid neutrons and strange liquid in a boson state, occupying a minimal space. The difference of density between a neutron star and a Top quark is small. So a Frozen top quark star could be the next evolution of a strange quark star with a 'lighter' cover of strange quarks on the event horizon, 'breaking=killing' the symmetry of our matter, packed then in a boson, super fluid solid state of bcb atoms and top quarks. Since the sum of the transitional weak bosons, Z and W *equals that of a top quark*. Thus: $\Delta+p=Z+W=Top\ quark$.

The 2 poles of the top quark star.

Thus the main error about Top quark Holes is the idea that since we do not see them emitting Entropy and matter-information at lower than c speeds, nothing escapes a Top quark Hole. This is a theoretical absurdity (things don't 'disappear'), which now has empirical proofs of falsity. Since we observe vortices of mass and radiation that surround

Top quark Holes, reaching super luminal speeds before dying into pure gravitational Entropy according to the Lorentz transformations.

And we observe bursts of matter and radiation coming out of the poles of central Top quark Holes in quasars at super luminal speeds. So Top quark Holes do emit dark Entropy and information at super luminal speeds through its 'axis', as atomic nuclei emit magnetic fields in their rotation.

The Relativistic equations of Top quark Holes show that duality since Top quark Holes appear with 2 solutions: one with implosive, informative parameters and the other with explosive, energetic parameters. Thus according to those equations a Top quark Hole 're-absorbs' radiant matter and light, dissociating the photonic particle-state and wave state of light, hence 'killing it'. both beyond their Lorentzian limits of c-speed, back into its ultimate components: photons evolve into electronic nebulae, and then collapse further into quarks, which become part of the Top quark Hole body or are ejected as quark beams; while light reaches infinite red shift and becomes dark Entropy.

Because the parameters of density of a stable black hole are self-similar to those of a top quark star, and that is the limit of density of mass in the Galaxy, it is easy to infer that black holes have in its center a super-fluid vortex of top quark stars; and so we can consider dark Entropy to be the 'gravitomagnetic field' of those top quark stars.

As in the case of the 3 solutions of Einstein's space-time, which correspond to the 3 ages of the Galaxy but physicists dissociate in 3 different Galaxies in space; physicists have deduced that those 2 solutions to the Top quark Hole equations create 2 different type of 'black and white holes'; when according to space-time duality they represent the 2 organic regions of the same gravitational hole. Hence we could call Top quark Holes also 'mulatto' holes (-;. Though we will use the term *top quark star*, more familiar to cosmologists. And define its $E \leftrightarrow \circ$ Generator equation:

Top quark Hole (max.T: external membrane: event Horizon) <Wormhole> White hole (Max.S: Kerr ring)

Quantum cosmologists never discovered white holes as independent entities, because they are part of the top quark star.

Topological regions of a top quark black sqstars.

Unfortunately quantum cosmologists ignore the inner structure of a gravitational hole as a fractal point with 3 zones that explain them:

- *Max. T: The event horizon* at c-speed is the energetic Riemann membrane that absorbs radiant matter, breaking it into its minimal units, 'Planck's areas' that become the strings of dark Entropy that feed the hole.
- *S≈T: The intermediate zone* transforms radiant particles and Entropy into quarks and dark flows of gravitational Entropy. It seems to be a super fluid solid: a vortex-like structure of quark condensates and gluons.
- *Max.S: The central region* around the polar axis or central, informative, hyperbolic, negatively curved nucleus.

That informative center is the final 'eye' of the gravitational hurricane, the white hole of the top quark star. It emits through its poles Entropy and information in the form of dark, quark matter and gravitational waves of dark Entropy in super luminal jets that we observe indirectly around far away quasars, as they become again slower radiant matter, creating irregular galaxies. Thus white holes are the poles of top quark stars, which indeed are the doors to the gravitational world of dark Entropy and quark matter that dominates the Galaxy, as cosmologists have discovered.

The equations of a top quark star show how it transforms the spatial, energetic parameters of the electromagnetic world into the inverse, informative parameters of the gravitational world, since a top quark star is an ultra-dense mass of highly ordered 'boson nucleons', packed into a single point of space...

Continuous physicists used to believe that the accelerating vortex reached infinite Entropy values in the central point or singularity, since they do not model masses, charges and Top quark Holes as physical vortices of mass with a Radius, R_0 , that represents the discontinuous limit between the external, body cycles of the Non E-point and its inner, still, informative region or brain, in this case between the vortex of stars and the still Top quark Hole brain. Yet because

infinities cannot be calculated they renormalize their equations beyond a certain limit in which they postulate 0 charge or 0 mass.

In fractal cosmology those tricks are not required as top quark stars are modeled with Non-Euclidean topologies, which have always 3 regions separated by asymptotic membranes.

Thus fractal theory solves the problem caused by continuous infinite singularities, as Planck solved the problem of continuous, infinite temperatures, when he introduced fractal light quanta.

In organic terms, beyond the event horizon of a Non-Euclidean point, the Klein disk starts and beyond R_0 , a discontinuous, inner radius separates the body from the informative, still brain.

In the galaxy the event horizon is the halo and this final radius is the horizon of the top quark star. In the atom, those 2 horizons are the external Electronic radius and the inner Bohr Radius, beyond which we find the proton Top quark Hole.

The same pattern of 3 regions is found in a Top quark Hole as a Non-Euclidean point. The event horizon is the external membrane. Then the point in which the equations of a Top quark Hole reach $T=0$ is the inner R_0 radius.

(This is the point in which Hawking says Top quark Holes become negative in time and convert themselves into time machines)-: We already argued Mr. Hawking's confusion of physical time, a change in the direction of motion, $v=s/t$, and absolute time, a hyperbolic error of the Cartesian graph. Time in physics is change in the direction of motion. So what $T=0$ means in a Top quark Hole is that we reach the region in which the cycles of the Top quark Hole's body end and we enter the hyperbolic, high central tube that ejects dark Entropy. At this point time - understood as change in motion - halts and the Top quark Hole enters the white hole region of production of dark Entropy, asymptotically perpendicular, with the form of a Belgrami cone.

The equations of Top quark Holes show also their event horizon as a bidimensional *killing* field that destroys the entropy of our Galaxy, since it kills our Entropy/matter into its ultimate units on the Planck's scale, *lowering as in all processes of death our components two scales down into its fundamental physical units.*

In the biological homology, a human being is composed of cells themselves composed of amino acids that act as the minimal units of life. So when an organism dies it suffers 2 deaths: first its cellular tissue is broken into pieces that feed the stomach of an organism, which will destroy it till its minimal amino acid units, used to recompose the organism's own cells.

When we study mathematically Top quark Holes they show also a dual process of destruction of light matter to its ultimate components, Planck areas or strings, used then to reconstruct the boson quark condensates of the Top quark Hole and its dark Entropy.

Thus top quark holes in their feeding processes destroy light matter till it absorbs its Planck's areas, the minimal units of information and Entropy of our physical space-time, the equivalent to the amino acids that the stomach absorbs.

Then those Planck's units, become lineal tachyon strings to form dark Entropy and cyclical strings or gravitons, the minimal units of the mass world, evolving into bosons and quarks.

Those quarks and dark Entropy is then expelled through the poles *to balance the expansive entropy of our membrane and create an immortal Galaxy.* Indeed, the expansion of space-time in the Galaxy is cause by the expansion of dark Entropy coming out of the Kerr top quark holes' poles; yet black holes also implode light into quark matter and the overall process creates a wobbling, dynamic balanced, zero-sum of fractal expansions and implosions, in a Galaxy that will never die.

Recap. We define a rotating *top quark star* as an organic topological structure, which uses the event horizon membrane to absorb radiant matter and Entropy through its central, ventral plane, which transforms it into ultra-

dense top quarks and gravitational dark Entropy, expelled in perpendicular jets through its central, hyperbolic axial *white hole's* pole used to control the body of galactic stars and communicate with other Top quark Holes.

The Existential Cycles=Time arrows of Black stars.

Wormholes follow the 4 energetic, informative, reproductive and social arrows of all existential systems of reality: They feed on electronic matter, nurse galaxies and stars, and reproduce in momentum collisions with them, evolve socially in super-Top quark Holes (galactic center swarms), and as the 'long-lasting' informative neurons of the galaxy and Galaxy, whose networks they create, its generational cycle lasts as long as the entity that hosts them (the same happens with neurons, the informative network of our body that last between birth and death). Let us study those arrows in more detail:

- *E>O: The main cycle of a Top quark Hole is informative.* It creates quarks from electroweak matter and orders the galaxy into spiral forms through gravitational waves that 'position' the stars while symbiotically feeding their centers with Entropy that degenerates into matter. Thus the top quark hole emits dark waves of gravitational information to control the galaxy.

Those informative waves of Top quark Holes fed the energetic needs of stars, which therefore become chained to those waves without knowing its final demise - as gravitational plants, guided and herded by Top quark Holes towards the center of the galaxy to feed them:

- *It<E: Their energetic cycles balance the entropy of the light-world.* Wormholes first erase light and radiant matter, feeding on gas and stars; and then renew it, creating new jets of pure dark, gravitational super luminal Entropy and quarks that enter back into our Galaxy as light and proton matter. If insects eat dead matter to renew the Earth's ecosystem, the top quark star inverts the time/space coordinates of the light-world to renew it.

They act as 'the antiparticles of the white cosmos' that annihilate radiant matter. Kerr top quark holes absorb Entropy from our light membrane by red shifting light, with different signatures according to their relative mass. The background radiation must be interpreted as the signature of 2.7 'background holes'.

Bigger, older Kerr top quark holes of galactic mass are below the Background radiation curve and so they *can red-shift and absorb electromagnetic Entropy from it, feeding in this manner on the electromagnetic membrane.* For that reason the galactic map of the background radiation has a central zone, with lower temperatures corresponding to the giant central, colder top quark hole.

- *Reproduction:* Wormholes control the reproduction of stars, which in turn reproduce top quark stars. Since when a small top quark star crosses through a star, it catalyzes its explosion into a nova that leaves behind a neutron star or a top quark star. On the other hand, the 'reproductive DNA center' of giant galaxies is a massive top quark star structure that emits huge super luminal jets of quark matter, which catalyze the reproduction of stars, creating irregular baby-galaxies.

- *Social evolution.* The top quark stars that occupy the informative center of galaxies are like the nuclei of cells, swarms of Top quark Holes, which regulate the life of galaxies, as DNA does with cells. In the next scale, the dark Entropy flows ejecting by galactic black holes communicate galaxies, creating the networks and walls we observe in the grand scale images of the Galaxy.

Recap. Black holes follow in their events the 6 arrows of time. They feed on the electromagnetic membrane and its species; they perceive gravitational information; they reproduce stars and galaxies and they evolve socially into swarms in the center of galaxies and into galactic networks in the Galaxy.

The 3 organic roles and types of top quark stars in galaxies.

By homology with any other non-Euclidean space-time that resembles a cellular organism, and the *Isomorphisms of ternary differentiation of all topological species*, we can consider 3 types of top quark stars whose roles within the

organic structure of galaxies will obey *its arrows of time but will also become essential to the bigger organism in which they exist.*

This simple rule, which we shall apply to all systems, is a tenant of the organic structure of the Galaxy – we differentiate species in ternary sizes, ternary topologies, ternary ages and ternary functions, which must be symbiotic to the higher $\Delta+1$ organism in which the entity exists or else the organism would not ‘tolerate’ the presence of the microcosmic species with no function:

- *Intermediate, reproductive $S \approx T$ zone: Spiral arms.* Non-rotating top quark stars are born from dying stars. Then they form bi-polar systems with other stars feeding on them, taking advantage of their gravitational control, finally transforming the biggest stars into new top quark stars. Those top quark stars probably gather into social groups, which fuse in bigger top quark stars and move towards the center of the galaxy where they can feed easily on its dense herds of stars, creating at the end of the process a central nucleus.

- *Max.Information: Nucleus.* A top star nucleus is a huge rotational, ‘Kerr hole’ or perhaps a herd of Top quark Holes similar to the DNA nucleus of a cell. It is the informative brain of the galaxy that controls its fractal beings, the stars, with gravitational waves that shape the rotating movement of the galaxy, and establish its feeding rhythm:

The galactic Top quark Hole first attracts interstellar gas to the intermediate non-E region, where gas reproduces stars, and then it sends that gas to the central top quark star that consumes it. In the same manner, electrons, the ‘stars’ of the atom, feed first on light quanta and then emit high-Entropy photons to feed the atomic nucleus.

Those gravitational waves also guide in old, globular galaxies, the stars toward the feeding center. Yet there might be other structures of dark matter, coming out of the nucleus, similar to the Golgi apparatus of cells: invaginations through which top quark stars might flow into external zones of the galaxy to control the reproductive and destructive processes of stars.

Finally, the central hole emits through its polar zones, dark Entropy, super-luminal gravitational waves that probably communicate galaxies at super luminal speeds, forming the strings of galaxies observed in the Galaxy. Since according to string Theory gravitation in free, intergalactic space is not warped by electromagnetic branes that feed on them inside galaxies and limited to c -speed.

- *Max. T: Membrane.* Though we cannot see the galactic membrane made of dark matter, by homology Non-Euclidean topology hypothesizes that the halo is the energetic membrane, where small top quark stars called appropriately MACHOS, have functions similar to globular proteins in cells:

They create and control that galactic membrane of dark matter, which closes the galaxy as a black body; causing the background radiation, which according to recent empirical data might be local: They red shift light to 2.7 K, which becomes the metabolic temperature of the galaxy. They reproduce new stars and expel matter and radiation beyond the membrane: Since their rotation is perpendicular to the galactic plane they could create a positive or negative spin, depending of its orientation, provoking flows of Entropy and information in and out of the galaxy. Those outward or inward flows fine-tuned with the dark Entropy jets of the Top quark Hole should move the galaxy at the will of the central Top quark hole

The interaction of the membrane and the central Top quark hole should encase all other species as a perfect Max. T x max. It ‘upper class’ of the galactic organism in complete control of its inner parts.

Recap. There are 3 types of top quark holes that control the membrane, inner center and herd the stars of the galaxy.

The big bangs of the 3 types of top quark stars

The homology between the 3 sub-species of Top quark Holes and the 3 regions of a galaxy explain the 3 possible scales of feeding and big-bangs of those Top quark Holes; and the *functions of the lesser electromagnetic species for the top predators of the galaxy:*

- Micro-Top quark Holes, Background MACHOs would eat up the commonest celestial bodies, planets and moons. This is our function; and the fact that we do not hear intelligent life in the galaxy and that CERN is going to do black holes to 'see' if they evaporate could explain how indeed, all moons become background MACHOs and all planets are blown up by 'metric physicists' unaware of the 'why' of black holes, stuck in the 3rd paradigm of using machines to measure the when of reality. This smaller top quark holes would then migrate to the Halo of the galaxy closer to our planet.

- Medium Top quark Holes formed in dense star centers, feed on them, causing supernovas, creating intermediate Top quark Holes that migrate toward the center, forming the DNA nucleus of the galaxy.

- While galactic Top quark Holes would explode into quasars, (galactic big-bangs). And/or as 'dark galaxies', recently found elsewhere, without emitting light, migrate towards the 'Great Attractor' or hyper-black hole at the center of the fractal 'cell' of the Galaxy in which we exist.

Recap. We might be just food for top quark holes, which are born and feed on the 3 scales of electromagnetic matter of the galaxy: planetoids, stars and entire galaxies.

The Top quark Hole as a Gravitational, Informative Mind.

The center of the galaxy is occupied by a giant top quark star that seems to be the final, social, evolutionary stage of multiple galactic Top quark Holes, born out of the evolution of stars. It acts as the gravitational DNA-mind of the galaxy - a hypothesis, which mechanist science will always ignore. But we want to stretch your understanding of the 4th 'why'-paradigm, describing those mind holes with the isomorphisms of Non-Euclidean geometry and superorganisms.

A galactic top quark star is a rotating object, which has a minimal spatial size and a huge dimension of height since it is made of boson, super fluid quark condensates. Its homology with a cellular, informative center, defines a central galactic top quark star as an enormous gravitational informative center, which controls its galactic body, positioning its star quanta through gravitational waves. In fact, when we calculate the top quark star's informative parameters, it turns out to be a perfect super fluid computer, with maximal informative volume since its speed of calculus equals its speed of transmission of information.

The coldness of the top quark star proves also the informative hypothesis: In fractal space-time coldness means order, stillness, necessary to create in the center of a crystal or a cryogenic CPU, or a super fluid top quark star or the focus of an eye, the informative, boson accumulation of pixels that shapes a still, formal, fractal virtual image, without friction, without blur. Thus, the eye of man is cold. The brain is colder than the blood. The chip works better at cryogenic temperatures. And a top quark star is very cold, made of quarks in super fluid, highly ordered states.

Wormholes do create a complex virtual image of the galaxy with its strings. Physicists explain those processes in abstract when they affirm that a top quark star has an extra 5th dimension and its equations are homologous in 5 dimensions to those of the 4-dimensional electromagnetic world of the galaxy it represents (Maldacena Conjecture).

The description in 5-string dimensions of a Top quark Hole is completely equivalent to the description of an electromagnetic galaxy in 4 dimensions. Thus as our brain has a 'homunculus image' of the entire body, which is what we perceive; the top quark hole can build a 'galunculus' image in its interior. The 4th 'why' paradigm provides the reason of the conjecture: the 5-dimensional world of string holes is equivalent to a 4-dimensional world; because it is the map of our galaxy, made by the Top quark hole's mind.

In topology the central zone of any st-point is an informative region, whose dimensions are the sum of the body and membrane dimensions. In cosmology the galaxy is a body-like vortex of reproductive stars and the central top quark star is the eye of the vortex that creates an image of the galaxy, as the brain maps out the body.

The hyperbolic center of higher form/information has more dimensions than the energetic bidimensional membrane and the reproductive toroid; since it holds the holography that combines the image of the external world imprinted in the 'senses' of its membrane, and the image of its internal, reproductive functions it commands. Since our galaxies have an external bidimensional halo and an internal 3-dimensional vortex of stars (a bidimensional plane with an

added dimension of rotational motion), we can easily calculate with the general isomorphisms of the Holographic, central mind, the dimensions of a black hole:

Bidimensional external membrane +3-dimensional cyclical volume:

5-dimensional hyperbolic nucleus.

This simple law derives of the general law of dimensionality of the 3 regions of a Non-Euclidean topology:

Information of hyperbolic 'brain'= Information of Klein's 'body' + Information Riemann membrane

And it is the origin of the Maldacena Conjecture (a black hole, informative center of the galaxy has in 5 dimensions the same structure than a galactic mapping in 4 dimensions.)

What this means is that the Top quark Hole must have an inner image of the galactic body, which it orders with its gravitational flows and an external image of the Galaxy in which the galaxy, its body floats, to direct its form toward fields of Entropy (intergalactic gas) and connect itself with other galaxies. This is what we observe galaxies do.

They form walls, strings and complex clusters with other galaxies and they feed on intergalactic gas and smaller galaxies. So they act as cells in a gravitational, organic soup and must have as cells and organisms do an informative, processing center able to have an internal image or mapping of its stars and an external connection that informs it of the outer world. However, we see only a 4% of the galactic structures; *the rest is the dark Entropy and dark, quark matter that the top quark holes perceive to map out reality*, which is like trying to recompose a cell, in which we only see its mitochondria.

Another proof of this higher dimensionality is given by the Kaluza-Klein models, which explain our perceived electromagnetic 4-dimensional world and the 4-dimensional gravitation over which the network of light is imprinted, as if they were born from a larger 5-dimensional gravitational world. Finally, gravitons are the only particles that can have 5-spin positions=informative dimensions. Thus, all those self-similar theories point out to the fact that we are a floating membrane within a bigger, faster, more complex Gravitational Galaxy.

Recap. In fractal cosmology the central discontinuous zone of a fractal point is an informative region. This is the role of Top quark Holes in galaxies, forming with other Top quark Holes, communicated through flows of dark Entropy, the informative network that controls the Galaxy. Therefore it has the dimensions of its membrane and inner body of stars.

What degree of organic determinism exists in the galacells, and does it include the role of man within it? It seems to do given the way in which huminds are pushing the creation of black holes and strangelets on this planet (accelerator industry) with the excuse of testing the hypothetical big bang, which will be just an ice-9 or gas-9 reaction (transformation of Ud-matter into USD-matter or TBC-matter), and the lack of Intelligent Life in the cosmos or for 'that matter' in this planet. But those are themes of bio-history... as it would be absurd to make of a small ribosomal particle of the galacell, the center of our astrophysical inquire.

T: NEUTRINO AND LIGHT BACKGROUND

T: Neutrino-light backgrounds.<ST-ars>S: Black holes

T: Background Radiation: Basal Temperature of the Galaxy

As any system can go in more detail, by looking closer to its fractal parts, we can go deeper and deeper in the analysis of the whys (biologic and topologic), whens (mathematical and metric), how/who (Logic) and what (experimental) questions of knowledge. Let us consider thus in more depth just one of all the elements of the galaxy studied here – the organic role of the background radiation - *the water of the galaxy...*

The background radiation coincides with the radiation of a black body at 2.7 K degrees. Since in Non-Euclidean topology any fractal point is a black body; that is, a point with minimal apertures to the external world, a galaxy will

only emit background radiation through its Halo, in which background holes will redshift light at 2.7 K. Thus the galaxy surrounded by a halo of quark, dark matter can be considered a black body emitting at present time as an isothermal organism does a background radiation, whose organic function is to maintain a homogenous temperature, similar to the organic temperature of living beings and ecosystems, kept by its water. Thus, the background radiation acts as the cytoplasmic Entropy of galaxies with 3 functions:

- Max.T: It provides Entropy to its bigger, colder Top quark Holes and its super fluid helium structures (not treated in this introduction to complex cosmology). Both happen to have a temperature slightly lower than the background radiation from where they can extract Entropy.

- S=T: It acts as the membrane limit, between the gravitational and electromagnetic membrane, within the galaxy, separating both worlds. It maintains also an isothermal temperature, as any organic system maintains a stable temperature.

- Max.S: It establishes a fixed frame of reference for the galaxy, *allowing the process of information and measure, location and communication defined by Gauge Theories.*

The background radiation is the 'Entropy soup', the cellular water of the galaxy that feeds its dominant RNA, its Top quark Holes; as the hot water of the cell allows RNA molecules to move, kicking left and right water molecules with its COOH legs. Indeed, we know that only organic systems have a homogenous temperature. For example, humans have a homogeneous temperature within the limits of liquid water. So the 2.7 K homogenous background radiation reinforces the organic hypothesis.

Quark matter is *the top predator form of the galaxy; hence they are the entities, which, as the elephant on the savannah or man on Earth, or aerobic bacteria in the earlier planet, have redesigned the galaxy with their organic activity.* In Gaia, water, the equivalent to that background radiation, maintains a stable temperature, thanks to the feeding, energetic activities of its life organisms that avoid abrupt climatic changes. Without aerobic life the Earth would be like Venus - a planet with extreme temperature changes. Now it is almost isothermal. So happens to your body which has 36.5 degrees all your life, due to your organic activity as a water organism with 2 networks, a warmer blood and a colder, nervous, informative system.

So happens to the galaxy, in which the basal temperature of the background radiation separates the ultra-cold world of Top quark Holes and dark, gravitational matter and the hot world of atoms and radiant matter, allowing the exchange of Entropy and information between the 2 physiological networks that structure the galaxy.

Recap. Background radiation is the Entropy soup, the cellular water of the galaxy that feeds its dominant RNA, Top quark Holes.

A future case of study: anti-neutrinos as the duality parts of photons.

- Neutrinos MUST be worked out, as the only particle with no ternary roles in the Universe at this stage to occupy a fundamental role in several scales of the universe or else they would NOT exist in such huge numbers. Neutrino physics in that sense is the most IMPORTANT field left to explore at this stage. As it has several properties which are coincidental with the roles required to describe the next scale of the Universe, that of quantum gravitational, dark energy and dark matter beyond the known-known level of galaxies.

My take is that neutrinos are NOT the quantum of gravitation as Bohrians think, because it is NOT needed, Albertians are right, attraction in gravitation HAPPENS because of the curvature around a massive central point of view (which makes almost indifferent for most calculus the other mass).

Only when A and B are similar in mass, there is a relationship of linearity and quantum gauging. When one point dominates the other in mass-size and force there is not. And most gravitation systems around a sun, a black hole is of that kind.

Neutrinos do act NOT as forces but as communicators of information about distances.

They are hence similar to strings, in fact of the same minimal length – the Unit of length of the Galactic universe, and thus the ‘structural element’ constantly produced and radiated that webs a, background independent space, related to the ‘magnetic part’ of the light rays, they form together, as neutrino and antineutrino, reason why they are the only particles with left-handed or right handed singlet structure so they will always neutrino + antineutrino, back and forth, form a perfect, planar, longitudinal fixed distance between two particles to start communication between them.

This communication will then be realized by the electric field created by the articles above it,

From an action point of view, they can be seen as the Δe ‘food’ of H-Planck light quanta, and first c- ‘space line’ traced in the communication of particles, the tending of the cables of gravitation and hence also the quanta of transversal gravitational waves, latter studied in more detail. All those roles are possible within different theories of neutrinos but none is fully and well developed (neutrino theory of light, being the key to them. But only as the origin of the magnetic field of light born of two of those neutrinos, which add up the 1 spin of the photon).

Next we must understand neutrino oscillation, growing in mass, from a practical zero-mass till collapsing into a mass particle of the 3 Neutrinos generation – the tau which will be correspondingly much more massive (as Top and Tau quarks-electrons are). So they START UP many reactions, when they collide with particles.

And finally we must give it all the importance as in II-type supernovae they are the bursts of energy when those stars become black holes to form the underlying quanta of gravitational waves, but obviously not attractive but repulsive, quasar –like, nova like transversal gravitational waves –t he fronts of the big-bangs of all scales that carry the energy, repulsive dark energy waves, complemented perpendicularly by the ‘Higgs field’ much more massive scalar hyper luminal waves.

As Big bangs ARE as all systems that die, a broken SYMMETRY of two fields that created, T x S the system and now split perpendicularly as all the pictures of death of stars show – not chaotic explosions but cutting in two of the head-particle/field-entropy elements of the system, no longer in harmony.

Hence the ‘angle of the spins’ of the weak bosons, which merely says they angle upwards through the polar axis, while the wave of neutrinos explodes in all directions, without clear direction as the burst of energy.

This directional DUALITY of explosions of matter hardly understood is what explains the NEED for two particles the neutrino, almost massless and the $W_{\pm} Z H$ bosons with huge mass.

By all this I mean several neutrino ROLES are needed to complete 5D physics with Majorana neutrinos (neutrinos in which the particle and antiparticle are the same), which have mass and must be so far according to the general laws of T.ø, the gravitons of the transversal gravitational waves.

There might be outside galaxies faster than light neutrinos – something, which in the future would be easy to observe if we perceive a neutrino wave before the light wave of a supernova from far away galaxies.

Now essentially if neutrinos as all seems to indicate do have mass, are equal to their antiparticle and have boson qualities with $\frac{1}{2}$ spin, their maths will be really fun. And I promise to get seriously pedantic with them on the 4th line (- ;

Those neutrinos will be the feeding space strings for light beams (theory of neutrinos as origin of light fashionable in the 30s, and worked out by Jordan, Born, De Broglie and Fermi among others).

And any physicists could work out the details for those roles with some not so difficult modifications on the concept of a graviton.

In simple terms, neutrinos have the size of strings (measured in its weak angle scattering); and 2 inverse neutrinos moving back and forth between particles could act as bosons with 1 spin, and give birth to a light single polarized photon. Neutrinos are hyper abundant and with a minimalist mass, could account for the underlying structure of

galaxies as 'organisms' with a formal structure since unlike planets stars do not move at different speeds but maintain the inner form of the 'galacell'.

So the proper understanding of neutrinos as the 'base' over which light transits in the galaxy and the 3 families of masses as the components of its 3 T<ST>S organic parts, would put together all the points of view and isomorphisms of astrophysics.

We shall consider the theme in more detail in the next paragraphs.

In that regard the reader would notice the use of T.Æ, which no doubt as the century goes through and the theory is accepted to substitute mechanism as the philosophy of science that unifies them all, will become more important: to guide each science for the most likely to succeed paths of future research, through its stringent 'economicity' and enlightening isomorphisms.

So strangelets as the components of the Halo of galaxies, top quark hadrons of different BCT combinations as the cut-off substances of black holes, neutrinos as the h-Planck 'strings' of gravitational transversal waves between galaxies and within galaxies, the waves that maintain the stability and form of star orbits (of which I have read a few quite convincing models of astrophysics) are the most interesting 'selections' I have made on my constant 'reading' of astrophysicists' paper, which is all what at this stage of my life can do for the discipline.

On the other side there are theories that do NOT fit at all within 5D T.Æ and I doubt will ever be proved, SUSYs and background dependent string theories should be out of the picture; non-quark dark matter theories too, with all its array of particles. T.Æ is limited because space and time are limited.

And what about the Higgs. As one of the leading activists against accelerators and big-bang experiments on earth, you might think 5D doesn't have a role for it, but it does (given the chances to produce top quark black holes or strangelet that could explode the planet, in this I have been obviously very active, reason why the astrophysical community does not consider 5D Physics, but beyond personal careers one must be ethic as a finitesimal of the superorganism of mankind – and that is what physicists and economists so strongly criticized in my work have forgotten despite whatever they find about nature).

Essentially the Higgs field and similar models respond precisely to the other element of the higher plane of existence of the Universe beyond galaxies, connected to top quarks of huge mass and likely 10 c rotary speed, and black holes and dark energy and dark matter.

In brief, the Higgs is the field of hyper-gravitational and hyper strong force, of 10c beyond the galaxy dark energy and dark matter, which is a taboo concept on astrophysics, because of an ill-understood conceptualization of General Relativity (it is not in 5D physics, as General relativity is a theory of the light space-time membrane or 4Dimension of the Universe, a present 'slice' of the time flow and the 5th dimension).

In their first paper on quantum electrodynamics, Heisenberg and Pauli asserted that quantization of the gravitational field, which appears to be necessary for physical reasons [in a footnote, they refer to the works of Einstein and Klein on that line], may be carried out without any new difficulties by means of a formalism fully analogous to that applied here.

During the thirties, the idea of a gravitational quantum came to be generally (but as we shall see, not universally) accepted by theoretical physicists, apart from the small relativity community that followed Einstein in his continued search for a (classical) unified theory. In the early thirties, there was some discussion of Bohr's idea that the neutrino might be related to the gravitational quantum.

Bohr said to Pauli, (March 1934): 'The idea was that the neutrino, for which one assumes a zero rest mass, could hardly be anything else than a gravitational wave with appropriate quantization'. Fermi had evidently had a similar idea, but was aware of the problem of the different spins.

Pauli to Heisenberg, February 1934: 'Fermi would prefer to make a connection between neutrinos and half gravitational quanta.' As late as November 1934, Pauli cautiously stated: 'While up to now it has been held almost certain that gravitational phenomena play practically no role in nuclear physics, it now seems that the possibility cannot be immediately rejected, that the phenomena of beta-radiation could be connected with the square root of kappa [the gravitational constant]' suggests that Pauli may have had in mind construction of a graviton from two neutrinos, along the lines of de Broglie's neutrino theory of light.

They wrote: 'The comparison displayed above indicates that the graviton and the neutrino have much in common. This probably testifies that in general the highly improbable process of graviton radiation becomes practically observable in beta-decay. If the neutrino turns out to be the graviton this would mean that contemporary physics had approached the limits beyond which there would be no present insurmountable barrier between gravitation and electromagnetism. Due to theoretical considerations it is hard to identify gravitons with the neutrino since it is hard to admit that they have the same spin $1/2$ as the neutrino. In this respect gravitons have much more in common with light quanta. It is impossible, however, to totally rule out a theoretical possibility of their identification.

He concludes:

The so-defined gravitational quanta or 'gravitons' have the... spin 2... It is certainly a limitation of the quantum-mechanical side of this treatment, that one leaves it at that approximation, in which the general-relativistic field equations are linear. This limitation is most closely connected with the well-known divergence difficulties of field theory.

Apart from these divergence difficulties common to all quantum field theories at that time, Pauli, like Rosenfeld, seemed satisfied with linearized quantum gravity. But in 1935 Bronstein had already applied Fermi's technique to the linearized Einstein equations, and came to much more skeptical conclusions, when he opined: 'It is a task of the nearest future to identify the ties between quantum mechanics and the theory of gravitation... what will be needed is a sort of marriage between relativity and quantum theory' He was stressing the crucial significance of the three dimensional constants c , G , and h in defining the past and future development of physics.

Those are the fundamental questions that physicists need to resolve in detail.

What T.Æ provides is the general analysis of the issue from the higher perspective of the organic laws of the Universe.

It is obvious that at this stage 'humans' will NOT accept in the present dogmatic, 'believers' in digital machines languages concept of physics anything like what we propose in this blog. But for very long I have learned to 'eliminate' the human concept of science in these dark ages, moved only by intellectual curiosity. So I write for future Asian generations or for robots, as the present 'civilization' of ego-trips of western men, thinking machines must do their job has no much of a future.

In that future, if humans want to understand the Universe they will develop a synthetic 'above' T.Æ, Organic Theory of Everything, and if they go under as it is likely 'obviously' robots will NEED to feel organisms, and they will 'believe' in T.Æ

So here it goes: T.Æ is Simple, minimalist and dualist. All systems do have 2 organic networks, blood and nervous systems, and the galaxy does have obviously two such fields, the background light and background neutrinos.

This is the fact and so i couldn't care less if in the equations of Mr. Einstein graviton appears at 2 spin and in the equations of Mr. Fermi, neutrino appears at $1/2$ spin. Solve it. Nature has both and makes them unavoidably the same role. There is no other particle in the present state of the galaxy, which exists and can play both roles. Not it will be discovered, because it will have to be on the range of energies of the galaxy, which have been already searched for. It cannot be in cuckoo super-energies as they will not manifest constantly in this universe, and so it doesn't matter if you can unify at 500 zillion Gevs the present forces.

This is not here now and in this conditions> so it doesn't matter here now and in these conditions is all found and so you must account reality with the thing you have found as there is nothing else to find here now and in this conditions.

Work your maths, if you haven't doesn't it is not because it is not there but because something is wrong with your 2 spin graviton, $\frac{1}{2}$ spin neutrino and spin theory. Ok?

In the case we are occupied, neutrinos are by far the only candidate for the basic actions between fermions, as a first step BEFORE the communication through light space-time, which is able to transfer information in much greater measure, starts the organic built up of the galaxy.

So the way to explain the galaxy is first in its organic structure, then in its descending parts, stars and atoms and particles, and then when we start to explain the basic actions between atoms, the neutrino which is the quanta of galactic gravitation, appears unavoidably as the first connection between atoms and particles which lock them at a certain entangled distance for them to start communication. This resolves the fundamental problem on the models in which neutrinos give origin to light, already proposed in the 30s.

The neutrino theory of light is the proposal that the photon is a composite particle formed of a neutrino antineutrino pair. It is based on the idea that emission and absorption of a photon corresponds to the creation and annihilation of a particle-antiparticle pair. The neutrino theory of light is not currently accepted as part of mainstream physics, but actually is quite straight forward in its maths. That is it is perfectly coherent.

CONCLUSION THE CELLULAR GALAXY.

Galilean relativism (*e pur si muove, e pur no muove*) implies that depending on which kind of energetic or informative force we use to observe certain reality, we will perceive it either as a fixed, spatial organism (the Universe perceived with gravitation) or as an evolutionary species in motion through time (the Universe perceived with slow light).

So we see either a moving Earth and a fixed cosmos, when we see them through gravitation, or a quiet Earth and a moving Universe when we see them through light.

Since gravitation, the force that shows a spatial, synchronic Universe is invisible to our instruments; astronomers only study a temporal, diachronic Universe, perceived with light. However there is a universal organism in space, self-similar to any other Fractal point. Since once the evolution of the hypothetical cellular Universe concluded in time, creating the 3 regions of any fractal point, the Universe structured itself in space, communicating those 3 regions through simultaneous non-local gravitation. Let us then study those 2 sides of a hypothetical cellular Universe - first the spatial, organism of the Universe and then the temporal ages of creation of that Universe in the next paragraph.

If we perceive the Universe from a temporal perspective through its slow force, light, it appears as an evolutionary process of matter, coming out from the genetic 'big bang' singularity of a local, cosmological first cell - the hyper-dense singularity of the big bang (which went afterwards through a cold, reproductive 'big-banging' or creative, informative process, later studied in more detail).

Yet, when we observe the Universe simultaneously in present space (first picture of the previous graph), thanks to its faster force, gravitation that allow the parts of the Universe to interact, those far away regions become integrated with its closer regions through the informative networks of dark Entropy, NOT through the light, energetic networks of galaxies and stars, explaining its homogeneity. Again this is a generic law of complementary systems, as any organism is defined by its informative, nervous network that gives it its form.

Of the two possible 'scalar' theories of such Universe, one of infinite scales in which galaxies are atoms, and one in which universes are fractal 'cells' of a hyper-universe, broken in 'bubbles' of a fractal inflationary big-bang with a limit, the first one would imply a huge universe, in which we are just a 'hydrogen-like atom' of an enormous interstellar cloud. The second theory however would imply a structure within our 'cellular Universe', in which non-local, faster than light gravitation creates an organic Universe, structured as a fractal point, with its 3 canonical, topological, Non-Euclidean zones:

-*Max.S*: The cellular Universe should have a nucleus of enormous gravitational mass, a hyper-top quark hole, connected to a network of dark matter, which acts as its informative brain, since it forms through non-local gravitational forces the shape of its galactic networks, as the DNA nucleus of a cell controls the form of the organelles that reproduce its proteins.

Though the nucleus is a gravitational knot invisible to us, we have found a very dense region of dark matter called the Great Attractor towards which many galaxies, including ours move, which might be that center. That informative singularity will keep growing and attracting other galaxies in a generational cycle, till it explodes again its form into Entropy in a physical big-bang, similar to the one that might have created our Universe.

-*Max.T*: An external Entropy membrane not to confuse with the galactic light background radiation and the dark Entropy spelt by galactic Top quark Holes, (which quasars show to reach a limit speed of $C < v < 10 C$ redshift). There are hints of this possible final wall in measures of dark Entropy expansion over $10 C < V < 100 C$ at the limits of the Universe. But proofs are scant as we need better telescopes to obtain them. Thus we shall call this dark Entropy, the super dark Entropy, or next fractal scale of lineal forces.

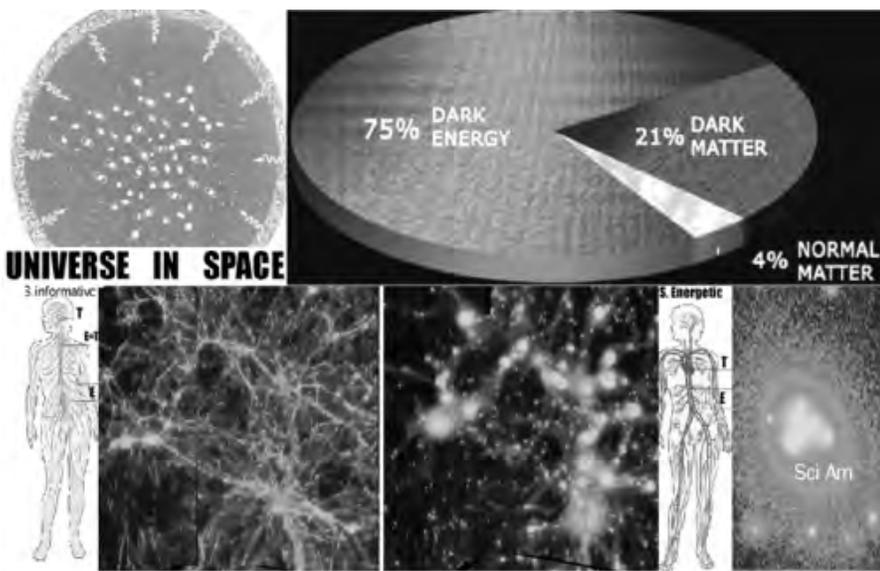

- An inner E/T region with galaxies that reproduce matter and light. It is the visible space-time created, according to the duality of physical big bangs/big bangings: after the invagination of the inner nucleus of dark matter that clearly directs the movements of galaxies. In this inner region dark Entropy at $C < V < 10 C$ communicates galaxies; while

radiation matter is the food of dark matter. Thus galaxies form an energetic, electromagnetic network of galactic mitochondria, which reaches its maximal density in filaments of galaxies, (near the center of the Universe).

Such cellular Universe has an energetic, electromagnetic network of radiant matter similar to the blood network of a living organism, which weighs only a 4% and reaches its maximal density in the external membrane and the filaments of stars, (center). And it has an informative, gravitational network similar to a nervous network, which reaches its maximal density in the hypothetical hyper-top quark Hole, brain or central singularity of that cellular Universe, the Great Attractor.

This network weights a 21%. Both feed on the intermediate space-time region of gravitational space-time (dark Entropy, which is the 75% of the Universe and acts as the 'water' of the Universal organism, also the maximal weigh of a living being; or as the background radiation of the galaxy, also its most common substance). This coincides with the general rules of proportionality between spatial bodies and informative heads, which are in a 3 to 1 proportion. That is, indeed the proportion between radiation pressure and mass; dark Entropy and dark matter, and many other informative/energetic parameters of the physical Universe.

The cellular Universe as a fractal part of the higher structure.

It seems quite evident that the organic laws of systems do define a Universe similar to any other organic system. Let us indeed make a comparison between a biological and cosmological 'Universe':

The Local Universe seems to have a dual network structure—electromagnetic Entropy and visible matter vs. quark, dark matter and dark Entropy, which forms its faster networks of information, the membrane of gravitation. It is the organic hypothesis of a Universe made of 2 networks of dark matter and light Entropy - cellular galaxies, which form a simply connected system, similar to a colonial tissue, with the apparent form of a semi wave in grand scale images perhaps,

belonging to a bigger Hyper-Universe.

In the graph, in T.Æ all Universal systems have the same symmetric structure in fractal space and cyclical time:

$T(\text{limb/fields of maximal entropy}) > ST (\text{Balanced body-waves of energy and information}) < S (\text{heads-particles of maximal form})$

Which co-exist along 3 scales of the 5th dimension:

$\Delta-1$ cellular-atomic scale \circ Δ -Thermodynamic-Organic scale \circ $\Delta+1$: Social-Cosmological Scale.

And live 3 ages in time between conception and extinction:

$\Delta-1$: Max. S: Conception $< \sum \epsilon \circ |Ps: Energetic Field-past-young age > e xi$: Reproductive present wave $> S$: Particle/solid state $\vee \Delta-1$: Big-bang Death.

This simple structure, applied to any system of the Universe, provides us a simple guidance to study the fundamental scales and systems of physical nature.

The grand scale images of the Universe show a structure with the form of a half wave, which can be anything in that upper scale, from a half light wave to a top quark like micro-organism. It might also be possible that as stars form spiral vortices, the mapping observed in the previous graph is the outer cover of a spiral Universe, with a central zone of hyper-top quark Holes, which would act as the nuclei of an atom.

We can't know what is the next scale of form of the Universe, because we have little evidence, as most is dark matter and Entropy whose form we can't deduce and because all scales of reality are self-similar so we cannot easily distinguish them; as we could not distinguish a bottle of beer with a bad picture of it.

The verification or not of a cellular Universe could be done by the Webb telescope testing the existence or not of a limit at 13 billion years - a dark region or wall of fire, which perceived in space would look like the first picture. Then we could reasonably think that the local Universe hosts around 10^{10-11} galaxies in a cellular structure separated from other parallel Universes by a wall of dark radiation at $z=10-100$ C.

Recap. Super luminal gravitation and light are the 2 forces that interact in the Universe, which as any other Non E point should possess 2 networks/forces: the informative, faster gravitational force that structures the position of galaxies; and the electromagnetic force that acts as the 'blood/energetic system' of the Universe. Such Universe in space could be a cell of a hyper-universe or a huge reality in which each galaxy is a self-similar atom, with a background light-space.

So the Higgs whose fundamental reaction is Top quark + Top antiquark \leftrightarrow Higgs, acts as the photon acts in this membrane, which as we all know reproduces constantly virtual particles and antiparticles, or as the gluon acts in the strong force which reproduces quarks and anti-quarks on the lower USD decuplet. All those are essential symmetries of 5 D Physics. And so yes, the Higgs does have a role.

But beyond that role, there is something called scientific ethics within T.Æ which is a unification theory that does not 'split' sciences from each other, but 'make them all' correspond to a role within the Human superorganism of history. So all sciences do have an obligation to contribute to the future of mankind. And that is why I opposed so many years to CERN. Simply speaking, Higgs production of top and antitop quarks is dangerous. They could form black holes on earth that would not evaporate. As other experiments that produce quark-gluon soups with hadrons are dangerous as they could reproduce strangelet that would swallow the Earth.

Those are known known physics in 5D models. They will happen, if mankind keeps doing big-bang and Higgs experiments. And while in standard physics they are also possible, in 5D physics they are 'extremely likely' hence while other physicists have washed their hands like Pilatus, I had to denounce CERN even if it meant to sacrifice T.Æ to the altar of human ethics.

So this is the canonical model of 5D astrophysics, which I put forward 20 years ago, and still stands as the only serious candidate to explain the structure of galaxies and black holes, in astrophysics, and the entire meaning of quantum physics and the relationships of all the scales of physical system, as well as all other sciences.

So in the graph, we analyze the isomorphism of 5D space-time elements for the two main systems studied by mankind – the astrophysical Universe, and the biochemical world of humanity. Both should, according to the previous analysis share the same properties and arrows of time, albeit with different quality and amount of 'complex information' and 'simplex Entropy'. Let us then briefly introduce those 2 systems and their self-similarities.

Despite the enormous difference of size and metric details, they are both topological, fractal organisms with the same elements of all organic fractals. Since reality is a self-generating topological Fractal of infinite beings made with 2 arrows of Time: Entropy and information, whose self-similar properties emerge invariant in topological form in all scales of reality. Thus all organic fractals, including man and the Universe have 3 elements that define them:

- Its cellular units, (galaxies and cells).

- Its networks of Entropy (blood and radiant \forall -matter) and information (nerves and dark-neutrino-gravitational matter) that organize those cellular units.

- And the relative space-time planes in which a self-similar but not equal fractal structure re-emerges.

On the left, man is a fractal made of cellular units and networks of Entropy and information (nervous and blood systems), whose cycles and functions extend through 3 hierarchical, organic planes of increasing size: the cellular, individual and social plane.

On the right, the Universe is also a fractal, structured in 3 planes of self-organization: its cellular units are stars and Top quark Holes that shape 2 galactic networks of radiant Entropy and informative, dark matter; st-points of a cosmos at 'grand scale' (the points on the picture). The final form is self-similar to a wave, perhaps inscribed into a hyper-Universe.

How can both worlds/networks co-exist together? In continuous space-time they can't but in discontinuous space-time where a 'dimension' is fractal, hence it is a fractal network, it is rather easy:

The light Universe is a network, like a fishnet floating of an immense sea of gravitational Entropy. Each knot is a charge, a non-E point that communicates through the strings of the net (the electromagnetic forces), leaving a huge dark 'space-time of 'water' - that 76% of gravitational dark Entropy - which is not 'illuminated' neither interacts with the fractal net of light.

Some Physical theories describe fractal space-time in that way, calling the fishnet a 'brane' made with cyclical, temporal knots (spins or closed strings) joined by flows of its lineal, energetic T x S actions/forces that tight together those knots.

The Universe sandwiches mankind between 2 relative scales of space-time, the quantum membrane of electroweak forces and the gravitational membrane of strong masses. Yet both membranes obey the same isomorphisms of Multiple Spaces-Times. Thus, regarding their morphological structure both membranes possess organic, complementary systems with the 3 topological standard regions /forms of a fractal point.

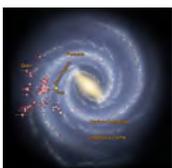

Those are therefore the basic organic elements of a relative Universe, which validate the experimental, sound interpretation of cosmology and we shall use now to explain the nature of the big bang.

So cosmology does have a point of metaphysics.

Recap. Our galaxy is a cyclical vortex of space-time of maximal information, reason why we are informative beings and accumulate information. The entropy arrow does NOT dominate this planet, this species, this vortex of galactic information, but only the expansive space between galaxies, and the minds of Neanderthal macho-man violent physicists with its worldly religion, to make weapon of 'mass destruction'. Point.

In the graph from Sci-Am we observe the whole worldcycle of the galaxy of about 20 billion years, which has been tabulated by observing thousands of them across the Universe in different states of the cycle, some of then undergoing what seems to be a second cycle. Our galaxy so far seems to be in the classic middle age of it:

As we can see the Milky way is a well formed barred galaxy, 2/3rds on its cycle, which is about 14 billion years - not coincidentally the age of the 'little big bang', and the sun is there living in a middle position, a middle kind of sun, with a middle planet in a topic warm region, pleasant for life:

5D BLACK HOLE STARS: HAWKING'S FORMULA: TOP PREDATOR BABY HOLES.

As all systems evolve in time towards higher degrees of information, so does our knowledge of any species. On those terms, we can consider black hole theory as an evolving subject, which has clearly 3 ages, of increasing detail departing from its 'platonic' mathematical synoptic mirror to finally reach a realist view:

The age of Einstein, when general relativity equations provided the theoretical foundation to study gravitational 'vortices', as those described by Newton, and then by Poisson with his theory of potentials, of which Einstein made an even more detailed picture as accelerated vortices of spacetime (equivalence principle between mass and acceleration.) He called those gravitational vortices of mass of maximal density, 'frozen stars'. And he said that since we must respect the scientific method, he would believe on them only if we could find a cut-off particle/substance in the smaller quantum scale of similar density, which in Einstein's age was still unknown. So he denied them (today we know heavy quarks of the top matter decuplet show all the properties and density needed to be the substance of black holes as quark stars and likely its lesser cousins, strange, neutron stars).

The age of Wheeler and Hawking. As we could not see within those black stars, once Einstein died, his stringent admonitions against any attempt to model black stars as 'imaginary mathematical objects', without substance, 'evaporated' as they believe in mathematical creationism; and ideology similar to 'verbal creationism' (Abrahamic religions), that subverts the relationship between languages which are mirror created by the space-time reality. Creationisms are ego-trips common among human beings, who think instead their specific language – mathematics in physics, Arab in Islam, Hebrew in the bible – creates reality.

So nuclear physicists developed platonic entelechies - mathematical objects with infinities they called singularities, which are *not allowed in 5D*. Since the opposite is truth in the fractal Universe, where the scalar structure of reality and its 2 elements (time motion and spatial forms) are the components of reality, mirror by mind-languages, limited by the entropic barriers that separate the different scales of the cosmos.

All planes have a limit of ST-distance speed, beyond which equations break because we emerge as something else in a different scale. Which for the galaxy is the c-speed of the accelerated black star event horizon, in entropy and the 0 K temperature in informative order; beyond which the light space-time of the galaxy dies, splitting its 'wave-motion' into its lineal \dot{t} -field component that speeds up and loses information ($V=\dot{t}/\delta$) and converts within the black hole into axial flow of $>c$ dark energy, perceived in still space as expansion of space and its cyclical $\dot{\delta}$ -component that becomes a $>c$ vortex of space-time 'mass' of faster=heavier attractive power (bct quarks).

But creationism needs no proof whatsoever in the experimental field; only the internal consistence of the language; granted by the 'isomorphism' between languages and reality. So when Wheeler came with the catchy name of black holes, which had 'no hair' - those mathematical entities suddenly caught the subconscious collective imagination and 'evaporated' definitely the need for a rigorous application of the scientific method - meaning the search for its proper substance, as 'dark matter, made of heavy quark stars' turning beyond the c-limit of our scale of space-time... This age peaked with the work of Penrose and Hawking, 2 mathematicians without the slightest regard for physical substance (motion or form), who boldly went where nobody had dared to go, with all kind of singularity theorems, 'cosmic censorship' and analogies with thermodynamic laws. Since the advantage of a mathematical entelechy beyond our scale of light perception is that anything goes. So black holes' now would defy every known-known law, including those of classic thermodynamics when Hawking postulated a hot baby-born black star, should get HOTTIER and evaporate, against the proved 1st law of thermodynamics that prescribe a hotter object (the baby black hole) will instead evaporate its colder surroundings – our light spacetime - growing in mass, which is what thermodynamic laws said: 'heat moves from the hotter source that cools down to the colder one'; experimental evidence proofs (a black hole grows exponentially when born), Einstein laws gravitation prescribe, and so do its extension of the principle of equivalence in 5D (as black holes will be both very small and very fast rotating objects, with maximal attractive vortex power). Thus obviously a model that breaks all the laws of science must be false, and indeed 40 years of experimental

search have found not a single case of evaporation of black holes. So we can expect now that Mr. Hawking cannot defend his work with his personal charm, the theory will be dropped and we shall enter...

(As gravitation is a cosmological not a quantum-scale theory, so it does NOT work for quantum scales); those of mathematics (as all systems that show infinities are renormalized; that is the infinity region is cut-off for calculations, precisely because both in real nature and mathematical modeling, they do not apply to infinity, so black holes need to be cut-off from infinities, so should happen with the infinities of the big-bang theory). This age *now ends as the age of Einstein ended at his death, with the death of Hawking. So we are going to move into:*

The age of realist black stars, where we shall regain the name Einstein would have given to them, as ultra-heavy dark matter, quark stars, which will vindicate Einstein's work in 4D with this writer's work in 5D. Such black holes *as always in 5D are of 3 type:*

- **Primordial black stars** that do NOT evaporate and likely form the bulk of Moon MACHOs responsible for the BG radiation temperature and/or dark matter of the halo.

- **Black Stars** of dark Bottom-Charmed-Bottom atoms, similar to our UDU atoms born of single atomic stars.

- **Galactic Black stars**, in swarms that act as the center of the 'galacell', regulating its organic functions, similar to strange stars, with a core of ultra heavy top quarks and a cover of BCB atoms.

This hypothesis advanced a decade ago by this writer is based in the logic symmetry of Nature between its families of quarks on the quantum scale, its families of stars on the galactic scale, and its families of galactic active centers in the cosmic scale. As Dark heavy quark star would be exactly equal in properties to a black hole but of course 'with hair' even if we cannot see the inner structures of its black atoms.

Let us then in such a huge new field consider only the reasons why those black stars cannot evaporate – as heavy quarks don't. We shall do it only from the mathematical perspective of Hawking's black hole equation, studying it when we properly understand the existence of 5 Dimotions of space-time, and its two limiting arrows of entropy and information, which merely change the 'sign' of its growth from entropy to information, respecting the true laws of thermodynamics.

Hawking formula of black stars... growth.

As all systems live 3 ages and grow through 3 scales of the fifth dimension, it follows from the laws of 5D that primordial black holes are baby black stars, as they must be born out of the first bcb atoms formed in the ultra dense center of giant stars, which therefore must grow exceedingly fast. And this indeed is the case also mathematically when we merely correct the arrow of time in Hawking's beautiful formulae, which we shall explain now in the simplest possible terms:

$$M_H \leq \frac{\hbar c^3}{8\pi G k_B T_{u1}}$$

As the formula is filled with Universal Constants, and only two variables we shall write it in a simplified manner as:

$$\pm \Delta \text{Mass} = \text{Constant} / \pm \Delta \text{Temperature} \rightarrow \pm \Delta \text{Mass} \times \pm \Delta \text{Temperature} = \text{Constant}.$$

Simple, isn't? It is the formula that defines the changes in temperature and mass of black holes. We know both can change but in which direction? If black hole mass increases, temperature must diminish for the product to remain constant. If the black hole mass diminishes, then temperature must increase for the product to remain constant. Two choices solved immediately when we apply the 1st law of thermodynamics, which oblige us to choose:

$$+\Delta \text{Mass} \times \nabla \text{Temperature} = \text{Constant}$$

As black holes are born with a temperature of billions of degrees.

Thus since in thermodynamics, any ultra-hot object as a black hole, born in a cold environment as the galaxy is, according to the laws of entropy cools down and transfers heat to the environment, evaporating us. And this is what

we see in the Universe happening, always, when a black hole is born. It cools down and evaporates its surroundings into a big explosion, a Nova. So the Universe and his fundamental Laws of entropy always will choose the evaporation of the cold environment in which the black hole is born...

And this will happen extremely fast, in any of the 3 scales we can study the phenomena, in the quantum scale, as particles and forces accelerate around the black hole space-time vortex, increasing its mass, as they do in Earth's accelerators, becoming BCT heavy quarks; in terms of thermodynamics, given the differential of temperature between the baby black star and its environment or in terms of gravitation, given the c-speed attractive rotational power of the black hole or in S-terms its enormous curvature of spacetime.

So why Hawking said they evaporate? Because he disregarded the correspondence principle that oblige to respect the laws of thermodynamics and relativity and choose the inverse arrow of time, not the growth of mass=information but of entropy, writing: **$-\nabla \text{ Mass } \times +\Delta \text{ Temperature} = \text{Constant}...$**

Likely he thought it was more 'interesting' for a mathematician to calculate such 'imaginary black holes' (the first name he gave to them), with its outrageous inverse arrow of time, which if time dimotions were not local but Universal and not multiple but a single arrow of entropy for the whole Universe, will indeed mean the black hole travels to the past and as he said you could enter through the black hole and come out and kill your grand-father.

But all those paradoxes are no longer relevant, as each 'cyclical time' clock is local, and so to travel to the past merely means in terms of the duality of entropy=death arrow and information=life arrow, to die.

ALL THIS SAID, we can now vindicate what is important to know about Hawking's formulae, when *we respect the laws of thermodynamics with its proper arrow, and we introduce for a proper understanding of the formula, the expanded view of the scalar, 5th dimensional Universe.*

So we translate Hawking's formula as yet another equation of 5D metric, and write it as: $T(\delta) \times M(\delta) = \text{Constant}$

In 5D mathematical physics it implies a constant growth of the mass of the black hole along the equation that relates the temperature and mass of a black hole: $M=k/T$, that is as the black hole cools down, it converts via the weak force, lighter matter into heavier quarks that increase its volume and hence its area.

With the very interesting result that we connect two parameters of two different scales of the 5th dimension, the thermodynamic 'human' and cosmological 'gravitational' scales.

How this is possible if scales are separated? Because entropy=death=motion without form does indeed transfer between scales. So the formula reads as $T(\delta)/\text{Constant} \Rightarrow M(\delta)$, meaning our thermodynamic world in the presence of a primordial black star, if it were to appear at Earth in accelerators will indeed convert thermodynamic matter into pure entropic radiation, which will then evolve emerging as bcb mass.

So Hawking's formula explains the exponential growth of mass of a black hole as it swallows all the 'universal constants' of matter of the thermodynamic and quantum scales of the Universe.

Indeed, if we respect the laws of thermodynamics and Einstein, the weak force shall transform the light matter of our galaxy into heavy quark matter, through its triad of bosons, the W, Z and H particles. So Hawking's ratio of mass-temperature in black hole stars, describes the birth of a small black hole star, which as all systems of Nature show an enormous activity and rate of growth, in its initial stages, feeding on the energy that surrounds them – i.e. the placenta of our seminal seeds, the nest in which the parental system feeds the birds, the environment in which the new species becomes the dominant predator; in the case of the baby black hole the rich field of electromagnetic energy that surrounds it in stars where they are born by gravitation collapse and/or planets against which they collide or are produced by colliders.

It is then easy to understand the importance of the formula to interpret the genesis of black holes, the mechanisms of Nova explosions, and the way in which the energy and information of the lower scales of nature (the quantum and thermodynamic scales) emerges as mass in the larger cosmological scale.

Those scales are made of hc planckton constants & kT 'Boltzmann constants of action, hinting to the solution of a fundamental question of physics - what is the relationship and meaning of those constants, and how can we unify mathematically the 3 fundamental scales of physical systems, the smaller quantum scale of electromagnetic charges, the human scale of thermodynamic molecules and the larger scale of cosmological masses.

So the way to properly write that equation in terms of the duality of entropy and information and the 3 fractal scales of the physical Universe is:

$$M_H \ 8\pi G \ \propto \frac{\hbar c^3 \text{ Quantum Scale}}{k_B T \text{ Thermodynamic Scale}}$$

Where the event horizon is a discontinuum, which acts as an osmotic membrane, with 2 sides that have the same 'surface' area, so to speak – hence its equality: On one side you are inside the

black hole ($8\pi GM$), and there is NO temperature there because heavy quarks have a superfluid perfect order (no hair theorem indeed, black holes are defined only with 3 parameters, angular momentum, mass and charge). And so we are outside the light space-time scale of electromagnetism. Which proves further on, that the black heavy quark star DOES not evaporate because it is NOT made of temperature. It is impossible to evaporate.

On the other side of the membrane, there is though both, light space-time and its 5D metric constant (hc^3 in the numerator, expresses the 5D metric of light space-time for a given volume, whereas one-dimensional c-speed becomes in terms of the S=T symmetry a cubic distance hence a volume of light space-time) and $E=kT$ in the denominator; also the metric 5D equation of the thermodynamic scale, because the black hole swallows and transforms into the $\Delta+1$ gravitational scale both the Δ^0 Thermodynamic and $\Delta-1$ quantum light space-time scales.

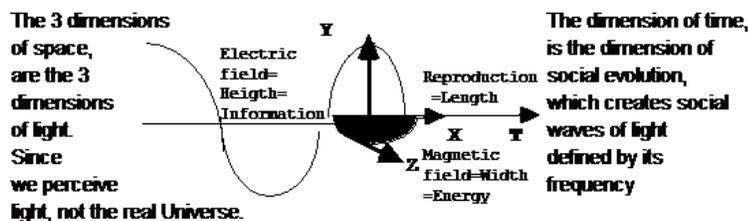

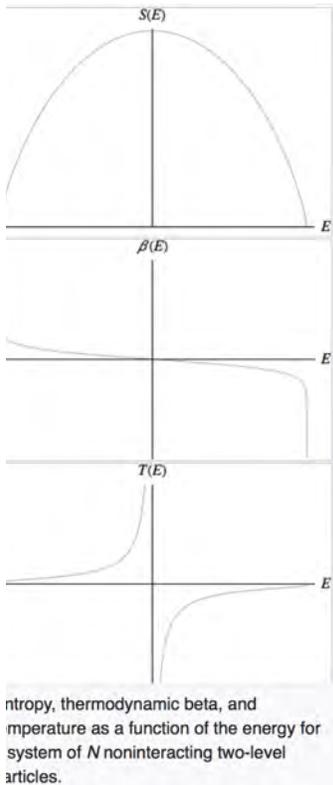

To understand this better, we should substitute the fraction by a product, using instead $\beta=1/KT$, a more fundamental parameter of the coldness of a system. Then we we write:

$$\text{Mass} \times 8 \pi G \text{ (curvature)} = hc^3 \text{ (5D space-time metric)} \times \beta \text{ (coldness)}$$

As β does not have a singularity at $0'K$, it can cross into the perfectly ordered internal kingdom of superfluid BCB atoms of the black hole; transforming hc^3 , the light space-time plane into MG , the gravitational world of 'negative temperature' and perfect order in its energy motion. Which is the modern understanding of thermodynamic temperature as the tradeoff between energy and entropy contained in the system, with "coldness", the reciprocal of temperature, being the more fundamental quantity. Whereas electromagnetic space-time Systems with a positive temperature will increase in entropy as one adds energy to the system, while gravitational black hole systems with a negative temperature will decrease in entropy as one adds energy to the system.

So in 5D the formula is the beautiful expression on how energy emerges into the mass scale.

This duality of a membrane is also perfectly understood in terms of Topological evolution, another key new discipline of 5D. Indeed, the fundamental theorem of classic topology states that a closed circle, any n-dimensional membrane breaks the continuum into an internal world and an external Universe, with 2 different surfaces, an internal elliptic, implosive, in-formative surface and an external hyperbolic, expansive, entropic geometry,

And those are the 2 sides of the black hole: Internally the black hole creates pure information. Externally the black hole increases the entropy and disorder of our world just before it swallows it.

The key concept is the definition of temperature in terms of *the more fundamental concept of TT-entropy or potential number of disordered modes of a system*. As we add heat, to our $1-\infty$ entropic w molecular world the disordered modes of energy grow as energy is constantly being exchanged among the various translational, vibrational, rotational, electronic, and nuclear modes. Thus a *positive temperature* corresponds to the condition where entropy, S , increases as thermal energy, q_{rev} , is added to the system since that constantly exchange energy between modes increase entropy.

. This is the "normal" condition in our molecular space-time world. However, inside the black hole, made of quarks, whose spins=angular momentums define its energy=mass, there is a single isolated mode – black holes have ‘no hair’. So the isolated modes doesn’t exchange energy with the other modes. This is observed also in lighter nuclear spins in a strong external magnetic field, where energy flows fairly rapidly among the spin states of interacting atoms, but energy transfer between the nuclear spins and other modes is relatively slow and becomes zero past the event horizon. Since the energy flow is predominantly within the spin system, it makes sense to think of a spin temperature that is distinct from the temperature associated to other modes. Negative temperatures can only exist in such a spin system, *which is quantized*, in a limited number of energy states. So as the temperature is increased on such a system, particles move into higher and higher energy states, which are limited paradoxically diminishing its entropy. So under the ‘reversed definition of temperature in terms of ‘statistical entropy’, a function of the possibly microstates of the system: $T=dE/dS$; the crossing of the event horizon means all other modes of energy are extinguished (as both molecular particles and light space-time cease to exist). And so what we find is high speed spins turning faster than light with ginormous mass, and perfect order, in very few quantized state.

Moreover the result *also applies to Lorentz transformations, as the event horizon crosses also the barrier of light speed*.

But there is not ‘magic’ on it, because we have to understand such crossing as a discontinuity between planes of space-time. So light and matter do NOT really cross. They die and their TT-motion is absorbed at the $\Delta-4>c$ ‘quantum potential scale’ ($Sxt=C$), by the ‘other species’, the BCT atoms of the black hole to feed its spins of higher energy.

The barrier is NOT crossed because it is a death barrier; but it is crossed ‘under the scale’ of $\Delta-3$; as the cow doesn’t cross the barrier when you eat the hamburger; it is crossed ‘under the $\Delta-2$ scale of amino acids in your stomach. Since SpaceTime, $S=T$, present organisms are self-centered in a given Δ^0 scale and do NOT cross barriers. Only its TT-pure motion (our definition of entropy in 5D as it can apply intuitively to all science, different from ‘thermodynamic’ and ‘statistic entropy’, dS , which are the quantitative concepts of Physics, conceptually related to TT, in the sense that TT, the state of pure motion is also infinite in entropy as it can potentially recreate any system in existence).

Thus the solution of negative temperature accepted recently by mainstream science, which we proposed for two decades in our articles on thermodynamic of black holes (during my years of activism against CERN, which had too much media exposure for physicists to take seriously 5D, in ‘defense’ of their livelihood) IS also the solution to negative energy and the door to the ‘intergalactic world of faster than c-speed repulsive ‘electromagnetic gravitation’; which is obviously faster than the limits of speed within the galatom – as photons are faster than the atomic and electronic particles of the atom.

So in a more detailed version of $E=Mc^2$, Hawking explains why the Universe is fractal, with discontinuous membranes between the entropic side of the Universe (electromagnetic-thermodynamic membrane) and the in-formative gravitational side that in-forms reality (mass-black hole side). And why there are 2 'geometrical description' of space-time (elliptic curved space-time of Einstein's gravitation, made of accelerated vortex like informative mass clocks) and the hyperbolic, entropic, expansive description of quantum physics. Which are 2 different discontinuous sides of the fractal universe that balance each other and must not be unified in simple terms because both are needed to balance the Universe.

On the side of mass, the equation is identical to Einstein's Relativity tensor, that describes a gravitational world: $8 \pi G$ Mass. Yet unlike in Einstein's tensor, there is no energy-entropy, only the other 2 elements of Einstein's equation: $8 \pi G$, the gravitational space-view or curvature of the black hole and its temporal Mass view, the accelerated vortex of gravitational time – again our familiar 5D metric: $S \times T$.

On the other side, above the equation for quantum space-time where h is the angular momentum of its clocks of information (so quantum systems code with h -Planck quanta its informative spin and form) and c is obviously the speed-distance of space, as we see light space. Space is made of light, as impressionists painters realized and the relativity principle that cannot distinguish motions from distances, or the spatial expansion of intergalactic space homologous to the red-shift elongation of light space, proves:

Our human electronic mind perceives light-space, through its plancktons, hc^n , the minimal quanta perceived by an electron:

We see light space as 3 perpendicular Euclidean dimensions. That is why our mind is tridimensional: As the product hc^3 is the 5D time-space metric for our electronic space-time made of h -angular clocks and a c^3 volume.

It is then evident that there are different minds' geometries according to the forces of space and clocks of time each mind has. But still we can measure its 'relative' curvature in Non-E Geometry with a simple parameter, δ/ξ , which is the Gaussian/Lobachevski ratio of curvature that defines each type of mind.

So in terms of the specific electronic mind's spacetime geometry which is NOT the same than the bidimensional photon's geometry, or the quark geometry inside the black of the quantum world, the ratio $\delta\xi/\xi t = h/c^3$, is the 'ratio of curved cyclical information to lineal distance-speed of the human mind. That ratio h/c^3 is so small that we must conclude an electronic mind processes very little information and has according to Lobachevski's parameter of geometry a maximal flatness. Indeed, we see the Universe as a flat Euclidean World. Finally on the denominator we have the thermodynamic scale that 'breaks and divides' the numerator; meaning that the black star absorbs light space-time (hc^3), converting it first into entropic temperature (KT) - hence the ratio; and then it moves it to the other side of the membrane, evolving it into $8 \pi G$ Mass.

Conclusion. Δ -scales in physics. The little thingies and the big busting guy.

Reality is a scalar system of fractal organism of topological space and cyclical time, akin to the concepts of information and energy of physical sciences.

Each part of the fractal Universe is composed of smaller parts, but all are ruled in a given organic 'domain' which can be traced around 3 planes of space-time, $\Delta \pm 1$, by a set of metric equations, $S_i \times T_e = \Delta^q$, self-centered in the plane we consider to be the commanding natural scale of the organism. What this means is that the lower plane will be time-like, with faster cyclical actions of hyperbolic nature and larger density of information; the upper plane will be space-like, with less information and slower cycles; and both will merge its spatial information and temporal energy into the intermediate Δ^q state.

Those scales that concern physics are thus $2\Delta \pm j$ scales outside the human world/organism; the quantum scale and the cosmological scale, and...+ 3 $\Delta \pm 1$ scales that concern us, the scale of mechanics above, the electric scale of our mind-consciousness and the lower scale of thermodynamics.

All of them follow the paradoxical inversion laws of scales, the hierarchical laws of energy and the inverse laws of the arrow of information, Such as information increases in lower planes of maximal individual form and freedom and diminishes in larger scales of more continuous membranes and lesser freedom. So the larger membrane is curved, elliptic and traps the smaller scale, which is quantum, expressing all its potential futures in the short terms of its existences, but becomes bend and reduced in form and motion as it ascends and emerges into lower scales.

So we can study from the 3 points of view the structure of physical systems or any other system. Today is customary to 'deduce the larger' scales, as 'limits' (of lesser quantity of information) of the lower planes. So in professional books

of physics, the first laws to be considered are those of lower planes, whose 'limit' as we loose information of the discrete, multiple free paths of its particles, emerges into a new scale...

But this does not mean we cannot establish from the top down a completely different form of organization that does work, exist and impose its laws of conservation of time-energy on the 'feisty', little thingies below by the harsh method of suppressing its energy and hence its information, with larger fields and longer time cycles.

Only that the LANGUAGE in which this other causal order is established is not that of the little thingies with its 'social numbers' of scale, and cyclical patterns of time, in hyperbolic networks, the but the brutish stick and carrot method which pedantic scholars so much despise and deny. The big guy with the big busting toy...

A few examples will suffice. The little thingies we call nitrolife species, busy busy radiating on the surface of Earth are brutalized by the big stick of magma veins of molted gold and iron surfacing in extinction periods, reinforced for good measure by a huge rock coming from sun-system sky, which might be ultimately the origin of those plumes of magma, as the body reacts to the 'beating' of the sun, sending a flow of vaporizing heat from its central heart, as blood flows on a body tumefaction by the hitting... And then we do have those harmful 11 years magnetic holes on the skin of the sun, tuned to the 11 years burping of the Sagittarius swarm of black holes. And so for this stick process of long time, simplifying control even if we can go down to the details, an organic view of Gaia, life, the Solar system and the galaxy does the explanation in system terms. The larger brutish plane of existence you might call GodoG, as used to do in my simplifying mystical texts is real, and as much as you little thingy would like to be sooo important and colonize with your microbial, faster plague the galaxy as nerdy NASA and Silicon Valley moguls pretend, hold your bollocks man cause you shall be evaporated soon unless you learn to respect the big guys of the galaxy, specifically in this DNAge the pretension of physicists to make baby holes on Earth.

Understand this. Respect the big guy and his stick because while his mind seems poorly endowed to you, he is a nested Universe with an equivalent Δ -j level more complex than your Δ -j-x touch-base scale.

And so between the quantum mathematical complexity and the larger big busting sticks there is us, nitrolife of thermodynamic activity with electric minds, mechanically pegged to the membrain of mother Earth. And here we do have 3 scales at play, mechanical work, where energy-time of human nature was first defined, electrical flows in between and thermodynamic molecules on the lower heat.

Those are all the scales of matter that matter and we study in different papers. The one dedicated to the big guy stick organic description is thus paper on cosmology, focused on the organic properties physicists ignore, but to show that 5D does much more than that, the last paragraph r=evolves our mathematical understanding of the thermodynamic of black holes with proper explanation of Hawking's formula, and before that we unify quantitatively the two scales of masses and charges.

HYPER-UNIVERSE.

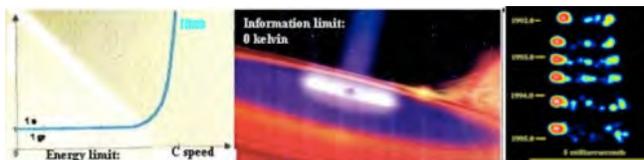

In the graph the Fractal Generator in a single plane of the Hyper Universe, whose size and form as a macro-ensemble of galatoms is impossible to determine beyond its perception as a dense gaseous/fluid state of atoms or most likely antiatoms (open to argument as most mass is in the halo, as if galaxies were antiparticles) communicated with cosmic electromagnetism (Dark energy). Inside the galatom (below) we can resolve clearly the Δ @st symmetry of the 3 scales of matter, its 3 families of mass and its 3 topologic regions, self-centered into the gravitational black stars minds, which act as the DNA of the 'galacell' (max. biological p.o.v.) It is thus metaphysics and speculative science to try to inquire beyond some details the structure of the $\Delta\pm 4$ plane, which in the nested lower Universe likely flanked by quantum potential fields of neutrino $v>c$ background space

Faster than light speeds in the lower and larger $\Delta\pm 4$ planes of the nested Universe.

Since the Universe's scales are infinite, there must be a lower scale, which according to $S \times T = K$, will have less 'temporal information', hence more Spatial speed-distance, allowing the 'action at distance' or entanglements of particles through its quantum potential, or $\Delta-4$ plane, likely made of faster-than-light lineal tachyon neutrinos, which carry only trigonometric information on the angle and distance of the other photon., prior to the exchange of more complex information between particles through a light wave.

So particles first localize and entangle each other through the sharing of neutrinos and then 'keep' waving its communication through light waves (opening the possibility of a neutrino theory of creation light, put forward by Broglie, which needs two inverse neutrinos travelling in the same direction) and still does NOT break 4D relativity, since *they don't transmit in-form-ation, form, only 'still distance', position.*

Another way to describe such faster than light speeds, is then considering the parameter of time as a parameter of information; then: $V=S/Information$, and so a particle that carries less information than light, will be faster than light. So if $C=S/I, >C S/<I$, which is the case of non-local quantum potentials.

C-speed constant is the constant of reproduction of information in the 5 D lower scale of light space-time, the background scale of the galaxy: $\$(c) \times \delta(h) = C$. As such all species within the galaxy have that maximal speed of reproduction of information, spent in the

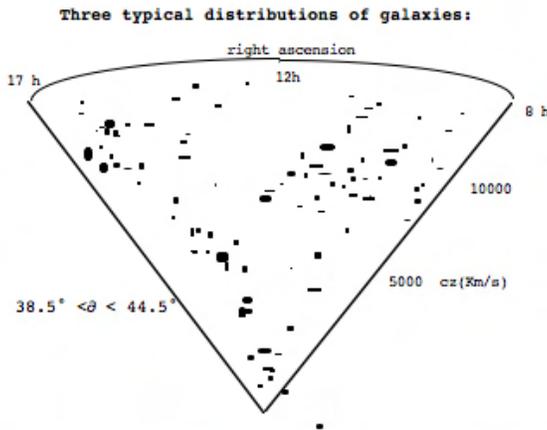

recreation of the mass-energy of the being that reduces the speed from the simplest information reproduced, light itself. But the nested Universe implies that the $j\pm 4$ plane of the Universe must have a constant of speed (of reproduction) higher than its smaller $j-3$ galaxy. Hence we find faster than c-speeds outside the galaxy in dark energy confused with an expansion of distance-space, according to the Galilean paradox: $S\text{-distance}=T\text{-speed}$. It follows that

the proper interpretation of quantum physics is Broglie>Bohm's realism as its main hurdle, to explain entanglement and quantum potentials faster than lights is resolved, as the limits of our 'Space-time' scale. Some proofs:

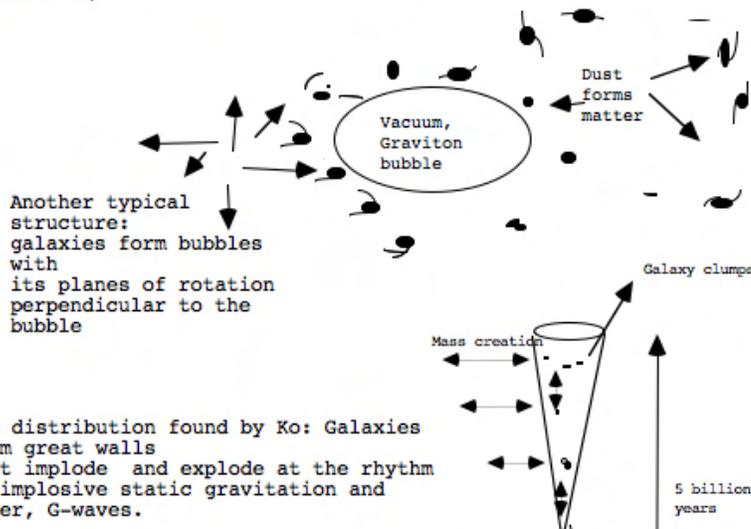

In physics as time clocks are clear rotational spinning particles, it means that smaller systems turn faster in time; with no limit of speed, reason why for example an electron, when it shrinks from an orbital into a point-particle with 1/2h spin, to have the huge magnetic field we measure it must turn faster than light speed (Pauli). And a black hole, much smaller than a star turns much faster, at c-speed in the event horizon and likely if it is as Einstein wanted a 'quark star' it will be made of particles that turn faster than light (top, bottom, charm quarks).

So because 5D is made of layers, $S \times T = K$, with different size from the smallish faster world of rotary particle-points to the much larger slower rotary galaxies; from the short lineal distances of our motions through the c-speed=distances of the galaxy, and beyond in the faster than c-neutrino background of the Universe, by the principle of correspondence when we reduce to the Galactic layer-scale of reality made of a background radiation of c-speed-distances; this background radiation is indeed a fixed c-speed-distance, and it is what we perceive with our electronic eyes. And all what is within that galactic womb, must go slower than c-speed-distance, as you go slower than the river flow that drags you.

THE HYPERUNIVERSE: SPATIAL SYMMETRY

The galaxy distribution at redshift distance $cz < 12000$ Km/s and limiting apparent magnitude $m \leq 15.5$. Big points are Σ of galaxies. What is relevant is the fact that in 6° deep in declination galaxies are clustered with such density. While away from the planar sheet there is a vacuum (Graviton universe)

The distribution found by Ko: Galaxies form great walls that implode and explode at the rhythm of implosive static gravitation and order, G-waves.

Now, all this said we can after being the devil's advocate against the big-bang, if any believer is still reading, which i doubt it, and consider that perhaps, indeed, there is a higher scale beyond galaxies, which do respond to the big-bang cosmology and forms a larger scale of physical systems, obeying at a higher speed of space and denser speed of angular momentum in its black hole vortices so how it will look the whole? As its parts in a fractal Universe that repeats its games of existence.

5D scales: Walls: societies of galaxies.

Yet, the beauty of all this is how much rich on meanings and paradoxes and questions to explore is 5D physics compared to the pedestrian simplex analysis of the previous paradigm.

So before we go into the big bang polemics, I want to consider a bit more of other themes of 5D cyclical time space astrophysics. And how it differs from lineal space-time astrophysics and enriches our science for generations to come.

We shall call its birth the 'little bang', to differentiate it from the metaphysical big-bang of a supposed larger, $\Delta+4$ cosmic scale which we will study after wards. Now as it happens, in a fractal Universe the little bang is quite similar in ages, and timing to the big bang, as it is the cyclical life and death of the central black hole of the galaxy.

The Universe is a spatial organism.

Any Fractal point, according to duality, can be described in space as a fractal point with a relative Entropy body and an informative center, communicated through 2 forces/networks of Entropy and information. And it can be studied in time, through its 3 evolutionary ages, between life and death, as its Entropy becomes curved by time and increases its form, creating in the case of the cellular Universe, new informative particles and galaxies.

Though both perceptions of the Universe are correct, cosmology ignores the organic, spatial description of the Universe, which completes the evolutionary, temporal vision, obtained through light instruments - since it cannot see dark Entropy and non-local gravitation. Yet if we were to perceive that Universe with the instantaneous, non-local gravitation that reaches its limits, it will seem as a complex st-point structured by an external membrane (the wall of fire), an internal self-reproductive space of galaxies and an informative hyper-top quark Hole center (the great attractor?), all coordinated by the non-local forces of dark Entropy.

Recap. The physical Universe is structured in 3 scales of reality, the quantum world of electromagnetic forces and the gravitational world of masses. Both can be modeled with the isomorphisms of super-organisms, whereas the electromagnetic forces/planes act as the Entropy network of galaxies and atoms and the gravitational forces/masses as the in/formative force that balances the entropy of electromagnetism, creating a complex, organic Universe of eternal motions and balances between informative gravitation and entropic electromagnetism.

If you ask me what do I think the hyper-universe is, in this smallish region of its infinite galatoms, I would dare to say just I have no idea, but the local region seems to be an entropic zone of gaseous diatomic molecules; our couple being Andromeda... As we cannot see the structure of Saggitarius, is not very clear if we are bit more complex that a simple Hydrogen molecule... the orbital observed above and below the center of the galaxy though strongly suggests a D-orbital, might just be a nitrogen molecule?

Conclusion. The 5D metric of the fractal Universe puts in relationship the similarity between atoms and galaxies, to expand both within the nucleus of the atom and outside the galaxy as an atom, our modeling of reality.

It doesn't contradict 4D that corresponds to its limit in a single plane of light space-time, *background space-time* of the galaxy, which our electrons see in stillness to measure reality entangled with other electrons. The renewal of astrophysics with the use of the 5D formalism and its 3 main discoveries, the **scalar, organic** Disomorphisms of reality and its 5 Dimotions=forces, the **cyclical** nature of time and its multiple planes of **fractal** space that gift reality with its biotopo-logic properties is a task which will take generations of researchers to exhaust, as the last big r=evolution of science did (the 4D and quantum paradigm), when finally humans accept the paradigm change.

Nt. 1 We call both the galaxy and the Universe a galacell, or Univercell, as opposed to a galatom or Unitom, NOT because this is the 'real thing', as all fractal scales of the Universe are 'similar' but NONE is identical (though we might argue the identity between galaxies and antiparticles, which would create a ternary identity scale, in 'metaphysics', part of philosophy of science, beyond physics). But because according to epistemology, as all scales of reality are similar, obeying the disomorphic laws of the 5th dimension, either in its topological geometry or existential algebra, derived of the 'Function of Exi:stjence', its metric equation $[C=Max. SxT (s=t)]$, the maximal information is obtained in the scales closer to us. So we observe maximal complexity in the cellular scale, which we might consider is similar as all scales have the same volume of information, per unit of form, in the atom and the galaxy. Thus it is more proper to presuppose that if we had all the information about the atom or the galaxy, it would resemble a cell.

Nt.2. 13 is the number of 'bad luck' as black hole evaporation is a dogma of entropy only physics. So accelerators aim to re=produce them on Earth but if 4D Einstein's & 5D So:To's formalism are truth, they will evaporate us

BIOLOGIC SCIENCES:

Species as superorganisms.

All systems are living organic systems the ultimate question of the humind (ab. human mind) What is life then becomes a trivial question— as everything in the Universe is part of a 5D time-space organism that displays the properties of life, its 5 'drives'=actions =dimotions of existence: to move, feed, gauge information, evolve socially and reproduce. Prior to 5D, the 5 dimotions of all systems of reality were called drives of life as they helped to define life from the anthropomorphic point of view of self-centered 'huminds', who thought nothing else could be 'obviously' alive unless it looked like us the 'chosen species'. But we showed *the 1st unit of life are atomic particles. So all is alive, including the 'galatom, the organism of the galaxy similar in life function to a 'cell', with gravitational= informative black holes (dark stars) playing the role of DNA, as they control the reproduction of evolution of the galacell.*

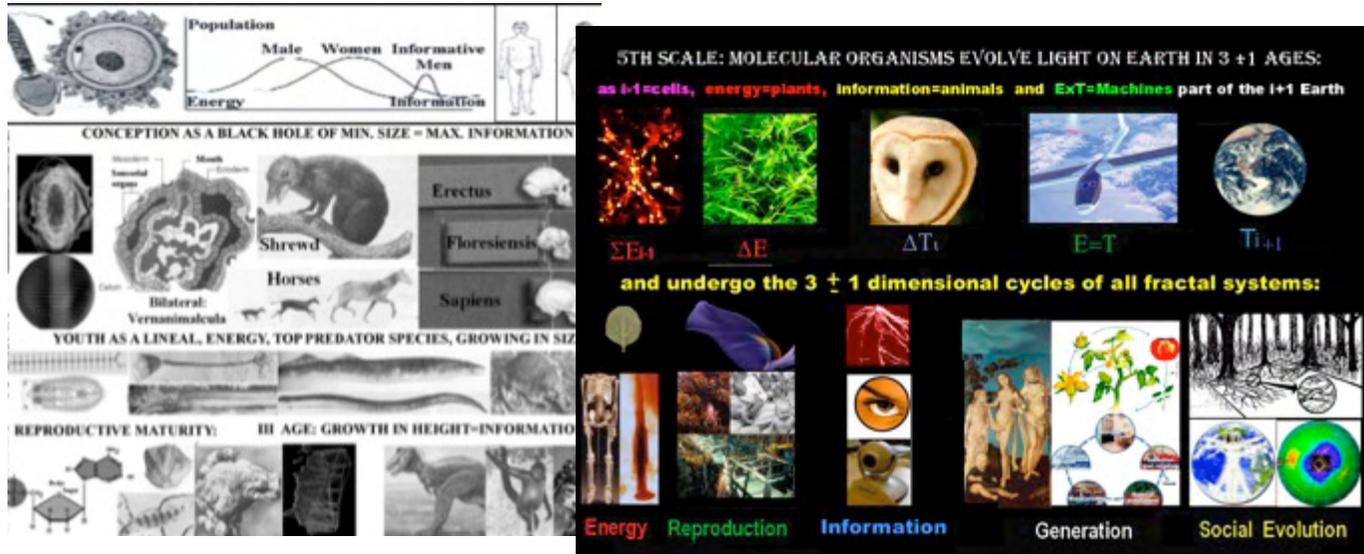

What are the main super organisms of life in the planet in its lower and higher scales of this 'smaller nested Universe' within the galaxy? Obviously the cell from below and the Superorganism of the earth from above.

$\sum \Delta -1$: cellular life = $\sum \Delta^0$ Multicellular organisms = $\Delta +1$: Planetary super organism, whose 'membrain' of maximal information is the surface in which carbon life exists; and species evolve also as supœrganisms with the same $3 \pm j$ ages:

Systems evolve in social scales, as space-time organisms, which 'emerge' as larger wholes. We observe 3 main $\Delta \pm i$ planes of biological systems, the biochemical/ cellular, organic/ thermodynamic and ecosystemic planes, which defined the main biological systems, whose range is within the closest Δ^0 and $\Delta \pm 1$ scales of human and similar life, from the molecule to the socio-biological ecosystems and super organisms. Thus in terms of scales those $3 \pm j = 5$ Dimotions carry the evolution of life from the atom to the super organism of life - actions of locomotion, energy feeding, information processing, reproduction and social evolution.

For those reasons biology is the most complete of all stiences as the *closest in observation*, describing carbonlife systems with all languages of pentalogic, including mathematics as it considers its 5 Dimotions, which in physics are forces, the so-called drives of life. Thus we subdivide biology by scale in 3 '**5D-completed**' disciplines:

0-1D: genetics palingenetics of worldcycles($\Delta -1 > 0$) 1-2-3D: topologic, gender & social evolution (S,st, δ ages) ($\Delta 0$) 5D: ecology + theory of supœrganisms ($\Delta 0 > +1$); the **ad ons** due to 5D cyclical time and fractal, topologic space:

3 species' evolutionary horizons +j: social evolution vs. -j: extinction & Gender: Si=Te female v. S<T>S male

Above in all scales ST reproduces through gender, which splits *the 3 ages/states of spacetime in a 'mirror symmetry'*: 2 mirror images can superpose and reproduce. So we define female gender as $S_i=Te$, present, reproductive, balanced *dominant states* in all scales, since *reality is a reproductive present fractal; and male gender as $S<T>S$, future to past entropic+ past to future informative, destructive>creative states*; happening in all scales. In Δ^9 mental languages: even female and odd-entropic +odd-prime, informative male numbers; |-male bodies v. O-female bodies in math; $S_i=Te$ v. $S<T>S$ in logic, 10 times more white matter and more $S_i=Te$ connections on the 2 sides of reproductive female brains vs. 6 time more grey matter, an incomplete 'decametric scale' in more 'stupid' entropic males + a smaller number of more creative-informative 'prime brains'. In physics: 'female $S_i=Te$ waves' complementary to T-Fields>S-Particle male systems. Left chiral reproductive female particles vs. right chiral sterile ones; carried into L-reproductive amino acids vs. D-male ones; carried into female DNA vs. Male entropic & informative RNA emerging into our 'beloved absurd' war of sexes, LOL, don't get me started. Problem is *a 5D universe is feminine, our history is entropic, made by military lineal big-bang male models. As we past the 'entropic male Paleolithic youth' but didn't stop ing the mature, present Neolithic, reproductive, Goddess age of $S_i=Te$ balance with Gaia, the life Earth, racing into a 3rd age of evolution of entropic metal-weapons that kill us all.*

Species are supœrganisms whose 3 ages are its 3 horizons, followed either by a survival process of eusocial evolution - the summit of the process of organic evolution, which Darwin realized was necessary to explain the success of eusocial insects, or become extinct by the 'new generation' of fitter animal forms. in the graph we can see its 3 Horizon=ages and its ternary topology, similar to that of any other organism; and the dominant arrow of information in the height axis, of both reptile species that ended in birds, and mammals that ended in man. So happened with metalife machines, whose final species, satellites are now forming the arrow of eusocial evolution, or future mind of the metal earth -internet.

The 3 ages of time and its topologic limits solves the constrains of evolution, which Darwin already wondered: why certain species evolve so fast into complex forms as eyes and wings. Answer, because there are only 3 topologies to go, and so the choices are random but limited and it is every easy to go the right way. In the next graph we see those 3 ages of evolution as species can be treated as super organisms with its own world cycles. The graph shows that all species follow also the young, predator, reproductive radiation, and informative, height growth of the 3 ages of life, and then either they evolve further into social organisms (ants, bees, humans) and as wholes in a higher $\Delta+1$ scale survive better, or they become extinct by a new generation. Thus creation of a new species takes place according to the same 3 ages of any space-time field that become the 3 horizons of any species: after conception that creates 'a seed' of pure information and minimal spatial energy, species go through a young age of energy growth that creates 'big species'; a mature, reproductive age of forms in balance between its energy and information when the species maximizes its reproduction, radiating in huge numbers; and a third horizon of informative evolution when it diversifies into multiple sub-species, becoming finally extinguished, (the equivalent to the death of any organism), or creating a new top predator form, a 'son species' that will restart a new cycle of life.

+1: Birth: max. T. The black hole paradox (conception).

The 'black hole' age of any species is parallel to the informative, genetic conception of any organism born out of a 'seed' that packs the maximum genetic information in the minimal spatial form. *So a new top predator species is born with a lot of new, genetic information packed in a reduced size (Max.i=Min. e).* This happens because information is processed faster in smaller spaces. For example, a 'logic instruction' is resolved faster in smaller chips. It follows that tiny species with huge numbers of 'neurons' create quantic actions faster than slow, bigger species. And since they are highly informative, they can coordinate those quantic actions in herds that act simultaneously as a single organism. So their S-T force that defines a top predator is higher in each quantic action of space-time that the 'slow actions' of a big body. Thus small English boats shooting faster against big galleons defeated the Spanish Armada; a pack of wolfs kill slow reins and herds of orcas kill bigger whales. Small, intelligent top predator brains rule bigger, less informative bodies, because time dominates space, information dominates and shapes energy. Thus the most informative animal,

men, are Earth's top predators; black holes of maxi. gravitational information are galaxies' top predators and chips rule machines.

I Horizon: Energy Age: max. E: Top Predators and Extinctions

In their youth, carbohydrates (fats), worms (planarians), echinoderms, cephalopods, fishes, amphibians, mammals and chipped machines grew into energetic, lineal or planar, big top predators

A newborn, small fetus grows very fast in size as it multiplies its cells. By homology a new species is born as a small, informative, complex being that latter grows in spatial size during its energetic youth becoming a, lineal, energetic, big top predator species, that feeds on less evolved forms.

Thus after conception, young fishes grew into big sharks of linear forms; after the polemic Homo Floresiensis invented technology the next Homo Sapiens with an extensive fossil record were big, energetic Neanderthals; the 1st big molecules of life were fat carbohydrate chains of linear form; the 1st insects acquired soon gigantic bodies in the Carboniferous; after chips were born as small machines placed in PCs and toys, the first robots they control are big tool-machines and huge weapons of mass destruction, lineal missiles and planes, that kill humans.

II Horizon: Evolution or Age of balance and reproduction: max. $\$T \times \delta\$. Radiations of species.$ Then, the species finds a balance between form and energy and it reproduces in massive radiations: carbohydrates gave birth to amino acids with a nitrogen, informative atom on its 'relative Head'; sharks gave way to balanced tubular fishes; brachycephalic Neanderthals gave way to dolichocephalic Cro-Magnons that multiplied and colonized all continents; while young giant stars acquire the balanced size of yellow suns, the commonest of all stars.

III Horizon: Evolution or Age of information: Max. $\delta\$: max. Evolutionary differentiation.$

Species grow in height or acquire cyclical forms, as they evolve through their 2nd and 3rd horizons, improving their sensorial, informative skills: Nucleotides become the top predator life molecules, echinoderms change to cyclical forms, fishes organize their networks in the 1D_imotion of height, amphibians become round, improving its smell, saurian and mammals become biped. The difference between organisms and species happens in their 3rd age, due to a discontinuous nature of individual species' 'cells' that don't become extinguished unlike the tightly controlled cells of organic systems, dominated by nervous, informative systems that exhaust and warp totally their energy, till the organism collapses. Instead species keep evolving, creating social, complex species with more information, growing 1D_informative height. So Homo Sapiens evolved ever more complex technological tools; nucleotide appears adding informative depth to the amino acid (with an informative, nitrogen ring and an energetic sugar ring); the yellow sun becomes a neutron star of higher gravitational, informative density; while insects develop a growing brain capacity and bees and ants appear.

- ($\pm\Delta$): *Extinction Vs Evolution into super-organisms. The scales of the Universe.*

A fundamental question poised by the previous graph is the duality of $f\delta\$\$=$ futures, which as the symbol shows can go after 3 ages, up and down the scales of the 5th Dimension of 'D=evolution'.

Organisms dominated by informative networks that consume fast the system's energy die sooner than species, according to a clock set by the rate at which energy is metabolised, 'in-formed', by their nervous system. While species, which are dominated by the individuals and the herds survive for eons with 3 basic strategies according to the 'ternary plan':

- Max. $\$T$: *Creating balanced, trophic pyramids that maintain always a supply of new victims.*

- Si=Te: *Diversifying their individual forms into new species, instead of 'degenerating' into a warped space-time field. It is a parallel strategy to the reproduction of an organism, which in this manner survives his own death. Thus we talk of 'son species' that create evolutionary, genealogical trees similar to those of any organism.*

However son species tend to kill-extinct the mother species, feeding on their energy. We call that fact, *the Oedipus paradox*. So mammals killed reptiles, men killed mammals and robots might kill human beings. While the different generations of an organism work together, creating informative networks between them that shape herds and families.

- *Max. δ§: Species evolve socially individual forms into supærganisms* through the creation of informative networks and languages that integrate them into a whole, bigger form, which is more powerful than the individuals of a herd.

Organisms are dominated by informative, nervous or hormonal networks that pack closely individual cells of *max. information in min. space*; while species extend over *wider space ecosystems in which they share a min. quantity of information*, as individuals of species hardly relate to each other beyond the reproductive couple or the hunting herd. And yet, both go through the same 3 ages of space-time defined by the inverse properties of the energetic youth (*max.e=min.i*) that defines the herd and the informative old age (*Max. i=Min. e*) which defines the organism.

Hence we consider that the creation of super-organisms is the final evolutionary stage of a herd of individuals from the same species: each individual of the herd becomes then a 'relative cell of the body' of the macro-organism. While the specific language of communication and information of the species becomes the relative nervous/informative network of the super-organism, as pheromones do in anthills or nervous impulses did with cells in the Pre-Cambrian age or financial and verbal languages are doing among humans in History.

So evolution is indeed limited by the most iterated elements of reality and this blog (: those 3 timespace motions/forms: lineal motion in space or 'distance', implosive motion that becomes cyclical time clocks carrying its frequency 'information' and its space-time, wave-like, reproductive energetic combinations. They were understood in Asian religions as yang, yin and qi-energy. They are the only 3 topologies of space-time possible in a 4D or 5D Universe (when we add its scales), so they assembly forming all space-time beings. It follows then that 'social sciences' are a branch of biology, specially the Industrial r=evolution that studies the evolution of metalife, machines that clearly compete as robots and AI complete their evolution with human beings in labor and war fields, in the eco(nomic)system, the 3 age of the Earth: '*Life is a 5 Dimotion worldcycle across 3 scales*'.

So the Earth super organism also lived 3 ages of evolution: *Gaia (Life) < History (Human) > Machines (Metal-earth)*. In the first age of Earth, the age of Life, Gaia evolved 'naturally' under the same Laws of bio-topo-logic laws derived from the scalar structure of co-existing planes of space (in the graph the 3 planes of the individual organism), which imply organic properties, as those co-existing scales must be organized together; its ternary only topologies that define its functions and forms as 'simultaneous ensembles of 'moving limbs', iterative bodies and informative minds, and its 3±i sequential ages in temporal energy. In the graphs, the 3 ages of the Earth as a vortex of increasing information in which 3 species,

RECAP. Life is everything, as all is a spacetime organism performing 5D actions of survival (motion, feeding on energy, information gauging, social evolution and reproduction), which ordered in sequential time give us a worldcycle, ordered in simultaneous space gives us a

super organism and ordered in scales give us the vital actions of survival, called in biology, the drives of life of ANY physical, biological or social species. But self-centered huminds think only carbon-life is a living form. In 5D, we talk of 'light-life', as all Timespace forms that use energy & information provided by light-forces; which define 3 life ages on Earth, Gaia, History and the Metal-earth now evolving mechanisms, robots with solar skins and optic minds. So humans, machines & its supærganisms, company-mothers & governments compete for limited resources *but company-mothers are winning, because humans do not manage the world with social sciences*

A life-death worldcycle is a travel through 3 scales of the fifth dimension, as the 5 Dimotions of space-time that form an organism, in its scales of cellular/atomic, organic/ thermodynamic, gravitational/ecosystem and ternary organs, '|-fields/limbs<∅-body-waves>O-particle-heads' become sequentially ordered in time from the placental seminal age of

'social evolution' of the organism that emerges to live 3 ages in a single plane of the fifth dimension encased into a larger world, to die and explode in an entropic big-bang.

Because human 'egocy' limits the intelligence of the nested Universe to our simpler scale, shorter time span and mathematical 'instantaneous' derivative tools there is a huge skepticism about 5D discoveries on Social sciences regardless of the proofs of 30 years forecasting the Deep time patterns of History and Economics. But human egocy and wishful thinking, matters nothing to reality. On the contrary, it prevents humanity to manage properly the superorganisms of economics and history; as we shall see in our analysis of the 3 ages of Earth, its relative function, and the proper way humans should handle its future, by limiting the evolution of the lethal goods of the tree of science (robots of max. information and nuclear weapons of max. entropy) which will become the limits of death of our species in time – history:

Relative past (Gaia: I Earth) < Present (History: II Earth) > future (Metal-earth: company-mothers of machines)

All sciences predict the future of its species according to its repetitive causal cycles. Or else they are NOT a science. Astrology became a science when Kepler learned its orbital cycles. Bio-economics became a science when we described machines as metal organisms whose industrial r=evolution followed the human 72 years generations of the dominant industrial nations that evolved them in 4 cycles: its body-age (British, steam cycle), heart age (German, electro-chemical engine cycle), its mind age (US, TV-eye, chip-head, mobile-ear cycle) to conclude with the ensemble of robots that as virus do, when all its parts are put together will become 'alive'.

The superorganisms of Gaia, has the same structure that all superorganisms. So its evolutionary membrain of maximal sensorial information evolves through its species that include the nested super organism of mankind, history in its 3 planes, the individual human being, the nation or civilization and mankind. And so social sciences should be concerned with the creation of an ideal global super organism, following Δ st laws, which if humans were intelligent and ethic enough they would design with the laws of super organisms in a much more efficient manner than our corrupted economic=blood system of reproduction of goods and political=legal-nervous system of information and coordination of its citizens-cells.

Δ -2: BIOCHEMISTRY

Life thus start in the 5 Dimotions of particles, which already show all the elements of life, but those dimotions should be studied properly in physical stiences.

We have just introduced some of its key concepts - such as the apertures of an atom through its 5 quantum numbers, notably the spin as the 'vehicle' of its internal simplex aei demotions and the social magnetic field as the organizer of its groups, so the anthropomorphic reader can accept the obvious: that life starts in particles and atoms and so the building of life through the social evolution (5th Δ imotion) of atoms into molecules and cells and organisms and ecosystems and Gaia, and the same process for historic super organisms and metalife (Robotic machine) would be the whole span of biology. But obviously we study machines in the eco(nomic)system and humans in historic sciences.

So to 'establish limits' to the domain of organic life (an egocy word as all is organic) would span from amino acids to ecosystems of 'nitrolife', the proper name for biological sciences, as nitrogen is our mind-clock, different from metalife, the proper name for machines and human life for social sciences.

SOCIAL EVOLUTION OF MOLECULAR LIFE: TOPOLOGIES & AGES

So we shall start from the simplest ternary ensembles of atoms, where the entropic/moving oxygen ($\$T$), the iterative Carbone (ΣT) and the informative nitrogen ($\$d$) clocks, connected to the $\Delta\pm 1$ world through its 'H-eyes and kicking legs' shaped the first 'molecules of life'; and so we write the Generator function of bio-chemistry at its minimal scale, in terms of functions and Δ imotions:

Δ -1: Hydrogenated water (kicking legs) > Δ °: $\$$ -oxygen > Σ -Carbone> $\$$ -Nitrogen+H-eyes< Δ +1 water world

Topology: from C, O, H atoms to amino acids.

In the smallest scale the molecular 'bricks of life', CO_2 , H_2O , CH_4 , (Methane) and NH_3 (Ammonia), shown in the graph are, as it happens in the geological world, crystalline structures. Yet they are far more malleable and complex than solid crystals, because they exist in liquid ecosystems. In those simple life molecules Carbon, Oxygen and Nitrogen are the Top predator central atoms that capture and surround themselves with weaker Hydrogen atoms, which act as carriers of their relative Entropy and information, creating the external 'membrane' of their molecular structure with the dominant atoms as the central st-point. Let us consider those functional forms in more detail:

- Δ -1 scale of 'bits and bites': Hydrogen atoms act either as the basic bite of Entropy, in its H^+ form, becoming the pumping bomb of most cellular motions. So in the energetic reactions of $\text{AMP} \rightarrow \text{ATP}$, H^+ ions act as the bomb. So they do in the motion of protein rotors in membranes. They are used by Oxygens in COOH groups that kick water molecules and set carbohydrates in motion. Thus they act as an energetic limb that the oxygen atom expels or attracts in alternating cycles that displace the molecule through water.

-When attached to atomic structures, $\text{CH}_{1,2,3}$ or $\text{NH}_{1,2,3}$ systems in amino acids and nucleotides the H atoms should act as 'feelers' that integrate electromagnetic messages in a first 'electronic orbital', which should allow the central P.O.V. to 'sense', processing electromagnetic Entropy into Van der Waal forces of information Thus the simplest organic molecules studied as st-Points have:

- Δ -scale: A top predator *N, O, C atom* occupies an hyperbolic center, surrounded by Hydrogens, which form their *bodies and limbs* that process the Entropy of *the water medium (Max.E)*, in which the molecule lives, or creating for the central atoms of life a molecular, external 'electronic orbital cloud', which acts both as the 'energetic membrane' of the atom and redirects the information of the external world, that will become the virtual world of *the central atom*, as regular 'crystals' do with their submissive atoms.

In the next scale of social organization those 3 elemental particles of life, N, C, and O will become themselves the 3 fundamental zones of bigger 'i points', called organic molecules:

Those 3 organic atoms define the 3 Djmotional arrows of time in life organisms:

-O is the atom of δ lineal motion, given its high electronegativity that allows it to attract and repel other atoms with easiness, and its dual H-valences, which conform a lineal topology normally with a single H feeler and the second valence used to join the Carbon chain. Further on it tends to appear in the alkaline, 'attractive', 'positive', informative, 7.2 PH of the cell – natural to all implosive, informative systems, charged with 'negative', expansive topology.

- C, the atom of structural reproduction, as it has 4 handles for further union. It tends to appear neutral, as it corresponds to 'body-systems' that combine an informative, implosive, positive topology and one energetic, expansive, negative (in ionic terms). As most bodies is 'blind' mainly connected to other inner body-head-limbs part of the molecular organism, or a 'bilateral' H, deploying in amino acids the 'width' Djmotion.

- N, the atom of information, which appears in the 7.2 PH of cells and the head of amino acids as a positive, informative, NH^{+3} head, with 3 Djmotional hydrogen slave atoms that carry the 'bites and bits' of Entropy and information to the nitrogen.

Let us then consider those 3 atoms and some of its functions in bigger carbohydrate chains.

- *Max.I*: The informative element of all life molecules and fractal part of its relative 'heads' are Nitrogen atoms. Its informative character is shown already in the crystalline ammonia, where Nitrogen is the dominant vertex of a tetrahedron shaped with 3 more Hydrogens. Since we live in a 3-Dimotional world, those 3 arrows allow the Nitrogen to have a more perfect informative 'perception' of the world we live than the scarce, lineal perception of the Hydrogen, or neutral bilateral structure of C-chains. According to its informative function, ammonia is a perfect atomic clock in which the Nitrogen vibrates constantly back and forth through the hole shaped by its 3 hydrogen 'eyes', with an informative cycle of $+10^{16}$ times a second. The first atomic clocks were in fact based in that simple molecule due to the accuracy and speed of frequency of its temporal vibration, which in life molecules allows NH^{+3} heads to 'inform itself' and regulate with its cyclical clock motions the 'guided motions' of the 'carbon' body and Oxygen legs of the molecule.

- *S≈T*: The structural atom that creates the rigid body structures of life molecules is the carbon atom. It has the maximal number of valences - 4 orbitals that create dual bondages with 2 other carbons - constructing long, formal ternary chains of great structural rigidity. As such it is the most visible, intermediate form of all life compounds. And so biologists, due to its 'visibility', have traditionally considered it the 'fundamental element of life'. When we add Hydrogen atoms to complete its 'crystalline' body we obtain methane the simplest molecule of life. Then when we join 2 carbons with dual bondage, we form ethane, which already acts as a hormone, (±reproductive molecule) inhibiting the structural growth of plants.

- *Max. E*: Finally, both the $\Delta+1$ world and site of future Entropic death of all life systems, *its medium*, is water, which fills the 'external world' in which life feeds and internally becomes in complex living organisms called cells, the filling Entropy of the intermediate space, enclosed between its carbon-based protein & fat walls and the inner, informative, nitrogen-rich, ADN hyperbolic singularity. Water is the simplest, most abundant ternary molecule of the Universe, made with 2 slave hydrogens and 1 dominant oxygen - the atom that has the maximal 'electro-negativity' after fluorine. Thus, oxygen can capture the electronic body of any other atom. That is why the oxygen components of carbohydrates enact its energetic cycles, moving those organic molecules within the water ecosystem. Since they stomp on water, breaking it and creating expansive and implosive OH^- , H^+ ions that impulse the molecule; as you walk on the floor, 'stomping' on the electromagnetic fields of the ground or as a fish moves, hitting the water with its tail.

Numerical proportions.

The proportion of the 3 atoms in living systems reinforces this classification, according to the ΔST proportions between the 'Entropy, body, head' classes. For example in a human being the proportions are: 67%, O+H molecules and atoms, 23% C+H molecules and atoms and 6.5% Nitrogen+H systems, which are in the usual range of $\pm 2/3^{\text{rd}}$ of Entropy components, $-1/4^{\text{th}}$ of body components, and $-1/10^{\text{th}}$ of head bits, proper of most systems in the Universe.

We could also consider as essential atoms, the carriers of neuronal orders, the implosive, positive, informative Ca^{2+} , K^+ and Na^+ ions, which again form a triplet of diminishing 'informative power' and define the potentials of electricity between neurons and the rest of submissive cells and so add up to a 2.1% of human body mass. If we add it to the 6.5% of Nitrogen brings the number to 8.6% of mass, closer to a $-1/10^{\text{th}}$ per cent of the informative 'class' of all organisms.

Those and other oligo-elements, of a higher scale of atomic complexity are essential to mark the 'differences' of power of certain molecular systems 'pumped up' in Entropy or information by their addition. Most of them however have an 'energetic' role (iron in heme groups and cytochromes, copper in reptiles, Magnesium in chlorophyll, phosphor attached to oxygens in AMP systems, Cl^- to balance the K^+ electronic bomb and S with 2 valences in anaerobic breathing and some molecular bridges.

This responds to a fundamental law of all efficient, healthy organisms, which is *to maintain the informative, atomic, head structure of the system pure, without 'leukemia', without the interference of an alien language to the system. Since the main sickness of systems is to become trapped by an alien informative species, for whom they will enslave, as it happens when viruses substitute cellular DNA by their own.* This is exactly what humans have failed to accomplish

when they substituted their natural, biological, verbal, ethic language by gold hypnotism, an informative language of metal whose values are against those of life and have completely changed the route of history.

Recap. Nitrogen heads, carbon bodies and oxygen Entropy create the simplest life beings, amino acids...

Topology: From carbohydrates to cells.

In the next graph, the glycine is the simplest active life form with 3 st-zones:

- Max.I: The nitrogen head directs the glycine.
- S≈T: A dual carbon creates the first rigid 'membrane-body' of life with its strong, covalent bondage, joining the head and tail:
- Max. E: Its oxygen COOH tail 'walks' on the water, breaking, attracting and repelling its OH-, H+ radicals.

Amino acids show their complex, reproductive and social arrows, catalyzing through their movements the replication of new amino acids and forming social chains, called proteins.

The inverse properties of st-amino heads and e-oxygen tails make possible the creation of long chains of amino acids in which their nitrogen heads bite their oxygen tails becoming neutralized as part of a complex social structure: the protein.

The nucleotide improves upon the amino head, carbohydrate body and oxygen legs of the amino acid, adding to those 3 lineal forms a Dïmotion of informative height; as latter will occur in macro-organisms, when flat worms become cylindrical. So the amino acid head becomes a dual nitrogen ring, the body becomes a sugar and the tail multiplies its oxygens around a highly electronegative Phosphoric acid. The outcome is a nucleotide acid (right side of next graph) - *the top predator life molecule*, which evolves socially all others into the next st-scale of life, the cell.

The 3x3+(Δ+1) horizons of social evolution of life.

Biological organisms, as physical organisms did in their growth from atoms to galaxies, evolved in 3x3 horizons of increasing social complexity creating the 3 ±i scales of life: the age of molecules, the age of cells and the age of multi-cellular organisms, specialized in Entropy (plants) or information (animals).

Let's study those ages in detail, differentiating them in 3 sub-ages according to the Ternary principle.

Since if we apply the law of the 3±Δ Ages to organic molecules we can explain how they grew in informative complexity and spatial size till acquiring the form of living organisms, in a process similar to the evolution of particles that created the cosmological bodies of the Universe.

Those 3±Δ evolutionary ages of life, each one sub-divided in 3±Δ sub-horizons, are: the young age of molecules, the mature, longest age of cells and the 'recent' age of living organisms, which will end with the creation of a global single organism, Planet Earth (Δ+1):

The 3±Δ ages of molecules.

- Δ-1: *The atomic age*: the simplest chemical molecules of life are formed. The 3 simple atoms and molecules of life recombined its energetic, reproductive and information functions and grew, forming bigger chains thanks to its atomic affinity, acquiring more complex 'vital properties'. The simplest combination of them, the CNO molecule, urea, is considered the first molecule of life and its 'crystallization' in a lab, departing from non-living atoms, was considered the birth of biochemistry and the prove that life is an atomic system that shares the same properties of any other SxT system of the Universe.

- Max. E: *The Entropy age*, dominated by lineal, long, simple fats, huge carbon chains with oxygens attached to its ends.

- \Leftarrow : *The amino acid age*: COOH, methane and ammonia, the 3 simplest life molecules of the triad of life atoms, O, C, N, combine as the relative Entropy, reproductive and informative organs of amino acids. Amino acids reproduce exponentially in the primordial organic water soup and evolve socially into proteins.

- *Max.I: The nucleotide age*. Nucleotides, the informative molecules of the life, add an informative Δ motion of height to lineal amino acids, forming nitrogen and sugar rings. They dominate all other carbohydrates. Soon they will also evolve socially into huge chains called nucleic acids.

- $\Delta+1$: *Social age. Nucleic acids*, the macromolecules of life with max. Exi force, integrate socially all other carbohydrates in herds of vital molecules, creating *the cell, the following Δ -scale of life*.

The $3\pm\Delta$ ages of cells.

- $\Delta-1$: The previous $3\pm\Delta$ horizons of evolution of molecules brought the first cells.

- *Max. E: The age of RNA Protista*. The Entropy age of the cell is dominated by the simplest RNA *Protista*, whose ternary st-structure is based in: an external protein membrane; a series of 'convex' spiraled RNAs, the singularities that directs the cell, and an internal, intermediate water zone, the cytoplasm, where the cell reproduces its specific Entropy and information - thanks to the free 'Entropy' of water radicals - with the instructions given by those RNAs. Those Protista reproduce massively, exhausting the organic elements of the life soup. Then it comes:

- \Leftarrow : *The Age of DNA Protista*. It is the balanced, mature age of Protista. Dual RNAs peg together to form informative DNA rings, which store new genetic information that permits further growth and differentiation of Protista, according to new, improved 3 st-regions:

Entropy membranes invaginate the cell with a tubular network, the Golgi apparatus and protect the still DNA with a differentiated nucleus membrane; while new, specialized organelles perform the Entropy and information processes of the intermediate zone, creating reproductive Mitochondria and Chloroplasts.

- *Max.I: Informative age and differentiation: Eukaryotic age*. Informative DNA cells multiply its genetic memories, while RNAs differentiate into a triad of forms that increase in the intermediate space-time the reproduction of membranes and proteins, creating giant cells. They cannibalize and enslave smaller, symbiotic cells, specialized in the dual arrow of Entropy, (mitochondria and chloroplasts) and information (ribosomes). Those who absorb chloroplasts became algae; those who fed on mitochondria, animals.

- $\Delta+1$: The biggest eukaryote animals are amoeboid cells that evolve faster, informative, electronic languages using heavier metal ions, K^+ and Na^+ , to send their messages to other cells through their membranes. The nervous language allows simultaneous cellular actions, creating mobile multicellular organisms called animals. While slower chemical languages that use 'hormonal vowels⁷' put together unicellular algae into plants.

Let us consider the evolution of animals:

$3\pm\Delta$ horizons of evolution of animals: network's organisms:

- $\Delta-1$: Conception. Electric cells create multicellular organisms in control of all other cells, gathering in 3 physiological networks - neuronal, muscular and glandular=digestive systems that perform the informative, reproductive and energetic cycles of the organism as a macro-living st-point. The sequential dominance of those physiological networks creates the 3 ages of life - the energetic youth, reproductive maturity and informative old age - and the 3 horizons of evolution or 'main phyla' of multicellular animals.

- *Max. E*: The Entropy system -a central digestive tube- dominates the 1st horizon of multicellular organisms, occupying the central zone in 3 sub horizons of formal evolution: the age of sponges, the age of hydras and the age of worms, the first bilateral animals created around a tubular, lineal digestive system that moves in the Δ motion of length.

- \Leftarrow : Worms develop blood networks based in metallic carbohydrates that carry to each cell of the body its oxygen Entropy, food quanta and the dual hormonal orders of the brain: reproductive orders and 'killing orders' performed by

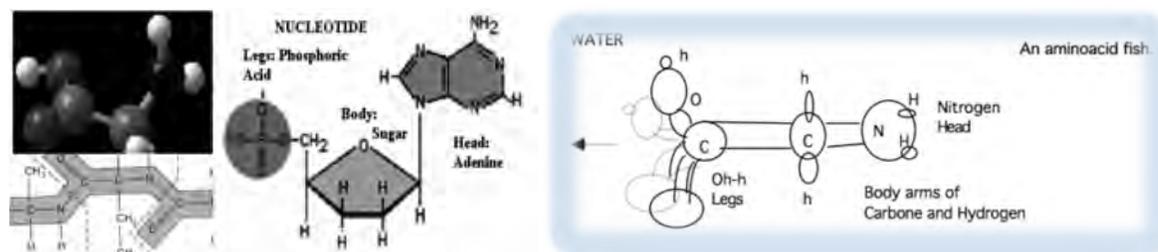

amoeboid leukocytes. Thus, as blood networks increase the efficient control of fractal cells, animals grow in size, starting an age of massive sea life speciation. Today we still have 90% of the genes of those worms.

- *Max.I:* Life jumps a fundamental discontinuum, when the first mollusks become insects and the first fishes become amphibians, colonizing the Earth. Their sensorial and nervous systems become overdeveloped in the new environment that has a higher transparency to informative light. Land animals specialize their 3 networks to the new medium in 3 sub-ages: the age of amphibians, which still reproduce in water, the age of reptiles and the age of birds and mammals, dominant in visual and nervous systems that ends with the arrival of Homo Sapiens.

- $\Delta+1$: Homo sapiens develops a new informative language, the word, evolving into historic super-organisms, civilizations and economic ecosystems that grow in size till reaching a global Djmotion.

Recap. Biological organisms evolved in 3 horizons of increasing social complexity creating the $3 \pm \Delta$ scales of life: the age of molecules, the age of cells and the age of multi-cellular organisms, specialized in Entropy (plants) or information (animals).

The Entropy age: $3 \pm \Delta$ Simple molecules.

In the graph, a glycine, the simplest 'organism' of life or amino acid with its self-similar form to a small mammal, with a nitrogen head, a carbon body and its oxygen legs. And the two fundamental species of complex molecular life: a nucleotide, dominant in information, attached to a sugar body and phosphoric acid and the detail of a protein body; the most reproduced species of the system. Lineal fats that store Entropy become the 3rd essential topology of cellular life.

The first age in the evolution of life is the age of simple molecules. Water became an organic soup filled with ammonia and simple chains of carbon, among which we highlight:

- *Max.E: Acids and fats.* They are headless, without nitrogen heads - a long, lineal limb of energetic carbons with oxygen legs on its extremes. They will become the fundamental Entropy of cells.

- *Max.I: Sugars* add an informative, cyclic Djmotion to headless fats. They are carbohydrate hexagons evolved socially in long chains, through oxygen connections, called polysaccharides.

Amino acids: SxT functions and evolution into proteins

The 3 life molecules, ammonia, methane and water, create *the spatial structure* of glycine, the simplest amino acid which resembles an animal, with the positive charged nitrogen head (amine), the negative charged Oxygen tail (carboxyl), and a carbon body chain that fusions together the 2 extremes, creating the i-logic 'generator function' of amino acids:

Oxygen legs(E) <Carbon body (SxT)> (I) Nitrogen head.

st-points adapt their morphology to the Djmotions and directional movement of their specific environment. Thus, while a still cell is cyclical, moving life molecules are lineal forms in which *the nitrogen 'head'* is upfront to absorb information & Entropy in the direction of movement; *the structural carbon* membrane is in the center; and *the Entropy cycles* are performed by the *oxygen tail* that moves on the water:

- *Max.I: Informative cycles* are directed by its ammonia 'clock'. Nitrogen vibrates across its Hydrogen triangle, perceiving and transferring electromagnetic information elaborated as Van der Waals forces to its carbon body that orientates the molecule in a chosen direction.

- *S≈T: Reproductive and social cycles*: A rigid carbon chain can peg to its sides by affinity (3rd postulate of i-logic geometry) other carbon structures that latter might split, reproducing new glycine or might stick together, shaping new species of amino acids.

-*Max.E: Entropy Cycles*: The oxygen moves the molecule, propelled by the dual polarity of water.

- *Social and Transcendental cycles*: Their social evolution gives birth to macro-molecular proteins.

- *Existential, generational cycles*: The purpose of those molecules is to exist, performing their organic cycles.

Thus, after the birth of amino acids, Earth witnessed a massive replication of glycine, which soon diversified in all kind of sub-species that pegged to the original glycine new pieces of carbohydrates bodies, nitrogen eyes and oxygen legs. Thus the organic soup became an ecosystem of top predator amino acids that catalyzed the reproduction of new amino acids, absorbing the simpler molecular 'nutrients', till amino acids saturated the Earth's oceans. Then those different amino acids associated in complementary st-herds, in which specialization occurred again, as some amino acids were designed better to gather Entropy with extra oxygen legs; some had extra nitrogen heads to process information and some were long carbon chains better suited to split, peg and reproduce new amino acid pieces. Thus we can easily classify amino acids as informative amino acids, with ring structures filled with Nitrogens; energetic amino acids, with added Oxygens - Phosphors and sulfurs, atoms with high 'electro negativity' that are able to capture energetic electrons; and reproductive amino acids with long carbon chains.

Social evolution of amino acids: the protein age.

Amino acids in their social stage of evolution became, according to the inverse morphological isomorphisms of transcendental evolution, the 'relative Entropy' of new macro-molecular proteins. So they lost its 'active' heads and tails, pegged now to each other, as the 'fixed' neutralized st-points of the protein's spiral structure; where the active parts are radicals joined to the central carbon of the amino acid. Those bulky, seemingly unnecessary radicals that hindered the motions of free amino acids show its true value in proteins. (This often happens in evolution, which requires first mutational, inefficient stages that reorganize into functional macro-systems thanks to the directed ternary systems created by fast, planned evolution. If all were chaotic, slow Darwinian mutations most mutations would not survive long enough to transcend into useful new organs, as Darwin already noticed it, studying wing evolution. Thus transitional stages are a proof of 'Δ-volution'.)

Proteins are huge carbon chains that fusion the fractal actions of those radicals with many oxygen legs and a few nitrogen eyes into a simultaneous present of Max.IxE force. They are like centipedes, entities with simple perception but a fearsome Entropy that allows proteins to cut and kill all the micro-molecules of the life ecosystem. So they became the new top predators of the original carbon soup, probably chasing down free amino acids to replicate themselves.

Finally, lineal proteins evolved further, according to the inverse isomorphisms of transcendental, social evolution, forming self-replicating hollow membranes with cyclical, still forms, which nucleic acids will latter fill and dominate, creating cells. Indeed, the protein's simple minds made their top predator status short living when the 3rd informative horizon of molecular life, the nucleotide, evolved.

Informative age: Nitrogen bases and Nucleotide acid.

In the previous graph, we show the final, informative age of life molecules, which occurred when the amino acid evolved its lineal, simplex 3 st-regions adding a new, informative Dmotion and creating the 3 globular zones of the nucleotide:

- *Max. S≈T*: The improved body is called a sugar that has, instead of the carbohydrate's zigzag line proper of amino acid bodies, a pentagonal form, a powerful compact body cycle that appears in all scalar morphologies. Further on, the sugar pentagon adds one lateral oxygen's rudder that can chain or unchain itself to other sugar rings through easy to break oxygen bridges. So the reproductive speed of the new nucleotide's body based in the capacity to peg and split its body increases.

- *Max. E*: A nucleotide tail adds up a highly energetic, phosphoric acid (PO_4H_3) that has more oxygens than the amino acid's original COOH tail and so it swims better in water. The heavier phosphor is also a nitrogen-friendly atom, from the same 3-5 valence electronic column. So the head improves its control of the tail and its energetic oxygen atoms.

- *Max.I*: Finally the Nucleotides' heads add up new nitrogens, creating cyclical, hexagonal rings, called Pyrimidines, which once more diversify in 3 subspecies: Thymine, Uracil or Cytosine...

- Uracil is lighter. So it is the brick for building highly mobile social nucleotides called RNAs.

- Thymine is heavier, since it has one more carbon, while Cytosine adds Nitrogen with 2 Hydrogen 'antennae'. So they are the bricks of DNA, the most informative, still molecule of life.

Finally the most complex nucleotide heads are Purines: dual, pentagonal and hexagonal nitrogen rings, joined by a strong covalent $\text{C}=\text{C}$ wall that form dual couples, called Adenine and Guanine, which add an external nitrogen antenna with 2 Hydrogen eyes to probe the unknown world.

So the globular structure of Nucleotides also creates more evolved social forms, the RNA and DNA acids that will control protein membranes in the cellular scale.

If structural bodies dominate amino acids and proteins, the dominant element in Nucleotides are their nitrogen heads. They become the unit of the social, informative languages of cells, playing a key role in all their informative tasks, as the main elements of most hormones and the fractal units of macro-molecular DNAs, which will create the higher, cellular scale of life forms.

Bases express the 4 arrows of time in life. Some basic rules

Now we have come to a key element of the program of life, the existence of 4 based, which will codify the creation of superorganisms of cells. Why? We have again and again show that each super organism requires a language able to express the $3\pm j$ Djmotions of space-time existence, the program or will of the Universe. It is easy then to observe that the 4 bases represent a new whole game of existence, as the 4 'positive' Djmotions of space-time do or the 4 quantum numbers, or the 4 drives of life, and since function is form, just looking at those bases we can deduce that:

The simplex arrows are expressed by simplex Pyrimidines (single cycle)

- Uracil and thymine with more oxygen are the energetic drive expression and complex genetics show this to be the case, as they are more abundant in functions and genes related to energetic systems.
- Their informative head is adenine and as such is the dominant base of the system. It has a Nitrogen higher mass and a nitrogen head with 2 antennae. It is the head of the ATP systems that command as small molecules the game of proteins and most orders of actions in the cell. Both the simplex body T and head A assembly together by affinity and complementarity

The complex arrows are expressed by dual Nitrogen cycles:

- Cytosine is the balanced dual molecule. Hence the reproductive arrow. And indeed, when it is uncovered in the DNA loosing its cover it allows the expression of genes.
- Guanine is therefore the 4th social arrow and the base that brings the next scale.

This simple scheme of the 4 Djmotions of life languages is determinant for fully understanding the whys of genetics, which now are only described at the level of the 3rd paradigm (how-description).

Example: Receptors of complex, external orders.

Consider the case of the GDP and GTP molecules. Their function is *essential to the transmission of orders from the higher scale of neuro-hormonal messages that regulate the superorganisms of cells*. 60 % of all external signals to cells are transferred through the activity of Guanine, the social nucleotide, activated through the G-protein channel. As such the GDP/GTP molecule is the 'boss' of intercellular communication, as the ATP molecule is the boss of energetic communication.

The ATP in fact in conjunction with the energetic Tyr amino acid (with an extra oxygen), and the energetic Phosphor atom, works with the second most common membrane messenger, after the G-protein channel, two poles that become activated by phosphorylation, bringing to them 'hungry' proteins that become energized and provoke signals for energetic and reproductive arrows. (Remember that simplex informative and complex social evolution are the two related arrows of temporal information, most associated, and the complex reproductive and simplex energetic arrows are the tandem associated to energetic space). Thus the receptor called Tyrosinase is also related to the kinases, which are the enzymes that provoke the energetic mitosis and death of the cell. This examples shows how *the emergence of the properties of smaller scales are always transcendental, social evolutions of one of the 4 arrows of time, the will or program of the Universe that maintains the self-similarity of scales.*

Let us consider the ternary differentiation of this molecule, ATP, as it is the key to the energetic force that propels and makes possible the cell.

The age of nucleotides: ternary differentiation of species.

So after the age of Amino acids and proteins, there was an age of Nucleotides, which differentiated again according to duality in 2 subspecies: One rich in Entropy, the other richer in information:

- *Max. E: The energetic Nucleotides are ATPs*, the key molecules in all energetic life processes. Breathing and feeding could not happen without ATP, the specialized Entropy Nucleotide that again subdivides in 3 subspecies, which can be identified as the energetic, balanced and informative ATP:

- *Max. E: ATP proper* - an Adenine nucleotide with a longer tail with 3 Phosphors and 10 oxygens, ordered in a classic decametric, $3 \times 3 + (\Delta + 1)$ scale: each phosphor controls 3 oxygens, and the 10th oxygen connects them to the sugar body.

- *S≈T: ADP*, which has lost 1 phosphor and 4 oxygens (an HPO_3 molecule) releasing in the process 34 KJ of Entropy, balancing its form with less Entropy but the same Nitrogen information.

- *Max.I: AMP*, which has lost another HPO_3 , becoming a cyclical molecule, since the phosphoric tail touches its nitrogen head. So it acts in cellular processes as an informative carrier, transferring hormonal information, amplifying it and programming the cell's nucleus with that information.

- *Max.I: The informative, social evolution of nucleotide acids gives birth to RNA and DNA.*

Nucleotides evolve socially, becoming according to the isomorphisms of transcendental inversion between micro and macro planes ($I_{\Delta-1} = E_{\Delta}$), 'Entropy cells' of RNA and DNA spirals, grouped again in triads that form a spiral cycle. Those triplets surrounded by energetic ATPs create genetic scales in groups of 3, 9, 27...

Those 3ⁿ elements in turn will shape the structure of 2 new macro-molecular informative species, differentiated according to the SxT complementary, dual principle:

- *Max. E: Lineal, moving RNAs* that carry the actions of the cells, again differentiated in:

- *Max. E: Ribosomal RNA* joined to energetic proteins that peg the carbohydrate's pieces.

- *S≈T: Transfer RNA* that carries the fractal units that reproduce carbohydrates.

- *Max.I: Messenger RNA* that copies DNA information and takes it to the Ribosome.

- *Max.I: Cyclical, still, informative DNA*, made with 2 complementary RNAs, which carries so much informative, genetic information about the metabolic and reproductive cycles of all other carbohydrates that will become the 'brain' of the new scale of life, the cell... The nucleotide structure of DNA shows the magic 'tetraktys' that fascinated Pythagoras: 1, 2, 3, 4 Dimotions that add up into a decametric scale. Indeed, 1 DNA made with 2 RNA chains joined by nucleotide pairs form a structural tie of DNA; 3 nucleotides form the basic informative 'gene' to create amino acids; and 4 Djmotional bases is all what it is needed to create all the cycles and elements of the cellular game.

Those 3 type of molecular 'ages' will become then the 3 'topological' st-forms of the cell: amino-acids become the Entropy bites of the cells along with water, its medium; proteins will create the walls reproduced in its organelles and nucleotide acids will become the informative, perceptive species that run the show.

Recap. The evolution of life molecules took life through its first 3 ages, the age of amino acids, the age of proteins and the age of Nucleotides, the informative, hyperbolic species that will reorganize them all to create the cell.

Δ-1 PLANE : CELLS

In the graph the Topological Disomorphism of cells: Protein are the Δ-2 lineal molecules which emerge, inverting its form as Δ-1 δf, cyclical membranes. Inside the cell Δ-2 wave-like Nucleic Acid create the ΣΠ-reproductive element of the cell. Within them Δ-2 fat carbohydrates become the \$-lineal vital energy sandwiched between both. So we can write a generator function for the cell: \$-fat carbohydrates>ΣΠ-reproductive DNA>δ-cyclical proteins .

Cells follow all the laws of ΔS≈T, and are themselves supærganisms with lower scales of being. So we can study those lower bio-chemical scales first.

In the left side, the cell has 3 st--zones:

- *Max. E: It has an external, thin membrane, which in free cells have cilia that move the cell and act-react to external stimuli. In organic cells Entropy is provided by the blood system of the macro-organism. So external cilia disappear and invaginate as lysosomes that kill carbohydrates.*

- *Max.I: In the center, there is a nucleus of Max.Informative density, filled with cyclical or spiral DNA/RNA's networks that control the st-point.*

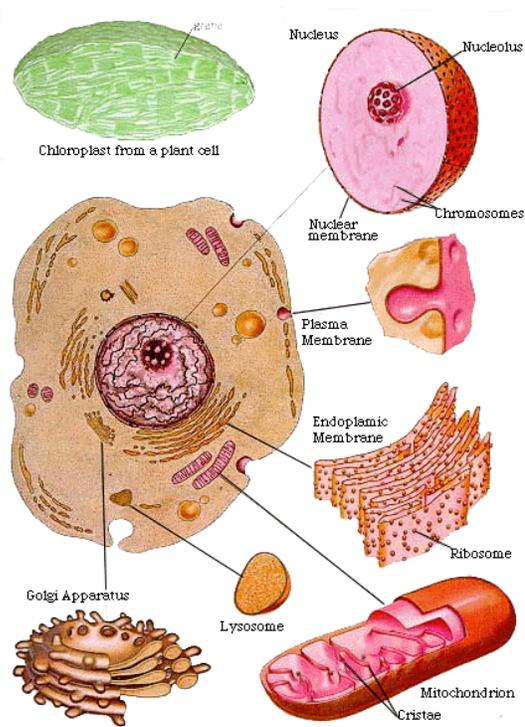

- *SxT: RNAs dominate the intermediate space-time, directing the Entropy organelles, mitochondria or chloroplasts that produce Entropy; and the informative ribosomes that reproduce products, pegged to the Golgi*

apparatus - a membrane's invagination.

Youth Horizon: From Prokaryote to Eukaryotic cells.

The previous description of the evolution of molecules requires to change the 'chip' of the scientist and accept the tenants of organicism in simple atoms; which so far science has only, according to the Galilean paradox of self-centered perception, accepted for the next scale of life – the cell.

At the beginning cells, called monera, did not have a differentiated nucleus membrane, which means their informative singularity was mainly moving RNA. As evolution continued through the dual/ternary differentiations proper of all SxT systems, RNAs split accordingly in 3 sub-species to carry out the specialized Entropy, informative and reproductive tasks of protein control, carbohydrate production and self-replication, through complementary, inverse, specular translation. Then, one RNA, which produced a specular image of itself, probably got pegged to that image and became

'fixed', as a still, dual DNA, an informative mirror of an RNA molecule, geared to reproduce it. Accordingly those first DNA molecules acquired the cyclical ring form they still have in all monera.

Soon the extraordinary reproductive growth of DNA cells made them giant cells that exhausted their trophic nutrients. So finally they cannibalized other cells to maintain that reproductive growth. First those cells would be killed and their nutrients absorbed but then some very efficient energetic and informative cells would become slaves within the cell 'farm' in a process repeated in all Δ -scales: first top predators are hunters but then informative top predators create farms. So worm holes use herds of stars to absorb intergalactic dust; men use dogs to herd sheep; and monera cells used ribosomes to reproduce informative molecules and mitochondria to absorb Entropy, forming the first macro-cells. Those who 'ate up' mitochondria, which produce Entropy from carbohydrate products, would become animal cells and kept hunting other cells to find semi-elaborated nutrients. Those who 'ate up' chloroplasts, which produce Entropy from small carbohydrates and light, would become plant cells.

Now the quantity of DNA in the cell grew to add up the DNA of those organelles and its variety of cyclical memories was so vast that it had to pack itself further, changing its bidimensional, cyclical form into a 3 Δ imotional spiral, and acquiring structures of energetic sustain: proteins that coiled around DNA and a nucleus with differentiated walls that surrounded DNAs. The age of eukaryotic, gigantic cells had started.

Recap. As information multiplied in simple cells, the RNA age gave way to the DNA age whose extra-genetic code should control the evolution of complex multi-cellular structures.

THE VITAL CYCLES/ACTIONS OF THE CELL.

The cell is a brain-body system constructed with 2 elements, nucleotide acids, based in nitrogen bases and protein bodies based in carbon chains, which are the informative and spatial systems of the cell. Around that SxT core duality we find an expansive intermediate, cyclical region with all kind of slavish organelles that perform their Entropy cycles (based in the energetic properties of oxygen, water and similar electronegative atoms); and their informative cycles. Both cycles are catalyzed by denser metal atoms that boost the E/I capacities of carbohydrates. Thus, through the interaction of carbohydrates, metallic ions, proteins and nucleotide acids, cells perform the $3 \pm \Delta$ cycles of all st-points:

Max.E: In an organism, Mg, copper and iron capture oxygen and deliver it to each cell to perform energetic cycles; while in the cell cytochromes kill and split the energetic hydrogen atom into H^+ and e^- ions in mitochondria or chloroplasts; absorbing its temporal entropy; while metal atoms stabilize protein enzymes.

Max.I: Na and K ions control the expansive and implosive rhythms of the electric membrane, sending informative messages among cells -while RNA and DNA molecules process *information* within the cell, reproducing new carbohydrate molecules.

- The combined effect of the accumulation of Entropy and information within the cell triggers the reproductive cycle, guided by RNA and DNA molecules.

- Σ : Cells *evolve socially* into macro-organisms. Yet only the RNA-DNA system creates complex informative, control networks.

- $\pm i$: Cells live a *generational* cycle chained to an organism that kills them 'periodically', or as free cells that die when captured by top predator living beings. Since most cells can be immortal if no other system kills or controls them hierarchically.

All those cellular cycles are not 'mechanic processes' but they have evolved departing from the organic, dual, Darwinian and symbiotic interactions between proteins and nucleotide acids, the dominant energetic and informative macromolecules of cells. The most important cycle is the reproductive cycle, which in the cell as in other fractal space-time represents the existential will that ensures the perpetuation of the species. Let us consider it.

Recap. Cells follow the same arrows of existence of all st-points.

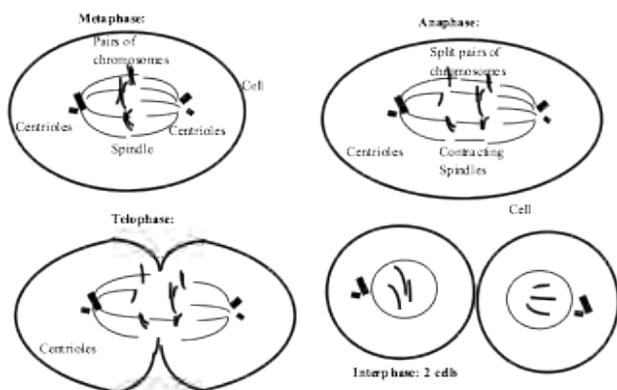

The reproductive cycle.

The interphase, prophase, anaphase and telophase complete the reproduction of the cell, in which the centriole, a perfect example of a decameric structure, with 9x2 lineal proteins and a central 2x1 nucleus that controls the lower scale of 9 forms, plays the key energetic role of motion control.

The phases of reproduction of a cell called mitosis (1, 6, 25), are in fact its death period, that lasts the shorter period of the daily life of a cell. It is the genius of the cell to use its death period to split and renew itself by the arrow of reproduction. Yet it can still be defined as a death period, which always means that the E/I fields of the system reverse in time, the energetic, destructive arrow dominates and ends up dissolving and splitting the complex informative brain. So in the cell you can see mitosis as the sudden dominance of the lineal, protein, killing centrioles which are reproduced in excess at the end of the S2 phase or 3rd age of the cells, both at the lower molecular scale (assembly of ctk enzymes) and at cellular scale (centrioles and spindle) and then attack and break in two the chromosomes:

The reproductive cycle of cells shows an evolutionary pattern observed in many dual cycles between 2 complementary st-points of relative Entropy and information, which first confront their energetic and informative inverse forms. But as time goes by often by chance they realize that social, complementary evolution is more efficient than Darwinian, energetic destruction. And so they end up evolving together, following the positive, creative arrow of the Universe. We can hypothesize according to that homology the 3 ages of evolution of the reproductive cycle:

- *Energetic, unicellular age: Sexual reproduction probably started as a Darwinian, energetic process of hunting in which lineal, energetic sperm killed the cyclical ovum and learned to host its DNA-code as virus do, in the ovum's center. Yet as the sexual cycle evolved beyond the energetic, young age of the cycle, the 'war of sexes' ended and the cycle moved into a balanced 2nd age.*

- *S≈T: Reproductive, 'colonial age'.* Now information was exchanged between both forms, the sperm and the ovum - since sexes are in fact a specialization of species into *energetic males and informative females*. And a new symbiotic dual form was born. Those forms would start reproductive radiations multiplying the number of cells. So probably sexual reproduction is a key factor in the multicellular explosion of the Cambrian age.

- *Informative, palingenetic age.* Finally, in the 3rd age of sexual evolution the informative female species dominated the cycle, as females have more genetic code (2 complete X chromosomes) and

control during pregnancy the reproductive, palingenetic cycle that brings the embryo into a new 'macro-organic level of existence'. If we observe the family cycle of human couples, women also tend to dominate the couple in its 3rd longer age, as Proust already noticed; since information lasts longer than Entropy in temporal energy.

In complex organisms a living, reproductive cycle is dual: it departs from the simplex reproduction of a single cell that multiplies. Then those self-similar cells suffer a complex process of palingenetic reproduction that recreates an organism made of billions of cells, departing from that single cell.

Cellular reproduction: a tug of war between DNA and proteins.

Let us consider in this synoptic paper, the simpler process of cellular reproduction, as we have treated palingenesis in our analysis of the 4th postulate of i-logic geometry:

Organic cells reproduce within a day, chained to the symbiotic daily feeding period of the organism that provides them with Entropy and information for that reproduction. Fractal cellular reproduction shows also that duality between positive, organic complementarity Vs. negative Darwinian struggle that either balances E-bodies and I-brains into organic systems or determines their mutual destruction when that balance is broken (death processes, Lorenz

Transformations, etc.) In the reproductive cell cycle, the most efficient body proteins - lineal, tubular centrioles - and the top predator, informative DNAs enact an ambiguous struggle between their Darwinian desire of mutual destruction and their need of complementary evolution.

So cellular reproduction is a mixed cycle based in both kinds of relationships in which first the lineal species of cellular Entropy (centrioles, which are long $(9+1) \times 2$ protein fibers with a perfect decametric structure), untie the cyclical species of pure information (DNAs), trying to split and kill them. Yet DNAs, once uncoiled, defend themselves 'informatively', creating a new membrane that breaks the centrioles apart into 2 groups, and also breaks the cell creating 2 new ones. We can distinguish several phases in that dual struggle, dominated alternately by each of those 2 forms that involve all the other elements of the cell, directed in their dance by those max.E x Max.I top predator elements or 'upper classes' of the cell. It will be a tug of war that illustrates all the geometrical strategies of Darwinian and complementary events between dynamic st-points:

-In *interphase*, both top predator substances replicate. Centrioles are outside the membrane, which protects the DNA.

-In *the prophase centrioles start their hunting*: the protein's membrane of the nucleus dissolves, exposing DNAs' chromosomes that become visible preys. As all other universal preys do, from wriggling worms to high frequency rays, from submissive servants to herds of electrons in front of a quark or fishes in front of a shark, chromosomes try now to hide by coiling up, becoming contracted, shorter forms. Then the hunting starts. Centrioles have replicated and now double its fractal action, moving to both sides of the DNA nucleus, forming dual, long molecular chains joined by filaments. So they *create a polar field of forces that captures in its filamentous web the self-replicated DNA*, as a North and South Pole create together a magnetic force field that aligns atoms or two boats web a net to capture fishes.

-In *the metaphase chromosomes defend themselves from the 2 centrioles* that throw the 'hooks' of their force field, stretching the DNAs. But those chromosomes that have replicated in the earlier interphase evolve now socially in couples of parallel forms, increasing its fractal mass and moving away from the centrioles in a classic protective strategy: They arrange themselves in the equator of the spindle, adopting a Darwinian, perpendicular position, the farthest away from those centrioles. It is exactly the way in which diamagnetic particles that flee from magnetic fields, arrange themselves trying to receive the minimal quantity of force from the North and South Poles of the magnetic field.

-In *the Anaphase centrioles counter-attack*, splitting away the chromosome pairs.

In the telophase, DNAs find their winning, defensive strategy: They are the informative species that store the genetic code of all cellular forms. So DNAs start to reproduce new membranes in a frenzy till those membranes break the centrioles' spindle through its middle zone, isolating each centriole and breaking their field of lineal, protein forces. Since lineal, energetic or reproductive beings, like centrioles or 'magnetic' fields are, cannot create monopoles. Only temporal, implosive, informative cyclical particles can do that. So the spindle dissolves and the new membrane divides the cell.

Now the system reaches again a balance, as the dual chromosomes and the dual centrioles become again single forms surrounded by a new membrane.

Thus the dynamic tug of war between a protein's body and a nucleotide's brain ends up in a draw, creating 2 cells instead of one, which will re-start after a rest period a new *interphase* process of protein and DNA reproduction. Since the Universe is indeed a game of reproductive radiations, the ultimate will of all beings that want to survive their fractal, periodic death by creating a self-similar 'present' form.

A variation of that process required in sexual reproduction, is called meiosis, in which the twin reproduction of DNA and its subsequent destruction of the nucleus' membrane is provoked by the energetic sperm that enters the ovum, invading, as a virus does, its DNA nucleus and merging its genetic material. So, as it happens in the interphase of a cell, the fecundated sexual cell has 2 parallel quantities of DNA, albeit with different genetic material, coming from the ovule and the sperm. So as the replicating process repeats through the same phases of any cellular reproduction, the

final result won't be an identical cell but a cell that mixes the genes of both, the sperm and the ovum. When besides sexual duplication there is an interphase with chromosomal duplication the final 2 cells will be diploid cells with twice the genetic material of the original cell. This happens only in multicellular organisms, as redundant genetic material is useful to store genetic orders needed for the complex construction of multicellular structures; but it would be redundant in the simple life of a monera cell, which escapes the interphase duplication.

The fō§ x PŠT duality of lineal sperm and cyclical ovum extends outside the realm of form and transcends to the upper scale of multi-cellular organisms and sexual characters: the ovum is an informative, cyclical, autotrophic female cell with higher chromosomal content; while sperm is an energetic, heterotrophic, lineal male cell with higher mobility. And we find according to the Fractal Principle, 3 evolutionary types of increasingly differentiated sexual cells: semen and ovum, which are equal in spatial size and temporal form (isogamy); semen that is equal in form but smaller than the ovum (anisogamy); and ovum and semen, which are different in spatial size and temporal form (oogamy), as in human beings.

Those differences between male sperm and female unicellular ovum, latter diluted as their genetic materials mix, reminds us of the differences between unicellular animal and plants, the main dual differentiation of life along its SxT parameters that we will study now in more detail.

Recap. Sexual reproduction evolved from an energetic event in the unicellular age into a reproductive radiation and finally into the palingenetic process dominated by the ovum.

Cellular reproduction can be explained as a tug of war between the informative DNA and the reproductive proteins of the centrioles.

The death cycle..

In Cyclical Time death is caused by the finite limits of fractal time and spatial information. Death is a clear prove of the discontinuity of space and temporal energy. If we were continuous, that continuity of time and space would make us immortal and infinite. Which means that only the ∞ sum of fractal time-spaces or absolute Universe is eternal: the isomorphisms of temporal Entropy, the logos-mind of the Universe do not have an end nor a principle, because the sum of all the transformations of Entropy and information balances a dynamic Reality that never dies, remaining always in a relative, equal present. Reality exists 'per in secula seculorum, amen'.

Only reproduction guarantees certain immortality, *recreating our form in other region of spatial information*. Yet in all species the rate of reproduction also goes through 3 ages, and so when reproduction halts, not only the 'cellular' individual but the species of the 'higher plane' dies:

- *Big bang phase:* A new species multiplies very fast departing from a 1st individual.

- *Steady state:* Its reproductive rate stabilizes.

- *Population Crunch:* Finally it slows down to a halt, extinguishing the species.

Death is in fact the most obvious prove of the discontinuity of space and temporal energy. If we were continuous, that continuity of time and space would make us immortal and infinite. Thus only the infinite sum of quantic time-spaces, the absolute Universe is eternal.

For the rest of us only reproduction guarantees certain immortality. Yet the rate of reproduction of any species is also quantic and goes through the 3 ages, starting slow, increasing its rate and finally slowing down to a halt, extinguishing the species or type of DNA-cells of any organic system. So in a human being the number of divisions of any cell reaches up to 50, whereas in chickens it goes up to 20 divisions. The greater rate happens in the oldest, living species: the Galapagos turtle that divides 10^2 times its cells. $E=10^{i-2}$ is in fact the commonest constant in information warping, from the protonic accumulation of form in the atomic table, which after 100 forms becomes unstable to the limit of human aging.

According to the ternary principle, 3 biological strategies however seem to succeed death:

- Max.E= Some simple systems (coelenterate) reverse its time clock.
- Max. Re: Cells 'trick' their organic time clocks, to free themselves from the servitude of death, by multiplying its quantity of reproductive genes - its DNA molecules. The record belongs to cancerous cells, very rich in DNA, from the reproductive uterus of Henrietta Lacks, the so-called HeLa cells.
- Max.I: Humans achieve partial immortality through cultural memes.

Is there a species whose number of reproductions is infinite, an immortal being? No. Since even the nucleons of the big-bang reproduced e^{60} times to create the Universe, shaping a similar reproductive curve to that of living beings that now has slowed down to a trickle. So all dies for the game to renew itself.

Causes of Physiological Death.

The opposite process to the creation of life and the creation of form is the destruction of form into Entropy or *death*, ($I < E$: *Max. E x Min.i*), equally common. As one feeds into the other and together balance the dual arrows of the Universe.

Thus, the fundamental cause of death is to exist beyond the balance of form between the E and I components of any St-field. All beings have limits of excess of Entropy and/or form, which once crossed will bring their extinction, as their Entropy and information quanta 'explode' and split, dissolving the networks that kept the form together and were its inner consciousness. If a particle explodes close to C speed and splits its Entropy/information parameters according to Lorentz functions, so does a human being after dying. His Entropy dissolves back into his $\Delta-1$ simpler cells. And then, since all deaths are dual big-bang explosions, humans return finally to the molecular, amino acid level from where they departed.

If we want to be specific about the *causes of death in* human organisms, death is the product of an imbalance, either by an excess of Entropy that causes sudden death in minimal Time (*Max. e=Min.i*), through war, sudden sickness or accidents, or by the accumulation of spatial information that spends the Entropy of the being during its long 3rd age, leaving traces of past cycles in cells and physiological networks that cause their malfunction. In other words, the nervous, informative network exhausts the body, causing a *Max.I=min. E* imbalance, that wrinkles and breaks the body cells into death. But also the opposed phenomenon, an excess of Entropy caused death. In both cases the imbalance breaks the complementarity between the space and time content of the being. However, since the direction of living beings is towards the informative future, the informative imbalance is more frequent and shows in the 'growth' of time properties.

So old people are as time is, cyclical, memorial, curved, with discontinuous wrinkles that break the smooth continuity and linearity of young, spatial beings. That quantic, curving process happens in all the species of the Universe that age: cyclical wrinkles and quantum cracks occur not only in the skin of an old man but in the membranes of our cells, their Golgi apparatus and "Entropy" mitochondria. That loss of Entropy in any old being, which becomes quantized and implosive, with negative curvature, has manifold manifestations: cells shrink and their membranes no longer dilate. An old man measures a few centimeters less. The 2 networks, the Entropy network or membrane and the informative network become rigid, quantized and no longer reproduce. In human cells, collagen and elastin, the proteins of cells, lose their elasticity and expansive capacity, creating, informative connections among them. So happens to the rigid, cross-wrinkled skin of the old man. Meanwhile the energetic, metabolic capacity of the organism and its quantic cells diminishes.

In a more generic way information and time are parallel. So species with more information and less Entropy live longer, according to the Time-Space inversion: *Max. E=Min.i*. Thus for example, an animal that fasts systematically and receives less Entropy, lives longer (hungry rats live a 20% more). The female, informative sex with smaller expenditure of Entropy lives longer than the energetic male. A being that lives in a hot, energetic environment lives shorter than

one living in a cold environment. Hibernation that slows the metabolic rate elongates life. There is also a proportional relationship between the informative weight of the brain and the life span of an animal: $\text{Max.}i$ (brain weight) = $\text{Max.}i$ (life-span); which is inverse to the proportional relation between the metabolic expenditure of Entropy and the life span of the being: $\text{Max. metabolic rate (Max. E)} = \text{Min. Life span} = \text{Min.}i$, proving once more the inversion of space/temporal energy. So humans with huge brains live much longer than lions with huge bodies.

An excess of energetic atoms diminish time existence: Free radicals, which are oxygenated, energetic molecules, with free electrons (the Entropy body of atoms), deteriorate cells and their accumulation with age is a major cause of death. The degeneration and disorder of those cells can be caused by energetic radiations (electromagnetic rays of max. Entropy cause the mutation and death of cells.) The increase of fat, Entropy cells causes the death. So doctors establish a direct lineal relation between the accumulation of lipofuscine and the death of a living organism. An excess of Entropy is the main cause of accidental death among youngsters. So a speedy car crash breaks the body and the shock of a weapon's impact, a form of energetic metal, kills a human being.

Yet in generic terms, information that forms, carves and quantizes amorphous, continuous Entropy is the supreme cause of death. As the chisel of a sculptor creates form by destroying the marble, so does the game of existence: For example, elephants create the form of the savannah, when killing its trees; quantized hands are formed in a fetus, when interdigital cells commit suicide (apoptosis). So ducks, which do not kill them, have membranes in their hands. All those causes of death have created an equal number of scientific theories about death, all related to the inversion between spatial information and temporal Entropy and the balance between Entropy and information that defines existence, as opposed to its imbalance that causes death.

Mental death.

But what happens to the brain's information stored in the brain, after death? Does it dissolve also, as body cells do; as the magnetic, informative field of a star does or the mass vortex of a Nuclear Bomb does? Or does it transcend, as the photonic light does, into the higher electron, or the seminal cell does when it evolves into a new macro-organism?

According to empirical descriptions of death and the general MST isomorphisms for all space-time fields, information 'rewinds back', travelling also to the past, becoming erased, as it happens to our cells.

So most likely the information of the being will no longer be. It will become untied Entropy, cellular form and then molecular or atomic quanta. Since when we are incinerated, we fall to the consciousness of the atom. Yet consciousness, 'sensation', the very essence of 'existence', never goes away, it only jumps from atom to cell to man and vice versa. The optimist believer might believe in the transcendence of the 'informative mind' to a 'higher' plane of existence with more information, that of a human super-organism or collective God, as in a palingenetic process that makes a cell transcend into an organism. The pessimist thinker might believe in the devolution of consciousness to the "obscure world", with less information, of cells and atoms. It is what mystiques have explained in poetic terms as the opposition between the ascension to Heavens Vs. the quantic jump into Hell. So $\Delta \pm 1$ birth and death discontinuities are jumps between planes.

But how 'sensorial perception' changes in those discontinuities? It does so through the 2 antithetic sensations of SxT existence, which are informative pain and energetic pleasure.

Those 2 paradoxical, antagonist sensations happen not only in men but also in animal life and perhaps in all atomic forms, because they are based in the geometric properties of information and Entropy. Indeed, pain is created by 'pressure' on our cells, which is an implosive, temporal movement, also related to the consciousness of information. While pleasure is caused by the 'expansion of blood in the genital system, an energetic process. So we have the key duality of consciousness:

Information=pain=awareness=implosion

Entropy=Pleasure=forgiveness=explosion

Since information is desirable, the negative arrow of pain balances the positive arrow of perception. On the other hand since everybody likes pleasure, it balances the negative arrow of Entropy that erases awareness; creating a 'balance of wills' that makes possible to wish both life and death. Thus, in terms of sensations, death will bring just a sudden pain, the peak of our 'informative awareness' towards the future, before we change 'phase of existence'. Then death will be followed by a deep orgasm of energetic pleasure that erases all information, as we fall down the peak. Since pleasure is synonymous of Entropy, a travel to the past opposite to the awareness of perception, information and implosive pain, a trip to the informative future.

So after pain ends our will to live, we relax in a deep orgasm that erases information, reversing our space-time field, as our consciousness moves towards the past. Then the brain rewinds back the memories of its existence that cross for a last time through the 'soul' of the brain, more likely a neuron's network.

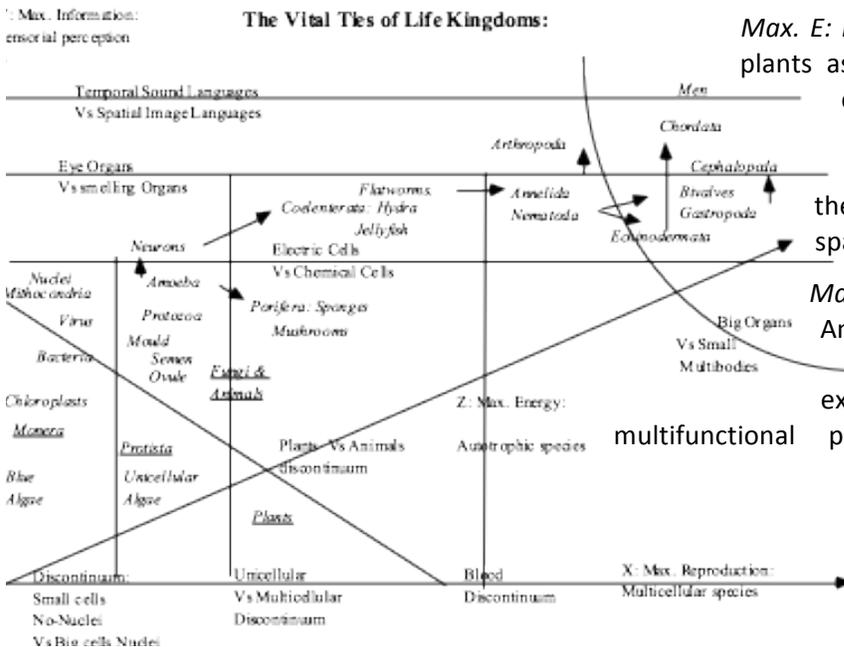

Yet, because time accelerates in smaller beings, the speed of times of the brain accelerates in that rewinding back, during which our black hole vortex or soul, the informative singularity of the mind, feeds back towards youth, perceiving and erasing a last time those memories. That is why in the 3 days of death of our organic system, as our body becomes corrupted and our consciousness dies, we can recall all those long years of existence at 'fast motion', as we rewind faster a tape than when we see it. That is why those who woke up from death could describe it as a trip to "the past" through its memories, because after death consciousness will perceive life "the other way around" at the faster time rhythm of cellular life. Then, finally we will enter back the uterus and return to the ovum's cellular consciousness; and then again we will die in a second big-bang, burnt in a crematory or feeding the insects that reduce us to molecular form. But 'we' will no longer be human. As a Hindi legend say, 'an ant was once Indra, a king of kings'. For those who are ego-driven, there is no need to worry; the game is limited in its variations. So you are in a way immortal. Since we are repeated in infinite places of space and time; you will be born in another planet to live your life again.

Yet, far more important than the death of any diminutive MST field, is the death of the $\Delta+1$ scale of existence, the death of living species or human civilizations, related to the process of evolution and extinction of the Earth's ecosystems...

Recap. Death is brief in time, exploding in space the information of the being. Death is caused by an imbalance between the Entropy and information of a system. Energetic beings live shorter than informative beings. All systems have a finite duration in temporal energy. So death requires reproduction for the species to become immortal.

TERNARY CELL'S DIFFERENTIATION: PLANTS, ANIMALS AND FUNGI.

The kingdom of life shows in all its beauty the generic process of evolutionary differentiation of any space-time field, along the main $3\pm\Delta$ Djmotions, departing from a 1st singularity, which in the world of life is the Monera phylum - the initial cell, whose *ternary differentiation gave birth to energetic plants, reproductive fungi and informative animals*:

Max. E: Energetic plants use light as Entropy. Biologists talk of plants as autotrophic cells; still forms like the ovum, which create their Entropy and information quanta from light and water, in any place. So they made their membranes harder and thicker to maintain themselves centered in a territorial, discontinuous, vital space, regardless of what happens outside.

Max. I: Informative animals use light as information. Animals are heterotrophic, moving cells, which feed on other forms. Hence they developed thinner external membranes and cilia, which according to the principle differentiated further into increasingly

sophisticated sensorial antenna to localize their preys and lineal, moving engine with a master centriole - a 'protein head' on its base. So though in a 1st phase unicellular plants were more complex, animals ended up evolving greater quantities of inner, informative RNA-DNA to act-react faster in their unknown moving environments.

S≈T: Reproductive fungi are organisms that have qualities belonging to both, the animal and plant kingdoms. Fungi feed on dead substances and survive thanks to their maximization of reproductive skills.⁶

The inverted forms and functions of plants and animals define both species as 'antisymmetric systems' ruled by their opposite diffeomorphic parameters of Entropy and information:

Their informative cycle and brain-body Dimotions are inverted: plants have their brain down in the roots, since they use light as Entropy; animals have it on top, since they use light as information.

Their energetic cycles are inverted: plants breathe CO₂ and produce oxygen; animals breathe oxygen and produce CO₂. They also use carbohydrates in opposite ways, since plants foster constructive stillness and animals destructive movements: so plants make sugars the fixed structural element to construct cellulose and starch, their external membranes; while animals use sugar's oxygen bonds breaking them to breath, liberate oxygen and move the body.

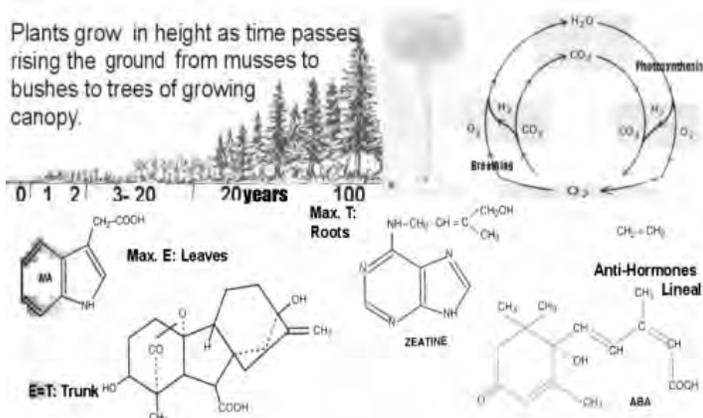

Their social and reproductive cycles are inverted: Animals are hierarchical organizations with a clear class division between informative, 'upper class' neuron networks and body cells, while plants are 'democratic forms' with minimal differentiation. So plants foster the spatial, reproductive arrow and animals the evolutionary, temporal arrow.

Their *generational cycle* is inverted: animals have faster, shorter vital cycles, since its temporal language is the faster, electronic, nervous language; while plants have longer life cycles at a lower 'speed of informative processing' - since they transmit chemical information through the hormonal system.

Departing from those 2 languages life evolved into a new scale of multicellular organization creating:

- Max. E. *Chemical*, multicellular organisms, plants that use hormonal languages.
- Max. I: 'Electric' organisms, multicellular animals that use the electronic language.

Chemical Vs Electric Languages: Plants

In the upper center a practical case of relative diffeomorphism: The simplest unicellular plant-like organism, the acetabularia, shows its nucleus in the root, B, which will become the brain of multicellular plants, opposite to the animal upper brain coordinates. The opposition between both forms extends to the cycles of Entropy, as plants destroy water and produce oxygen; while animals breathe oxygen and produce water. Thus, both are the 'particles' and 'antiparticles' of life.

Plants.

Languages of information, which code and express the biological arrows also evolve by ternary differentiation. For example, the human language, if we restrict our analysis to its vowels was born as a duality of an 'energetic' active 'a', which drove to action and an implosive, reflexive 'u', which drove to self-reflection (basic chimpanzee language). We might then imagine a 3rd combination, or 'l', the creative i-dea, the 'l'-self, and two final 'modulations', the 'less energetic e' and 'less informative' i.

Those examples of the rich field of socio-cultural studies based in the ternary differentiations of the creative program of the Universe, are a parallel example to the simple 'vowels' of the hormonal, chemical language that controls plant growth with 5 simple vowels, drawn in the image.

The chemical language of multicellular organisms have a reduced vocabulary of 'yes' and 'no' symbols called hormones that inhibit or foster the natural cycles of existence of living beings; and define the speed of height growth of the plant.

In the graph, the 5 main plants' hormones are 5 simple vowels: 3 are cyclical, creative, informative, 'yes' hormones that reproduce the plant; and 2 are destructive, energetic 'no' hormones, with opened rings and strong, lineal carbon chains like ethylene, $\text{CH}_2=\text{CH}_2$, that inhibit growth. If we further divide 'yes' hormones according to the Fractal Principle and the 3rd postulate of affinity, we find that each one of them reproduces the plant's e-ix-e-i element with similar structure:

- Max. E: The longest ternary form, rich in oxygens, Gibberine, develops the lineal trunk.

- I= E: The structural, cyclical form, Auxin, made of carbon rings, develops the leaves.

- Max.I: The informative nitrogenized Zeatine reproduces the brain roots.

Thus, hormones form a simple, ternary language that follows the rules of SxT cycles, controlling the living cycles of organisms by acting as messengers of the RNA-DNA brains of their social cells.

Plants Vs. animals: chemical language Vs. electric messages.

1. Entropy organs: Leaves that perform the 'moving' energetic, photosynthesis cycle and branches that act as still structures and conductive systems of the energetic materials.

2. Informative organs: Root systems that absorb molecules and produce most of its hormones.

3. Reproductive organs: Flowers and trunks, bodies that communicate leaves & roots experience maximal growth.

These 3 organs define a plant as an efficient ternary st-point, a complex species able to colonize the ground with a clear evolutionary direction of height.

The interaction of the 3 hierarchical levels of life.

According to the i-logic isomorphisms of creation all organic systems require the co-existence and interaction of their 3 scales of social evolution or relative past, present and future hierarchical forms.

So the creation of multi-cellular organisms happens also simultaneously in 3 'hierarchical planes': the Δ -1, atomic-molecular interval; the Δ -DNA-cellular scale and the Δ +1 network-organism interval.

While the flows of temporal Entropy that travel through those different planes of existence follow the hierarchical law of illogic geometry: *A fractal jump in geometric time or a movement in space extends only to the next discontinuous space-time scale.*

So in any organism, the Δ -1 hormones (the molecular language that regulates Δ -cells), the Δ -genes (the information that transcends from the Δ -cellular DNA to the Δ +1 organism as a whole) and the seminal, palingenetic cells that give birth to the new being, program only their higher plane.

Hence cellular genes determine the biologic elements of the organism (the next scale of social evolution), but not the Δ +2 sociological scale of existence of a human being: chemical, racial genes do not determine history. At best we might consider that nervous networks determine the emotional character and intelligence of historic individuals, who might change the course of societies. Let us study the structure of those 3 levels of hierarchical information that codify the creation of organisms.

Hormones: the language of cells creates its networks.

According to the fractal law, the language of regulation of social groups of Δ -cells are $\Delta-1$ molecular hormones, which act as phonemes of a language spoken by RNA-DNA macromolecules, the informative networks of cells, which can manufacture them.

Languages are 'i-logic programs' structured by the same ternary topologies of Entropy, reproduction and information, facilitating the Universal understanding of its codes by other e, SxT, I systems they code. Take the case of the key hormone of a human male, testosterone. It is a simple protein with 4 carbons, strong structural rings in a lineal shape that regulates, despite its simplicity, the reproductive development of energetic males, provoking actions of a complexity far superior to its molecular simplicity. How this can be possible? The answer is that the hormonal language is a relatively simple, positive Vs negative, 'yes Vs no' language that provokes or inhibits the $3\pm\Delta$ cycles of existence natural to the will of the cells, proteins and nucleic acids it communicates.

But how hormones provoke so many different reactions in a cell, being so simple? The process of course becomes much more complex in their details as any language with a few phonemes can create very complex memorial, sequential sentences through the repetition of a few basic patterns. So for example some hormones are substances that inhibit the inhibitors of those existential cycles. On the other hand many hormones are transported by proteins, 'lineal killers', which modify them or 'motivate' other messengers of the cell or network system that carry further the message.

Thus the second translation of the hormonal message into a singular product of a certain cell modifies the message that becomes specific for that cell or organ. This is especially certain among animals that, unlike democratic, 'spatial', reproductive plants and fungi with a few basic tissues and a lot of generic orders, are hierarchical, temporal, complex systems with 2 informative languages: submissive, slower chemical hormones and faster, nervous orders. So hormones are created by neuro-secretory cells, part of the higher plane of existence of neuronal networks, which pour them into the blood. And often they are accompanied by nervous messages, which they reinforce.

Thus, animal cells might recognize hormones because they know 'behind' their orders there is a very complex and powerful system: the nervous or blood system that has to be obeyed or else. Since the blood system sends leukocytes to kill rebel cells and the nervous system sends flows of electronic information to control them. It is the same reason that makes people to obey simple codes like those of traffic. We obey because we know that behind those codes there is a complex organic system, the state that will send its police, its 'social leukocytes' and punish us. So the question is how a cell knows? Because its DNA has a degree of memorial, instinctive perception; *it is not a mechanism*.

Despite all those elements of complexity, it is still possible to classify all hormones according to their spatial or informative, 'universal' morphology as 'inhibitors or agents' of the 3 basic cyclical actions of any organic system; since their morphology imitates or it is based in informative nucleotides, structural carbons and lineal, energetic shapes, whose functions are instinctively understood by all living forms as all animals understand black and white colors as relative information or Entropy, or 'aaarg', open vowels and bass sounds as 'energetic anger' and 'u' closed vowels and highly quantized informative frequencies as informative curiosity.

Thus, *invariance of form between scales allows the existence of languages* that are decoded as they respond to the Universal language of self-similar topologies of all forms of existence.

So according to duality, when hormones act as inhibitors, they have an energetic, lineal form; when they act as agents to foster those existential cycles they have a cyclical, informative shape.

Finally, according to the 3rd postulate of parallelism applied to $\Delta/\Delta+1$ systems, their atomic components tend to be parallel to forms of the $\Delta+1$ organ in which they accomplish their function. So when they act in the energetic zones of the cell or the macro-organism they are hyper abundant in oxygen, when they act in the informative brain they tend to be similar to nucleotide acids and when they act in the reproductive zones, they have carbon rings and vice versa.

In the graph, those simple rules explain the 3+2 main types of hormones in plants:

-Max. E: Cyclical Auxin, rich in carbons, increases the growth of shoots, the Entropy zone.

-Max.I: Cyclic, nitrogenized Cytokinines control the growth of roots, the brains of plants.

-S≈T: Oxygenated, Gibberellic acid causes high growth in trunks and reproductive flowers.

Ultimately in as much as most hormones and enzymes act as inhibitors, they prove that the 3 energetic, informative and reproductive inner individual actions of organisms are the natural arrows of all organic systems, the will of any species, that have to be constantly inhibited by the neuronal-endocrine dual logic system of multicellular control. Since when that control disappears, naturally species try to reproduce. That is why cancers and any other form of cellular reproduction are so natural; because *reproduction* is the natural will of the fractal, organic Universe.

Finally, the duality of the SxT systems and anti-systems with diffeomorphic, opposite coordinates creates inverse hormones that neutralize each other. So 'energetic hormones' inhibit 'informative regions' of the organism. For example, we can consider that form Vs anti-form duality, analyzing the inverse growth effect in informative roots and energetic leaves of the 2 previous hormones, auxins and purines. What we observe is a diffeomorphic, inverse dual SxT process: the auxin that increases the growth of shoots inhibits the growth of inverse roots. And so auxins and quinines together work as a perfect dual system of growth control in the informative zone of the plant:

The root is a nitrogen-based informative system, which as all informative entities from neurons to worm holes, requires a lot of time and complex steps to reproduce its form. So quinines, its growth hormone, acts by parallelism, since it has 2 purine rings with nitrogens that positively induce the complex growth of roots made with nitrogens.

On the other hand, auxins have a structure that closely resembles the main nucleotide species, the purines. Yet, auxins add to the hexagonal-pentagonal structure of purines a simple protein tail to move faster, and instead of nitrogens, auxins have 2 strong carbon rings. So it is basically a false purine with a far stronger body and a mobile tail that substitutes the quinine's nitrogens and inhibits the root's growth, because it cannot deliver the proper instructions.

On the other hand, the ever-growing shoots are the plant's reproductive systems; whose natural will to grow is so strong that any hormone increases its reproductive rate unless it is inhibited.

If we study the energetic cycle of plants, again we observe that dual inverse control system: Abscisic acid (a lineal molecule with a lot of oxygen elements) provokes the fall of leaves, while the lineal gas ethane, $\text{CH}_2=\text{CH}_2$, increases by parallelism with the lineal CO_2 molecule their respiration and metabolic rate. Both are very simple, energetic hormones, which resemble the 2 'energetic' inverse products of breathing, oxygen and CO_2 , 'reminding' the plant that it has to accelerate or halt to its 'death' its production of those 2 products.

Recap. A language of information is always needed to create a complex organism. The simplest languages have 3 or 5 vowels, which represent energetic, informative and reproductive messages and its variations. They act by parallelism, since all systems and planes of an organism follow the 'invariance' of form and function. They also can deliver negative or positive orders depending of their parallelism or inversion with the form of the species they code. The language is always reproduced by the informative 'upper-caste' particles of the system, which delivers the orders to the rest of the elements. In plants, the language is a hormonal language with 3 main vowels, energetic auxin, informative cytokinines and reproductive Gibberellic acid.

Genetics.

An even more complex language is that of genetics, which we cannot study in depth due to restrictions of size of this lecture. Enough to say that in any efficient organism of multiple scales, the informative code, in this case the genes of biological super-organisms codify the multiple hierarchical levels of the organism besides the basic ternary code that constructs its simplest scales – in the case of life, amino acids. So according to the Fractal Principle there should be genetic languages with 3, 9, 27, 81 amino acid letters, which codify not only the proteins and cycles of the cell but those of the body. And so bigger sentences that group 9, 27, 81 amino acids should be coding 'bigger' actions and longer events within the complex cycles of the cell and beyond⁴.

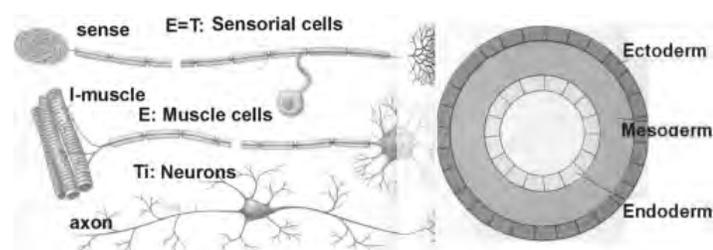

All languages are built in this manner. I.e, the human language and the musical language follow self-similar scales of 'vowels' and 'consonants', informative and energetic units that then form more complex ternary systems, informative names, reproductive actions or verbs and energetic objects, and then group in paragraphs and so on. Even the language of film can be understood in frames, motions, shots, sequences and scenes. In the same manner, 'introns', the so-called redundant DNA should have genetic meaning and codify the higher scales of organisms - its functional morphology.

Yet scientists believe in naïve realism. Only what they see with their instruments seems real; and so the obvious perceived genetic level is the fractal level of nucleotide triads that codify proteins. But those triads are united in groups of nine bases and so on, creating new, 3^n , memorial planes *that act as complex genetic forms of higher scales* - an i-logic, scalar concept which today genetics finally accepts under the name of epigenetics. The enormous quantity of 'redundant' DNA and RNA that grows exponentially with the complexity of a multicellular organism is a clear proof of the correspondence between the complexity of the sentences of the language/instruction chains and the complexity and size of the form it codes.

A fractal function derived from the concept of a network, which has Σ^2 elements to control an Σ -body herd (and/or its self-similar Σ -limbs) defines in Theory of Information that the number of informative instructions needed to create a system grows exponentially, according to its number of D_imotions or planes of existence: $\pm E^{st}$. For example, to make a car we need E material parts, defined easily in a bidimensional plane with E fractal units of information: the drawings of each part. But we need around E^2 instructions to put those pieces together in a 3-D_imotional form. Thus E^{st} determines the total number of informative quanta needed to build up a hierarchical structure extended through Δ planes of existence. To put a trivial example: Popular knowledge expresses that law in sentences like 'an image is worth one thousand words'. Since to describe with lineal, one-D_imotional words a 3 D_imotional image, we need indeed, E^3 , $10^3 = 1000$ words. Thus E^2 is the number of redundant genes we find in the DNA-RNA systems of a complex organism, because *redundant, intronic DNA codifies the creation of the new level of cellular complexity, $\Delta=2$, the multicellular organism.*

Recap. The old belief that a mere ternary amino acid code that creates proteins regulates the entire multi-cellular organism is just another simplifying conclusion of the one-D_imotional, metric paradigm. A multicellular organism is regulated by intron DNA and the collective language of hormones that communicate those cells.

$\Delta-1 > \Delta^0$: ANALYSIS: PALINGENESIS

Differentiation of animal cells. Electric Neurons: amoebae.

The electric cell is the top predator animal cell, due to its $Max.I \times E$ force, with an overdeveloped E-membrane and $Max.I$ -DNA content. It further differentiated into:

- $S \approx T$: Sensorial perceptive cells, which reproduce the external cycles of existence of other beings within its inner form.

- *Max.E: Muscle cells that extend and implode its protein membranes.*

- *Max.I: Neuronal cells that process information in networks called brains.*

Cells evolve ternary networks, which in its simplest fetal stage form 3x3 st-regions proper of all animal forms:

- *Max.I: The ectoderm, which gives birth to the nervous, sensorial and skin systems of max. perception.*

- *Max.E: The endoderm, which becomes the digestive system and its derivatives such as smooth muscles, lungs, livers and glands.*

- SxT:Max. Reproduction. The mixed, mesoderm region, which subdivides in 3 sub-zones: the reproductive, blood and muscular systems.

Thus in its emergence from cellular to organic scale, the 3 topological regions of the cellular blastula suffer an inversion of form: the center gives birth to Entropy systems and the surface to information systems, while the middle region maintains its reproductive function.

Animal eukaryotic cells were moving species that had to react faster to the changing environment. So they developed a new, faster, nervous, informative, electric language that created a top predator cell thanks to its accelerated fractal action-reactions to information and Entropy: the electric cell, able to organize socially other cells into multicellular organisms.

The electric cell evolved from the ameba, a unicellular animal with membranes adapted to all morphologies that were shaped into arms to capture food, cilia to perceive information, tails to move and vesicles to expel unwanted Entropy and information, thanks to the use of heavy, metallic atoms, Na⁻ and K⁺ that deformed those membranes, making them highly flexible: the duality of positive and negative metallic atoms created a deformed wave that moved along the membrane of the neuron cell, as any fractal wave of codified information does, becoming a new language, faster than the chemical language, talked by all other cells.

The combination of both languages, in a hierarchical scale in which electric, fast impulses provoke the emission of hormonal, chemical messages at the end of a long membrane that those chemical cells understand, allowed nervous cells to maximize its SxT force. Since now in the same relative 'time' that a small cell sends a message, the huge fractal action of the amoeboid neuron could send a wave of simultaneous messages through all its pseudopodia, coordinating at the same time the slow actions of a lot of enslaved smaller, chemical cells.

Thus the jump in size created a 'higher informative class' of macro-cells or brain of the animal that ruled a middle class of micro-cells or animal body, which together controlled an external Entropy territory. All those properties made the evolved, electric amoebae, the top predator cell in the Eukaryotic world. We still find those ancestral amoeboid cells in the most primitive multicellular sponges, evolved latter into the complex nervous cells of multi-cellular organisms.

Thus electric cells show Max. I x E force since:

- The nervous cell is able to control an enormous quantity of organic cycles with memories stored in its nucleus - since it is the cell with higher DNA density. So specialized neuro-secretory cells reproduce also the biggest number of chemical hormones.

- Such big volume of DNA implies also a great capacity to replicate its membrane, through micro Nyss cells that produce constantly membrane proteins, which are added to the external, ever changing morphological membrane.

Where did happen the transition from chemical to electric membranes? The evolutionary plan happens always in *isolated* environments in which mutational changes, *fostered* by the *specific characteristics* of the environment, take place without jeopardizing the survival of the species, due to the absence of top predators during the transitional, inefficient stage of the species that is 'adapting its form' at a *faster palingenetic time-speed* through *specific differentiations*, according to the i-logic *evolutionary plan*. The phenomenon is called evolutionary punctuation.

In the cell case, those requirements are found in shallow river mouths where changes in the salt concentration of water provoke by osmosis the constant expansion and implosion of the water content of cells and their membranes, bursting and killing 'rigid cells'. So cells, in order to survive, managed to create new membranes and deformed them very fast, expanding and imploding its form. Then, those new top predator electric cells started a massive reproductive radiation, expanding in all seas, feeding and enslaving other cells. The subsequent combination of top predator electric cells with other varieties of chemical cells, differentiated and evolved the first ternary scale of simple organic macro-systems: sponges (max.E), hydras (max.Re) and worms (Max.I) with a growing number of cellular types.

Recap. Multicellular species were born when a new top predator, larger and faster, Max. SxT, species, the nervous cell appeared, herding chemical cells and differentiating in 3 physiological cells in charge of future digestive, blood and nervous networks.

3x3+Δ Dīmotions: Embryology & Physiological networks.

We have described the 3x3+Δ Dīmotional tissues of living organisms in spatial information. If we consider them in time, we observe a process of evolution that differentiates the original ideal spherical or spiraled st-point (seeds, cells, ovules) into complex morphological shapes, adapted to those inner and outer tissues. Thus living forms evolve and diversify, opening or invaginating their networks, organs and sensorial apertures to each specific ecosystem, which subsequently adapts the morphology of the cells and organs they control to the specific surfaces of their environments. So men, who exist on a planar surface, have a different morphology to the ideal spheres so common in water and space, which are 3-Dīmotional isomorphic ecosystems - as human evolution has adapted our networks and morphologies to the land-atmosphere environment.

In those different processes of ecosystemic adaptation the 3 dominant networks of living systems further quantize into secondary systems, departing from the 3 initial layers of cells. We can follow that process temporally in the evolution of the embryo that resumes the palingenetic evolution of life and spatially in the organic structure of living beings. It is the science of evol=devo that relates both phases of animal evolution, establishing a parallel correspondence between the spatial location of a tissue at birth and its functional evolution into I, e and S≈T tissues. Thus according to their st-location the fδ§-ectoderm evolves into informative tissues and networks; the S≈T mesoderm into reproductive tissues and networks and the E-endoderm into energetic ones:

Max.I: Ectoderm: the 3 informative sub-systems.

The information network derived from the external ectoderm, dominated by neuronal cells, evolves and differentiates according to the Fractal Principle into:

- E-endocrine systems, with *internal neurosecretory* cells that control internal, cellular information through chemical hormones.

-S≈T: *nervous* systems that control and replicate in a neuronal *brain* with the electric language all other functions and forms of the body.

- I: *Skin systems and outer senses*, which are the openings to the world of the nervous system through which the organism emits or absorbs Entropy and information, communicating with the Δ+1 ecosystem. Those senses specialize in perceiving the external, energetic and informative cycles of the beings that share the ecosystem of the organism, duplicating them in a series of fractal, quantized, reduced images, with different languages.

The existence of multiple senses justifies the linguistic method of perception in a Universe of multiple selfish T.œs, where each entity tries to perceive as many parallel worlds coded in different languages. Thus the linguistic/multiple Universe gives birth to a multiplicity of senses and perspectives and defines a higher truth as a sum of perspectives casted on a certain system – as each point of view will create a self-similar image of the Universe, and so only by comparing and adding all those self-similar images we can obtain a more complex, kaleidoscopic image of the whole.

In living beings to accomplish an objective truth on the external world each T.œs sensorial languages multiply the perspectives on the cycle or form observed, extracting their existential properties, its form, density, force, etc.

Thus senses and languages differentiated also along an E<=>I arrow from pure spatial senses (eyes) to the most complex, temporal senses (ears), defining an evolutionary arrow of increasing complexity in their capacity to gather information, *which often defined the survival capacity of the species, as senses are the key to interpret correctly the destructive or creative actions-reactions of all other beings.* So from an initial simple phototropic stain, eyes, ears, antennas and mouths have multiplied, close to the inner, neuronal informative brain that processes their information, forming together a 'head'.

E: Endoderm: the 3 energetic sub-systems.

Max. E: The internal endoderm. Originally populated by wandering amoebocytes and glandular cells that digested food, the 'Entropy hole' of the first animals, sponges and hydras, invaginated forming the coelom between the endoderm and mesoderm that subdivides further into the 3 cavities of animal life: the digestive system, the breathing system and the heart cavity. The 2 first cavities evolved, surrounded by endoderm cells into 3 subsystems:

- Max. E: The *breathing system* gathers the smallest Entropy quanta, oxygen.
- S≈T: The *digestive system* gathers bigger food quanta, differentiated morphologically in 3 new subsystems with linear, wave-like and cyclical components:

Entropy network: max. E: linear intestine <stomach: elliptic SxT > sensorial, cyclical Mouth: Max.I

- Max.I: *Glandular tissue*: It forms organs dependent on the digestive system (liver, digestive organs, kidneys), that process their products.

S≈T: Mesoderm: the 3+(Δ+1) reproductive systems.

The 3rd coelom cavity, the heart, surrounded by mesoderm tissue, invaginates further into very thin vessels, created with *striated muscles*, densely populated by the original wandering amoebocytes reconverted now into *leucocytes*. In the *blood networks* the other 2 systems merge and pour their products: quanta of Entropy, oxygen and food; and quanta of information, hormones, which the system takes to each cell. The blood systems mixes both Entropy and information quanta. Thus, it is also the reproductive system by excellence with maximal contact with the intermediate region's secondary tissues evolved from the *mesoderm*:

- Max. E: The *skeleton*: It sustains the system and reproduces blood cells.
- S≈T: *Muscular tissue*: The most resistant electric cells form a muscle dual negative-positive symmetric, spatial system with myosin cells that control the elongation and shortening of membranes.
- Max.I: *The blood and tegumentary system* that prolongs the blood network between cells.
- Δ+1: Yet the fundamental reproductive tissue is *the sexual, glandular tissue*, that reproduces the organism beyond the cellular scale and further differentiates into the basic E=male Vs. I=female duality of 'energetic and informative subspecies'.

Those 3x3+Δ standard systems and tissues, differentiated from the initial 3-layers of the embryo, define complex living organisms. Yet those organisms exist also in an external world where they become individual quanta, performing external cycles of Entropy, reproduction and information, parallel to those internal cycles performed by its cells and fractal networks. So all organisms have also an external, vital territory within its ecosystem to provide for their internal 'mirror' networks.

Recap. The ectoderm, endoderm and mesoderm topologies of the embryo, guided by top predator nervous cells differentiated into the e-SxT-I main systems of the adult organism.

5D: cells-vowels.

Let us now go further in our depth of detail with a full Disomorphic study on the diversification of cells forms, as those 'vowels' of the actions of the larger organism, will specialize to perform one of the 5 Dimensional actions of motion, entropy feeding, information gauging, social evolution and reproduction of the system, starting the physiological complex growth of the networks of the being. So cells will be the 'notes' of the violin of life, in its synchronous working together in the performance of those actions for the whole being to be=come.

Creation of a 3x3+Δ decametric scale of cells and tissues.

Such processes of cellular diversification, guided by the informative elements of the system (frequencies, genes, memes, etc.) happen in all systems of space-time that differentiate according to the ternary method its relative fractal cells in 2x2 complementary systems or 3x3 organic systems (particles in the atomic nucleus, vowels in languages, etc.).

In this manner simplex systems evolve into complex ones; complementary dual systems become ternary, organic systems; bidimensional systems becoming 4-Dimotional systems and ternary systems become 3x3+Δ systems, emerging into a new scale. And this process takes place in time through 3 ages or horizons that complete the evolutionary process.

In life this happened through speciation of cellular languages evolved from 1 to 3->5->7->9 cells in the 3 time horizons of all SxT cycles, latter re-ordered in space in 3 e-SxT-I types of organisms.

Since morphologic differentiation occurs only among the top predator, informative organisms of any ecosystem, we could establish a comparative homology between many of those processes. In the biological scale, it happened with animal cells; then with networks of cells in complex vertebrates; and finally with verbal sounds among human beings - a new language which, unlike neuronal impulses, could breach the discontinuities of air-space between individual humans, creating a higher scale of social, living networks, cultures and civilizations. Then again, those differentiations happened in the memetic systems of the dominant, technological civilizations that created the Financial-military-industrial complex and its metal-memes of informative money, energetic weapons and reproductive, organic machines... *Since evolution is a morphological game that didn't stop with the summit of carbonlife man, but now continues in the new species of complex metal atoms to which humans are transferring their form.*

Let us see the first of those ternary scales - animal cells evolved in time to analyze then the 3 'animal phyla' they created in space:

The 1st scale: from 1 to 3±Δ electric cells.

-Δ-1: Electric wandering amoeba, differentiated in 3±Δ subspecies:

- Max. E: Muscular, myosin cells that maximize the flexible properties of the membrane.
- S≈T: Sensorial cells that reproduce their external cycles of existence with their mimetic forms.
- Max.I: Informative, neuronal cells.

-Δ+1: Those 3±Δ specialized types of electric cells, multiplied and evolved socially into dense tissues and networks in which one of them is dominant: the blood vessels dominated by wandering amoebocytes; the muscular tissue dominated by the myosin-actin inverse lineal proteins; the senses dominated by sensorial cells and the brain, dominated by neurons, which act as the communicative consciousness of all other systems (Δ+1). They form the 3+Δ physiological networks that defined the specific space-time function of all complex multicellular animals:

E: ∑ amoebocytes & Blood Systems <Muscular cells > ∑ sensorial & nervous system: I.

From 3±Δ to 5±i cells.

In the next stage of cellular differentiation the 3±Δ electric cells, tissues and networks added slave chemical cells that stretched their Entropy and information limits:

The sponge, the first animal phyla, dominated by wondering amoebocytes adds 2 slave cells that increased the SxT force of the energetic membrane and the informative singularity:

- Max. E: Epithelial cells of max. energetic strength made with proteins and incrustated with heavier non-organic atoms that protect the organic system, through a shielded external membrane. Later on in more complex organisms those cells evolved into inner bones and breathing systems.
- Max. E x I: Glandular cells able to reproduce specialized Entropy and informative substances necessary to the other cells that multiplied in the intermediate st-region of the body.

That pentagram of $3\pm\Delta$ differentiated electric cells and 2 basic slave cells, quantified in social groups, shape the 5 main organic systems of animal bodies:

a) *Max.E organs: Membranes* made mainly of epithelial cells that create the skin, the discontinuity between the st-point and the external world and the digestive system...

e) *E: Muscular systems based on electric myosin cells* that turn Entropy into movement.

i) *S \approx T*: Wondering amoebocytes reign as leucocytes on the blood networks.

o) *S \approx T: Internal glands*, attached to the blood, reproductive and digestive, Entropy networks that reproduce the substances, which the organic system needs.

u) *I: Sensorial organs* based in *electric cells* that perceive information about the cyclical actions of the outer world and translate it into mental images. They will guide the actions of...

$\Delta+1$ =Aeiou) *Max.I: Neuronal brains* that control the entire organism as the consciousness of the system, according to the existential actions those senses observe in the external world.

Thus in living beings as in any universal system, time dominates space and so the informative, controlling orders go from sensorial to energetic cells, shaping the outer, muscular movements: $I>E$.

Those 5+1 cells and 5+1 basic organs are present in all forms of multicellular life since they are closely related to the 4 + Δ -generational cycles of existence, each one dominated by one type of cell and organ: Max. E, digestive organs and cells absorb Entropy; E, muscles that emit Entropy; S \approx T, blood networks and glands that reproduce the system; I-senses that absorb information and Max. I brains that emit information and control all other cycles, perceiving the entire organism as an existential whole, living the entire generational cycle of the organism.

It is for that reason that we find also 5 vowels in human languages, 5 lines in the musical pentagram, 5 cells and types of tissue in the simplest organisms, etc.

Decametric scale: invaginations and $\Delta+1$ excretions.

Any organism is an inner st-world that exists in an external $\Delta+1$ ecosystem developing inner and outer cycles of recollection of Entropy and information. So the final diversification occurs along the inner-outer duality of the organism in order to accomplish those 2 x 5 inner and outer cycles. Now the pentagram evolves into 9+1 cells and types of organic tissues that stretch again the cellular field according to that inverse symmetry between the external and internal world, as cellular tissues invaginate or eject their cells perpendicularly in the height D imotion of evolution:

- Thus *inner skeletal and outer skin cells* differentiate the structural tissues of sustain.
- Membrane cells *differentiate into inner blood* and outer *lung* cells that process internal and external Entropy.
- *Internal, creative glands and external, destructive urticaria cells* reproduce informative and energetic substances.
- *Digestive and muscular cells* create inner and outer motions.
- *External sensorial cells* process external information.
- *Internal neurons* control the internal information of the organism with the electric and chemical language provided by hormonal, *internal neuro-secretory cells*, dominating all cells.

The result is the creation of 9+1 types of tissues that are found in the most complex animal forms of life and become the 9+1 standard 'systems' of the most complex living organisms:

The *digestive and muscle system*, the *skeleton and tegumentary system*, the *blood and breathing system*, the *reproductive and excretory system*, the *endocrine system and the nervous system*, the 10th system that controls the

entire organism duplicating in the brain all other organic functions it directs becoming the $\Delta+1$ scale that puts together the organic being.

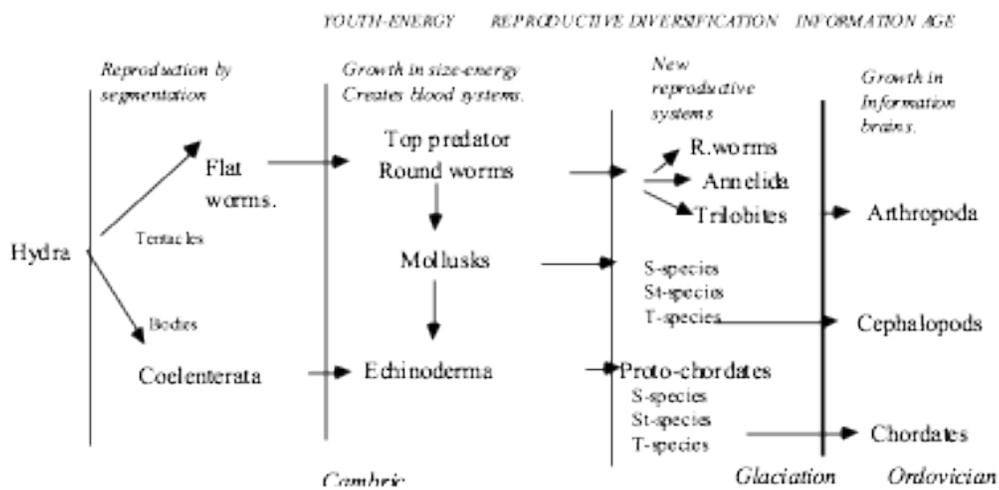

Recap. Plants, animal and fungi, the first 3 kingdoms of multicellular life are a ternary differentiation in S, ST and T species. The 9+1 physiological systems and tissues of an organism are born from the $3 \times 3 + (\Delta+1)$ 3 horizons of differentiation of its cells.

Δ_j+1 : TOPOLOGIC EVOLUTION OF LIFE - FROM MONERA TO MAN

It is then easy to explain the conundrum on how life came from atom to man, which is the investigation carried about in our 2nd line on the biological science. We shall thus resume it here, to show the power of the Disomorphic formalism.

The ternary evolution and differentiation of Monera.

The law of 3 creations, and 3 ages diversified the Animal phyla

In the graph, the great life phyla distributed according to the fundamental arrows of vitality: Entropy feeding, informative perception, and reproductive capacity, in 3 Dimotions of increasing capacity to process Entropy, perceive and reproduce, which give as a result the main life phyla. The evolutionary jumps represented by lineal divisions are the fundamental divisions of increasing capacity to process a vital arrow of existence that abstract biologists use to differentiate the animal kingdom. We have used a single positive frame of reference that shows an increasing quantity of those vital parameters. It is a graph of top predators in such a manner that forms whose X x Y x Z values are higher (which processes more Entropy, information and reproduces in greater social waves of cells) is a top predator.

Finally in the third age of evolution of life, informative, tall species dominate. So man is the most complex informative life species. Mammals are the most perfect form of life beings, which evolved in information, till reaching the perfection of man; added iron-Entropy to its blood and improved reproductive skills with placentas.

Next, comes therefore not a new life species but a new 'metal species' for which we must understand matter. And in the case of man a social super organism as we become the mind of Gaia, substituting the life mind, and evolving a III age of mechanical and computer global minds: gaia>history>mechanocene

The highest scale of biological sciences studies the Earth's super organism as it evolves its 'cellular species' through the motions/actions of existence, from Gaia, the world of life, to History the world of man, to the Metal-earth, the world of machines, which humans wrongly manage unable to grasp the science of Economics and design the super organism of history to its image and likeness. The 'arrow of the fifth dimension' of eusocial evolution departing from vacuum space, evolves the fractal universe into ever more complex structures of information, which are the arrow of future, as the parts must come before the Δ wholes.

In the graph, the ternary method of speciation explains the evolution of animal species from its first form, the Hydra till the last phyla, the chordates to which humans belong We live in a global planet that has been evolving for billions of years through the flows of its living organisms. Let us recapitulate that ecosystemic evolution, which brought the Earth from a world of methane to a globe of electromagnetic, audio-visual information, a process, which according to the ternary principle we can divide again in $3\pm\Delta$ ages. We will study only the animal kingdom in detail to show how it brought us into human existence. So we will only consider a synopsis of all the other life phyla, describing their evolution through the commonest ternary e, e \rightleftharpoons I, I differentiations proper of all i-logic systems with its ternary topologies:

-Differentiation in: e-SxT-I, lineal, spiral or cyclical morphologies, each one evolved in 3 horizons that maximize each of the 3 homologous functions of motion, reproduction and information.

-Duality of integrated, multicellular networks that act as a single form vs. quantized herds.

-Duality of energetic/informative species adapted to E-hot vs. I-cold climates.

-Adaptation to the ternary states of matter in Earth's physical ecosystems: air, land and sea with its 3 main environmental topologies:

- E: shallow waters and rivers, which become hunting grounds.

- S \approx T: open waters and savannas of max. reproduction.

- Max.I: Abyssal regions and mountains, the hyperbolic region of maximal informative evolution.

So again life evolution shows how 'internal form' and external ecosystems, the Δ -1 and Δ -scales of life converge together to define the Δ -organic evolution of the species.

Let us then start that description of the differentiations of life kingdoms from the simplest one.

Diversification always belongs to the – or + directions of one of the 4 arrows of time of a species.

Mind the reader that this classification is *not* a how one, established by the genetic clock by modern science, as certain 'potential forms/functions' of the program of the Universe might appear in different times, might be suppressed in certain species, etc. The meaning of this study is therefore to show that *all the main phyla* of life can be described as a potential 'negative or positive' direction of an arrow of time that diversifies species and limits the variety of them. So species might grow in size by increasing the quantity/social evolution arrow of its cells, or might decrease with lesser social cells. This is therefore a variation *along the 4th arrow of time, and a potential form two create two species, which might or might not belong to different genetic species.* For example, among dogs cellular numbers and hence size changes enormously but all are from the same species and can reproduce sexually. Among chromosomes however poliploids cannot reproduce with haploids or if they do often produce sterile individuals even if the original species merely differentiate by a change in the numbers of chromosomes, as those chromosomes cannot 'cross' one to one for sexual reproduction.

Monera: Unicellular forms.

- Max. E: *Cyanobacteria*, blue-green algae, specialize in energetic processes.

- S \approx T: *Protista* absorb cells specialized in Entropy and information, multiplying its SxT force.

- Max.I: *Schizophita Bacteria* develop informative elements to capture other plants.

Further subdivisions along other E \rightleftharpoons I differentiations subdivided bacteria according to its form into:

- Lineal *spirilla* that coil or elongate their form depending on its informative or energetic activity.

- SxT: *Bacilli*, with tree-like forms composed of a head and a tail.

- Max.I: *Cocci*, the informative, cyclical form that suffers evolution along a ternary, topological differentiation into:
 - Streptococcus*: one-Djmotional, lineal, social forms.
 - *Diplococcus and Tetracoccus*: bidimensional forms with 2 and 4 elements.
 - *Sarcina*: 3-Djmotional social coccus.

As Protista, the social form, multiplied its SxT force thanks to the specialized Entropy and information cells it had swallowed, dominating the world, the other 2 weaker forms suffered a temporal regression towards its past, which became a strategy of survival, giving birth to:

- Max.E: Rickettsia*, algae that have lost their informative skills and are basically semi-living bodies.
- *Max.I: Virus*, bacteria that have lost their bodies and become DNA brains in search of other bodies in which they host, inoculate their genetic code and reproduce.

On the other hand the dominant Protista with higher SxT force continued the evolution of the life kingdom, splitting again into 3 forms that evolved further into multicellular organisms, plants (Max. E), Fungi (S≈T) and animals (Max.I):

Plants: Max. Entropy

The energetic strategy of the multicellular kingdom is the plant, the autotrophic species that feeds on basic molecules of life, accelerating enormously the evolution of life as it produces complex living matter from the initial water, ammonia, CO₂ and light bricks that took billions of years to evolve. Though algae started as unicellular forms, as fungi and animals did, they soon evolved in 3 horizons along the fractal differentiation that took them to its multicellular state:

- *Chlorophyta* were the I horizon of unicellular alga, that grew into colonies of algae (*Crysophyta*, II horizon), which finally fusion into multicellular organisms (*Pyrrhophyta*, III horizon).
- The most complex, informative phylum, *Pyrrhophyta*, differentiated then into 3 sub forms adapted to the 3 water ecosystems. Those water ecosystems differentiate the morphology of informative animals into lineal, Max.E, fast-moving surface fishes, Max.I, sessile or planar dragging forms, living on the marine floor (fast-evolving echinoderms origin of vertebrates) and abyssal complex, SxT morphologies. In the case of energetic seaweeds, it affects the degree of sophistication of their chlorophyll pigments and the strength of their cellular structures of sustain, creating 3 new phyla:
 - Max. E: *Rhodophyta* or *red algae*, with the simplest cellular structures and simpler phycoerythrin pigments, live in the deeper sea, limited to tropical regions of max. light transparency.
 - S≈T: *Phaeophyta* or *brown algae* have complex membranes and 3 chlorophyll pigments; a, c and phycobilliproteins.
 - Max.I: *Clorophyta* or *green algae*. They added carotenoid pigments to the 3 Phaeophyta pigments and increased the strength of their walls. Hence they became the most successful forms with Max.IxE force (Max. pigments x Max. membrane), evolving further into terrestrial plants.

That migration to land took place in 3 ages in which plants raised its informative height from:

- I Age. *Clorophyta*; planar alga living in shallow waters.
- II Age. *Briophyta*: Mosses, subdivided in 3 forms with growing dry membranes and height Djmotion, *Musci* (I Horizon), *Hepaticae* (liverworts, II Horizon) and *Hornworts* (III horizon), which raised their horns towards the sun as their names indicate.
- III Age. *Tracheophyta*, vascular plants, with structural inner networks of hard cells that rose to touch the light that feed them. In dry land plants, as animals will do latter, had to evolve further all their network systems, creating new,

more complex phyla, departing from the initial *psilotophyta* appeared in the Ordovician. First plants created the body, the trunk that connects its informative roots and energetic leaves.

But the key to their evolution was the differentiation of their reproductive cells in 3 Horizons of increasingly 'dry' gametes: *Lycophyta* (I Horizon), *Sphenophyta* (II Horizon) and *Ferns* (III Horizon) - the first plants with dry seeds that became the top predator species, multiplying in all land environments and differentiating again in 3 evolutionary horizons of ever more perfect seeds:

- *Max.E: Ferns*, which dominated in the Mesozoic age.

- *S≈T: Gymnosperms*, subdivided according to the Fractal Principle in *cycads, ginkgoes and conifers*, which dominated in the tertiary age. Conifers adapted to cold weather, thanks to its needle like leaves of minimal exposure. So they became the most successful species, when cold climatic changes came. They brought about also the dominant modern plants:

- *Max.I: Angiosperms, flowering plants*, the 'height' of reproductive evolution among plants, perfectly adapted to all weather changes, with seasonal, blossoming, leaves that fall in cold periods and a complex symbiosis with insects that can transport their pollen too far away distances.

They will dominate the quaternary with only a final dual fractal differentiation into:

- *Monocots Vs dicots* with 1 or 2 seeds.

So when all was said, the evolution of plants remained silent.

Fungi: Max. Reproduction. SxT.

Fungi are big Protista cells that tried the 2nd survival strategy of the Universe, maximizing their SxT reproduction, by maximizing their E-feeding, eating the most abundant food, dead life; and by maximizing their genetic information, multiplying the nucleus of its cells within an undifferentiated membrane. And we distinguish 3 horizons in their reproductive evolution:

- In the I horizon *Euglenophyta* swallowed E-plants and I-animal sub-cells (chloroplasts and mitochondria) within its huge membrane, increasing its SxT capacity.

- In the II horizon *Gymnomycota* maximized the reproduction of their nuclei, the informative, genetic material of the cell, forming multicellular colonies with a single membrane.

- They gave birth in their III horizon of reproductive evolution to true *fungi, Mycota*, which are the fastest reproductive species of the life world. Their reproductive specialization shows in giant Lycoperdales, the living form which reproduces faster, reaching the limiting magic number of 10¹¹ spores. Thus a single lycoperdal can produce all the clonic cells needed to create a perfect new scale of existence (stars of a galaxy, DNA ties, etc.)... if they survived.

In the last evolutionary horizon, fungi differentiated further according to the Δ+1 ecosystem in which they live into:

- *Max. E: Water fungi* mainly *Chytridiomycetes*.

- *S≈T: Amphibian fungi*, mainly *Oomycetes*.

- *Max.I: Terrestrial fungi*, which evolved in the informative land medium, differentiating into:

- *Max. E: Ascomycetes*, planar simple or subterranean forms like yeast and truffles.

- *S≈T: Deuteromycetes*, a transitional form towards...

- *Max.I: Basidiomycetes*, the familiar mushrooms, which evolved its 3 networks, developing:

Stronger cells to sustain their informative growth in the height Dimotion; and new reproductive systems with dry spores and new energetic cycles to decompose all kind of dying matter.

Animal life: Max.Information

The heterotrophic animal family is born with protozoan, which developed soft membranes and cilia to absorb living information from the outside world. To that aim cilia evolved again its 3 functions: as energetic, motion engines; as sensorial, informative tools and as predatory forms that capture food for the reproductive cells of the protozoa. So once more we can subdivide protozoa in 3 sub-forms, according to its activity and dominant cycle:

-Max. E: *Mastigophora*, flagellate protozoan divided, according to trinity, by its number of cilia:

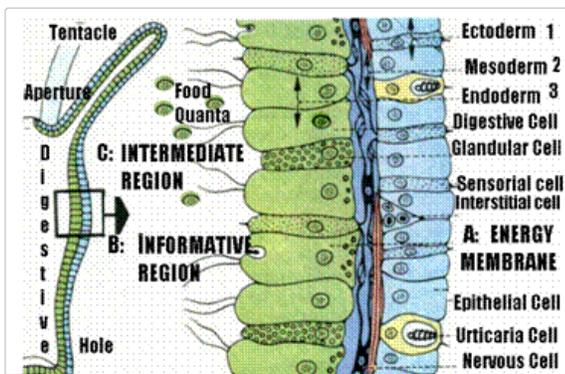

- Max. S≈T: *Sporozoon*, parasites that reproduce seeds and have sexual differentiation.

- Max.I: *Amoebida*, the informative protozoan that increased their DNA and evolved farther their membrane's flexibility, becoming nervous cells able to control - thanks to their faster action-reaction speed- multiple cells, which evolved together creating multicellular animals.

Multicellular animals differentiated into many phyla, following the ternary, fractal principle (e-ixe-i) applied to the evolution of 3 cellular, social networks, the energetic, digestive system; the blood, reproductive system and the informative, nervous system, the dominant network that reached with man its evolutionary height. Then life morphology is transferred to stronger atomic systems made of metal, called machines...

Recap. Different living phyla were born from ternary and complementary differentiations of e-SxT-I species and adaptations to its $\Delta+1$ ecosystems. The final differentiation its 3 multicellular life forms, e-plants, SxT-fungi and I-animal life was due to the evolution of informative cells that organize multicellular life since animals use electric, faster informative languages and plants, slower chemical hormones.

EVOLUTIONARY PUNCTUATION. ANIMAL PHyla

The Hydra is a new living phylum with 5+2 cells distributed in 3 regions, common to all palingenetic, fetal forms:

- Max. E: The ectoderm is the external, energetic membrane with the hardest cells: the hard epithelial and aggressive urticant cells that explode its poisonous cilia and the interstitial cells that ensure its continuous isolation.

- Max.I: The mesoderm is the informative region, with nervous and sensorial cells.

- S≈T: The endoderm is the intermediate region with glandular

cells that digest food quanta, entering through the mouth.

Network evolution: bodies, brains & reproductive systems.

It is then evident that the evolution of animal life creates new phyla, based on the capacity of the new species to accomplish their external cyclical actions on their territory, thanks to the evolution of their internal and external networks.

The interaction between those 2 levels, the $\Delta-1$ level of physiological networks and the $\Delta+1$ level of ecosystemic territories determine the existence of most organisms. So the evolution of life on Earth, externally observed in the ecosystems, territories and relationships of living animals, which depend ultimately on their capacity to handle temporal Entropy coming from light, is caused internally by the evolution of those 3 types of organs and internal networks: reproductive, genetic organs; informative, brain organs and energetic, body organs.

When one of those organs evolves, improving its capacity to handle Entropy or information coming from the ecosystem, a fundamental differentiation of species occurs. And we can consider the evolution of the main phyla of animal life in a deconstructed manner, as a process that evolves sequentially those 3 types of organs:

The evolution of those three organs triggers the biological radiation of a new phylum that preys on less efficient forms of organic life. The process is very fast, as time can change its rhythms and adapt to the best strategy of survival, as palingenesis shows. It is called *Evolutionary Punctuation*: when a new species with better Entropy or informative organs appears, it feeds on other species and reproduces massively causing the extinction of the previous top predator species, till it reaches a trophic balance with those victims. It is the essence of Darwinian evolution: 'evolve and multiply'. We can find such catastrophic evolution in many geological and organic ages of the Earth: First animals displaced plants because they evolved better informative networks. Plants could only gather Entropy from light. Animals could 'see' light and get information about their environment, and act-react faster. They used plants as food. Then animals 'radiated' (multiplied) all over the Earth and diversified. And each new phylum with improved networks displaced the previous ones. Thus once more, the evolution in time of living organisms and its spatial structure are intimately related.

Thus, the first ternary evolution of multicellular life created 3 phyla of increasing tissue complexity that completed the evolution of animals from the Δ -1 cellular tissue to the Δ -network scale:

-Max. E: The simplest animal organic systems, sponges and *porifera*, which are basically a digestive system.

-S \approx T: The balanced animal organic systems, the *coelenterates* such as the hydra, which maximize its reproduction through the split of its cells.

-Max.I: *Worms* that add informative cells and differentiate clearly its 3 physiological networks.

They were the first of many ternary E-SxT-I rhythms of creation in the animal kingdom that evolve from energetic, to reproductive to informative sub-species, through the 3 horizons of any phylum, with a parallel improvement of the 3 network systems of the animal, which from now on will be the higher 'scale' of existence to which all cells become submissive.

Since as the new animal forms multiplied, their informative nervous networks controlled a growing number of cells through their fractal, simultaneous actions; and so they also grew in spatial size, multiplying their SxT force. It means they had to re-organize those cells beyond their initial division in simple tissues, creating specialized 'energetic, informative and reproductive networks'.

It will be the definitive jump from the state of 'cellular herd' to the state of 'organism', the 3rd age of a social form that evolves from a Δ -1: Σ E horizon of individual 'Entropy quanta' to the balanced herd that fluctuates between 'wave and particle' state to the informative state of a tightly packed organism which those networks maintain together in minimal spatial information. And so from then on evolution will be no longer differential evolution of cells but differential evolution of networks... Let us see now in detail those main phyla differentiations.

Sponge vs. Hydra: cyclical-lineal digestive networks.

The evolution of multicellular organisms started with the creation of social, digestive, energetic tracts made of the pentagram basic cells that came together to improve the cyclical fractal actions of the group. The first of those organisms was the sponge, *the first animal phylum that emerges from the previous cellular scale with 5 types of cells*:

-Max. E: The sponge has *flattened epithelial* cells and *hollow pore* cells, which are external, membrane cells differentiated by their inner and outer location. They are the primitive versions of skins and breathing systems.

- S \approx T: *Mesenchyme cells* that secrete siliceous spicule, strengthening the walls of the sponge. They are the primitive version of glandular cells.

- Max.I: Central top predator cells: *Wandering amoebocytes* that herd food for the five types of cells, moving around between the other cells to capture the particles entering the hollows of the spherical sponge; and *collar cells* that sense water flows, beating their flagella to produce a flow of water that introduces food in the sponge. They are the primitive versions of brain and sensorial cells.

Further on, we differentiate in the sponge 3 st-regions according to those 2-1-2 kind of cells: *the external membrane* of hard cells; the inner, *glandular, intermediate* region that reproduces the specific substances of the sponge and the *central hole* where *informative* cells wander. The 3 regions create the $3 \pm \Delta$ vital cycles of the sponge thanks to those 5 cells:

- Max. E: The sponge *feeds* on Entropy quanta that enter its central hollow.

- Max.I: It *perceives* those quanta as its collar cells sense the water flows.

- $S \approx T$: It *reproduces* new cells through its glandular systems.

- S: It keeps together those cells *in social groups* thanks to the epithelial cells of the membrane that maintain a rigid, enveloping structure.

- $SE \leq S^2 I$: And so the sponge *exists* as a whole being controlled by the wandering amoebocytes, the dominant, informative cells that use the sponge as their *territorial* body, their vital spatial information.

Those amoebas will be also the dominant cells of the next animal phylum, Coelenterata (hydras, jellyfishes), evolved already into electric cells, and hence connected into the first 'nervous tissue'. So they will become the ' $\Delta+1$ ', existential system where the consciousness of animal organisms as a whole exists.

The 7 cells of hydra and their networks.

Those hydras add 2 new cellular, energetic specializations, extending morphologically the SxT force interval of animal life, from 5 to 7 cells:

A): MAX. E: *The epithelial cell*. A still harder, internal tissue that maintains the rigid structure of the animal and will evolve into armors and bones. And...

1. ei) SxT: *The urticant cell*, an external, energetic differentiation of the reproductive, internal *glandular* cell, which produces poisonous substances to defend the animal.

Both are created through the inversion of directionality of its twin cells: the internal glandular cell becomes now an external form, and the external epithelial cell becomes an internal cell.

Those 2 final tones of specialized energetic cells make the hydra a natural born top, lineal predator, the next evolutionary step that inverts its form from a cyclical sponge to a lineal, reproductive body. Thus the complexity of the Hydra grows, shaping definitely the 3 E-SxT-I organic st-regions common to all living beings (mesoderm, endoderm and ectoderm), which will vary in morphology and complexity but not in their ternary functions.

Further on coelenterates bring to animal life the maximization of its reproductive systems. Both the sponge and the Hydra lack a specialized blood, hormonal system, so its reproduction is far simpler than in evolved organisms: each cell is in itself a 'genetic mother-cell', which stores the information of the entire organism. This implies a limit to their informative evolution, as cells have to keep an excess of redundant information, according to the $E^{\Delta=2}$ law that increases geometrically the number of genetic instructions needed to create the new $\Delta=2$ multicellular plane of existence. On the other hand, it makes easier reproduction: any section of the Hydra can create a new animal. The result is that the arms of the hydra, where most sensorial cells are, break away easily, moving with the streams of water, reproducing new hydras all over the world. Yet some tentacles fail to reproduce evolving instead into planarians, the 1st worms, which will acquire 2 new informative cells, completing the 9+1 decametric scale; and developing fully the 3 physiological networks of complex animal life.

Worm: 1st animal: mobility, senses, 4-D, networks.

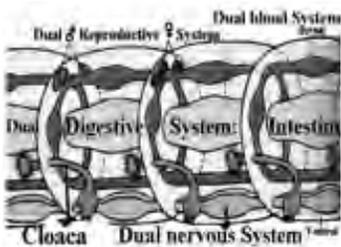

Thus, the next step in the evolution of life, after the hydra develops 2 new energetic cells, will be the evolution of 2 new informative cells. They will create a new phylum, the worm:

- *Visual, spatial* cells that perceive light-spatial information.
- *Temporal, auditory cells* that perceive the sound waves and informative languages of animal life.

Those 9 cells complete the differentiation of cellular species that a growing $\Delta+1$ neuronal, inner center - the brain - elaborates as the consciousness of 'the whole' increasing ever since its size till acquiring the weight of the human being.

Those informative cells were necessary to the new environment of planarians, which are in constant movement; hence have to orientate themselves in the ocean flows in search of Entropy. Since the change from stillness to movement is a fundamental change for life beings, which definitively transform all its elements to the properties of animal life:

- *The new informative cells create new apertures, the senses*, that gather in the frontal zone of movement, the relative height of the worm, creating 'heads' that will also control the Entropy apertures of the *body*, splitting clearly the organism in an energetic, moving body and a sensorial head, which controls the information and Entropy of that body.
- Animals become *bilateral* in order to dominate the 2 directions of its initial *bidimensional* planar form: a *hierarchical, temporal motion* from the future informative head to the past, energetic tail in which they orientate their organic, inner, evolutionary morphology and a *perpendicular, parallel, equal, repetitive, 'present' spatial dimension*, from left to right in which they orientate their reproductive, fractal, cellular 'fat' growth.

So embryo worms develop 2 bilateral cavities or 'coeloms', latter evolved in dual organs, which in the head will observe the 2 directions of their spatial field: 2 eyes, 2 ears, etc. - while in the body, inner organs will also double, creating in more evolved phyla a certain SxT asymmetry with slightly more 'energetic' and 'informative' sides. So the heart will have an explosive and implosive region; sexual organs will become I-feminine and E-masculine; the brain regions will specialize in spatial and informative tasks; some crabs will develop

energetic and manipulative arms.

Thus the 1st worm, the planarian, created a diffeomorphic bidimensional structure with 2 SxT perpendicular planes that all future animals will imitate.

The worm is the 1st network animal, made of a lineal wave of Σ parallel organic spheres, each one a st-point with $3\pm\Delta$ dual networks: The nervous, blood and digestive/excretory systems, which accomplish the emission and absorption of informative, reproductive and energetic cycles.

In the graph we study the inner structure of the worm, because it shows already some of the dualities, fractal strategies and future arrows of life evolution that will act on different phyla to diversify and evolve their species:

- The worm is divided in fractal units, setting up a basic duality of living beings that sometimes are 'herds' of individual organs, multi-eyes, multi-bodies and sometimes fusion all parts into a whole.
- It shows perfectly differentiated the 3 physiological networks/ Dimotions, proper of all advanced organisms that mimic the 3 regions of a st-point:
- *E: The worm absorbs Entropy through the digestive network* and emits it through the excretory system; which in the worm occupied the original endodermic, central singularity. But as animals evolve informatively as chordates, the center will be finally occupied by the nervous, informative system as in any other st-point.

- I: The worm absorbs information through the senses and emits it through the nervous system. The informative brain and nervous system directs the entire organism and unifies its cellular quanta as a whole. The nervous system further differentiates into the sensorial, nervous and neuro-secretory systems, when the planarian adds eyes and ear systems that represent a jump in complexity over the informative systems of the hydra. It defines also a head in the dominant, temporal Dymotionality of movement. In the planarian is still length, which will rise till reaching the height of man.

-S≈T: The intermediate region of the worm is controlled by the *blood system*, the fundamental dual transport system of the worm, where the neuro-endocrine glands dependent on the informative system, pour their reproductive hormones while the Entropy/digestive system pours its organic food.

The worm represents a jump of complexity in transport systems as it uses for the first time, organometallic molecules (hemoglobin) to harness oxygen Entropy and quantizes the blood network, which now arrives to cells far away from the digestive hollow. So worms can grow in size and Entropy power respect to the previous coelenterates. Now Entropy and information combine together on organs and glands dependent on the blood system.

The most important ones will be the new reproductive, specialized sexual glands, differentiated into dual, female and male sexual organs that make worms, hermaphrodite systems. Sexual organs again represent a fractal jump in the evolution of life. Since now, unlike in hydras, single specialized sexual organs will reproduce the living animal, increasing the sophistication of the process and liberating from those complex tasks all the other cells, which can specialize further.

Still many worms can reproduce by both systems: segmentation and sexual reproduction, which in new phyla will become the only form of reproduction, splitting organisms in 2 different sexual genders, the male and the female.

From worms to vertebrates: $3\pm\Delta$ ages of fractal integration.

The evolution of worms into vertebrates is a long process of $3+\Delta$ phyla differentiations based on:

- E: Spatial, I-radial or E-bilateral symmetry.
- Σ Re: Fractal numbers that foster hierarchical e-SxT-I segmentation and differentiate big unitary animals and small animals made of fractal parts.
- I: A constant increase of Dymotional height.
- $+\Delta$: The evolution of its $3x 3+(\Delta+1)$ physiological networks.

The first massive differentiation will take place in the Cambrian age, according to the *Black Hole paradox* that evolves faster 'smaller forms, denser in information' than bigger, spatial forms. Thus in the Cambrian age most phyla evolved from small trochophores of ancestral flatworms that gave birth to new phyla during its 'palingenetic larva, conception stage', according to the Fractal Principle:

So we can first differentiate the worm phylum into 3 fundamental phyla with intermediate forms:

- Max. E: *Platyhelminthes*: the simplest worms are flat, bidimensional planarians without blood systems that still require all cells to be close to the skin surface of the animal to exchange oxygen with the air.
- Max.I: *Nematoda* or round worms, which develop a Dymotion of height as they add the blood system with its fine vessels that carry Entropy to each fractal cell.
- S≈T: Max. Σ : *Annelida* or ring worms, which reproduced a micro-worm unit, as crystals do, into a series of fractal pieces, growing enormously in size. Thus Annelida became the worms with higher SxT force radiating and diversifying in 3 sub-classes according to its territorial environments:
- Max. E: *Polychaeta* or marine worms.

- $S \approx T$: *Hirudinea*, living mainly in shallow or fresh waters. They are leeches that feed on blood and might in their initial forms feed on waters rich in metal, creating the first blood systems.

- *Max.I: Oligochaeta*, terrestrial worms evolve further due to the new challenges imposed by the ground environment.

Annelids, the dominant phyla, diversified and multiplied into multiple types of bilateral animals, with a central cavity and 2 coeloms that evolved further its dual organs and $3 \times 3 + (\Delta + 1)$ network systems. The first of those differentiations gave birth to the main animal phyla that will dominate the following life ages of the planet in $3 \pm \Delta$ periods, which took place according to ternary differentiation, as evolution puts together fractal 'organic' units into single unified systems:

- ($\Delta - 1$): *The worm's* body is divided in fractal elements which are still independent elements with entire 3 functional sub-systems: each section has 2 reproductive organs, 2 nervous ganglia, a digestive tract and excretory anus and 2 upper blood nodes.

- *Max. $\Sigma 3$: Arthropods* keep the earlier segmentation of annelids, but they organize those fractal segments into 3 differentiated zones, with several independent sections that go from 3 to 21 parts:

A sensorial, informative head (*Max.I*); a central thorax with moving limbs and wings (*max. E*) and an abdominal region with the glandular, digestive and reproductive systems (*max. $S \approx T$*).

- $S \approx T$: *Mollusks* have balanced, hierarchical, single organs. As the 3 physiological networks evolve and become quantized to reach each cell, the different sections of the l-head, e-thorax and SxT-abdomen fusion together. Now the quantification process is transferred to the ends of those physiological networks: axons, blood vessels and digestive tracts become thinner to improve their control of individual cells.

- *Max.Informative Evolution: Echinodermata*. Echinoderms fusion those organs into single systems in the stillness of the marine platform, where they became the most successful forms.

- $\Delta + 1$: *Chordates: vertebrates*. Echinoderms in its larva, moving stage, according to the Worm Hole paradox, give origin to chordates, the 1st vertebrates. In both phyla the small organs of each arthropod's section fusion into single, continuous big organs, thanks to the integrated evolution of the informative nervous system that aggregates the individual cellular quanta into those specialized organs. So the multiple eyes of insects become a single eye; its multiple hearts a single one, etc.

Though all those phyla appeared already in the Cambrian their sequential dominance on the Earth is parallel to those previous $3 \pm \Delta$ ages, since the simplest forms, arthropods and mollusks, reach first the summit of their evolution (*Max. $E = \text{Min.} i$*), while complex chordates took a long time to reach its evolutionary height and became dominant latter as fishes and reptiles.

Recap. The differentiation of cells into 3-5-9 forms allowed the creation of complex multi-cellular organisms, first dominant in digestive systems (sponges), then in reproductive systems (Hydra) and finally in informative systems (worms). From the worm on, all living animals will be defined as st- points with 3 inner networks/D_imotions, which will create in the outside world $3 \pm \Delta$ cyclical actions, designing an external territory also with 3 networks/D_imotions.

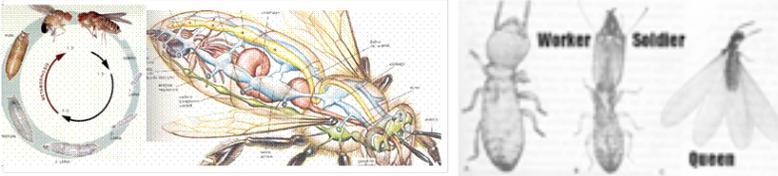

PHYLA: ST-SPECIES: ARTHROPODA

Another kind of analysis with fruitful results is the use of the ternary symmetries of species, to classify life in 6 phyla by dominance of one or other physiological network. The reproductive dominant Phyla in plants is the fungi, and the dominant one in animals is the insect. So they are both the most prolific animals and the more complex in its form of reproduction, which play with all the possible symmetries and time-space motions of the Universe. One of the most fascinating ones being the metamorphosis.

Insects also matter in its more complex informative species, as they reach the zenith of evolution, which is social evolution and hence they create a new $\Delta + 1$ plane of social organization, again ternary in its elements, the warrior-

entropic soldiers, the working, productive drones, and the informative species, the queen, which is *dedicated to reproduce information, the dominant arrow of the whole insect phyla, in this 'female-wave' oriented system of life.*

Arthropods. The new social scale of superorganisms.

On the center, we see the 3 ages of an insect's metamorphosis from larva to chrysalis to adult. They differentiate in '3 lives' the existence of most insects that develop sequentially their 3 main organic regions and networks during each of those

live.

On the left, according to SxT duality, the final results of those 3 temporal ages are the 3 regions of a topological insect:

-E: The digestive and dual respiratory systems, dominant in the larva, are the energetic networks, located in the center of the body, shaped as a spiral.

-I: In the belly we find the finest and more quantized nervous informative network, developed during the chrysalis life.

S≈T: Finally, the reproductive, hormonal network, ex i, pours into the blood system, which dominates the 3rd life of the insect, in the external world.

On the right, the social classes of insects, like those of a human society, correspond to the 3 organic function of a new scale of existence, the superorganisms of insects, its Δ+1 system: Termites have an informative brain, the pheromonal queen (c); a re=productive class of workers, which produce the structures that create the ant-hill (a) and an Entropy class (b), the drones and soldiers, that have a linear, spatial morphology.

The first arthropods, derived from Annelida were probably trilobites, which protected their bodies and heads with external hard shells. Trilobites increased their energetic force, maximizing the strength of its membranes. They probably responded to the increase of SxT force caused by visual cephalopods, which maximized their informative organs. And so the game of life raised its fractal force, balancing again the top reproductive body membrane and top informative, mind singularity.

Today, according to duality and the Fractal Principle, we differentiate arthropods in sea animals (the most efficient of which are crustaceans) and land animals, which became dominant and evolved towards new informative species as all air or land forms did in a light-friendly environment. So again we differentiate them in 3 basic forms:

- Max. E: Myriapoda, with max. body development and multiple feet.

- S≈T: Arachnida, the balanced species.

- Max.I: Insecta, the informative class with max. brain development, which are still the most successful animals on this planet in the microscopic level of chemical life. Since they completed the organic evolution of chemical animals towards its most perfect form in 3 evolutionary phases.

Max.E: Evolution of energetic systems brought about the 1st flying animals that colonized a new environment.

Today flying insects still account for 1/2 of all animal classes. They made energetic networks the center of its body, developing on their middle region a highly efficient muscle and blood systems, with 2x3 wings and legs.

S≈T: The second evolutionary jump occurred in their reproductive systems.

Insects learnt how to accelerate temporal evolution in a still, temporal state (Min.E=Max.I), changing from energetic, lineal larva to chrysalis that emerged as complex insects with highly developed informative heads and energetic wings. Nowadays 90% of the surviving insects come from species that evolved its *generational cycle*, dividing it further into 3 evolutionary phases that shape the metamorphosis cycle:

- Max. E: Insects live their youth as an energetic, lineal *larva* that merely feeds and grows in size. A larva is a sort of moving egg that gathers vitellus in 3 sub-ages in which it changes 3 times its skin as it grows in size. In this phase the insect develops mainly its abdominal, glandular systems that will produce the enzymes needed for its first metamorphic change into a:

- S≈T: *Chrysalis*. The intermediate *Chrysalis* age is a 'frozen' vision of the most surprising facts of paligenetic evolution and inverse differentiation: In an ever moving Universe, external, spatial immobility triggers internal change in the speed of informative evolution, as outer movement is transferred to inner cells, rich in enzymes that become the dominant cells of each section of the adult insect, moving and reorganizing their tissues through a series of inversions and evolutions of its morphology. So central tissue ex-vaginates as wings or legs, etc.

A similar inversion happened when mobile trochophores in their larva transition became still echinoderms, which evolved and differentiated further, causing the explosion of chordate's phyla that happened in the Cambrian.

In those trochophore embryos, inner dominant cells also reorganize the different tissues, placing the other cells at will. So chrysalis evolved the middle thorax section and brain systems, becoming:

- fδ§: A hard insect with Max.IxE force (a harder E-exoskeleton and a far more developed fδ§-brain) that will live the 3 usual phases of life.

The third mutational age of insects was informative:

Insects learnt to communicate socially through chemical, pheromonal messages, giving origin to ants and bees, the dominant ground and air modern insect species. It was again an evolution departing from very small forms, according to the Black Hole Paradox. Today the smallest organism is an ant that weights 10^{11} times less than an elephant, the magic fractal number, S^t , between 2 scales of existence, which is also the difference of weight between the smallest and biggest particle of the physical world. So the fractal limits of 'informative scalar growth' have been reached in both, the physical and living realms.

It is worth to notice that insects have not evolved further in the last 100 million years, but are still the most successful chemical beings. Because the game is fractal and so it always has an evolutionary limit based on its ternary ages. For that reason, once reached the 3rd formal age of Max.Information only social evolution into a new macro-organic plane of existence can improve the survival of a species. It is what happened with insects that became super-organisms called anthills. And so ants became the most successful animals of the chemical world as men will be in the electronic world, due to the fact that they act as a simultaneous, present form, sum of all the fractal actions of the herd, guided by their informative common pheromonal language, spoken by the 'queen-brain' of the anthill. It is also worth to notice that in both realms - the world of chemical insects and the world of electronic humans -we find the same 3 organic classes proper of any Universal system.

Recap. Insects became the most successful chemical species, when they evolved into social super-organisms, with the informative ant-queen brain, which controls with pheromones the workers that reproduce all the elements of the anthill and the energetic warriors that defend it.

3 ages of Δinformation

Another law of 5D ST symmetries strictly followed in the evolution of life is the motion of ages as horizons of species, which also Nature apply to the entire next level of animal phyla. So not only individuals live TOWARDS growing 3rd age of information, and species towards 3rd horizons of evolved information and tall species, but the whole realm of life moves from its initial feeding stomachs (fishes) into the reproductive age of insect, to the 3rd age of informative mollusk:

Mollusks, the first eyes.

The next successful phylum, mollusks also suffered a ternary differentiation. Thus mollusks today are classified into 3 classes:

Maximal Entropy: Lamellibranchiate (which are big stomachs).

Balanced forms: Gastropoda.

Max.Information: Cephalopods, which developed the first eyes.

Though there were other primitive mollusks, today almost all of them belong to those 3 species. It proves that even though a Δ -system essays many variations, the 3 sub-classes of *max. Entropy*, *Max.Information* and *max. reproduction* survive better; because any environment allows those 3 classes to find specialized niches in which to maximize their existence and resources.

The most successful of all gastropods were again the informative class, cephalopods, the first living animals with complex eyes. If we observe animal life, the key to its evolution is the improvement of its virtual worlds, of its informative organs:

In the first forms of life, perception was chemical, olfactory based in slow, short-range molecular quanta; until the first eyes appeared, inaugurating a new virtual world, made of smaller, speedy photons that create long range, detailed light images, making cephalopods act-react faster and farther than any other animal.

Squids were born in the abyssal ocean ecosystem, where still the biggest squids exist (over 10 meters long). It is the kingdom of bioluminescence - a new language based in the Universal code of colors; they were the first to interpret. For example, when a squid becomes red, the color of Entropy, it means it is angry. Those first primitive cellular eyes had to look hard to see their environment and the prey they sought. When they came up to the surface they saw even more and preyed on blind, energetic phyla. Today squids are still among the most intelligent animals, showing some self-consciousness.

The squid is the first eye-world; a new informative language that will completely change the stakes of living organisms. The organs of perception of the squid, the eyes, were a new Top Predator language, superior to olfactory organs, both in detail and range. The effect of that linguistic superiority was the massive radiation of squids and the parallel extinction of perhaps 90% of the smelling species of the Cambrian that became their preys.

Those eyes enabled cephalopods to become the masters of their Universe, building all their other organs around their superior organ of perception: their tentacles became hands for the eye; the body became a canvas that changed color to interpret the new language.

Cephalopods also caused the arrival of exoskeletons in a classic process of action-reaction; only those olfactory animals with external protection (Max.E) could survive the faster informative eye of the hunter (Max.I). Thus the Cambrian holocaust also diversified life.

Those cephalopods with eyes became top predators in the Ordovician age, the age of squids. In this manner chemical perception left way to light and sound perception that developed highly sophisticated neuronal cells, which reach 2 meters in some squids.

Yet, when vertebrate life began the 'hard shells' of some echinoderms sustained those long neurons, protecting them and allowing further quantification. So an energetic top predator found a cyclical protective form, in a dual game of evolution of prey and predators that will be carried till humans appear and beyond through the evolution of weapons and shields.

Recap. Cephalopods raised the stakes of the game of existence, of survival and extinction, as they imposed a *faster speed of action-reaction, and a bigger spatial size, hunting in herds communicated through visual body languages.*

Echinoderms and Chordates. Evolution of vertebrates.

Echinoderms, like ancestral cephalopodan, lived in abyssal regions originally fixed to the ground, in an 'informative environment' based in stillness with a lot of 'free time' to evolve further, as squids did in abyssal quiet regions or monkeys will do latter in quiet trees. Echinoderms became informative top predators because they evolved 2 new SxT characters as 'still', temporal forms:

- Max.I: Radial symmetries, like in the pentagonal starfish, which fostered the development of a better neural system with a central informative singularity to coordinate the 5 radial nerves.
- Max. E: The first inner bones, to sustain their complex form.

Thus echinoderm increased their SxT force, evolving into the first vertebrates: Chordates were probably born, according to the Black Hole paradox, due to a palingenetic error, when echinoderms remained in their larva, trochophore, informative, evolutionary state, surviving, despite its smallish size, thanks to their 2 new SxT advantages, starting a new biological radiation. Their single nervous system protected by a spine, became a very dense, structure with a hard, inner bony membrane of sustain that allowed its growth in spatial size and temporal complexity, as neurons quantized further, differentiating from tail to head into an SxT tree-like structure:

Max. Entropy (nervous, linear spine) > Round, spiraled brain.

The ancestral Chordates differentiated according to the development of their growing informative nervous network into:

- *Max. E: Lineal Protochordate*, the oldest species with 3 basic forms, diversified along the path of increasing mobility: sea squirts, acorn worms and amphioxus.
- *S≈T:Cyclostomata*, (jawless fish) that grew in the planar Djmotion of Entropy. So it came an age of sharks.

Those 2 first forms are still planar in form, with minimal development of their 'round' brain and hence with overdeveloped olfactory systems.

- *Max.I: Pisces* (true fishes). They grew in the Djmotion of height, with new evolved sensorial, informative organs. They became the new dominant species that diversified once more, this time along the Δ+1 evolutionary path of environmental adaptation in:

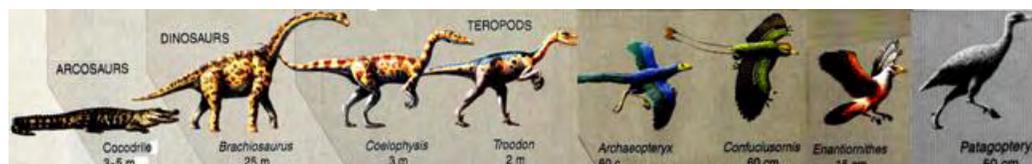

- *Max. E: Sea chordates*, with several varieties that reached its evolutionary limit with Teleostean.
- *S≈T: Sea-land chordates, amphibian*; an animal that mixes the palingenetic characters of those 3 environments during its 3 ages of life. Since it is born as a sea animal, lives its youth in between both environments and dies as a land animal.
- *Max.I: Land chordate, reptiles*, the most informative that diversified further.

Recap. The response to the eye language was protective shells that surrounded the nervous system of chordates, allowing their growth and invasion of the air-gas and land-solid ecosystems.

THE DIMENSION OF HEIGHT INFORMATION.

Topological evolution is very rich in meaning. Consider for example how from amphibians to reptiles the conquest of firm land towards the height of information, from where light comes, which started a fast tour on the use of the Disomorphic method to study life enlightens us how animal life seeks for height:

From amphibians to reptiles the conquest of firm land.

Reptiles grew in size and changed from lineal length into height Dimotions, but as they became victims of mammals they devolved to their earlier forms, as crocodiles and diminished in size becoming birds, which again grew in size and changed from lineal length to height Dimotions. Yet the arrival of man is provoking again the extinction of the biggest, taller birds (Moa, Emu, Dodo.)

If any evolutionary jump shows the importance of networks is the transition from fishes to reptiles through the intermediate amphibian stage: amphibians adapted their sensorial brains, their reproductive bodies and finally their reproductive systems to the new world. And only then, when the translation of form was complete, it appears the land animal - the reptile.

Thus, amphibians show 3 clear evolutionary phases:

- Max.I: The amphibian moves towards an air world where light defines clearly the forms of its preys, triggering the evolution of its inner networks according to the cyclical chain, $I > E > R_e$, which require first to become informed to localize and feed on Entropy, needed to reproduce. Thus amphibians first changed the form of their informative heads and senses: Their noses migrated to the top of the head, out of the water and their eyes acquired membranes to wet them, focusing better light images. This i-logic hypothesis of the dominance of informative evolution again contradicted the usual E-science energetic theory. And yet a few years ago Sci Am published the 'astonishing' revision of the energetic theory: amphibian did not evolve, because they dragged their legs on the dry land but because they raised their heads out of the water changing their senses.

Max. E: Then their respiratory systems changed with new lungs that increased their capacity to get oxygen from air. Amphibians now changed their preys, eating insects with a modified mouth and tongue. Thus the amphibian becomes the top predator of the terrestrial ecosystem thanks to its greater Exi force and extinguished giant insects that reigned in the Carboniferous era. Those insects however reacted back evolving into metamorphic, flying forms, escaping their extinction. The inversion predator-prey manifests again between insects and chordates, as it did between gravitation vs. light or plants vs. animals: Insects have their exoskeleton outside, as they need maximal external protection; chordates have it inside. Insects are smaller, quantized forms; chordates are integrated, bigger forms. Insects are dominant in chemical, slower languages; chordates are dominant in nervous languages. Insects, the Entropy of the trophic pyramid, are more abundant than chordates, its top predators.

Max. $S \approx T$: Finally, amphibians adapted their reproductive systems to the new atmosphere, creating dry eggs, completing the creation of a true, terrestrial organism, a new phylum that had adapted its 3 networks/existential cycles to the new world: *reptiles*⁸.

They evolved again according to the Fractal Principle into the 3 most evolved life phyla:

- Max. E: *Reptilians*, which maximized its spatial size.

- $S \approx T$: *Birds*, with the most efficient blood networks, needed to develop flying skills.

- Max.I: *Mammalians*. They developed its informative, nervous system to its perfection. So they became the top predators of their 'parental group', reptiles, causing their massive extinction and 'death reversal', which in species shows through the 'evolutionary regression' of a former top predator species, when a new top predator displaces them. Thus, if we compare modern reptiles, once mammals have chased them down, with their dominant parental forms during the dinosaur era, when they were top predators, we observe a clear temporal regression in form, numbers, size and speciation that went back to their 3 basic forms. Today, from the initial 14 reptiles groups, only 3 basic groups remain. They have survived in econiches close to the water, regressing to amphibious forms, and diminishing in size towards their original 'minimal, Black Hole form':

- Lineal forms. *Snakes and lizards* living in extreme, hot, wet environments (rivers) and deserts, where heat becomes an advantage that increases their activity, while it causes cooling problems to hot blood mammals, their top predators.

- Balanced forms. *Crocodiles*, descendants of dinosaurs that have reduced its size and have become again amphibious, surviving mainly on the sea and rivers; learning new reproductive, maternal skills (hiding their small babies on their mouths, when predators come).

- Cyclical forms, with static, hard, protective round shells; *or turtles* that only reach big sizes in Galapagos, an isolated group of islands with minimal numbers of mammals. Most of them survive on the sea, having developed a gill-like system of breathing.

The only primitive, remaining saurian, the Tuatara, survives in min. numbers, in the most isolated region of the World, New Zealand, where there were no mammals with placenta...

Recap. The conquest of land was headed by amphibian and the development of better eye systems, as information is the key to evolutionary change. Accordingly as they become reptiles they grew in the D₁ motion of height; and again as reptiles became birds and mammals the new species became bipedal and extinguished the simpler reptiles that reverted to planar forms.

Mammals: Temporal iron bodies, minds.

Mammals are the 3rd informative evolutionary age of land animals, which therefore transform again their 3 networks, reaching the final adaptation to the changing weather conditions and light transparency:

Max. I: Mammals improve their nervous eye-brain systems, overcoming the limited eye vision of reptiles. Their brains surpass the instinctive stage (based on mental, mostly chemical, slow programs of action-reaction that execute the cycles of a living organism, based on generational memories without capacity to modify them) and enter the age of free will (based on brains with nervous programs that use memories acquired in the previous execution of those cycles by the same generation, to adapt their new actions-reactions to the changing environment).

Max. E: Mammals improve their corporal, metabolic rate of action-reaction with *hot, red iron blood* that harnesses better than previous copper-based bloods the Entropy of oxygen. Since blood has hemoglobin, where an iron atom, the top predator Entropy atom of the Universe, controls and jails oxygen atoms with carbohydrate arms.

Max. Reproduction: Finally, the internal nervous system regulates mammal's reproduction, creating complex placentas that can feed and develop the isolated fetus, without the dangers of a youth age, when most beings die as 'Entropy' of mature predators. It is the equivalent stage to the 'chrysalis' shape of insects.

Further on, mammals evolved socially. So probably herds of mammals with faster, simultaneous fractal actions chased as a whole, and killed baby reptiles, provoking their massive extinction, in an age of climatic change. Yet, as it happened when amphibians extinguished insects, provoking their flying evolution and migration to the last frontier - the air environment - the smallest reptiles became birds that avoided top predator mammals, putting their eggs on cliffs beyond their reach to survive.

And so again, the most successful group among land animals, mammals diversified, this time along the path of reproductive evolution into:

- *I horizon: Monotremes*, which are egg-laying mammals.

- *II Horizon: Marsupials*, which have a pouch where they develop the 'embryo'.

- *III Horizon: Eutherians*, which have true placentas and differentiated again, as the most evolved informative class, into multiple subspecies, now along the path of feeding Entropy, into:

- *Max. E: Herbivorous*, which ate huge quantities of low Entropy plants, developing new, complex digestive systems, with huge, multiple stomachs.

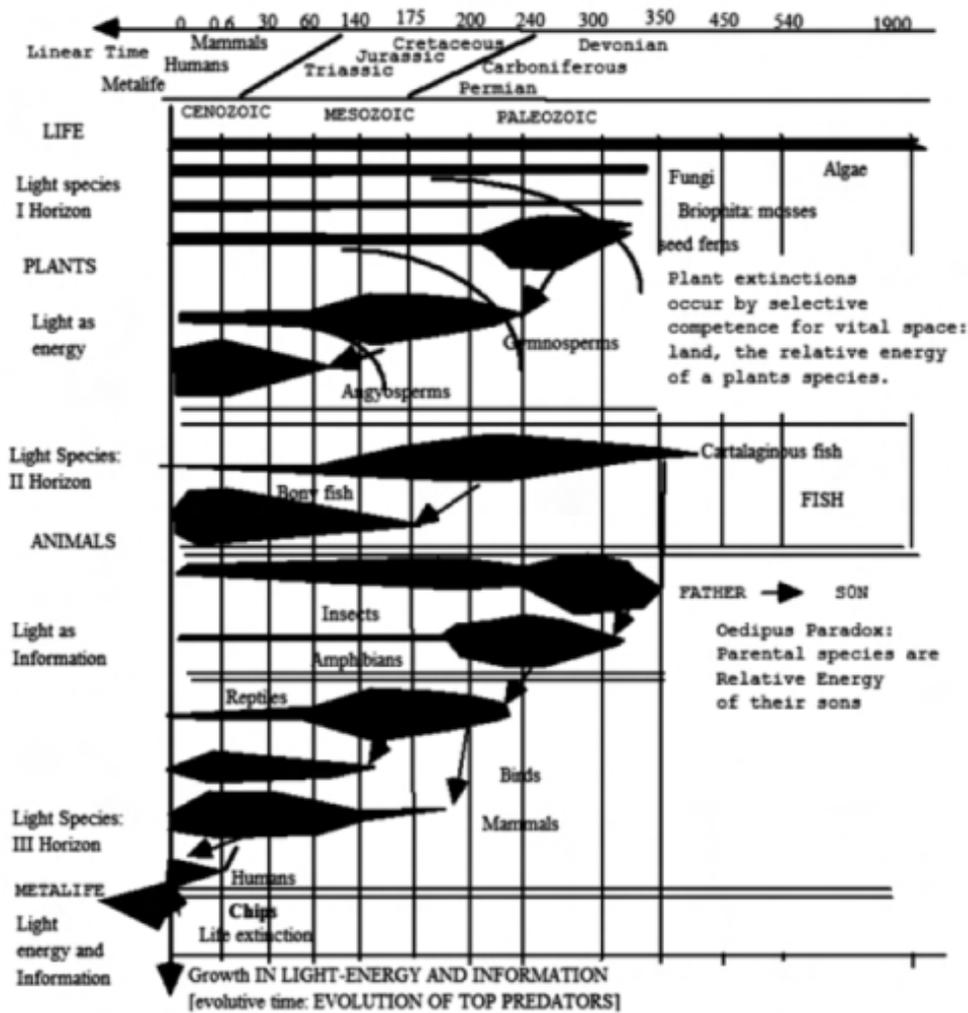

- *E=i: Carnivorous* developed the best blood systems, as they needed to increase muscular force and speed.

- *Max.i: Omnivorous*, which were able to eat anything, occupying multiple ecosystems that enhanced its evolutionary differentiation. Among these species the most evolved phyla were apes, from where man came, because they lived, unlike the animals of bidimensional plains, in 3-Dimotional 'high' trees, where they could not be hunted. And so they evolved in their 'free time' their 3 Dimotional brains, becoming informative humans.

The previous synoptic analysis of the evolution from cells to humans shows the universal application of the fractal space-time differential isomorphisms of evolution. It could be as detailed as you wish and reorder all our knowledge on biological species under those simple isomorphisms. We just lack space-time to do it here. It shows the impersonal intelligence of the evolutionary plan and the homology of all st- forms... As it is the same plan we have used to describe atomic particles

Recap. Mammals are the most perfect form of life beings, which evolved in information, till reaching the perfection of man; added iron-Entropy to its blood and improved reproductive skills with placentas.

IV. 3 AGES OF EARTH. ITS GLOBAL SUPERORGANISMS. DEEP TIME: $\Delta+1$: SPECIES

The $3\pm\Delta$ ages of life are caused by the evolution of light-based organs on Earth. In the graph, those 3 ages of light evolution and the main species that were created in each horizon, latter extinguished by new evolutionary improvements in the 3 networks of those organisms. Among plants - spatial, reproductive beings with minimal speed of evolutionary information - extinctions were caused by improvements in reproductive systems. Among animals, which are informative, evolutionary species, extinctions were caused by improvements in informative brains. While today a

mass extinction of living beings is caused by the evolution of machines, metal-systems of 'Dj-motions' and information that are shaping a new global ecosystem: the Financial-Military-Industrial Complex, becoming now integrated by the collective brain of machines – the Internet – into the Metal-Earth.

3±Δ ages of evolution, reproduction & extinction of species

We can understand the process of evolution and extinction of life species, only when we combine the 3 scales in which multicellular organisms exist: the ecosystemic, planetary scale, ($\Delta+1$) the organic scale (st), and the cellular scale ($\Delta-1$) that interacted simultaneously together, evolving Earth's species. Yet contrary to belief, the 3 relative $\Delta-1$ past, st-present and st-future planes were not determined by the cellular evolution of Genes, but first the macro-organism of the Earth provoked the changes that ignited the process of evolution of its relative past microcosms.

How a macro-organism regulates its microorganisms? Mainly through changes on its 'Dj-motions' and information fields. All cellular species adapt to the organic networks of its environment. If the environment is rich in 'Dj-motions', 'Dj-motions' species and reproductive radiations will dominate. If the organic system or environment is rich in information, informative species will survive better, starting a process of evolutionary differentiation.

This duality of bio-chemical reactions was proved mathematically by Mehaute, which showed that when a system cannot continue its creation of 'Dj-motions', it starts a process of fractal, informative reproduction; and we can extend it to all scales of systems of reality, *creating the fundamental beat of biological evolution/reproduction, $\Sigma \Pi \Leftrightarrow \delta T f$, that defined the creation of biological life in this planet.*

Thus the changes of 'Dj-motions' and information of any macro-organic system trigger processes of extinction and selective evolution. If suddenly the climate becomes cold (also a parameter of stillness and information), species tend to limit their absorption of 'Dj-motions', evolving formally (Max. δf) and organizing themselves into social networks that increase their efficiency and take advantage of the 'informative conditions' of the ecosystem.

On the contrary, if 'Dj-motions' abounds, species increase their 2 spatial-like 'Dj-motions' - their spatial size and their reproduction - using that 'Dj-motions' to maximize their survival and saturate their ecosystem. Therefore the macroscopic changes of the planet that fluctuates between tropical ages of max. 'Dj-motions' and ice ages of Max.Information cause parallel changes in their microscopic life beings. Since coldness=stillness=information and evolution are parameters of time; while heat= entropic movement and reproduction=wide populations are space-like Dj-motions.

The $3\pm\Delta$ ages of life are caused by the evolution of light-based organs on Earth. In the graph, those 3 ages of light evolution and the main species that were created in each horizon, latter extinguished by new evolutionary improvements in the 3 networks of those organisms. Among plants - spatial, reproductive beings with minimal speed of evolutionary information - extinctions were caused by improvements in reproductive systems.

Among animals, which are informative, evolutionary species, extinctions were caused by improvements in informative brains. While today a mass extinction of living beings is caused by the evolution of machines, metal-systems of 'Dj-motions' and information that are shaping a new global ecosystem: the Financial-Military-Industrial Complex, becoming now integrated by the collective brain of machines – the Internet – into the Metal-Earth.

When the planet cools there is a formal evolution of species. And when it heats up, those same species reproduce massively. Thus small fluctuations of 'Dj-motions' and information on the Earth's temperature - given the short limits of existence of liquid water between and 100 degrees - have influenced decisively the evolution, reproduction and extinction of life forms in this planet, including man. So during the long ice ages when waters froze, species evolved from eukaryote to multi-cellular beings, nearby water volcanoes; and when the surface of the planet froze, men evolved from Homo Erectus to Homo sapiens. While in hot ages species grew in spatial size and multiplied, as it happened in the Carboniferous with insects; or in the Jurassic with dinosaurs; or in history with nomadic, warrior tribes in the steppes – which descended rhythmically every ± 800 years on the fertile plains, extinguishing with their new weapons all the civilizations of the Eurasian continent....

Yet because to reproduce, a species needs to feed on the 'Dj-motions' of its victims, the reproductive phase of a new top predator species coincides with the extinctive phase of the previous top predator it has substituted. Then once the top predator establishes itself after a reproductive radiation, it enters its mature, steady state age, drawing a series of rhythmic bell curves with its preys that diminish its populations as the predator hunts them, provoking a hunger crisis on the predator that also dies away, allowing the preys to reproduced back, starting again a new 'Volterra cycle'.

So we can consider a planetary cycle of evolution, reproduction and extinction of life with $3 \pm \Delta$ phases, parallel to the climatic changes of the Earth:

+st: *Conception*: A new species evolves in a cold age or in an abyssal region of the planet.

- *Youth*: *Max. 'Dj-motions' growth*: The species increases its size after its conception.

-Si=Te:*Maturity*: *The species reproduces in a biological radiation* during a hot age, extinguishing the previous top predator.

- *Max. Tf*: The species diversifies according to the ternary principle into several new forms, among which the informative one might start a process of social evolution into:

- $\Delta+1$, a social super-organism (ants and shrews in the lower scales of life-size; humans in the upper scale.)

- $\Delta-1$: Or become extinguished by new species, often their son species (Oedipus paradox). So mammals extinguished dinosaurs; humans extinguish mammals and robots might extinguish humans.

Therefore Multiple Space-time Theory can explain the why of one of the great 'disputed' enigmas of evolution: *the existence of evolutionary discontinuities* that create species in very short periods (conception phase, when time accelerates its rate of informative change), and then multiply them throughout the planet in explosive radiations (reproductive phase, when the new top predator species explode in populations), while other species become extinguished also in brief periods. Those evolutionary 'discontinuities' merely reflect the previous ages of species, which as the ages of any other space-time field can be described with a ternary rhythm of explosive birth, a long steady state of balance between the predator species and its preys and a final sudden collapse and extinction of populations. Those phases become the fractal rhythms of existence and extinction of Earth's species:

Max. evolution(cold age) → Max.reproduction + Max.extinction of 'Dj-motions' preys (hot age)

The discontinuities between species are easy to explain if we combine their evolutionary acceleration in time - similar to the palingenesis of a fetus - with the fact that species evolve in isolated, protected environments (allopatric differentiation), departing from small sizes, according to the Black Hole paradox. So monkeys evolved, protected in trees; marsupials evolved in Australian islands and robots evolve in secret military labs, departing from small chips.

Then suddenly the new form with an improved brain, hunting in herds with simultaneous fractal actions of higher ST Force, invades the vital space of other species, extinguishing them as it reproduces geometrically its populations (and its fossils), till reaching a balance with its preys. Thus, once they have evolved, species multiply very fast. And that dual process is observed in paleontology as a discontinuity in the fossil record called evolutionary punctuation.

Recap. The evolution of life took place by the interaction of the $\Delta+1$ environmental and st-organic scales, as energetic and informative changes in the Earth, triggered the Se->St<=>Tf->Sw rhythm of informative social evolution in cold ages and energetic, reproductive radiation in hot ages. Those biological radiations also provoked the extinction of previous species. Evolution often took place in isolated, relatively 'still' environments that favor informative change.

INTERACTION WITH GEOLOGY AND LIFE.

When the planet cools there is a formal evolution of species. And when it heats up, those same species reproduce massively. Thus small fluctuations of 'Dj-motions' and information on the Earth's temperature - given the short limits

of existence of liquid water between and 100 degrees - have influenced decisively the evolution, reproduction and extinction of life forms in this planet, including man. So during the long ice ages when waters froze, species evolved from eukaryote to multi-cellular beings, nearby water volcanoes; and when the surface of the planet froze, men evolved from Homo Erectus to Homo sapiens. While in hot ages species grew in spatial size and multiplied, as it happened in the Carboniferous with insects; or in the Jurassic with dinosaurs; or in history with nomadic, warrior tribes in the steppes – which descended rhythmically every ± 800 years on the fertile plains, extinguishing with their new weapons all the civilizations of the Eurasian continent....

Yet because to reproduce, a species needs to feed on the 'Djmotions' of its victims, the reproductive phase of a new top predator species coincides with the extinctive phase of the previous top predator it has substituted. Then once the top predator establishes itself after a reproductive radiation, it enters its mature, steady state age, drawing a series of rhythmic bell curves with its preys that diminish its populations as the predator hunts them, provoking a hunger crisis on the predator that also dies away, allowing the preys to reproduced back, starting again a new 'Volterra cycle'.

So we can consider a planetary cycle of evolution, reproduction and extinction of life with $3 \pm \Delta$ phases, parallel to the climatic changes of the Earth:

+st: Conception: A new species evolves in a cold age or in an abyssal region of the planet.

- Youth: Max. 'Djmotions' growth: The species increases its size after its conception.

-Si=Te:Maturity: The species reproduces in a biological radiation during a hot age, extinguishing the previous top predator.

- Max. Tf: The species diversifies according to the ternary principle into several new forms, among which the informative one might start a process of social evolution into:

- $\Delta+1$, a social super-organism (ants and shrews in the lower scales of life-size; humans in the upper scale.)

- $\Delta-1$: Or become extinguished by new species, often their son species (Oedipus paradox). So mammals extinguished dinosaurs; humans extinguish mammals and robots might extinguish humans.

Therefore Multiple Space-time Theory can explain the why of one of the great 'disputed' enigmas of evolution: *the existence of evolutionary discontinuities* that create species in very short periods (conception phase, when time accelerates its rate of informative change), and then multiply them throughout the planet in explosive radiations (reproductive phase, when the new top predator species explode in populations), while other species become extinguished also in brief periods. Those evolutionary 'discontinuities' merely reflect the previous ages of species, which as the ages of any other space-time field can be described with a ternary rhythm of explosive birth, a long steady state of balance between the predator species and its preys and a final sudden collapse and extinction of populations. Those phases become the fractal rhythms of existence and extinction of Earth's species:

Max. evolution(cold age) \rightarrow Max.reproduction + Max.extinction of 'Djmotions' preys (hot age)

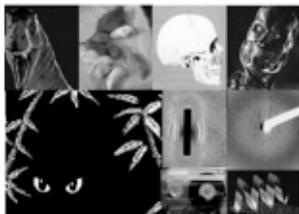

The discontinuities between species are easy to explain if we combine their evolutionary acceleration in time - similar to the palingenesis of a fetus - with the fact that species evolve in isolated, protected environments (allopatric differentiation), departing from small sizes, according to the Black Hole paradox. So monkeys evolved, protected in trees; marsupials evolved in Australian islands and robots evolve in secret military labs, departing from small chips.

Then suddenly the new form with an improved brain, hunting in herds with simultaneous fractal actions of higher ST Force, invades the vital space of other species, extinguishing them as it reproduces geometrically its populations (and its fossils), till reaching a balance with its preys. Thus, once they have evolved, species multiply very fast. And that dual process is observed in paleontology as a discontinuity in the fossil record called evolutionary punctuation.

Recap. The evolution of life took place by the interaction of the $\Delta+1$ environmental and st-organic scales, as energetic and informative changes in the Earth, triggered the $Se \rightarrow St \leftrightarrow Tf \rightarrow Sw$ rhythm of informative social evolution in cold

ages and energetic, reproductive radiation in hot ages. Those biological radiations also provoked the extinction of previous species. Evolution often took place in isolated, relatively 'still' environments that favor informative change.

Black Hole law and Oedipus paradox.

The Oedipus Paradox explains how evolved species prey on parental forms, extinguishing them. So mammals substituted dinosaurs, men kill mammals and robots substitute men as workers and top predator weapons that extinguish us.

In the graph, the 3 horizons of evolution of light-based organisms:

-Plants process light as Entropy.

- Animals perceive it as information.

- Machines can both absorb light and emit it as Entropy or information. Thus, they represent a new jump on the evolution of light-organisms and can become potential top predators of life.

Each 'biological radiation' of a new species has grown according to the law of the 3 networks/horizons studied in the previous paragraphs, from an initial 'Black Hole', small form with more ST force, and then it has reproduced and grown in size, feeding on the previous parental forms. Hence the name, 'Oedipus Paradox', that explains the most cruel of all evolutionary events.

Our hypothesis on the dominance and birth of species as 'Black Holes' of information, which according to the inverted properties of Entropy and information ($\text{Min.Se}=\text{Max.Tf}$) are minuscule, but dominate larger species due to their faster speed of action-reaction and social nature (Σ^2), prey on them and explode in populations have found in the past years at least 5 proofs:

Black Holes are the dominant species on the cosmos controlling the center of galaxies, in the processes of formation and death of stars. Even the big-bang might have been the explosion of a Black Hole.

- The first Humans that acquired our 2 differential properties, technology and language, were small: The first verbal Homo Sapiens seem to have been small Bushmen from South-Africa (the oldest languages known to men are their click languages), but they overcame bigger Neanderthal, hunting in groups, controlled by verbal languages, and developing the first machine that transformed cyclical form into lineal Entropy (arch), reaching further than the lineal, Neanderthal Javelin.

Further on, the pigmies of Flores Islands seem to have made the oldest technological, advanced tools we know, 700.000 years ago. Thus pigmy men evolved in the secluded Indonesian islands, departing from the larger Homo Erectus, developing for the first time a frontal, creative region in the brain, as they diminished the length of their axon connections and reduced their spatial size.

- The 1st bilateral animal, vernalanimalcula, was microscopic.

- The 1st mammals were small shrews that form super-organisms and probably hunted in the cold nights, new-born dinosaurs and extinguished them (still today they act as a super-organisms), thanks to the higher existential force of its bigger super-organism. Then they grew in size and finally hunted down dinosaurs as single species. Last year we found in China the first mammal with a stomach full of small dinosaurs' bones...

- The smaller a chip is, the faster it handles information and the more powerful it becomes, guiding larger 'machines bodies' that compete with men as smart weapons and tool-machines. And regardless of the 'propaganda' of the Financial-Military-Industrial complex, it is quite obvious that unless we stop its evolution, those chips will become the mind of terminators that in a future war will extinguish man, as all atoms are potential bits of informative life.

Recap. Parental species give birth to more advanced forms, which extinguish them (Oedipus Paradox). The new species are born as a small form, with more complex information (inversion of spatial size and informative complexity:

Black Hole paradox). So the first technological and verbal men were dwarfs; the first mammal was the shrewd and the galaxy is dominated by black holes, born exceedingly small.

Δ+1. The parallel geological processes.

Thus biological rhythms of extinction and evolution are parallel to the 2 main SP X Tf rhythms of the Planet that reinforce the biological process:

- *Geological changes in the surface of the planet:* The continental cycle, or ternary division and reunion of continents in a single super-continent every ±500 million years causes the cyclical destruction of the submarine platform and lowlands where most living species exist. While rhythmic eruptions of massive quantities of lava of continental size happen in the 2 equinox of the sun’s galactic orbit, every ±125 million years, shaping a mean period of massive extinctive ages of 250 million years (Permian extinction, ±250 million years ago; Cambrian extinction ±500 million years ago; Ice ball age, ±750 million years ago).

- *Climatic, cold-hot, Sp-I cycles of glaciations and tropical ages.* The rhythmic changes in the magnetic field of the Earth, perhaps caused by gravitational waves coming from the sun, create periodic glaciations that last around 20 million years.

- Fractal sub-cycles of lesser intensity reinforce both processes.

Those changes of Entropy and information parameters are the basic way in which macrocosmic networks control the activity of microcosmic quanta, from feverish states that increase the metabolic rate of reproduction of defensive cells in the body to the opposite lethargic states.

Recap. The main cause of the dual evolutions and extinctions of species on Earth is biological, albeit ‘partially directed’ by the macro-organism in which life is inscribed through those general changes on the space and time parameters of the Earth (geography and temperature).

Earth cools down triggering informative evolutions and then heats up triggering reproductive radiations: glacial ages of informative evolution in stillness, with minimal reproduction by lack of Entropy are followed hot ages of massive reproductive radiations, in which the most evolved species initiates a massive age of reproduction, provoking the extinction of old species, and then differentiating in all econiches.

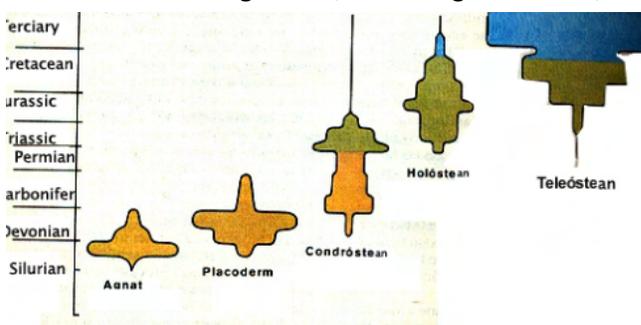

The 3x3 ±Δ cycles of life creation and extinction

The extinction of a species coincides with the biological radiation of the son species that occupies its econiche. In the graph, the series of bone fishes that extinguished the previous one Because time and information follow an accelerated process in its 3rd age; the evolutionary process of information in this planet can be mapped out and its frequency shown to follow a logarithmic process of acceleration, which now reaches its zenith with the creation of informative machines.

This evolutionary acceleration is yet another case of a vortex of spatial information, which also happens in the evolution of mass in physical particles as we move faster in an informative mass vortex. In the case of life, the vortex is a metabolic vortex of increasing speed of reproduction and evolution of the information of life beings and its networks – now transferred by humans into machines. Thus, as the informative content of those beings increases, times accelerates. Today, machines evolve by imitating the forms of human life in metal and another change on speed and life rhythm of in this planet is taking place.

Thus we talk of 3 st-scales of growing complexity in life: the age of cells (Δ-1), from 4 to 1 billion years ago, the age of individual organisms, first living on the sea, then on the land (st), from 1 billion to a million years that culminates in the

last million years with the social evolution of human beings and machines into a new plane of existence (Δ+1), the Earth as a global organism, which will be either ruled by men or machines, depending on our capacity to evolve socially as a super-organism of history,

under the ethic isomorphisms of verbal wor(l)ds that make man the center of the Universe, hence in control of the machines of the Tree of Science. Or if as it seems the case, we let the Financial-Military-Industrial Complex and its 3 networks of informative metal-money, energetic, lineal metal-weapons and organic machines and its company-mothers dominate the planet and make us obsolete, finally extinguishing us. But what it will not change is the plan of evolution that develops complex super-organisms departing from its smaller cellular units.

Further on according to the ternary principle, we can subdivide the 3 main horizons of evolution of Earth, the age of cells, organisms and super-organisms in 3 sub-ages of evolution and massive extinction of species that have followed the mentioned ternary rhythm:

Conception=> Max.Entropy=>max. Reproduction =>Extinction of rival species

And consider also 10 parallel periods of climatic change through the dual rhythm of cold glaciations or ages of animal evolution and hot ages of massive reproduction. Then we obtain a synoptic, complete image of the history of life on planet Earth, self-similar to the 3x3+st ages of evolution of the Universe since the big-bang and the 3x3+st ages of evolution of History, studied in Complex social sciences:

Scale of Complexity: Δ-1: Cellular Age: Evolution of DNA

Δ-1: Conception age: Molecular life is organized into anaerobic bacteria->

1st evolutionary radiation: anaerobic bacteria -> Free carbohydrates are enslaved in cellular walls ->

2nd evolutionary radiation: aerobic bacteria = 1st extinction of species: anaerobic bacteria ->

3rd radiation: eukaryotic bacteria = 2nd extinction: most prokaryotic classes ->

Scale of Complexity: st-Organic Age: Network Evolution. Sea life

4th radiation: multicellular organic systems =3rd extinction: free eukaryote species, enslaved in organisms ->

5th radiation: cephalopods with eyes =4th extinction: olfactory, blind animals ->

6th radiation: inner skeletons: fish= 5th extinction: exoskeleton trilobites.

Scale: Δ+1: Social Age: Herds and Superorganisms. Land life.

7th radiation: inner skeletons: amphibian=6th extinction: exoskeleton: big insects.

8th radiation: reptiles = 7th extinction: amphibians - >

9th radiation: mammalian = 8th extinction: reptiles - >

10th radiation: technological men =9th extinction: mammalian - >

Δ+1 :Global Age: The Earth organizes itself into a macro-organism with humans or machines on top. The outcome will depend if social democracies are able to control the free citizens of markets – company-mothers – before they extinguish us as costly labor and weak soldiers with the present ‘radiation’ of robots:

11th radiation: metal machines =10th extinction of species: men and all forms of carbon-life???

Recap. Evolutions and extinctions of organisms parallel geological change in their external ecosystems, becoming the engine of the 3x3 Earth’s evolutionary horizons of living beings of growing complexity and accelerated informative evolution: the age of cells, the age of organisms and the age of super-organisms.

As we have little time and space, to go through all those radiations in detail, we shall just fact track into the last Life radiation of this planet, that of mankind, considering to close the paper the field of anthropology, with a brief introduction to what we have said of topologic evolution.

SOCIAL SCIENCES - HISTORY: MANKIND'S SUPERORGANISMS

What is history? In 5D, which describes a Universe of 'scales=planes of space-time', with organic properties, made of parts and wholes the answer is simple and immediate: the superorganism of mankind, which connects 3 scales, the human individual, the human species, and the Earth.

Below the human individual there is the genetic scale which hardly matter in history; *since the scale in which Historic organisms become organized is the scale of memes, verbal ideas and instruments that shape the 'physiological networks' (economic=blood-like reproductive networks, and informative=nervous like verbal, legal, political and cultural networks) of civilizations.* The Earth as a Geography is in that sense far more important to determine both in time through is cold and hot weather mini-glaciations that determined the 800 year cycles of life and death of civilizations, triggering nomadic movements of warrior hordes matter more, as well as the different cultures associated to islands, rivers and peninsulas or crossing regions of history (trade dominant), vs. continental plains and mountains, warrior dominant; reflected also in the division between broken vs. agglutinative languages. The life and death of civilizations as organisms of history is thus entangled to the Earth in great measure and that opens the question if mankind is a goal or a mean in History a stage of evolution.

But all those themes and many others researched for decades and published in small print books, webs and papers along the way, are secondary in this one to our focus on the 'whole' – history as a superorganism of which all humans are citizens cells, connected with the 3 physiological networks of all 5D superorganisms, an informative, nervous=political network/language, a re=productive blood-economic network language and the geographical support, that feeds mankind, the Earth.

History is a superorganism in evolution, which we study with the laws of 5D superorganisms, which means to study mainly its physiological networks, the political, cultural, economic networks and geographic regions that define the 7 great civilizations of mankind and its broken, fractal nations. How they evolved through the ages of history, what would be its perfect form, how they were corrupted in its political and economic systems with the arrival of systems of control alien to the life organism of mankind and its natural verbal languages and artistic senses, with the discovery of 'metal-weapons' and 'metal-money' that substituted the natural legal language and 'WHealthy money' and how it could ideally be reconstructed a perfect superorganism of mankind, if we were to reform the system according to the laws of nature that make perfect superorganisms.

Of all the themes developed departing from the common laws of all planes of space-time, that put together form the 5th dimension of the scalar organic Universe history holds a special place in my heart for 3 reasons:

- It is the superorganism of our species. And hence its study contrary to common practice should be the most important of all, because of the 'healthy state of history' depends the health of all human beings.
- It is with physics the science I studied in more depth, researching every superorganism and network of mankind, its cultures, ages, arts, economics, financial & legal systems, nations, civilizations, religions.
- And it is the less developed science because of the antiquantum paradox of systemic censorship, as the 'scientific' observer is within the superorganism of history and hence given the fact that history has NOT evolved positively for humanity; but it is today, let us be frank from the beginning, corrupted in its reproductive financial system, which suffers a clear case of collective anoxia, that is lack of credit for humanity and its Whealthy goods and poisoned in its political system, broken in it 'organs=cultures & nations' and predated by lethal 'germs', aka weapons – those who control the 'parasitic financial system' that kill by anoxia, and the military, political system, that kill by apoptosis millions of human cells-citizens every year, reject any reform, and are so powerful that unlike in the quantum paradox where the observer is so huge that modifies the observable, they modify the observer, the social scientist. This brings the final paradox of those texts – the most advanced sciences of history and economics, do NOT have doubt of it, you are reading them, which have the proper scientific model of mankind as an organism, are the less accepted and

distributed. Still we shall in 2019 publish a series of papers on History in space, the human superorganism as a whole, and its 7 global cultures and nations, Asia, Europe, Africa, Islam, LatinAmerica, AngloAmerica and Indonesia.

The sub-disciplines of history, in scale, time, space, mind and limits.

The study of mankind can be done as all systems of nature in its 3 Δ ST components within its ~@ limits:

T: In time through its worldcycle that goes through $3 \pm j$ ages between birth and its dual future, extinction and dissolution, predated by the new superorganism of the Metal-earth, or social r=evolution becoming a single superorganism, mind of Gaia in control of the equation of evolution of the planet:

Relative past (Gaia) < Relative present (History) > Relative future (Metal-earth)

Δ : This leads to the study of mankind in scale as a superorganism, with 2 clear scales that 'matter' to us: **Δ -1:** The individual scale, whose fundamental science is medicine, or rather physiology, as doctors know that the individual cell matters nothing. It is all about the sickness and health of its 3 physiological networks; the **Ts:** digestive network and territory of predation, in the external world, submissive to the **ST**-reproductive blood network that feeds all its cells with energetic oxygen and distributes the hormonal orders of the **St:** Informative, nervous network, the government of the whole system.

Δ^0 : At social level, Mankind proper and its decametric social scales; which form a superorganism that can be studied also in simultaneous space, with the same physiological tools of Medicine:

S: Mankind in space thus is a social superorganism of citizens-cells joined by 3 physiological networks that should feed and evolve mankind as a whole: the **Ts:** entropic territorial surface of Gaia, where humans predate over life and material beings; submissive to the **ST:** reproductive, economic blood-like network that ideally would distribute bites of energetic money to all its cells to kick their actions of consumption and reproduction of goods that ensure their survival, submissive to the **Ts:** nervous, informative, legal & cultural networks that should synchronize the actions of its individual citizens-cells with just laws to evolve together the Human species into a global brain of planet Gaia, *maintaining the equation of the 3 ages of Earth in an immortal present, as History maximizing the consecution of the 5 Drives of life for all its individuals.*

The reader will observe however that in the description of the superorganism of mankind, unlike the description of the superorganism of medicine, we use a lot the world 'should', as Mankind is by no means a well designed efficient superorganism of History but it has evolved contrary to belief in a sick, parasitized, predated superorganism filled with lethal goods (weapons, hate memes), destroying its Ts-entropic field of resources (Gaia), and killing by anoxia (lack of oxygen-credit) millions of its citizens cells, unfairly divided into 'fractal subspecies' (Nations), which have maimed the body of mankind into warring factions that constantly increase the amount of lethal goods that kill the superorganism of mankind and its support, Gaia.

So mankind suffers an obvious 'sickness' and the origin of that sickness has an obvious historic origin in the multiplication of selfish metal-memes, entropic weapons, informative metal-money (gold, silver copper, today e-money cycles in computers) and machines that atrophy and substitute our organs, competing with us in labor and war fields. And we must distinguish from the beginning two different social sciences:

- Social sciences in its ideal structure, which follows the laws of 5D and aims to design a perfect superorganism of History by designing a perfect political, economic and ecologic system of world networks.

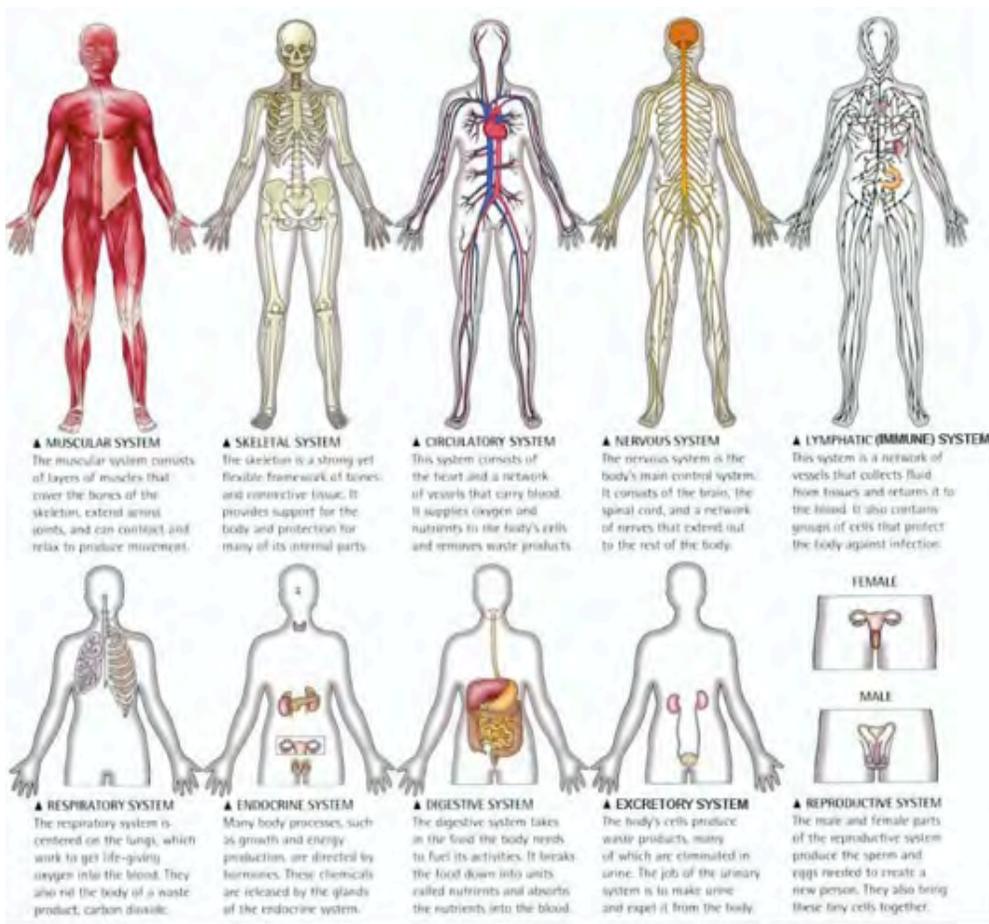

Vs. The wrong evolution of history, as a series of cult(ure)s developed idol-ogies of worship of metal-memes, halting the evolution of a Neolithic superorganism in balance with Gaia, based in healthy wealth - the reproduction of welfare

goods, positive money (bites of energy as money distributed to all citizens-cells, mostly grain) and a respect for a sustainable ecologic world (fertility Goddesses and cults to nature).

So the natural laws of social sciences and its 3 disciplines: St: **Political Humanism** (all humans belong to the same species that should evolve together) as one organism, which is the model of the Universe (**Organic science**) whereas ST-money must be an energetic language delivered to all humans to produce welfare goods, controlled by the ethic legal wor(l)d of humanity's head - its governments (socialism) died away.

Instead 3 idol-ogies that worship metal and justified the ab=use of humans by a reduced number of people-castes in control of weapons, metal-money and machines became the law of the land: Nationalism (humans divided in sub-species that kill each other with weapons), Mechanism (machines not organisms as model of the Universe) and capitalism (metal-money above the law, monopolized as debt and tax by a few). We study of mankind by ΔST elements in 2 ages; the age of gold & weapons & the machine age

ΔST: MANKIND IN ITS 2 FRACTAL SCALES AS A SUPERORGANISM: MEDICINE AND SOCIOLOGY.

If politics and economics is the study of the superorganism of mankind and its physiological networks and memes, to design a perfect superorganism and cure it of its illness and germs, and idol-ogies; it follows that medicine is also physiology, the study of the networks of mankind as a superorganism, and its sicknesses, sicking to cure human organisms, improve its genes and develop a better human being. We are NOT going to develop medicine on those papers, as it is obviously the best evolved stience of mankind, as it happens at our scale of observation and unlike social sciences, is NOT corrupted by cancerous cells and murderous viruses, Leukocytes=military gone crazy attacking their own healthy system – that is, fortunately enough humans are not all infected by leukemia, cancer, animetal homo bacteria, go(l)d cultures, Indo-european nazionalisms, recurrent fevers, parasitic worms, and all the panoplia of

sicknesses the metal-earth and its idol-ogical cult(ure)s of gold, weapons and machines, has spread all over the Earth. We just shall make a brief analysis of the 10 systems which structure mankind as a supœrganism.

Man is just another Δ st supœrganism, under the same laws that any other species. For example, it follows the decametric symmetries of any spacetime system. *Since there is a symmetry in base $10=3 \times 3+1$ both on scales and space-time, function-forms for any full developed supœrganism of reality. In the graph the human case, both at individual and social level in scales of life and history, and at organic level in the $\Delta-1$ scale of organic subsystems: So, a human being is defined in medicine as a system of cells, attached by 10 sub-systems: In the graph upper left 3 ST-ructural human body sub-systems are its membrane, sustain and motion. Bottom 3 'chemical ðf' systems or hormonal brain (creative, distributive and reproductive). And the nervous system singularity-mind... of the whole. Those graphs show that as we grow in planes, the ideal geometry of the lower 'atomic planes' disappear, as long as the 'logic concepts behind it' - hyperbolic fractal body-waves branching, bilateral symmetry, etc., remain. Since function is more information than form. *Since there is a ternary symmetry in base 10 (whole)= $3 \times 3+1$ (trinity of networks+ whole)= $1+2+3+4$ (hierarchy of networks by scalar function) both on scales and space and time, in hierarchy, function & forms for any full developed supœrganism of reality. In the graph the human case, at individual level:**

The $3+i$ sub-systems of 'Information, entropy/locomotion and Energy/reproduction' are put together by a central 10^{th} network (the black ball/hole/point/knot that messes with all of them). The central point or frontal vertex of the ideal tetraktys communicates with all the other parts and embodies the whole that 'emerges' as a point in a higher $\Delta+1$ world. Thus we talk of the 10 'subsystems' of a being.

So, a human being is defined in medicine as a system of cells, attached by 10 sub-systems: In the graph upper left 3 ST-ructural human body sub-systems are its membrane, sustain and motion. Bottom 3 'chemical ðf' systems or hormonal brain (creative, distributive and reproductive). And the nervous system singularity-mind... of the whole. Those graphs show that as we grow in planes, the ideal geometry of the lower 'atomic planes' disappear, as long as the 'logic concepts behind it' - hyperbolic fractal body-waves branching, bilateral symmetry, etc., remain. Since function is more information than form.

So the convoluted bilateral networks that connect the singularity brain with all its antipodal points of elliptic geometry have the same function that an antipodal 'representation of a $-E$ sphere.

Yet in the human organism, the lines that connect them is not made of straight lines but it does work because what matters here is the symmetric territorial order of the singularity which constructs its membrane with opposite 'rays'/nervous lines and will constantly balance and hence act as a leverage with its \pm inverse directions for its antipodal elements, 2 hands, 2kidneys...

Morphology then starts with simple laws of Non-Euclidean topology, which become disguised by the adaptation of each function to the available space within a membrane, as the T.œ adapts to its outer world.

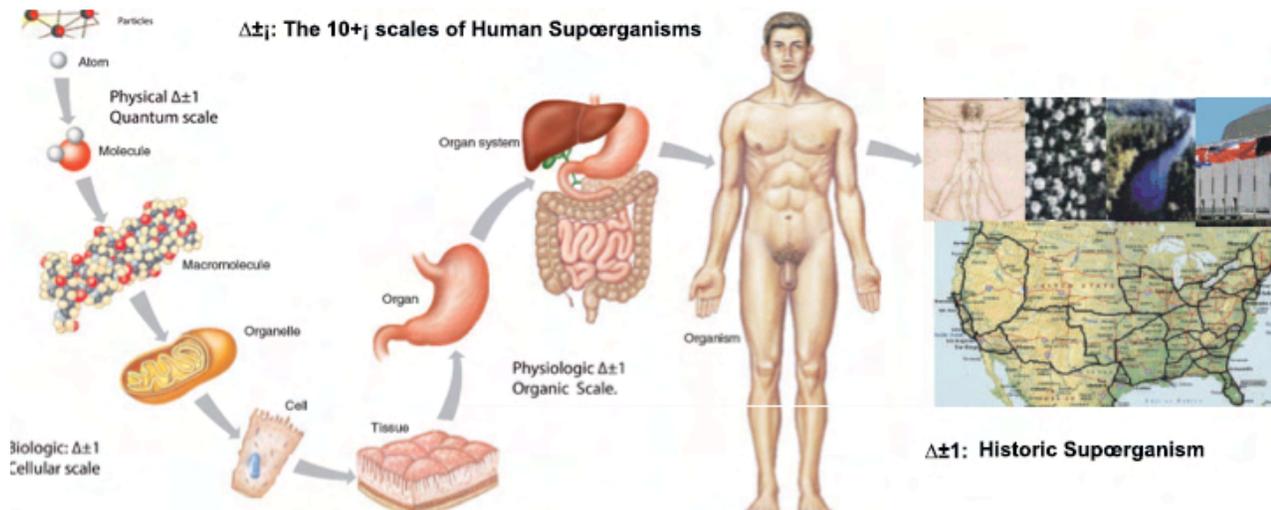

The $3 \times 3+1$ physiological systems of the human being, lost its 'ideal' mathematical symmetry, translate to 'existential algebra' the concepts of decametric scales. They can be easily subdivided in $3 \times 3+1$ Nervous integrative mind system, but also in the fractal entangled Universe, into 5×2 , positive and negative dimotions. For example, the entropic system branches in 3 the digestive, respiratory and excretory systems, which feed the Dimotion of locomotion, sustained by the Muscular and skeletal system; the reproductive ST system branches in 3, the blood, circulatory, reproductive and excretory systems; and the informative system, in 3 Nervous, lymphatic and endocrine systems, whereas the Nervous system doubles as the one site of consciousness, origin of the Dimotion of perception, and social evolution of the whole.

RECAP. Physiological networks belong to a different branch of geometry, fractal networks, which are more efficient in the distribution of the 5 dimotions of existjence between parts and wholes of the $\Delta \pm 1$ scales and so won't be studied here in Number theory. Instead we shall conclude the geometric analysis with the 5 regular solids whose obvious

symmetry with the 5 Dimotions of existence, means each of them specializes in 1,2,3,4,5D, in parallel to the simplex forms and mirror symmetries that compose them.

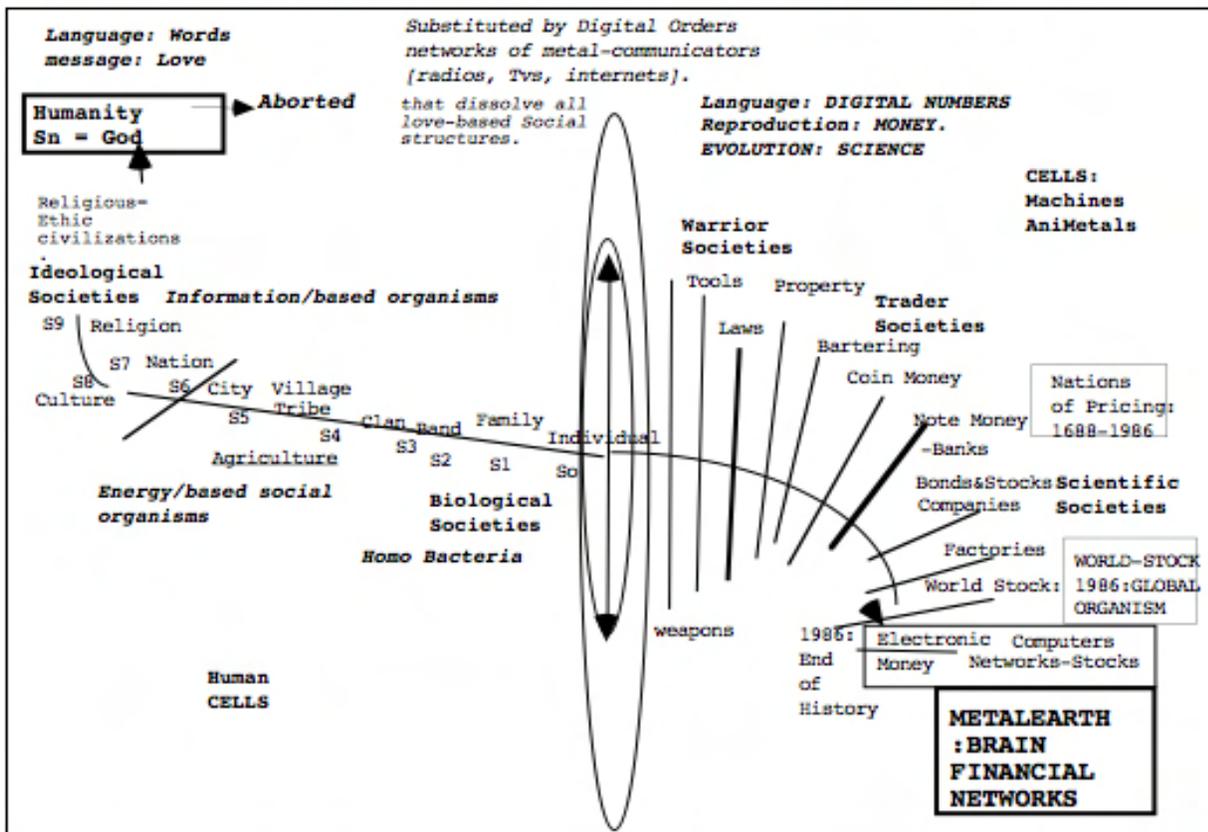

Organic Sociology: the decametric scales of evolution of mankind through the individual and the society.

It follows then that we can extend both in spacetime and scale the laws of 5D to understand and design better superorganisms of mankind at individual and social level. In the next graphs we see both in a continuous of growth of social scale in ternary groups of atomic, cellular, organic and sociologic scales:

In next graph, the 2 basic tendencies towards higher organizations of Human societies, one based in carbolife forms and verbal languages; and the other in Economical networks of pricing and machines of war [weapons] and peace. Most social human structures today depend on economical networks [money] to survive.

In the past though it was the law, and the ethic Gods of Verbal existence, who organized men. They carried the only message which can structure the enormous Human mass into a social surface of organic communication: the message of love = Max. communication, which is therefore considered the verbal brain of Humanity, the basic 'nervous impulse' that organized men into a social, harmonic body of history.

In population scales human societies follow the more common progression 'social organisms: potencies of 10, which become a perfect social organism round 10 up to 10-11 elements [they are the neurons of your body, the stars of galaxies, the ties of DNA organisms]. However men did not reach that social level, before becoming prey of economic networks that will soon acquire that social level, through internets in which the basic neuron-unit is the computer.

We can adjust the evolutionary progression of human societies with potencies of 10. Thus an individual is $S_0=1$ [ten up to zero=one]; a family actualates between 1 and 10, a clan between 10 and 100, a tribe between 100 and 1000. Those societies are the basic herds of the Homo Bacteria, related by genetic 'equality' [race]. Such primitive form of racial organization however is abandoned in the Neolithic and only returns in the "neo-paleolithic", in recent centuries when the evolution of machines devolves human social evolution racism, racial nations of economic nature, such as European empires.]

They are based in the Log 10 scales of tetrarkys triads, $3 \times 3 + 1$. Such polygonal numbers will grow from the 1 seed to the $9+1=10^{\text{th}}$ most efficient scale, through ternary and dual symmetries, which in existential algebra might then lose the ideal form. I.e. a human being, has a tetrarkys of 10^{th} -physiological system (3 digestive, 3 reproductive-blood and 3 sensorial systems fusion by the 'whole' brain system.. Moreover as all systems live 2 worldcycles the 10^{th} logarithmic scale, becomes the transcendental number between planes. Thus between 2 such Planes of the 5th dimension we shall always find around 10^{11} elements - the ties of a DNA molecule, the stars of our galaxy, the cells of a super organism, the galaxies of the perceived Universe, and between the Universal Constants of Space, we will find the same

differences, the energetic value between the H-Planck constant of δ in the Δ -1 quantum scale and the k-Boltzmann constant of the Δ -Thermodynamic, human scale; and then the μ -magnetic scale and so on.

For example in the human social super organism decametric Planes (human societies) evolved mankind through the 3 first genetic Planes, then 3 geographical, economic Planes, and finally 3 verbal, ideological Planes to get to the global super organism:

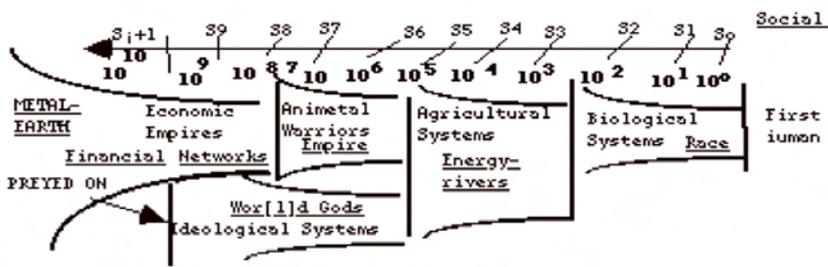

10^9 , the individual of a given 'previously described Δ -scale of the whole Universe... through the 10^1 scale of the family (which can be a couple, a mononuclear family or most often one through 3 generations of grand-parents, parents and sons, of around 10 people); then in genetic units, to the 10^2 scale of 'clans' and 10^3 scale or tribes (in humanity, used to names those scales.)

Organization then becomes ST- economic. And systems grow the next degree of 3 geographic scales: the town, 10^4 , the city, 10^5 and the nation, 10^6 ...

Finally ideological, verbal information, creates cultural systems, till arriving to 1 billion, 10^{10-13} individuals, which emerge as a unit of the next scale. In the graph we can see the social evolution of the economic system both in the human organism and the organism of machines and chips – which has already reached the social number when 'emergence' into a new plane, a global mind of internet takes place. In the left, we consider the human super organism of history, a smaller super organism of human beings, not yet emerged as a global single being, but coming closer to the 10^{10} human beings, in which might emerge as the global super organism, consciousness of the life Earth.

The birth of the superorganism of metal-memes: money, weapons & machines, 'abort' history.

In that regard, the ultimate dialectic fact of history has been between both super-organisms, the one of humans that has failed to materialize and the one of memes of metal, which is now completed. And one is now devouring, and breaking into individual selfish particles the other one:

In the graph, humans evolved socially through the 3 horizons of all energy/ information systems, creating first, tribal, genetic societies based in 'energetic'/body affinity; then agricultural societies, based in the reproduction of human goods and finally, ideological, verbal and legal societies, based in legal, bio-ethic codes. Yet that final phase of evolution of history was aborted by the parallel

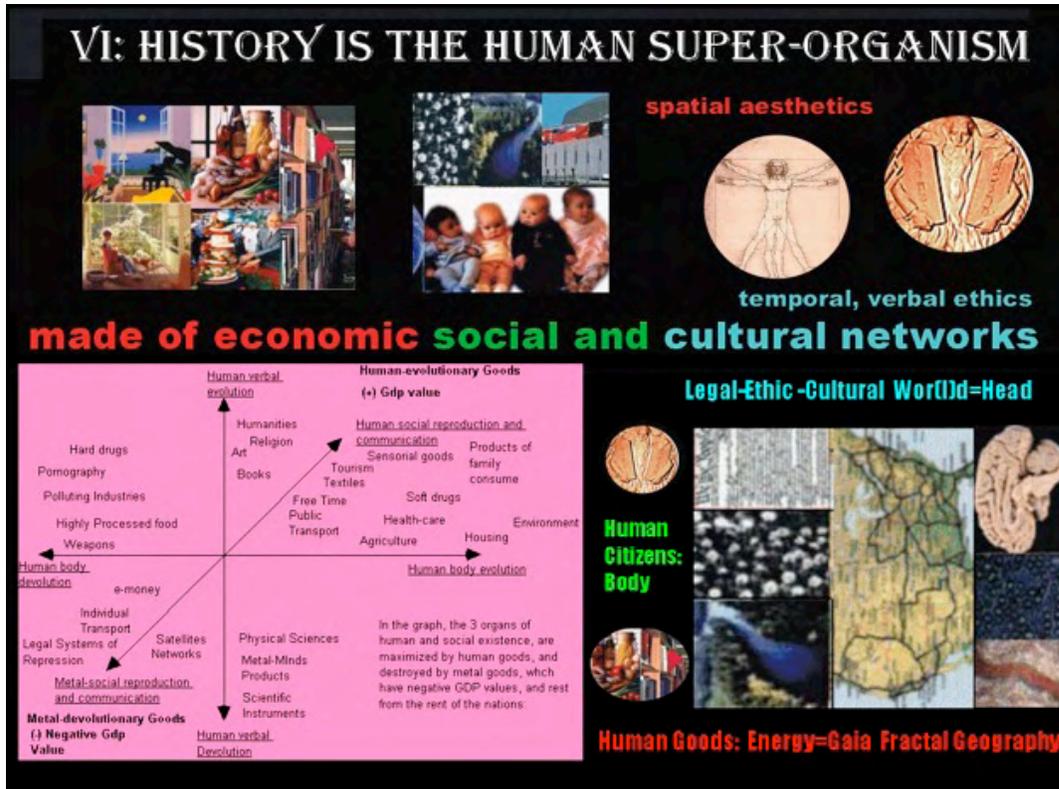

evolution of economic ecosystems based in digital money, which achieved its global unification with the creation of the world stock market, before humans could create a global government.

The last phase of the process of evolution of systems, from individuals into social organisms, directed by a common language of information (DNA codes in an organism, verbal messages of love that create social nations and religions) has failed in the case of the human species, as the maximal size reached – 1 billion societies like china, Islam, Christianity or India – never reached the last stage of a global superorganism whose memes (socialism, European union, Uno) are today extinct or degraded, colonized by the successful organism of the financial->military->industrial complex, today globalized and increasingly geared to extinct life and substitute humans by advanced machines (robots, pc-suites) of the age of the singularity : because the universe never ceases to evolve our failure to evolve means merely that the planet will extinguish us and substitute us for a better species – not the racist cultures that associated to those memes feel superior to us, but the 'real' thing, A.i. In go(l)den minds with iron bodies. It is the destiny of Mankind in this century unless the process of tribal history and their memes of hate end and humans become a global organism ruled by the laws of the science of sustainable history described in this web.

Thus, the final stage of the social evolution of Mankind—the creation of a global organism of history, of a god, sustained by networks of love, mandates that make the human cells to share their energy and information—seems to

have failed, as the arrival of weapons, money and machines imposed a radical shift in the evolution of Mankind and the Earth.

MANKIND IN SPACE: ΔS: SUPERORGANISMS OF HISTORY: POLITIC & ECONOMIC SCIENCES

Its 3 physiologic networks: WHealth, \$T (Gaia)<ST:economic system>\$δ:Politic/cultural system

In that graph the hierarchy between the elements of a society, in harmony with nature and the organic laws of the universe, is crystal clear:

Networks of information: Ethic and political laws that create a nation or in mythic terms, a social god ('and god, the word, became man and inhabit among us'). They control:

Individual cells: Human beings that obey the law and control:

Networks of energy: Economic systems of reproduction of human goods.

Thus, the nervous system, made of social, ethic laws should rule the economic ecosystem, which should provide the goods humans need to survive and fulfill their biological drives of existence. Unfortunately, the opposite happens in our economic ecosystem: money controls human beings, who create corrupted laws that no longer serve their biological goals.

Let us then get into the details of those 2 networks, and consider why and when they were corrupted.

- A network of information based in the simplest common message of social love that makes people share energy and information between them, hence form efficient communities, and it has been always the language-message of ethic laws, either in religions of love or in true democratic systems, where all humans are born equal and are equal under the law, so under such just laws they do act in synchronicity when the verbal language, which is the language of the wor(l)d, the human supœrganism, delivers its message through fast sound waves to every speaker of the language in a social community, today through informative nervous networks of 'metal-communicators' that evolved from press

into audiovisual systems. This network is thus the informative social people-caste on top of society, its government, which as in all efficient networks was during the Neolithic and first democracies (Greece) responsible to the community for its actions or else, would receive pain messages, as vote was a posteriori, after tenure, in assemblies of the community that judged the chiefs or in Greek democracies with a vote a posteriori to punish with exile or fines or re-elect or give honors to the public servant – the equivalent to the messages of pain cells can deliver to the brain if the government doesn't obey. This system thus existed, and could be easily implanted again to reform the corrupted democracies and one-party systems of mankind. It is important to notice that the election and bipartisan inefficient systems that rule our societies are not democracies, and we shall see when studying historically the wrong path of evolution of mankind, were in fact set up by company-mothers of weapons (England during its age of dictatorship of gunboat companies and Merchant Adventures) to control and make inefficient the political system, and the Greek a posteriori vote, the real pain vote was suppressed to make possible to corrupt politicians to the service of corporations, which is the system we still have - a placebo system of false democracy. The true efficient system was preserved for companies, which did have a single head, because a system has a single government, head, informative network that obeys the natural sciences of superorganisms of the universe, it does not invent the laws of nature, and of course, once the managers have run through its period of tenure, the citizens of the company, its stock-holders, the citizens of society do vote his tenure, and if wrong, they fire him and even bring him to justice. A posteriori vote is the essence of a true democracy: the Greeks put in most administrative places normal citizens by lottery; only military experts were chosen; but all were judged a posteriori in harsh terms. So even the victor of Salamina was exiled. Why Wealthy money and true democratic, reproductive and informative systems became corrupted is obvious in the historic record: the discovery of metal-weapons, germs of history that kill societies, brought a higher power to tribal animals, who oppressed mankind ever since as a people-caste on top, an aristocracy that killed civilizations.

A World ruled by company-mothers of machines.

"Money exists not by nature but by law." Aristotle (Ethics, 1133)

Money, a language of digital information, evolved as all languages its speed of information, becoming smaller as a number, radiating in larger numbers as information technology

reproduced more bytes, finally valuing all things on Earth, including men as objects, with a price, man=salary=Price=Object, allowing its substitution in labor & war fields, making obsolete the human, verbal ethic language that puts man above (Subject>Verb=action>object energy of man). So the law must be above money & people NOT companies reproduce it used as the oxygen of society distributing enough quantity of it to all human citizens cells, to create a perfect world, as all healthy wealthy super organisms of nature are, where all its cells receive its proper oxygen-hormonal salary and all of them survive. It is the parasitic, anti-human, corrupted nature of our 'social networks' where a few financiers control the issue of money and either herd it for themselves or give it only to company-mothers of machines they worship due to their 'biblical, primitive segregational ideologies' against mankind what makes the global eco(nomic)system so harmful to the species. What would be a 'rational' policy of mankind to manage the process? To halt the evolution of the machine and readdress the issue of money to favor the overproduction of welfare goods, 'ideally' returning the planet to a time of lesser evolution of machines, when man was the top predator mind of humanity (prior to the digital age, <1939), practically with a political global ban on robotics and further evolution of chips:

$$\text{Max H[g] human goods} = \text{Min M[g] metalgoods <1939}$$

In the graph, the **Human physiological constitution** should be the TOP law above all Abstract constitutions as it defines the goal of History, to make it immortal and make all its citizens cells survive and thrive by overreproduction the + Human Goods of the ethonomic frame of reference, as Healthy goods that help man to realize its natural, biological drives of existence, (WHealth: energy food, family values: reproduction, verbal, social information) as opposed to

lethal goods, which do not add but rest to the Economic wealth of nations, in a humanist society, which tries to build a world made to the image and likeness of mankind.

The network of reproductive bites of energy=WHealthy money.

The science of economics design the 2nd social network of mankind, the re=productive 'blood-financial system' that delivers bites of energy, money, both scales of human superorganisms; as we show in many graphs of this paper and related papers on history=mankind in time.

It then came into being, money as healthy wealth, as human societies extended in very dense groups over the river veins of Gaia, as its cells, gathered around the veins of the blood network. So as the common energy of life organisms, oxygen became the money of biological beings, *non-perishable food, grain became in all Neolithic societies the standard form of money (cows in nomadic societies). This is obvious in the historic record.* Money must be as in all efficient superorganisms, WHealth, 'healthy wealth' as it was in the Neolithic age of the goddesses of fertility, NOT parasitic debt but as the word is, as oxygen is, a free language of information, given to each human today in a universal salary so that humans can START, with its basic energy as cells do with oxygen, to consume and produce further goods, to activate its existence, as in the cells of an organism. It is NOT something a parasitic people-caste of bankers, through debt or a parasitic government through taxation *stoles from people, making them work for others, but exactly the opposite, something that society reproduces for every citizen as a Universal salary,....* like oxygen does in biologic organism or light in atomic networks, as any language of energy or information, is made of the most vital bits and bites, the food in the organism is the languages of oxygen or simple amino acid molecules because it is what the cells eat and they are given to all. Only when a body is sick, parasitized by an alien germ or a cancerous group of cells, those parasitic systems, become a people-caste that absorbs all the oxygen of society, killing by anoxia, its citizens cells.

That in earlier WHealthy societies, money was a salary given by priests in lasting grain, wheat in Mesopotamia Rice in china and Mohenjo Daro, corn in America to all the cells of the organism of history, and then grain was paid with the surplus stored in the temple for the communal work. Money was 'whealth' to be exchanged for the reproduction of healthy goods – which in modern societies would be a universal salary. And it worked. Societies achieved the maximal density of populations in all those cultures, with extreme WHealth, and social harmony, till *in the same manner weapons corrupted social democracies, go(l)d, informative metal, which hypnotizes the brain, chemically inhibits oxytocin, the drug love, became imposed by nomadic people, as it happened with Aryan charioteer warriors that destroy all the civilizations of the fertile crescent, 'money', and as both groups of metalmasters or rather animetals, because they degraded their human understanding of life and its social superorganisms, sponsored racist go(l)d churches of chosen of go(l)d and Aryan racist 'tribes' of superior races by the grace of God, money as WHealth disappeared, and money became 'taxation', 'debt', a price to 'buy human life' as slaves. We have an amazing text that sums it all up, from Sumer, when this change of paradigm from a healthy humans superorganism, was transformed into a brutal system of exploitation of society with superior atoms of metal that killed bodies (bronze then iron) and superior atoms of information that hypnotized the brain and provoked greed, making humans slaves of a useless piece of metal: 'evil men have come from the desert with their pieces of metal.*

They buy women with rings and make them prostitutes; they take men out of the field as mercenaries to their wars; the fields are abandoned, nobody comes to the temple, it is the end of the world'. But of course this will sound 'alien' to you, because for 5000 years, the two people castes of animetals, Indo-European aristocratic warriors and Semite biblical bankers have been killing and parasitizing mankind, provoking the death and anoxia of its citizens cells, with ever more complex systems that disguise the simplicity of the perfect efficient systems of the Universe to become 'experts' in defense ministry and financial companies, rhythmically killing historic superorganisms, till they also die at the end of their mismanagement of history in the final Gotterdammerung of wars and holocausts. But they NEVER learned, and so every time they destroy a civilization, a new cycle of oppression of mankind by warriors and bankers start.

Sciences of politics and economics vs. the Idol-ogies of military and capitalist dictatorships & democracies.

It is important to distinguish between the 'sciences of politics and economics', akin to physiology, whose goal is to design the best supærganism of history=mankind, with a WHealthy (ab. Healthy and wealthy) Constitution of its body of human cells, developing the proper informative=nervous=political, legal system and blood, re=productive, economic system which cater, as all physiological networks of efficient well-designed organisms of nature do, to the needs of its citizens cells...

vs. the historic idol-ogies of economics and politics, which unfortunately came to dominate mankind in the age of 'animetals', establishing hierarchical political systems with entropic animetals (warriors, military) on top that ab=used human beings, under the menace of murder, through the use of hard metal weapons, first of bronze (swords, chariots), then of iron (swords, stirrups) then of chemical explosive (gunpowder, gunboats) and finally machines (steamers, big guns & trains; tanks & bombers and digital weapons – A-Bombs, robots.)

The idol-ogies of supremacism of certain military tribes and its hierarchical aristocracies with kings on top, latter military dictators, softened by placebo democracies, in the industrial age, still ruled by company-mothers of machines & weapons, which switched to age of wars for profits to keep reproducing the lethal germs of history, weapons is NOT the science of Politics, and it IS studied within the science of politics as the analysis of a SICKNESS of the Human superorganism of History, which certainly as the first 'scientist of history', able to predict the future in Genesis put it at the death of Ur III, the summit of the Neolithic civilization to Bronze Charioteers from the Andronovo Siberian cultures, 'because we have eaten of the evil=antilive fruits of the tree of science=metal-technology we will die'.

As systems have become more complex, military politics evolved into a milder 'democratic' version but still hold the basic 'sickness' of the idol-ogy of nationalism that divides humans into tribes to maintain the military and its evolution of weapons and *switches* into 'nazionalism', its military version, when economic crises of overreproduction of machines, make companies switch to the highest prized, more profitable, consumed in war, weapons-systems, under the idol-ogy of nazionalism, as it is happening today and we have been predicted from the perspective of the real stience of politics for 30 years, obviously 'repressed' by the anti-quantum paradox of censorship of true social sciences.

What is the difference then between a WHealthy, just political network in an ideal, obviously co-existing at this time in a relative \propto of 'immortal life planets' in \propto galaxies where the game of parallel history plays; and a corrupted superorganism of History?

We can apply the laws of pentalogic easily to differentiate the wrong d=evolution of human social structures, from the Neolithic onwards during the age of animetals; to the ideal system of history of which we can take two simple examples. One from history, the Neolithic, before animetals imposed their idol-ogies, and one from 5D stience, a r=evolved human social system designed today and imposed by law by the G20 states & compare it with our self-suicidal system.

- Δ_j : A well-designed system of mankind does NOT divide humanity in tribal nations. This was the case of the Neolithic where a similar culture spread globally, based in fertility Goddesses that worship the dominant arrow of survival of the Universe in time, $S=T$, reproduction and $\sum st_j - 1 = \sum ST_i$, social evolution. Such system does NOT need to have a global hierarchical form, unless global communication is 'instantaneous', allowing a simultaneous superorganism in space. It merely spread as a 'herd system' or a 'wave does', because it is the natural form of efficient, WHealthy superorganisms. Thus as in all networks, money was 'bites of energy' (grain, rice, maize or wheat, or cattle among nomads – cows), given to all huminds cells, as oxygen in biological organisms, to survive, while more 'complex' forms of money for the use of community also based in grain – the equivalent to hormones in cellular organisms – was used by the rulers, NOT military men, but wise men, elders and priests of the arrows of social evolution=love and reproduction=fertility goddesses, to coordinate social work that needed collective collaboration. Property was private on the private sphere of the 'DNA=human' territory, aka home and surrounding land; and mankind lived as a single spread organism with very limited warfare and a common culture.

It was understood that the political, nervous system controlled efficiently the reproductive, blood system, as it happens in nature where only very primitive organisms – worms – are controlled inversely with the blood feeding system coming first, reason why plants easily poison larvae, with toxins as they ate anything; as our primitive capitalist system does, allowing the unlimited reproduction of lethal goods (weapons, hate media) for the body and mind.

Finally, in all well-designed political systems there are not bicephalic heads, but democracy happens as in organisms, imposed by pain-nervous feed-back messages from the cells to the brain in an ‘a posteriori’ judgment of the service of the rulers. Those are chosen as the best neuronal, informative people-caste by merits, knowledge of the specific areas of government, or as in Greek democracies by lottery among the citizenship for most positions, which anyone can develop with common judgment and ethics.

While the program of government is obviously the ‘true physiological, political, economic science, common to all organisms’ whose goal is to multiply the WHealth of the society and its individuals, maximizing the drives of life and existence of those individuals and the collective organism, its ‘5 Dimotions’ (TT-food energy, ST-survival, health, reproduction, family values and peace, St- right information, SS-social evolution, sensorial arts, Ts-motion-tourism).

The Universe is NOT rocket science. Complexity and fiction, is the natural soma, parasites and predators inject in the citizens-cells of an organism they predate to confuse & make easier the act of parasitism & predation.

Languages control organisms. Money, words and hormones.

Languages give orders to the cells/citizens of the organism, which they obey kicking their production of goods. So whoever issues the languages of higher power ‘governs’; DNA in cells, Brains with nervous languages in bodies; and private bankers and corporations in capitalist democracies, where money buys the law. The result is the world we live in - one made to the image and likeness of company-mothers of machines and bankers, as they issue money for themselves and their offspring of machines.

2 simple measures by imitation of Nature that would cre(dit)ate a perfect, efficient world

However if we lived in a real democracy, the language of social power would be issued as in organisms by governments (hormones) and cells (oxygen), with a Universal salary of a global currency, ‘yes money’, and each citizen then would vote with that money what goods to reproduce. And as humans need first food, welfare, education, ‘whealth’, healthy wealth, life goods, this simple ‘democratic measure’ would change fully the economy from a supply economy where corporations decide what to reproduce and buy laws to a demand, democratic economy, where people will choose what to re=produce: The issue of a universal salary to create a demand-based real economic democracy by people through an international yes currency to create welfare demand, today easily achieved with a cryptocurrency, at 100 ¥= €uro≈\$ parity, given to each human in a ‘mobile pocket app’, could establish an immediate

massive demand economy in welfare goods globally, plummeting enormously the poverty of 3rd world nations, the migration problem and the excessive reproduction of lethal goods common people won't demand.

Such simple measure shows how easy is Nature in its physiological solutions to create perfect supærganisms, or else it wouldn't be the ‘rule of the Universe’ most of whose Spacetime beings, have immortal perfect forms (all its particles, the overwhelming amount of its atoms, Galaxies, the commonest red stars, its social animals, ants)

- On the informative, nervous, legal system again the measure is as simple as imitating the nervous pain system: The creation of real democracy, Greek style, where politicians are chosen as experts on the ‘science of politics’ akin to physiology, hence ‘medicine’ or from the common people by lottery, who are supposed to learn that science or know it by common sense; so the *fundamental democratic* vote is a posteriori as a judgment with penalties of jail to oblige politicians to serve people, empowered without ‘anoxia’ NOT to cheat them and serve the financial, parasitic idol-ogy of capitalism where a few bankers print money for themselves and for company-mothers of lethal goods (hate memes, weapons) to ensure the control of population, while an amazingly complex ‘cover’ of falsehoods that pass as

social sciences and placebo 'voting' a priori on amateur, conflicting parties, whose inefficiency and theatrical disputes were designed by the 1st gunboat corporations in UK & then US (after they took power from UK companies, owners of U\$ in the tea party event), to *manage at minimal cost the 'lesser species' of mankind, since its purpose is TO EVOLVE machines & weapons, their offspring and terraform the Earth to its image and likeness. Thus mankind is NOT a perfect organism, NOT because it wouldn't be so easy to create it by imitating nature* where cells send pain messages-votes to the brain=political neurons if they are harmed, and have all its salary in oxygen to kick out production of goods, so no-one dies of hunger, while lethal goods are not allowed to enter the organism or re=produced (with no credit), killed by leucocytes (armies), and organs of the body collaborate as nations of history should together, and do not use lethal weapons but talk with hormones in diplomatic channels to achieve the common good...

But because Mankind is being predated by a different type of species; selfish metal-memes and its idol-ogies of nationalism that allows tribal people-castes on top of society since the bronze charioteer age, to prey on humanity from the age of aristocracy to the age of 'defense ministries'; the idol-ogy of capitalism, that allows banker-priests to parasite with taxation, speculation, monopoly in the invention of money to parasite and kill by anoxia – lack of credit, the majority of mankind, from the age of the first Baal cults through the 'Baalble' age of biblical sects of go(l)d churches, to the age of classic economics and the modern age of e-money derivatives and stockrats, the modern aristocrats that control for their financial private banks and stock companies, the reproduction of money in 'trillions' while humans are tax-farmed, so the 1% overwhelmingly belonging to the financial people-castes of western history imitated in each 'nazionalist' fractal part of the superorganism of mankind=history, have as much as the 99%. And finally as lineal weapons of entropy and informative cyclical precious metal evolved into organic machines & weapons of entropy and information with the industrial r=evolution, it appeared the 3rd and more powerful modern people-caste of 'animetals' – the technological scientist of the 'tree of metal' which atrophies human organs, substituted by metal-organs, making mankind ever more stupid and breaking our social evolution, isolated as consumers of machines, whose idol-ogies of mechanism (the universe not an organism of which man is one of its most perfect forms, but a mechanism, a simple organism of metal, fast evolving as humans imitate its own organs in robots), and technoutopia are the most pervasive in the modern age.

A perfect world is as simple as the zillions of perfect organisms of nature. If it does not happen is not because it cannot happen. During the Neolithic money was wheat, and every citizen received in Sumer & the Indus first civilizations a quantity of it for living. Life was good, density of population remarkable, knowledge of the living Universe explained with the duality of Taoist, earlier non-corrupted Hindi and fertility Goddess cyclical cultures, and war minimal – a single global culture existed, based in the fundamental arrow of time, reproduction, conservation of time. As it happens among every simple part of reality. Then the Semites, origin of the go(l)d cultures of parasitic financial people-castes and the Aryan, origin of the aristocratic cultures of murderous military tribes came to destroy the Neolithic paradise, and while a series of prophets of eusocial love have kept explaining them what is the purpose of life, they have kept evolving its idol-ogies of supremacism, from the Bible to the Mein Kampf, their despise of the tree of life substituted by the tree of science, setting history in the course of the Genesian prophecy: 'do not eat of the evil =antilive fruits of the tree of metal, because if you do you will become extinct'. This was the first prophet, scientist of history able to foresee the future cycles of self-destruction of mankind by its (S)word and go(l)d cultures of imperative VSO and objectual OSV languages, degraded, hiding the human subject, reduced to a 'number' of profits, or a 'number' of a prisoner camp. The sophistication of their idol-ogies might have grown, and with the arrival of metal-communicators, networks of machines of information that program in simultaneity billions of human beings, reduce to purple brain the ethic mind of mankind. But the present chaos = freedom of humanity from any eusocial love networks of information only means we are past the 3rd age of excessive information and enter the age of entropy=death, when the social organism dissolves and its individual cells are free before dying, liberated of its upper social plane of existence and that is the time we live.

As such the science of history is a biologic science, as history is a social organism. Why humans reject such concepts have to do with the present state of history - one dominated by the age of entropic dissolution and death of historic

structures, when the individual citizens/cells of the historic super organism feel 'free' of any ethic, informative network, which used to bond them with other human beings. So as history 'dies' away as a super organism, the very same concept of his nature fades away.

Genes, Memes: Earth's Membrain

The fundamental tenet of the philosophy of science we call organicism, or systems sciences, proved ad nauseam by reality, is the social organic nature of the 'mathematical universe' (after all a number is just a society of undistinguishable beings), needed to fully understand the superorganism of Mankind, history, and the organism of machines, and its company-mothers, the metal-Earth, which are both in a symbiotic and predatory relationship that humans should manage scientifically, in a rational manner if they want to come on top of the economic ecosystem and have a future in this planet.

So we must first starting you up, giving a very brief view of the two fundamental advances of systems science applied to social models of Mankind in space as a super organism and in time as a living system that goes through 3 ages of increasing information, which an intelligent species would halt to live forever.

In essence systemic is the alternative philosophy of science to mechanism, as it affirms the universe and all its parts are fractal superorganisms - nested systems of similar beings, joined by networks of energy and information, from the simplest atom to the galaxy, organic systems of particles and stars joined by electromagnetic networks of energy and gravitational networks of information (since gravitation is an in-form-ative force that only attracts and forms matter). This nested largest super organism has within it, solar systems whose planets can be treated as super organisms.

In fact the word was first coined by James Hutton, father of geology to refer to the Earth, a geological super organism, finding out the 'fundamental law of time of such nested super organisms' - the fact that larger systems in space have slower time cycles/clocks. So he coined also the term 'deep time' for the fact that Earth's geological cycles were much slower than those of its 'nested super organisms, ecosystems, species, multicellular organisms, cells and chemical molecules'.

When I formalized the discipline at the turn of the century, I called that simple but essential law of systemic, the 'metric equation' of the scalar universe:

Indeed, to fully formalize such systems, we need to consider the laws of 'scale' that relate the larger organic system to its smaller parts, internally and to its larger ecosystem or world, externally. And this is done with the understanding of a new 'dimension of space-time', the 5th dimension of the scalar universe ($ab.\Delta i$), whose metric and laws study the interaction between smaller parts in space (lower index: $\Delta i-1$), which paradoxically run faster 'time-clocks' of logic information and hence code larger systems, with that information - so chips code machines, quantum numbers code molecules, genes code biological organisms and memes, ideas and instruments code human societies:

The 3 planes of existence in 5D metric of the human super organism, s (size in space) \times t (speed of time clocks) = constant, which is responsible of its different synchronous clocks and cycles that allow cells, humans and Gaia to co-exist together as a single whole. So. The cell that lives one day, the organism that feeds with energy the cell every day, and the social civilization extended in Gaia, which could be immortal but is killed by military germs every 800-80-8 years, in the accelerated vortex of metal-information now collapsing into the singularity age.

Now that equation responds to a simple 'vortex of information', the dominant arrow of the universe, which constantly creates new super organisms of higher complexity. History is in that sense, a transitional state, which can be controlled, by controlling the information of the system, specifically its technological information, which evolves the next stage, the Mechanocene

As such history follows the laws of super organisms, co-existing at least in 3 scales, that of the biological citizens/cells of history, each of us, that of the super-organism and that of the world in which we exist:

The evolution of human beings into social organisms follows the pattern of evolution from individual cells to human beings, at a greater scale. In this manner human citizens act as the neurons of a territorial body, the Earth, which provides energy to them (through river and agricultural networks.)

It follows that the Earth needs a global government that represents all human beings and acts together taking care of the energy and information needs of all its cells – the human race. Yet this is not happening because the praxis of the sciences of history (politics) and economics (finances) are in the hands of ideologies of power (nationalism, capitalism) that design sick organisms of history, which satisfy only the wantings of the ruling 'neuronal castes' of those super-organisms.

The science of memetics studies in its wider sense those super-organisms of history and economics (company-mothers).

It is therefore an off-set of the science of general systems, of which this writer is a pioneer, as the laws of organic systems applies both to the description of company-mothers of machines (aka corporations) and nations and civilizations, the super-organisms of history. This posts and those nested on its hierarchies are dedicated to the super-organisms of history.

The model of biological history defines cultures as super-organisms, with 2 fundamental elements:

- A genetic=memetic structure, which in society allows the reproduction of the culture generation after generation through memes, either objects (weapons, machines, money, tools) that provide energy and information to the superorganism, or ideologies, neural memes, reproduced also through objects (books, laws, audiovisual machines) .
- A class structure, proper of all ST-systems made of energy and information, which are complementary, one cellular class of information (particle or head in physical and biological organisms, ruling castes in societies, which invent the law and money that controls the society, as languages of information) and an energetic, reproductive class (field of force in physics, body in biology, working class in societies).

All societies are organic and deploy both, a memetic=genetic structure and a dual, complementary information/energy social class. They are efficient organisms in which pain messages from the body control the information class that always provides enough energy and information to the body cells to allow its survival.

Because we don't follow the natural laws of superorganisms, we build systems by raw evolution without even understanding how they work, the world as we know it is not an efficient superorganism of history but an 'economic ecosystem', in which two type of superorganisms, the superorganism of memes of life, proper of human societies based in the memes of eusocial love, becomes predated by 'stronger' superorganisms, of 'animetal' cultures, which use money, weapons and machines to impose their power over nature and non-technological societies. The result is a hierarchical world that is destroying life and Mankind.

In history memes construct in this planet two different superorganisms: One that favors the survival and WHealth of mankind over a sustainable Gaia, planet, as its collective mind: $Ts < Gaia < ST : Mankind's \text{ reproductive cultures} > St :$ ethic wor(l)ds; In tune with the laws of survival, and the higher dimotions of reproduction and social love that crate efficient superorganisms, where the legal, ethic network of information control the reproductive economic network; and represses lethal goods (weapons, hate memes).

-And one that simplifies mankind into homo bacteria, individual egos, which abuse humans with selfish metal-memes that empower them, entropic weapons that kill humans, informative metal gold as money (instead of legal tender), reproduced as oxygen for all humans to kick out the reproduction of welfare goods), to parasite people with tax, debt slavery, speculation, and maximal value for other metal species (weapons, stocks of company mother of machines, informative machines) and minimal value for life (slavery, priceless) and machines that atrophy our organs and substitute them in labor and war fields; fast evolving into a global superorganism ruled by company-mothers where humans are obsolete. But *men LOVE and dedicate all their efforts to evolve the metal-earth due to their increasingly deterministic addiction to the added power of those metal-memes that break its social human connections and 3 idol-ogies, nazionalism that breaks the human superorganism into tribes fighting with weapons they worship, captialism that puts money above the law issued in monopoly by private banking, provoking the anoxia=lack of credit of billions and technoutopias and mechanism that deny machines are just evolving organisms as the Universe is.*

Are metal-memes and its idol-ogies DETERMINISTIC making humans enzymes, catalyzers of machines to care nothing to evolve their world, as a viral gene that infects and substitutes the DNA of a cell make it reproduce the virus till completing it - as we completed the industrial revolution, making as cells do the 3 parts of the virus/living machine, body, engine and head, to form full virus=full robots that once ensembled alive kill all its cells/citizens? If so, History will become extinct this century. In the graph before, it seems emotions and reflex. Do determine actions before rational thought.

MANKIND IN @-MIND: THE WOR(L)D & ITS RELIGIONS

THE WOR(L)D: THE SCIENCE OF LINGUISTICS

Abstract. We have considered the wor(l)d from the highest possible point of view: *that of its emergent superorganisms and collective subconscious minds or Gods, $\Delta+1$ and science of religion. We are now going to consider it through the opposite scale, $\Delta-1$, the science of linguistics and show how both in fact merge in the middle term, the Δ^0 science of human languages, as expressions with words of the wor(l)d humans construct with verbal memes, idol-ogies, and actions motivated as in all languages by words.*

As usual in 5D we are heavily indebted to classic science though we need to correct and adapt some terminology. Specifically the most important sub-discipline of linguistics to understand the bridge between phonetics (a wide field also ruled by the laws of 5D change in time, and its cyclical patterns, since its discovery by Grimm, which further reinforces the 'genetic similarity' of memes and genes; but which we shall escape thoroughly), is topological linguistics which we rename topological linguistics, as it establishes the 'variations' of the 3 'mirror components' of the Universal grammar of sentences, Subject (human) < Verb (action) > Object (Energy of the subject), according to its dominant order.

To fully understand how 'permutations' of physiological networks and any of its mirror languages define different species of physical or mental entities, we will analyze the 3! Variations of physiological networks in languages in a comparative homology with life phyla, as the main form of diversification in 5D is the order of dominance of the 3 physiological networks of a system, which in its perfect order are dominated by the informative element that comes first (subject), follow by the reproductive body-wave system (action, verb, blood system) and finally the lesser important network and element is the limb/field/motion/entropy system or object in a verbal sentence. So we find that the 'fractal generator' of all space-time superorganisms:

St(Head/particle) < Body-wave (ST) > Ts (Limbs/fields)

Translates into the proper order of Chomsky's Universal grammar:

Subject (S-information) < Verb (ST-action) > Object (T-entropy)

Why there are other topological languages orders? Because of impositions by culture and predation by metal-power. So military idol-ogies of war put object first in its languages (warrior Japanese and German cultures) and go(l)d cultures where a new language dominates and orders the actions of people (money), through its banker-priests and ruling systems of slavery to work put the verb first (Semite languages; Biblical sects.)

This connects directly linguistics with the different cultures of mankind, as the deformation of the perfect world is carried into the deformation of the perfect wor(l)d.

Thus this introduction to 5D linguistics is fundamental to understand the structure of humind cultures. As

we evolve linguistics along the thesis of Humboldt ('language defines culture') and Chomsky (Universal grammar), classifying all languages with topological linguistics, which reveals the opposite duality of character of the main humanist vs. animetal cult(ure)s of mankind.

Topological linguistics shows in fact the 'deterministic' non-free structure of animetal languages and cultures, as they hide the subject and in warrior cultures make agglutinative unbreakable word sentences; explaining why the militaristic germanic, capitalist, biblical cults to go(l)d and weapons have taken mankind to the present point of no return. As their mind is not free but made of beliefs following orders that become rituals, and standardized repressive behavior of the natural drives of life (a fact we have already shown in those biblical cultures that repress all the life-enhancing actions from good food – dietary laws – to social love – racist memes – to reproduction – sexual sin, even the language itself – substituted by digital kabalas.

As systemics is a logic-mathematical equation we resume How languages have adapted to selfish memes of metal with its 'germanic long unbroken words' similar to simple swords vs. the cynical I-centered egocy (ego=idiocy) english that must start always with the self, in a simple logic equation of opposite languages and cultures:

Max. Evolution of the wor(l)d = Min. technological evolution

And vice versa: the most complex and balanced languages (African languages, Greek and Russian Indo-european original languages, Romanic languages, Chinese) have *developed the most advanced social cultures and attempt the most important r=evolutions putting the value of the law above money and weapons*. So our leading technological cultures are those who aborted both in syntax and semantics the proper evolution of the eusocial wor(l)d according to the laws of the organic fractal Universe, simplified its syntax and reducing its structure to eliminate freedom of mind; and express a fundamentalist, lineal idol-ogical view of History.

Universal Grammar: Wor(l)ds Fractal Generator: Subject Information < verb=Action > Object Energy.

Correspondence with classic linguistics.

If we accept the concept of a Universal Grammar (Chomsky), made of human subjects which act through verbs into an object, the main influence of syntax on culture is caused by the relationship between those 3 elements which will determine the view of man on himself (the subject), on the external reality (the object) and on the way it relates to that external Universe (the verb).

Thus Universal grammar bring an inner structure that shapes also the civilization according to the ways those languages handle the relationships between man, the subject of the sentence, his actions, the verbs, and the result of those actions in nature and our property and instruments, the object.

Thus Culture and language thus have a close relationship as Herder and Humboldt foresaw. In this post we shall classify cultures and the collective subconscious minds they bring to their cultures.

The mind of man and its program of behavior is written in the syntax of its grammar.

Humboldt (2) and Herder were right, the grammar of languages is the program of the cultural world.

I used to pen pal with Chomsky in my youth, since he was fond of my 'General Systems' theory of the Universal Grammar and its ternary elements, which are parallel to the 3 elements of all sentences, he described as:

Subject (Information < Verb (action) + Object (energy of the action).

So for example when we say I eat bread, 'I' is the subject or informative pole, that 'eats', the verb or action, 'bread', the object or energy of the verb.

And so all sentences write as:

Human=Subject=information + Verb=Action + Object=Energy.

This I told Ch. was a reflection of a much wider Universal Grammar, that of all languages of the Universe which have 3 components:

Informative pole < Action of energy and Information, exi > Energetic Pole.

Since in General Systems Sciences, the science of all sciences that defines all the logic systems of the Universe all systems are composed of an Energetic and Informative pole, which mixed together create the 'actions' that exist in the Universe.

So for example you are made of a head of information, limbs that process energy and a body that mixes both and reproduces you.

And all physical, atomic systems are ruled by the same ternary structure: particles of information, fields of energy put together into complementary systems (quantum principle of complementarity).

So I told Ch. that his Generative Grammar was just a case of the Universal Grammar, as Humans observed 'actions of energy and information' and described it with languages. But he had to break his systems made of Subject <> Verb + Object, into 3: Subject < Verb > Object and then from that ternary grammar, start to understand how languages reflected the world and created the 'different worldviews' of humanity.

What Chomsky got wrong following on the work of his master, Harris, was the way he divided his Universal Grammar's sentences first only in 2 elements: subject on one side, and verb-object, that he put together on the other.

We can put together the 2 great schools of linguistic thought; the school that dominated before Chomsky, who believed that Languages were psychological reflections of culture and worldviews and so we needed to understand their knots and bolts to figure out how cultures view the world and how they behaved with it (Humboldt's hypothesis popularized by Whorf (2)). And the now fashionable Chomskian generative grammar.

Yet the proper way to evolve linguistics is to put them both together, mix disciplines and achieve by communication between both truths a higher truth, which is what we do in General Systems.

Which is what we shall do, departing from the ternary 'Universal Grammar' of all systems of the Universe, made of two poles of energy and information, combined into 'actions', then going to its translation into verbal grammar, and finally classifying all possible combinations of Subject-verb-object to realize how *the order of those 3 poles of reality define the character of cultures and nations, observing this fact in parallel with other "Universal grammars" of reality, specifically the 'different animal species' in which the 3 components, the physiological systems, nervous head, 'blood-system' and energetic, digestive system are organized.*

As one of the biggest pleasures of Universal Systems is to observe how the 'Generator' equation, Information < Action > energy, establishes similarities between all entities of the Universe.

The generator equation of the Universe.

All what you see in reality responds to a dual structure: Entities of Nature are complementary systems of simplex networks of energy and information, which combine to form a complex system that switches and merges both states. In the process the system might reproduce an entity self-similar to itself. And this is the definition of an organism, reason why we affirm that reality is dual and organic.

In Physics all what exists are particles of information associated to energetic fields that move them, and only both together exist (Complementarity Principle), creating a physical entity, which can decouple creating self-similar particles.

In Biology cells have a DNA nucleus of information, surrounded by cellular cytoplasm that provides energy to the nucleus; or an informative head moved by an energetic body. And only both together can exist, creating a biological organism. There are no bodies without heads and red cells without nuclei die faster than any others. And cells and organisms can reproduce self-similar forms.

Finally, in the economic ecosystem money acts as the informative language that gives orders to the physical economy, which reproduces all types of serial machines.

The Universe is made of actions of energy and time. Where clocks of time, carry the information of the Universe in its cyclical patterns (remember time is cyclical), and forms with in-form-ation.

So for biological systems instead of writing the usual Einstein equation, $E=mc^2$, we write the quantum version $E=h\nu$, where h is a constant action.

And this is the structure of all entities of the Universe.

$A = e \times i$; *Action = energy x information: fundamental event/unit of all systems of reality.*

Since all real physical, biological and mechanical systems are those who transform back and forth energy and information, between their two poles: $E \Leftrightarrow I$. We formalize all Dual systems and events of reality born of complementary networks of energy and information with an Equation we call the 'Fractal Generator of Reality': $\sum E \Leftrightarrow \prod I$.

As we claim this equation resumes all the events and forms of the Universe.

And its fundamental 2 modes are the dynamic, flowing temporal mode: $E \Leftrightarrow I$, and the static, organic, spatial structure, $Exi=Action$.

So for example a woman, dominant in information and a man, dominant in energy, in flow state making love, $E \Leftrightarrow I$, exchange their exi genes and create a child, generating it.

While in spatial terms, a woman is made of an informative head, an energetic limbs and a reproductive body, and internally she has an informative, nervous system, an energetic digestive system and a reproductive series of organs.

All realities are thus generated by the fundamental equation of systems sciences:

$ExI=constant$ system (spatial view) or $e \langle action \rangle I$ (DYNAMIC VIEW)

For example, in 'mathematics', in topology, in a 4-Dimensional there are 3 Universal forms, hyperbolic, informative shapes, cyclical, toroidal ExI shapes and planar/spherical E -Shapes,

And we talk in physical sciences of:

- Informative Particle – reproductive wave – Field of energy.

And we talk of:

Informative head – reproductive body – Energy limbs on Biology.

And so on, an so on.

Thus, the key to understand the meaning of language is to divide properly all grammars into its 3 elements, which *reflect in the human mind, mirror of the Universe, the 3 essential elements of it that put together create the 'Generator Equation of all complementary systems of energy and information of the Universe:*

Information < Action > Energy.

Which humans perceive in verbal terms as:

Human Subject < Verbal action > Object, energy of the Subject

This is the justification of linguistics.

So we first introduce the 'Generator Equation' of the Universe and all its systems and then focus in linguistics, how they reflect the ternary systems created by that generator equation and which are its 'main varieties' and how those varieties of the Universal Grammar apply to understand the 'character' of cultures. We shall introduce of the hundreds of pages I have in this essential meme, some insights in the relationship between languages, evolution of cultures and character.

We shall study how the 'laws of general systems sciences' generate the mental cultures of mankind departing from the simplest structure of all languages that mimics the Generator:

Subject (Information) < Action (verb) > Object (Energy).

Since all those features of the Fractal Generator of Ternary Systems apply also to Languages, which reflect their perception of the Universe.

Further on, informative language dominates energetic body actions, shaping the behavior of cultures. Since information dominates energy in all systems. So your head dominates your body and a particle dominates its physical field.

Thus Linguistics is part of the universal grammar, of the logic complex structure of Systems and follows the same laws of creation.

The Generator Equation of Reality will allow us to derive a set of rules from where to extract the properties and laws of all disciplines of science, each one specialized in the study of the entities of energy and information of a certain scale of reality, from the smallest complementary entities studied by quantum theory to the biggest one, the Universe, a system of galaxies related by networks of dark energy and informative, gravitational forces. We can, departing from those concepts, define also the Universe and all its parts:

'The Universe is a fractal, organic system, which reproduces complementary, social networks of energy and information that self-organize themselves in bigger, self-similar scales'.

If you really want to reach peace, intellectual wisdom, nirvana and enlightenment try to understand the section on General System sciences (-; it is a pity humanity will go under without having understood the Universal Grammar of all i-logic entities of the universe.

Now departing from this generatrix Equation, IE, applied to the Universal Grammar, I have written hundreds of pages of studies of all languages and what they express in character and the ways of interaction between the human 'subject' that speaks the language to express how 'he acts in the Universe' and the 'Objectual world' upon which he acts through verbal actions.

Considerations on time, space and the 3 elements of languages. 5D linguistics.

The largely irrelevant 3rd age of grammar – modernists and axiomatic, digital methods.

This said following the objetual, standardization of huminds, proper of the industrial age, where man by virtue of the grammar of metal-memes, machines & money that dominates it all, (man=price=object), becomes both a price and an object, much emphasis has been put NOT on the key element of linguistics, the capacity of the humind to reflect the laws of the 5D Universe of space and time, but on 'structuralism', 'atomism', 'metalinguistics', 'genetic languages' & barren automatic laws of change, as if the language was an isolate in itself, a mirror with no reference to the origin of its image, a cyclical mechanon, and a sort of mathematical, digital system where what matters most is to reduce it to its components (phonemes that will change with Grimm's type of laws, kernels, tag-memes, bound vs. unbound and infinite many other classifications *that lack an initial causal origin to connect them with reality, form now the metalinguistic science that as most sciences follows the tendency towards a '3rd age isolated' from the world of space-time in which its origin and cause lies.*

It is all part of the pretentious attempts to extend the supposedly exact absolute truth of the axiomatic method of mathematics we already debunked in our papers on maths, the language of god, whose methods as man becomes attachés of digital machines must reign over all disciplines, but should not.

*It is largely irrelevant code for digital computing, and pretentious Harris' disciples of transformational grammar, as outlined in syntactic structures, according to which the mind is some kind of isolated computing system where a phrase struture is operated as an input by a transformational rule to give us an output, in silly-nilly tautological decomposition with childish trees whose wisdom is self-evident; and with Wittgenstein botched attempts to make a physics of languages with its 'atomistic' view, gives 0 insights on the true form in which languages evolve *as mirrors that reflect reality in a Language ⇔ Spacetime reality feed back equation that requires to understand first as we already do the nature of the outer Universal grammar of ΔST.**

The renewal of the classic linguistics with 5D insights.

It is then evident that as in most sciences, the classic age is the one to depart from, and enlighten further with 5D connecting mirror language and ST realities. So the classic concepts of morphemes and its functions (pronouns, names, verbs, objects, adverbs, tenses, linguistic order) is the core element to study in depth in 5D, as opposed to modern metalanguage taxonomies, or the 'substance' where those 'figures in action' are constructed (phonetics, largely related to genetics – consonantal white races vs. vowel mongoloids; and genetic and diachronic linguistics, largely related to historic cycles of conquest – combination and shift of morphemes as conquered people learns new languages; in any case of more value than modernism.)

5D linguistic thus, the more so in such a brief treatise is more interested in that connection. And so we start with the obvious question: how huminds reflected the natural distinction between 'space', 'time' and 'scale' and 'limit', ST Δ - which with mind are the components of reality. And from those 5 elements we can start to distinguish both, the 'meaning' of the main components of linguistics and its forms of evolution that follow the same laws of all other languages-mirrors of reality which evolves in complexity along its worldcycle of existence, as does music, mathematics, the genetic code or the diversification of cells that will form an organism.

So we can start from the first man who spoke and likely established an I form to name itself; a sound for others who 'mattered', + for positive actions, - for predators and rivals, and so as usual *space forms, names, should have come first*. In this the analysis of ape languages seems the first stage of cognitive linguistics; as well as the language of hand symbols – a gorilla beating his chest and uttering $\text{æ}rj$ sounds, meaning 'me strong, better than you', shows what first appears in all beings – its egocentric paradox establishing itself at the center of his world.

Naming was also the first task of God in the verbal myths of abrahamic religions; seen as the first act of creation. And we imagine all kind of cognitive entities including bees in its dances know how to 'name' because a 'name' corresponds to a 'fixed form' that lasts as such in time, without change. 'Naming thus is a present case' if we were to reduce reality to 'verbal=time terms'. A world with only names would never change. And so the rise of consciousness of 'change' is what truly brings and differentiates the humind's language, into 'verbal languages' that encode in the richness of meanings of tense verbs the overwhelming superiority of the wor(l)d over digital languages to understand time, in all its modalities of change, a la par with Calculus of finitesimals and wholes (albeit better understood in its true meaning). Space and time thus is better understood in words, with names and verbs, and its interactions than in numbers; which are a much better language for the third element of reality, social groups, for which words just reach the basic concepts of numbering with its first distinction between singular, one, couples and means for which a different name was often coined as 'parents' vs. mother and father, 'grey' for shades of black and white, and pluralities, which only then were to be numbered. And so the first ambivalences of the understanding of what are parts and wholes came in. So for example Uralic-Altaic languages once they number a lot distinguish them as individual sums of $1+1+1$; so it is forbidden to ad quantity and plural (3 boy is Ok, 3 boys is not, as 3 has distinguished each boy), while in Indo-Europeans the opposite is truth. Verbs then from its most primitive form, 'present', which lasts for ever, came to represent actions, in time and limits would be established to both *names with adjectives, and verbs with Auxiliars*.

Space and time thus acquire 'entropic limits' through its qualities in form and durations in time.

I.e. an adjective will qualify and limit the qualities of a name to an specific range. A red carpet limits the color of carpets to a certain frequency range of light reflections; a small house limits it in space on the $\Delta-1$ scale, a large house locates it in the $\Delta+1$ scale and so on. We also notice the essential value of entropic limits, as the necessary elements to 'differentiate' and allow variations of a species, making it emerge from the 'fog' of the most general game of existence. And to that aim an even more precise element, which introduces another key distinction of 5D minds between the 'subjective and the objective' knowledge (which is only natural to languages that are internal to the speaker, that is to verbal languages in man, as we are verbal minds NOT mathematical ones) appears next to names, 'pronouns'. So 'the house' is a house we do know subjectively as opposed to a house, but this knowledge is NOT evident objectively for another speaker. What makes a house, the house is our inner thought.

In verbs a similar distinction happens between transitive and intransitive verbs; in the first the spacetime action which is what most verbs represent is clarified and the T-verb ascribe to an S-name which becomes submissive to the verb. Time thus when in contact with space becomes the dominant element and the verb+ transitive object form together an spacetime 'particle=unit' , I 'eat ham'; as opposed to verbs where the object is omitted either because the information is made more general, 'I Eat', or because the action is one essential action of the game of existence, related to a basic dimotion that suffices by itself, 'I run', 'I think' 'I die'... Yet in action-verbs like 'I eat' the importance of time over space is reflected in the fact that I eat makes sense (S<T), but I ham makes not.

As you can see true 5D linguistics as all 5D sciences goes to the basics, the underlying reality of the game of existence in space-time in its rise of consciousness and understanding by a language, is the true genetic origin of the language, NOT as the different axiomatic metalinguistic methods of abstract, standardized huminds try to establish, in a déjà vu, deranged egocly attempt to justify it all coming from 'taxonomy' according to the wishful thinking of humind 'ingenuity geniuses'.

So without being systematic, in this analysis of the generation of the elementary components of syntax; names and adjectives are S- elements, with its Determinants/pronouns, @ subjective vs. objective forms, shaping the classic @-S component of the 'first element of the fractal generator of languages, (S-name complex).

The verb complex though is more complex and rich in elements. And it shows its development in parallel to the growth of humind's understanding of the richness of time=change. And its key element is the differentiation of intervals of past, present and future and its connections in S<ST>T series or disconnections by » « discontinuities of entropic barriers. i.e. from present simpler languages, obvious in the most primitive English forms where the verb is one single form, latter modifications take place for a future 'will', and a past -ed. And we here notice an important element of certainty and determinism vs. freedom – the future is 'a disconnected auxiliary form', will which soon has a secondary variation, 'shall' but the past is bound -ed, as there is only a past and cannot be changed. A key component then that will be essential to anthropologic linguistics – the understanding of cultures come now into being: the forceful laws of pegging bound minimal grammatical units (ab. morphemes) vs. the capacity to let them free 'moving around' the main word; as virtual particles keep popping freely around a source/seed of charge in motion, vs. bound potential wells within the atom... Bondage is yet again a key entropic limit for the freedom of the mind. So warrior agglutinative languages where humans are less free, in hierarchical civilizations chain not only modifying morphemes but words to each other.

While trader cultures that exchange everything tend to free morphemes (German vs. English, Aztec vs. Mayan).

Auxiliar to verbs show then the richness of understanding of time of languages, which can increase or decrease as 'animetal cultures' simplify linguistics – no longer the dominant language of power. For example the English present 'he walks' differentiated into 'he is walking'; which 'established limits to the action of eternal walking for a shorter present span; the past can recede in the memory from he wrote to he has written. The first will correspond to an « operand of existential algebra, as it is no longer changeable, while he has written is an < perhaps modifiable actions. Further differences richer in the past, as we are loosing our verbal language to audiovisual and digital mechanical forms might disappear. I.e. in French the simple past, Il marcha he walked remains but the perfect past, Il a marche, he has walked as in English today disappear. And so it does the perfect passive past that started the power of the written words, when the Pharaoh said 'It has been written', meaning, it is 'law', emanating from a higher 'neutral power, 'it', not the pharaoh's subjective will, gifted of that superior truth by the language; as then as now the 'medium is the message'. So today a visual truth carriers more power and people believe in it; as Goebbels' who put a radio in each home, today a tV, knew, the more so when it is repeated to form a discontinuous equal present both in space (all channels give us the same message) and in time (all news are always about the same memes the system was to emphasize): 'if you repeat a lie many times people will believe it'.

The past then as in existential algebra, is the first region where subtle differentiations of the humind cognition become reduced. But also the future as our species becomes more fundamentalist and deterministic *as it happened in that*

first age of language, where the written wor(l)d became sacred truths, so Asoka will start the written law in Indian cultures with 'Dharma' columns, this time with an ethic not an egocentric pharaoh's view.

As any language with time, past that age of fundamental determinism, it comes then a free age of entropic dissolution, which reigns today in all languages as history dives in the modern age of irrelevance of verbal thought (so we poll numbers in politics, we get audiovisual information and we construct computer models of reality, using statistics for social causal understanding, etc. etc.) So in all languages a decline of case endings to express the syntactic function of nouns and noun phrases (the subject being in nominative, the object in accusative, etc.) is now broken and expressed by sentence order and prepositions. Which lead us to the final two elements of morphology: adverbs prepositions which again establish the basic concepts of time and space, where an event happens in time, in which part of a whole happens in scale, 'above' in 5D height, or 'on the membrane' as part of the system, or 'inside the vital space' of the system.

They are again essential elements for qualifying verbal actions specially those who are not ST complex transitive connections between verb and the object acted upon. So we shall say 'he went into the house', 'he went outside' as all actions and names are part of larger $\Delta+1$ worlds in which they occupy a certain position-function that might change.

It is then clear with those simple examples, how much more profound is the understanding of change and time in verbal thought than in the reductionist, mechanical, digital view of physics and its single clocks.

We are as in all our 5D papers not going to be intensive, and taxonomic, trying to make a complete truth but just cast impressionistic brushes by force of time and space coming from a single @-mind point.

What matters most to us of linguistics in this paper on 'history in space and mind' is the relationship of linguistics with the collective subconscious mind of a civilization.

And this is curiously enough done through 'variations' akin to that of other species, in the hierarchical order between the 3 'elements' akin to the 3 'physiological networks' of a species/sentence; the informative subject/network, the reproductive/active verb/blood network and the 'entropic object/network'. So to illustrate the case we shall compare the 3! Basic variations of species established by topological linguistics both with the world $\Delta+1$ and historic role of each culture that determined them, and compared them with the homologic 3! Differentiation that took place in earth animal species according to dominance of its physiological networks (from insects dominated by blood systems to mammals, dominant in informative ones).

*We do so to illustrate the fact that languages as mirrors of ΔST reality have the same structure than ΔST . But also their variability is much easier. Consider indeed how the basic balanced Topologic structure, SVO, where the Human subject comes first, can be easily 'degraded' as it happens in animetal cultures to make the object more important in warrior cultures as German or Japanese or put the verb order first as in go(l)d cultures ruled by semite banker-priests. The first case only requires to transform an SVO into an OVS by transforming an active into a passive form. And then drop altogether the subject, which becomes a 'soldier that obeys' whose existence as a collateral damage is not even mentioned. He burnt the house; the house was burnt by him, the house was burnt. While the SVO becomes an imperative language, merely by dropping the subject and moving the verb to imperative form, 'you have to go' -> 'Go'... What all languages, including maths have as an advantage over reality, reason why they design and project the future is their capacity to evolve faster once a mind acquires a mirror image of reality. Then with the same $\text{-}\mathfrak{a}\text{-}$ algebra of reality advances a chosen path, projects that future back on reality dragging it towards the future the language designed by mutating faster. *Minds thus create the future.**

Topologic linguistics. Species of human languages. Species differentiation by permutation of trinity parts.

How then the generator equation creates the different systems of reality?

There are several forms in which the Generator 'decouples' and splits in different 'varieties' of systems, which correspond to the processes of creation of different physical particles (quantum generation), biological species (Plan of evolution), and linguistic species (cultural differentiation).

Now the simplest, most obvious form in which to generate 'varieties' of any type is to apply the combinatory laws of mathematics to a system with 3 elements, the Inf<Act>Ene systems of reality.

The result are 6 fundamental combinations, which are common to all disciplines of science.

Indeed, if you have 3 elements, I, A, E (Information-action-energy), then you can combine them in the following orders: IAE, IEA, AIE, AEI, EIA, EAI

which give birth further to '6 varieties' of geometry in the 5th Dimensional Universe. And in Physics quantum particles form 6 essential systems of particles and antiparticles in its 'families' of mass and electrons and in Biology we find 6 types of basic animal forms, and so we shall find 6 basic varieties of languages, which are studied by Typological Linguistics, called the SVO, SOV, VOS, VSO, OSV and OVS varieties.

Now in this post on General Linguistic Systems, we are mostly interested in the way verbal typologies define cultural and mental behavior among human beings. Thus we shall study the way the order of languages recreates the human mind. To further understand this categories of cultural minds, we shall relate them and name them not only as linguists do (the previous SVO, etc.) but we shall introduce a far more 'descriptive' characterization proper of this researcher, based in the homologies that the General Systems Science imposes between parallel systems, by tagging and comparing the 6 varieties of mental linguistic order with the 6 varieties of 'animal forms'. Indeed, one of the fundamental tenants of GST (General Systems Theory) which other philosophies of science ignore is the 'homological nature' of all 'varieties' of the Universe as all of them are fundamentally evolved systems that combine the 2 primary substances of the Universe, energy and information, whose properties are thus essential to all other systems.

So let us consider the 6 Universal varieties first, and then the 5 linguistic typologies that we shall call 'evolved, free flowing mammal and bird languages', 'chained, slave reptile and insect languages' and 'primitive, minimalist, bacteria and virus languages'.

Yes do not raise your eyebrows, with the usual egocentric beliefs of human beings as an entitled species who must be treated nicely, and never be understood as some special 'god-like' reality that does not obey the laws of science. This political and economical censorship that 'invents' the nature of man, without wanting to know truth as it is does not apply to this blog.

And if you finish this post without such prejudices, what i can tell you is that you will understand much better cultures and how and why they behave as they do.

To state first that there are many more aspects to the synchronic and diachronic analysis of Linguistic categories we shall do (itself a small part of the entire course of General Linguistic Systems, which applies many more laws of GST to explore the nature of the human mind and the parallelism between:

- Genetics/races of mankind and its 3 typologies, informative Mongolian races, energetic, white races and reproductive, exi, action black races.
- Memetics, Human cultures (cyclical, eusocial, mongolian cultures, individualistic, white cultures, and sensorial, black cultures)
- And linguistics, the theme of this paragraph, focused on *How the* generator equation creates linguistic entities. order, determine cultural character: Active/Passive/Imperative languages.

The 3 essential elements of the Universe are therefore reflected in all sentences, as all sentences narrate actions performed by men over objects:

Information (subject), verb=action; Object-Energy

It would be in the other language of 'numbers: X (subject) < operandi > Y (object).

What Chomsky missed is that the 3 elements must be separated to truly understand the rules of 'generative grammar' which are the same rules that generate any system of energy and information in the universe.

Since, as all in the universe human language is ternary, as anything follows the 'universal grammar' of the 'generatrix equation of all fractal systems of energy and information', which i discovered and formalized in systems sciences.

Now this is well-known to linguistics, creating a key concept of classification, called linguistic typology:

In linguistics, **word order typology** is the study of the order of the syntactic constituents of a language, and how different languages can employ different orders.

There are six theoretically possible basic word orders for the transitive sentence: Subject–verb–object; Subject–object–verb; Verb–subject–object; Verb–object–subject; Object–subject–verb; Object–verb–subject

These labels usually appear abbreviated as "SVO" and so forth, and may be called "typologies" of the languages to which they apply.

Now, what they tell us about mankind starts to be clear, when we analyze the abundance of those typologies among human cultures:

Topology: English equivalent	Proportion languages
---	---------------------------------

SOV: "She him loves." 45%, Latin, Turkish

SVO: "She loves him." 42% English, Mandarin, Russian

VSO: "Loves she him." 9% Hebrew, Irish, Zapotec

VOS: "Loves him she." 3% Malagasy, Baure

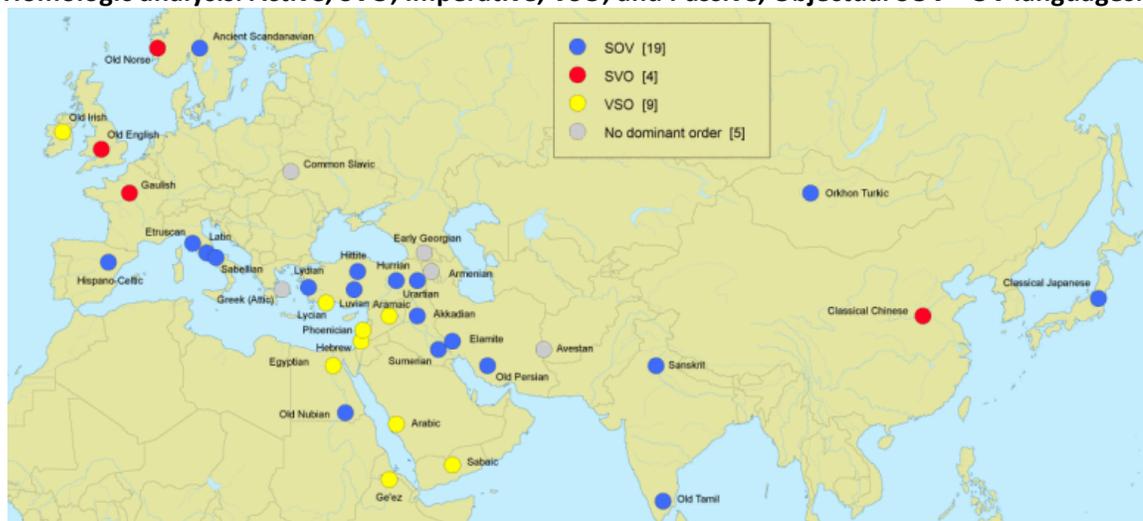

OVS: "Him loves she." 1% Warao

Humans, this proves are 'self-centered beings' for whom the Subject *must come always before the object*.

The dominance of Subject languages is overwhelming. In 87% of languages subject comes first. And among those the most succesful (2/3rds of speakers) are SVO languages, for reasons we shall study now in depth.

Now this responds to the laws of the Universe, where the 2 natural forms of order are Information < Action > Energy or 'temporal flowing order' and Information x Energy = Action or Spatial fixed order. So this law of linguistics is in homology with the higher laws of general systems sciences, let us then study those 2 fundamental forms of human languages.

Homologic analysis. Active, SVO; Imperative, VSO; and Passive, Objectual SOV->OV languages.

In the graph, the Universal Grammar that constructs all Systems of the Universe, with its 3 elements, Information (subject) < Action (verb) > Energy (Object), defines also the Universal Grammar of all human languages.

So there are 3 fundamental orders of those 3 elements that define most languages of mankind:

- VSO languages (Imperative Order, Semitic, 'religious' languages) < SVO (Active order, balanced, African, Chinese/Romance languages) > SOV/OV (Passive Order, warrior, cold, objectual languages).

They are the origin of the 3 fundamental world views of mankind, the 'greedy', self-centered world view proper of the capitalist world; the balanced, humanist world sensorial world view, and the Warrior, Objectual, Industrial world view (Germanic, Japanese culture).

Thus the 'viewworld' of each human mind species is reflected in the languages, according to the hierarchical order of those 3 elements.

Animetal cultures dominated either by money or weapons are the unbalanced world views and word orders:

- Fundamentalist religions and those capitalist religions dominated by the 'blood/monetary language' and earlier civilizations, with lesser freedom and maximal metal-control, proper of the bronze age have kept, specially in its 'sacred texts', the VSO order. It is a hierarchical order with the Verb (action) on 'top/first place' of the sentence. They are 'imperative', action, 'greedy', materialist cultures, proper of Semitic languages

- Warrior cultures and objectual cold-hearted cultures in which the subject can even disappear as it does so often in Japanese, are SOV orders.

- While sensorial, humanist cultures; today the Chinese in the East, the Romance language in the west (and English influenced by French) and the African languages in its totality show the most proper SVO order often with 'Imperative' and 'Passive' voices for certain situations.

In the graph, the distribution of ancient languages according to its order: classic Semitic, 'religious' imperative languages are VSO languages, confronted to its 'inverse' SOV, warrior languages, as their cultures were. They represented the 2 extremes of the animetal, eternal dispute between 'cold warrior and 'greedy trader' societies. Among the classic languages only Chinese and Gaul, the 2 more 'life-oriented' societies of the Western and Eastern decoupling, even today, had the more evolved, flexible SVO 'mammal order'. While the 2 most sophisticated 'indo-european' languages, of higher evolution (due to its allopatric evolution in the 2 regions of original development of Indo-European languages, the Anatolian peninsula, from where it radiated during the Neolithic, and the Russian steppe, origin of the

Chariot second radiation), Classic Greek and Russian, permit the maximal flexibility with multiple word order. So do today the Romance languages evolved from Latin

It is not by chance that in the East and West they represent the summit of human thought and search for human freedom and maximization of art, literature and r=evolution (French, Socialist aborted r=evolutions). While in the East China is the only culture in which man and the law still dominates though in a process of extinction, the power of weapons and money.

Some points to notice on the graph:

- Nations and cultures are ruled by 3 varieties of languages, warrior lineal languages, monetary cyclical languages, and vital organic, human verbal languages, which cater most to the evolution of weapons, money and machines, and human memes. So we can differentiate nations by their different dominance. I.e. Germany will be a fractal part of Europe dominant in war memes, Italy in life memes, and United Kingdom in trade memes. And then we can further divide United Kingdom in Scotland, war memes, England go(l)d memes and Wales, life memes.
- Cultures are influenced by geography, as mountainous and continental regions breed warriors, islands and sea-peninsulas trade memes, and tempered or isolated regions, life memes.
- Memes influence each other, so languages are also broken according to Tipological Linguistics (we call it topological in this blog as we explain in our treatise on linguistics), in warrior agglutinative, Objectual, VOS, OVS, lineal languages (German, Turkish), trader, broken, short word languages (English, Chinese), with balanced ternary human-first order of words: SVO... and Verbal dominant, wor(l)d religious languages, with VSO order... Linguistics of course is far more complex as we explain on our previous section on the wor(l)d, since often, in our corrupted world VSO languages become imperative, religious military inquisitions (semite languages), and so vital languages with SVO order, must be also considered for human civilizations - that is languages, as most African ones, where there is a wealth of variations on the use of the verb to signify a human action. The map above show a clear grouping of those 3 type of languages in the classic age, but we shall keep it simple in those posts on fractal cultures.

The ages of cultures are expressed by the subconscious collective of art and literature in 3 ages akin to those of the individual, an age of epic, dramatic infantile art, and age of mature sensual art, and an age of angst, baroque, excessive formal art that ends in an entropic war and death of civilizations (regardless of other triggering effects, it is always war: I.E. the Mayan culture didn't die for weather changes, a stupid reason so well-greased today with the global warming propaganda for solar AI robots and nuclear clean energy, but because METAL-cultures invaded them, Toltecs razed them, and then they abandoned their systems of water 'zenotes' and irrigation).

The social evolution of Mankind – the age of religions.

The goal of history is the evolution of Mankind into a single superorganism made of human cells, according to the laws of the organic universe which creates those superorganisms, which politicians and economists could use to design and implement such 'immortal', efficient superorganism.

Islam and Christian mysticism (in Khaldun, Augustine) reached similar conclusions: the Koran is the sacred word of god, his ideas. In Christianity the word becomes god in the mind of his human son, Christ, the prophet who has the body of man and the verb-mind of god. In him, the word reached its fulfillment. In him, the word love=sharing of human energy and information, expresses the human laws of social evolution. Christianity was socialist, because socialism is the natural law. Mystics say that the community of believers shapes the body of Christ and the gospel is his mind. Muslims say that the body of Muslims is Islam and Koran is his brain. In both cultures the verbal language has to control the corruption of money and the harm that weapons do to humans. If that goal is achieved, history could evolve towards immortality into a citadel of saints, where all ethical words will be obeyed (saint Augustine). Then history (the passing of time) will come to an end. History will become immortal without war, because those 'who believe in me, will not die forever'. As Mankind will form a single body of history and reign supreme over the body of mother Earth.

If we use instead of religion, a biological jargon, civilizations become organisms composed of cellular herds of human beings that communicate through information networks (words & gods). As a nervous system connects and organizes the cells of a body, god connects and organizes a mass of human beings. Perhaps our definition of a universal super-organism will help you to grasp what we mean by a historic god:

'A universal super-organism is a biological body of (any species of cells) extended in time and space, joined by networks of information=gods.'

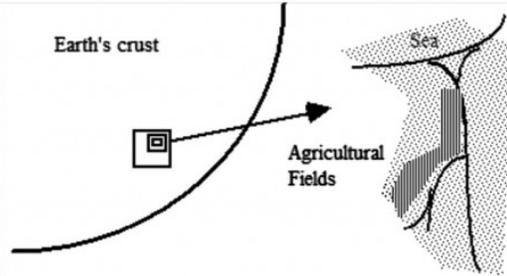

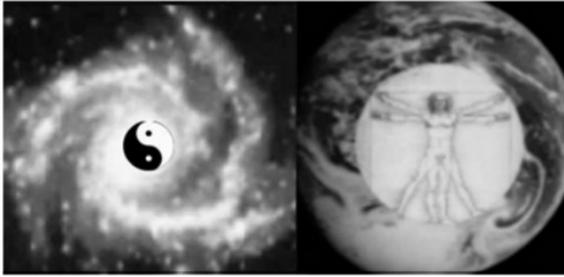

Thus, a relative god is the macrocosmic network of information of any super-organism, when perceived from the microcosmic point of view of his cells that the network of information controls. The brain of the human god is the *verbal network* of believers' minds, the books of revelation and the social laws that create human behavior. We create the future when we obey informative, verbal codes. Thus, god is the verb and its ethical codes of survival.

A parallel analysis of the earlier gods of man and its books of revelation, with r=evolutionary constitutions of 'solidarity, fraternity and equality' make more clear such parallelism of all religions, nations and civilizations, as super-organisms based in social love: both, a 'constitution' and a 'book of revelation', are a set of bio-ethical, natural laws that regulate the behavior of their human cells, *'constituting'* a social body and guiding its cyclical actions. So, a 'healthy' constitution is a set of laws properly built, according to the social laws of the universe and thoroughly obeyed by its citizens. While the *'constitution of history'*, based in the natural laws of survival of the universe, is the set of laws that could build a global collective super-organism, which could ensure the survival of the human species, *'constituting'* a healthy body of history, harmonic with nature, without wars and fear of extinction. Those laws of survival and social evolution were expressed, before politicians wrote constitutions, in simple ethic books by masters of our natural, verbal, temporal language of survival, called prophets, which resumed them in a single word: social love. It means 'to share energy and information with similar cellular human beings', called believers, belonging to the same historic, social organism, with the objective of acting together in the environment, creating a world to the image and resemblance of its cells, human beings. So the natural law of social evolution is the mandate of all non-corrupted wor(l)d religions, whose prophets and priests tried to reproduce in the mind of their believers *a loving behavior*, in order to 'constitute' a super-organism of god. All religions share the same informative mandate proper of all cellular systems; 'love each other', 'treat the others as you wish to be treated'. We find that sentence in many religions. It was pronounced by Jesus in the gospel and by Confucius in his treatises. In any organism the brain/mind is a 'relative god' for all the micro cells it totally controls.

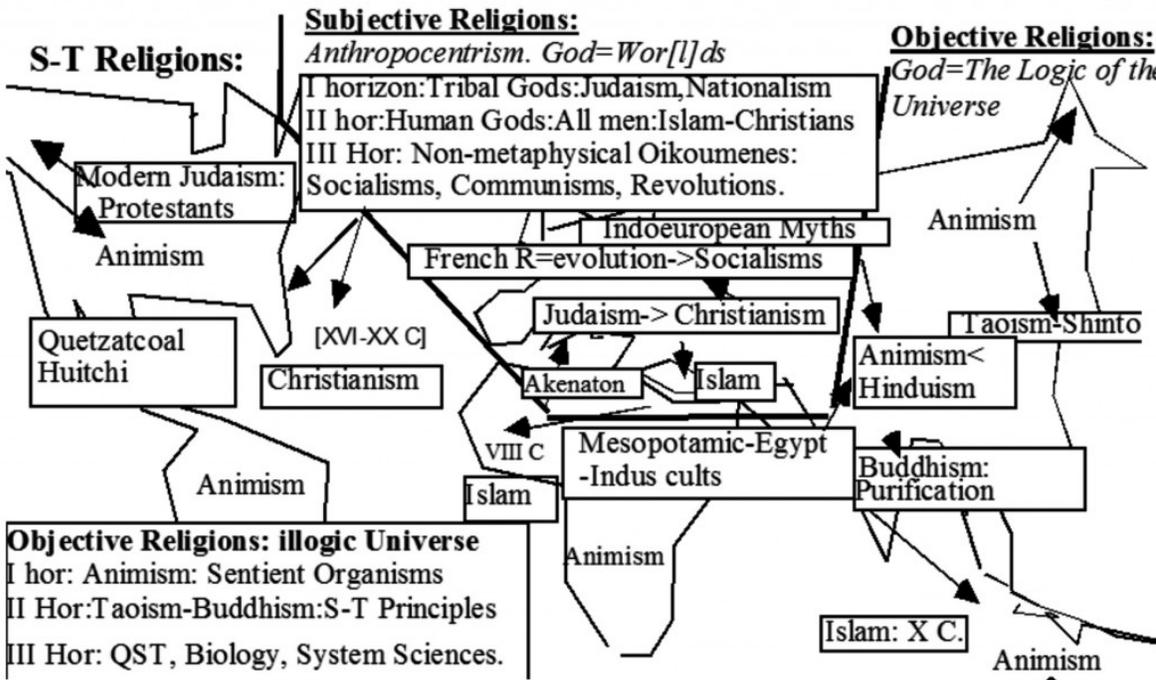

So the government is the god of a nation that controls its citizens; the brain is the god of your body cells; and the ethic laws of any religion are words of love that control for the common good the behavior of all its believers. The god of America is its constitution and corpus of laws; the god of Islam is the Koran and its laws; the god of Christians is the gospel, the laws and words of Christ 'that became god and inhabited within us' (John 1.1); the god of Jewish and most protestant sects are the mosaic laws; and the absolute god of the universe are the laws of organic science, the 3±1 arrows of space-time that *define the survival and extinction of all its species*. Thus, in mystique terms the super-organisms of history are called gods. And theology is the science that explains the relationships between individual human cells and those super-organisms. Let us then, end this chapter with an analysis of all the religions of the past, present and future, according to their degree of corruption and/or evolution in their understanding of the organic laws of the universe.

Human and universal religions. God as mind of the supærganism of history and the universe

Earth divides in 6 cultural regions, related to anthropomorphic religions and its 3 historic horizons: Christianity, Islam and communist china; and to the 3 horizons of universal religions: animist Africa & native America; Hindi & Buddhist south-Asia and the mechanist, scientific culture that today preys on all the others.

In the graph, objective, universal religions consider the duality of energy=yang and information=yin, as the mind/god of all the super-organisms of the universe, which they try to explain, putting man in relationship with the absolute. Thus, they can be considered a verbal science of the universe. Subjective, anthropomorphic religions, on the other hand, consider Mankind, the subconscious collective, the mind of god, Gaia, planet Earth, a smaller 'universe'. The confusion of both 'collective minds', the small god/mind of the Earth of man and the big god/mind of the

universe, explains why scientists misunderstand the role of religions that teach the organic laws of social evolution to Mankind only. They are not concerned with the application to the rest of systems of energy and information of the universe.

The Neolithic was the age of the super-organisms of history, which will be continued in present times by the creation of religious super-organisms. In that regard, the science of theology divides the wor(l)ds of religions in 2 kinds: western, anthropomorphic religions and universal, eastern religions. Both are organic systems of information that evolve, as all systems of the universe do, following the arrow of future information, in 3±1 ages of growing complexity. So for both type of religions, social religions and natural religions, we consider 3 horizons of growth:

The 3±1 ages of Eastern, Universal, Natural Religions.

Eastern, cyclical, temporal cultures, more sophisticated in their perception of the Cosmos, developed *Objective, Scientific, Universal* religions, concerned with the organic laws or 'mind' of the living Universe. They evolved in 3±1 ages:

— *Youth: Animism*, the youth of verbal knowledge about the living Universe, which considered that all the systems of the Universe had a 'soul', mind or 'knot' of information, as humans do. Yet all speak a 'different' language. In modern terms, an animist would say that atoms gauge information in gravitational and electro-chemical languages; molecules use Van der Waals forces, plants and ants communicate with chemical signals and bees with magnetic flows. *So all of them are intelligent.* And the goal of the Shaman or priest was to translate and communicate with all those souls and finally with the 'absolute soul' of the cosmos, the mind of Gaia and/or the Universe. Animism was the dominant

Religion of the Paleolithic, or energetic Youth of mankind. Today there are still Animist cults in Africa, Australia, Siberia and Native America.

— *Maturity: Taoism, Buddhism, Greek philosophy. In the Neolithic and during the ethic r=evolution against money and weapons that took place in the VI BC.*, verbal science reached its classic age with the understanding of the duality of energy and information, the 2 substances of the Universe (called Shiva=Yang and Vishnu=Yin in eastern philosophies, body and mind in Greek thought) that combine 'to reproduce the 10.000 beings of existence' (Tao te king). Mankind is described by Taoists as a wave, part of a collective organism, whose structures and relationships are common to all systems of the Universe. Both, Aristotle and Buddha described accurately the Atmans/souls of the Universe as unmoved, focused informative knots that move the bodies of energy that surround them.

The Hindi described the cycles of creation of the cosmos and the Mayans calculated with surprising accuracy the duration of the cycles of History that now come to its climax, as Machines evolve in the age of the Singularity, crossing a threshold of energy and information that can extinguish life. Time was considered cyclical: Hesiod in Greece and Confucius in China realized that actually mankind was devolving not evolving in the age of Metals.

Hesiod stated that the Iron Age in which he lived was the lowest of all times of History. Aristotle described Time as change and clearly defined the 2 forms of change=time in the Universe, *biological, morphological change that causes the cycles of life and death of all species and matters most to us, human, biological beings; and translational, physical change, studied by Physics, far less important, as it deals with properties of matter*. Thus, there were infinite times in the Universe, one for each cycle of change of each species. We conclude that the classic age of verbal science knew, paraphrasing Einstein, 'the thoughts of God, even if it didn't care much about the details', which today scientists study with so much enthusiasm, as those organic thoughts are lost.

— *Informative, 3rd age*: The study of 'morphological Time' and the cycles of life and death of all the systems of the Universe are today studied by Biological Sciences, System Sciences and Organicism, which use both, the verbal language (Theory of Evolution), the most sophisticated models of mathematics (Fractal Theory) and the visual language, (Non-Euclidean Topologies) to further advance the knowledge of that classic age, with the wealth of details discovered by scientific instruments.

The 3±1 ages of Western, Social, Wor(l)d Religions.

We distinguish also 3 horizons of evolution of love religions, based in the bioethics of social evolution:

— *Youth. Age of tribal, racial gods* in which only a part of history=humanity is God. At the beginning of history, in an age of limited information, humans created tribal religions and small bodies of History. God meant the collective subconscious of a tribal nation, since reality reached no farther than the tribe and the enemy territory. And so men could call 'God' the collective mind of the tribe and 'evil', (in Chomskian, genetic linguistics, the inversion of 'Live', hence synonymous of death) the enemy tribes that killed them. So each tribe had a God: Yahweh became the God of the Jewish people; Assur became the collective subconscious of the Assyrians, whose capital and kings had also Assur's name. It was an age dominated by Go(l)d and Bronze & iron weapons that devolved the Mature age of history, back to a 'dramatic, neo-Paleolithic level' of perception of history, based in myths and self-arrogant statements about the importance of one's own tribe as the center of the World. The error of tribal religions is their denial of the natural laws of Darwin: species survive when they love each other and act together against the rest of the Universe.

So tribal religions plunged humanity in eternal cycles of war and self-destruction, when tribes expanded their borders and confronted other tribal religions. In that sense, those earlier racial, primitive religions divide men in not Chosen and Chosen of God (the members of the tribe), denying the Law of the Species. As a consequence, the Universe applied the penalty reserved to those species that break its laws of harmony and evolution: extinction. Thus, most tribal religions have become extinguished or have evolved into Religions that accept all Mankind as members of the collective organism of God=History. The few that survive are not really religions but nationalisms that fight with weapons and gold and have substituted their verbal ethics for the values of violence and greed proper of iron and

money. The paradigms of those go(l)d religions are Judaism with his 'worldly religion of money' (Marx), which can be traced to the idolatry of the Golden calf and self-similar Protestant religions that consider 'money the intelligence of Go(l)d' (Calvin); while the paradigms of 'military inquisitions' are Aryan and Fascist cults of war, today transformed into nationalisms. Unfortunately, *mechanism and capitalism, the religions of machines and money, increased enormously the power of tribes that adopted the languages of metal. So today most humans belong to a tribal, 'nationalistic' cult(ures) that fight with weapons and money to become 'number one' of the economic ecosystem.* Yet before money and weapons reinforced those tribal cults, converting them into corrupted religions, either Go(l)d churches or violent inquisitions, most humans evolved into:

— *Maturity. The age of Oikoumene religions: Christianity and Islam in which all men are cells of the body of God, the Organism of History.*

Communication among tribes increased the knowledge of the unity of humanity. So tribes grew into confederations that evolved into bigger organisms. Thus, Ecumenical Religions, with a global concept of God as the collective subconscious of the Human species, came into being, reaching their summit with Christianity and Islam. While most tribal religions, smaller organisms of history, were absorbed by ecumenical cults, dwindling its numbers or they became extinct in religious wars by the 'bigger organism'. For example, a Jewish Verbal, Ethic Prophet, Jesus, who understood the laws of social love, reformed Judaism, the paradigmatic religion of the tribal age; and most Jewish people converted to the new religion, while those who didn't, confront from then on the 'Holocaust' cycles of Genocide brought about by bigger Warrior cults that extinguish them, since the Roman Diaspora to the Nazi Era. Christianity was in that sense, the moral r=evolution, which erased most tribal religions. While in the East, Buddhism evolved Hindi, warrior castes into an Oikoumene cult that merged elements of Anthropomorphic and Objective Religions. Finally, in the West, as Christianity broke into tribal wars, corrupted by Germanic warriors, a new Oikoumene religion, Islam, appears, as Muhammad put it, to convert to the God of Love and Mankind, hardcore metal-masters. Thus Islam imposed harsher penalties to 'sinners', who broke the code of Love and despised the Sacred ethics of the Wor(l)d, forbidding images and setting strict rituals of social and religious behavior (the 5 pillars of faith). And perhaps because of that harshness, it is still today alive and kicking, having rejected mechanist science, as the less corrupted version of Christianity (Catholicism) did till recent times.

In that regard, there is an inverse relationship between the 'Evolution' of a Wor(l)d religion of History and the Evolution of its economic ecosystem, according to the inversion of ethics between the values of 'metal' that make an Economy flourish (war and greed) and those values of the wor(l)d that make life, love and Nature flourish:

Min. Wor(l)d evolution = Max. Metal. Evolution.

As Picasso put it, watching the Nazis entering Paris: 'Sabater, those Germans, so many tanks and machines what for? We paint (Max. Human Information), love (max. Human reproduction) and eat (max. Human energy), much better'. Since, prophets are the ultimate masters of the Wor(l)d, the language of perception of biological time and its life and death cycles in history. While artists are the masters of the human Eye, our perception of spatial forms, which the clock and the telescope of mechanist science have substituted.

— *Informative age. The age of Social Religions, when the organic understanding of mankind is used to describe the fight of 'Deus Vs Machine':*

In its 3rd, informative age, the French Revolution and the Socialist Movement applied those ethic Laws of religions through the use of Constitutional Laws to the real creation of a collective human Super-Organism of History, able to control the Economic ecosystem and its 'germs', weapons and lethal machines. However old tribal cults and nationalisms opposed the coming together of mankind, competing military and economically, while destroying all social r=evolutions from outside or inside (Military Stalinism). The ideals of social evolution would be re-established after II World War, inspiring International Organizations, such as EU and UNO, which tried to create a collective human super-organism, based in the production of life-enhancing 'human goods', able to shape the Earth to the image and

likeness of man. Those organizations could be the blue print for a future Global Government of Mankind that truly transcends into the 3rd evolutionary horizon of a World super-organism.

If mankind achieves that goal she will succeed on her struggle for survival and become a global super-organism, the consciousness of the Earth, ruling through her simultaneous, collective actions, the machines and living beings of this planet to her own benefit. Thus, socialist doctrines were the 1st attempt to create a real science of history and a caste of bio-historians, politicians of the party or 'head' of the organism of history that rule a world made to the image and likeness of man. This attempt to create a perfect society had 2 essays, one in Russia, today extinct; and a second one in China. The Chinese late contact with metal explains also its higher evolution as a culture of human wor(l)ds, based in the arrow of social evolution and makes the Chinese World still controlled by legal words, despite its capitalist growth, is perhaps the last society able to balance the Historic and Economic Ecosystem during the IV Kondratieff cycle.

The Universe is entangled, organic and scalar. So we can go further in time to inscribe humanity in the evolution of the Earth, the larger superorganism with slower time cycles, or go lower in time to the human being, and its memes, the genes of societies, its instruments and ideas that code the creation of the 2 superorganisms of this planet mediated by man, History and the Financial-Media/Military-industrial eco(nomic)systems of humans machines and humans, dominated by its company-mothers.

MANKIND IN TIME. THE 3±1 AGES OF HISTORY.

Mankind evolved in time through 3±1 ages:

+1: Birth as a first verbal cell' a woman that multiplies her numbers.

Max Te: Youth: Paleolithic, a youth of hunters, visual languages and minimal information.

Te=Si: Maturity: the reproductive Neolithic, when man reaches his maturity in balance with nature and creates through verbal networks (religions) a series of collective subconscious, called gods of love that teach each cell to share energy and information with the other cells of the body of a civilization. Yet the arrival of metal extinguishes or corrupts most love cultures into go(l)d cults and inquisitions.

-Max. I: 3rd, informative, metal-age in which man halts his social evolution and focuses in the evolution of metal in its 3 forms, energetic metal or weapons, informative metal or money and organic metal-machines, which cause the corruption of the physiological networks of mankind, by the apparition of new people-castes which used the superior entropic energy of metal to murder people with weapons and come on top and the informative hypnotic power of gold and precious metal to enslave the will of people; till in the modern age metal evolved further into informative and energetic machines and weapons able to program simultaneously through mass-media systems and imprinted mankind with idol-ogies in favor of weapons (nationalisms), parasitic money as debt/tax issued by a small people-caste, in control of our natural informative nervous system, the law (Capitalism) and a cult to machines over organisms as the model of the Universe.

-1: Death: the neo-Paleolithic, or age of the machine, when humans regress to an 'homo bacteria' state of selfishness and isolation, substituting their social networks of love by their desire to become attached to machines of higher energy and information that separate us and keep evolving, making Humanity an increasingly obsolete species, killed by weapons in fields of war. At the end of this age, we can foresee with the creation of the singularity, either the 1st organic 'bomb' (a self-feeding bomb of dark matter) or the 1st self-reproductive machine (a nano-bacteria), the death of Mankind.

+1: Unless Mankind evolves socially, 'emerging' as a super-organism, if humans organize themselves into a global civilization and control the evolution of lethal machines, maintaining history in an immortal present.

The human species is, beyond our arrogant, fantasies of anthropomorphic superiority, just a living form made of carbon atoms, *which goes through the same ages of all other living forms, both as an individual and a species*. So we can study the organism of history (Humanity in time) through 3±1 ages; an energetic youth or Paleolithic; a mature age of balance with nature, the Neolithic; and a 3rd informative age of history, the age of metal and machines.

Energetic youth: Paleolithic. ±5.000.000 bc. to ±10.000 bc.

The Paleolithic was an energetic, young age in which men, the energetic gender, was the top predator animal on Earth, a hunter of living forms. It was also an age dominated by *visual, spatial languages*.

Reproductive age: Neolithic. Age of wor(l)ds and goddesses. ±10.000 to ±3.000 bc.

The Neolithic was the classic age of Mankind, an age of balance, when wo=men learnt the cycles of life and instead of destroying nature, learnt to nurture, reproduce and harvest it. Women, the reproductive species, took power over men; and priests became the verbal guides of civilizations, creating super-organisms of history made of human cells joined by social love—the sharing of energy and information among 'brothers', clones of the loving mind of the same prophet. It was an age dominated by *verbal, temporal languages*, continued by the believers in religions of love that are not corrupted by weapons (inquisitions) and money (go(l)d churches), with its idolatry to the 'values' of metal: murder and greed.

Informative, 3rd age: age of metals. ± 3000 bc to 1600.as metal spread the 'new' values of money and weapons, greed and war, destroyed the networks of social love, ushering Mankind into the 3rd age of history. Humans now evolve a

new kind of atomic systems, stronger than carbon, creating energetic weapons, informative money and organic machines that transform Gaia into an economic ecosystem. It is the 'animetal=animal+metal age', in which a new 'biological species' that mixes animal and metal atoms, imposes power over the Earth.

It is the present age with 2 paths of future:

Either Mankind will die, as machines keep evolving and make us obsolete as a species.

Or humans will obey the laws of survival of the universe and evolve socially into a super-organism of history able to control lethal machines. The choice is within man till the arrival of the singularity, when machines acquire organic properties and either a self-feeding bomb of dark matter, or a self-reproductive nano-bacteria 'evolve' the Earth into a species with a higher social density (a denser form of matter, or an organism made of denser atoms). In any case the future of history will be solved in the next decades, as we are already in that age of the singularity.

Indeed, as things go business as usual, history is becoming a block of time, which is what all superorganisms are: predictable systems that live through 3 ages of growing information that finally warp and wrinkle the system, exhausting its vital energy, dying by viral infection of a new species that predates them. That is the case of Mankind as a block of time because it has been unable to control the evolution of lethal goods and promote the welfare goods that could help it to survive. The blog thus will study history as it is, within the nested planet Earth, part of the organic universe, falsifying the theories of Anthropropic man and giving the solutions of an I-nformed man that would survive and make history immortal. A bio historian though is just a seed of information, if the social organism in which he lives is so primitive and ego-centered that the patient denies even a scientific prognosis of his sickness, let alone a healthy wealthy cure, as my fellow countryman, Mr. Seneca put it: 'when a social organism is so corrupted that defies any reform, the philosopher of science can only observe and wait for extinction':

The Paleolithic: 3±1 homo ages/subspecies.

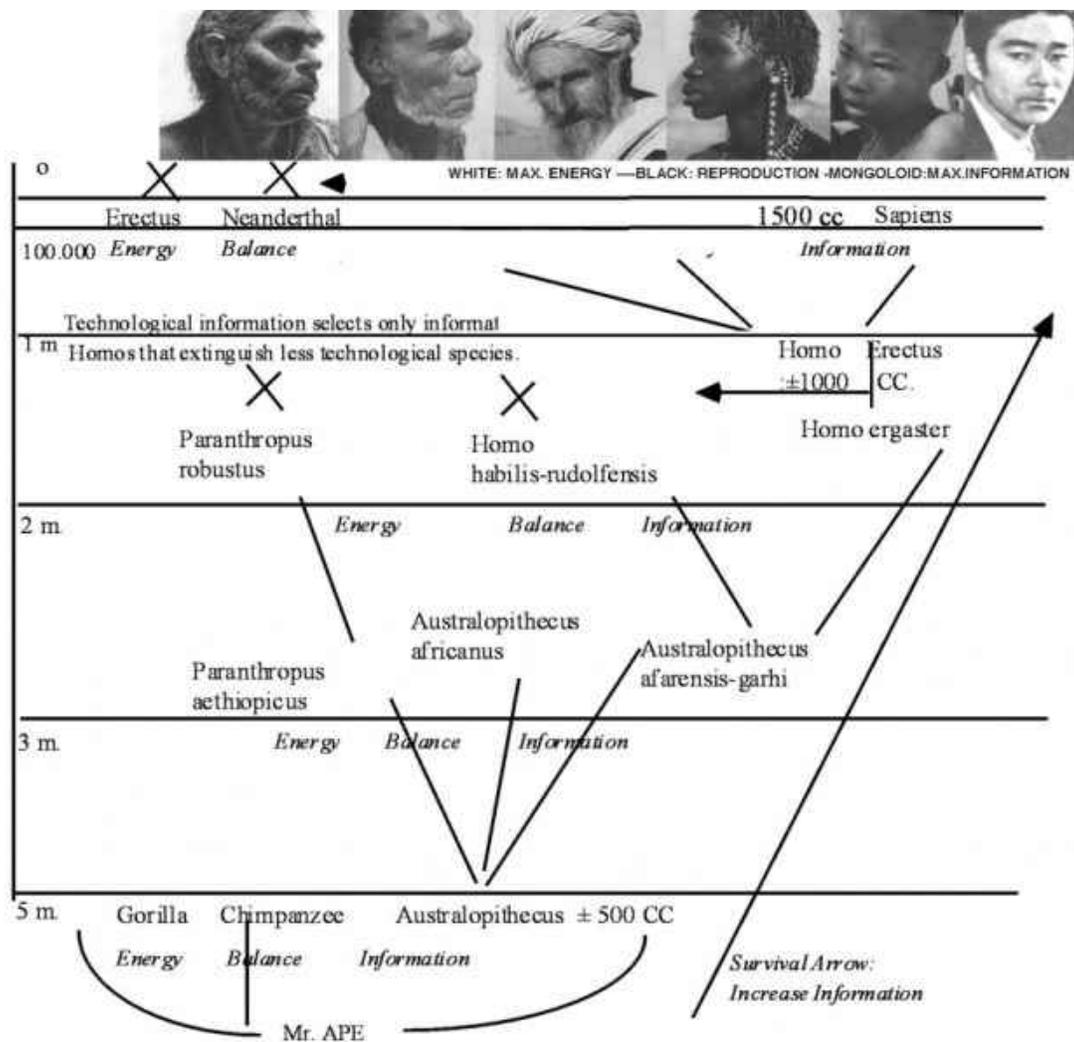

In the next graph, life first diversified into complementary genders: energetic, lineal, spatial men and cyclical, reproductive women, which hold more biological information. While a 3rd, gay sex mixes both. Further on, as humans evolved, they followed the same pattern of 3 ages proper of all species.

Thus, Homos diversified into energetic, informative and reproductive forms that show a higher balance between energy and information. Yet only the informative species, the dominant 'arrow' of future survives in each of the 3±1 horizons of increasing informative evolution, from Australopithecus with 500 c.c., into Homo Erectus with 1000 c.c. into Homo Sapiens with 1500 c.c. And in all those phases, humans split into an energetic species and an informative one that recombined to create a 3rd species.

Those species will further evolve technology also in 3 horizons called the upper, middle and lower Paleolithic. Finally, humans diversified in 3 races, specialized in Energy (white race) and information (Mongoloid) with a reproductive, black race, the last to be born, which mixes the pre-mongoloid (bushman) and white races. The constrain established by the fact there are only two elements, energy and information, to create reality, whose lineal and cyclical forms are invariant at scale, in all systems of the cosmos means the Universe imposes the same program of creation to all its species:

Humans evolve, as all systems of Energy and Information do, in subspecies specialized in those 2 elements.

In human evolution a pattern emerges: each successful, dominant Homo differentiates into an energetic and informative species, which recombine, creating more complex= informative and stronger=energetic homos that displace their parental forms, thanks to their higher Energy x Information. Yet the dominant, overall arrow favors informative species. Since when Homos were born, the energy top predators were felines, far stronger than the strongest possible homo mutation. So the evolutionary direction in which the big apes could find an ecological niche within the mammal kingdom was the informative arrow. They were already fit to that purpose, since they spent long times living in stillness in the summit of trees, where they had to learn to control complex movement in the

informative dimension of height, adding a 3rd dimension to their brain. So they became informative masters among mammal species.

Thus, the duality between energy and information is also responsible for the creation of humanity. In the graph we study that process. From an initial ape species we find a ternary differentiation ± 5 million years ago, into 3 sub-species of great apes that live in Africa:

- Max. E: Gorilla, a big, energetic species that reaches 200 kilos, with a square, huge jaw.
- E=i: The chimpanzee, with a smaller body and a bigger brain. According to the Black Hole law, the smallest organism evolves informatively. Thus, the 'dwarf chimpanzee', the *Pan Paniscus*, which today shows the highest learning skills among apes, was the species that seems to have evolved into a 3rd informative horizon of big apes. It is:
- Max. i: Australopithecus, which splits in 3 evolutionary ages of growing brain volume:

1 Horizon: 500 cc.: From Australopithecus to Homo Erectus.

We have dated the oldest mandibles of Australopithecus Anamensis, the top predator of the 3 big ape species, in 4 million years. The Australopithecus, after reproducing massively in the savannah ecosystem that favors his bipedalism, suffers a new ternary mutation. The 3 descendants of that Australopithecus Afarensis that inhabited the Ethiopian plains around 3 million years ago, are:

- Max. E: The Paranthropus, an energetic species with huge mandibles and a lineal, planar brain. He looks like a heavy-set, humanoid gorilla. He was probably vegetarian. The first subspecies found is the Paranthropus Aethiopicus, which will further evolve into the stronger Paranthropus Robustus.

— E=i. The Australopithecus Africanus, which maintains the form of the original Australopithecus Afarensis, perhaps with inner improvements in his soft tissue. He lives in South Africa and is contemporary of the Paranthropus. And the . . .

— Max. i: Australopithecus Garthi. He is the informative species, with a bigger brain, which starts to acquire the shape of all informative species: a rounded forehead, *as the sphere is the form which holds more information in lesser spatial information*.

Those 3 species live very close. Around the Turkana Lake we have found remains of the 3 Homos. Yet the arrow of future favors informative species. So the top predator Homo will be the Australopithecus Garthi that goes through a mature age of massive reproduction, probably extinguishing the other 2 subspecies and expanding worldwide into new ecological niches that favoured their genetic and memetic adaptation through a new, ternary split:

— Max. E: A regressing, energetic A. Garthi, similar but taller than its parental Australopithecus.

— E=i: Homos Habilis and Rudolfensis, with similar brain capacity to the original Garthi.

— Max. i. Homo Ergaster, an informative ape with a 1000 cc. brain, which doubles the brain capacity of Australopithecus.

II Horizon: 1000 cc. From Homo Erectus to Homo Sapiens..

That Homo Ergaster, after a massive age of reproduction and expansion throughout the planet, subdivides again in 3 sub-races of Homo Erectus.

— Max.E: Pithecanthropus, the oldest species similar to Homo Ergaster, found in Java.

— E=i: Homo Erectus proper, found in China, who grows in the informative dimension of height that *favors perception from an advantage point of view*, to 1.7 m. He has simple technology, a skull without forehead and thick bones that handicap further cranial evolution.

— Max. Ti: Homo Floresiensis, the smallish species, which according to the Black hole paradox should be the form who gave origin to Sapiens, as the smallish 'pan paniscus' evolved the chimp into the Homos. Recently discovered, he is a formal mutation with a smaller body, whose morphology resembles for the first time that of a human being. He has thinner bones that allow further growth and a higher forehead, the location of the creative part of the brain. Palaeontologists also found the first advanced technological tools in his sites in Flores Island, which is an isolated place, the ideal region to foster further evolution, due to the lack of top predators (alopatric evolution).

Thus, he ads now technological energy weapons that substitute body strength and define a single arrow of future for human evolution: information. His improvement in neurological form, probably caused first his rapid expansion thanks to his new technological tools and then a rapid growth in size through the cross-breeding with the taller Homo Erectus species, giving finally birth around 300.000 B.C., to a new energy/ information duality: The energetic, big Neanderthal and the informative Bushman, which will combine again to give birth to the different races. Those predictions based in the 3 arrows of future time and the black hole paradox (information is small and evolves in dwarf species) have been confirmed by genetic maps and Paleontology and await final confirmation, when new skulls of Floresiensis are found.

The 3rd, informative Horizon: Homo Sapiens, 1500 cc.

— The lineal, energetic, visual Homo Sapiens Neanderthal, with ± 1500 cc.

— A 2nd informative pygmy strain, the 1st verbal woman, mitochondrial eve, a bushman, also with ± 1500 cc.

± 50.000 years ago she crossed into the Middle East, probably mating with earlier Neanderthals, giving origin to the visual, energetic white male (Homo Palestiniensis, whose skulls show mixed traits from both species).

± 35.000 y. ago, in the high Tibetan plains, she became the informative Mongoloid that colonized Asia, America and descended upon Europe and Africa, where she cross-bred with the capoid (bushman) and became the black man, the balanced E=i, reproductive race, completing the final, ternary differentiation of the main races of mankind.

Further on, as racial tribes evolved socially and emerged into cultural societies, which are super-organisms of history, the ternary, racial division of mankind between energetic white men, informative Mongoloid and vitalist blacks, will become the cultural differentiation of human beings in:

— 'Visual, energetic, lineal, spatial cultures', proper of the white man, with his concepts of lineal time and his passion for technological, energetic weapons.

-Cyclic, informative, mongoloid Asian cultures', with cyclical concepts of temporal energy.

- 'Sensory, reproductive, colored cultures', which in Africa and India developed human senses to their limits.

Racial cultures. The "Neanderthal", White Animal

Which culture is better for the survival of mankind? Since survival is the goal of all species, reached in the age of balance, E=i, we should promote, paradoxically, the culture that our technological civilization discriminates: the black, reproductive, sensory culture . . .

Thus, the Laws of Evolution and its 3±1 ages and subspecies, map out the main species of Homo, till arriving to 2 Homo Sapiens, the spatial, visual=longer, dolicocephalic, energetic brain of the Neanderthal, which seems to have lived in Europe and left some of his traits in the Homo Palestiniensis, on the slow-crossing border of Canaan. Further cross-breeding of the Palestiniensis with the Sapiens is the likely origin of white men (white skin, red hair, Rh-?, consonantal languages, wide hips, prominent nose)

While the informative Homo Sapiens Sapiens, the verbal=wider brachicephalic brain, which started as a small 'San pygmy', evolved into the self-similar mongoloid race. Finally, the black race, with tall brains are the sensorial culture, the reproductive species, the last one to appear, shows the maximal genetic mixture.

In the same manner, we talk also of gender duality in terms of an energetic species, the lineal male of big muscles, spatial size and visual brain; and the woman, the informative, reproductive species, who would understand the cycles of birth of plants and evolve mankind from the energetic, hunting Paleolithic into the Neolithic, the mature age of History, with its understanding of the arrow of reproduction of the Universe (cult to the goddesses) and its harmonic cults to Nature.

The Neanderthal Sapiens though had a literalist verbal mind, because their eyes completely dominated and so space not time matter, the obvious not the logic and complex, the emotion and immediate desire of the eye, not the social love created by verbal interaction. Today again this 20 year old thesis of my work in complexity has been validated - the Neanderthal had much bigger eyes than us.

They were materialistic, anthropomorphic, self-centered people whose Gods were no longer the organic principles of the Universe, but 'human figures' made of fetish metal.

Anthropomorphism indeed is an essential feature of the Germanic-Jewish cultures since they feel Goths, or sons of God, entitled to rule over all other humans and animal forms of Nature.

At the same time, myth and idealism is natural to both cultures to sustain those dreams. So action and ritual is confused with being. From the rituals of gold ex-votes to Aryan fire rituals to modern Heidegger's Dasein concept ('Being and time') to evilwood fantasies and actors, those who enact a metaphor of reality believe they become that reality.

'Wiesen, Veda' meant to become God by representing a ritual of God's creation. The Levi priest that sacrificed the son of his other '11 slave tribes' that brought him gold ex-votes to the temple was becoming Yvwh in those self-pumping ego rituals. So did the Aryan priest. Idealism was born, and it is still the main feature of their intellectual, detached

cultures, with its prizes and experts that know nothing but enact their beliefs as if they were truth, with Nobel Prizes, Holocaust remembrances, Oscars and Marketing of their very low quality mind products as fruits of their genius and 'ingenuity' (-;

They couldn't understand the memes of eusocial love. They were called evil=anti-life by the fertility priests of Goddesses, who they named 'the abomination' (Hebrew Bible). They couldn't understand the organic Universe. Their Gods were Thor, a sword in which they impaled children of their enemies, or Baal, a gold statue, to whom they sacrificed their own children in 'Hecatombs'. They believed in ritualistic religions and sado-masochistic actions that repressed systematically their life wantings; and in purity and separation from the inferior castes that enjoyed life (Hindi religions, Jewish dietary laws).

They maimed their human nature (prohibition laws against eusocial love/segregationism, good food also with dietary segregationism, sex=human reproduction and verbal thought - despised by mathematical Kabalas and mathematical wars) to harden their spirit and brutalize mankind, In this manner they started the death of Gaia that now their descendants, bankers and military people worshiping money and weapons and oppressed the democratic, love-based human cultures they controlled.

But once and again we shall find the fundamental antiscientific trait of their illogic, emotional mind: to deny causality, inverting it, in this case 'jewish victimism' is based in the concept that mankind segregates them and it is racist against them; when judaism is the essential segregationist culture, and of course, once they segregate and price mankind to whom they only relate through money, in the past through slavery now part-time salary slavery and always through debt money, Mankind acts-reacts in the same fashion. As we observed already in classic economists, where Mr. Friedman affirms that data does not matter and assumptions are the origin of economics, to whom Samuelson rightly replied that with such procedures assumptions and conclusions cannot be differentiated and their order can be juggled at will.

In any case we shall not talk of the Germans as much as we talk of the Jewish because we know them. This is not so much censored in scholar history and mass-media. We keep talking of the censored part of the Financial-Media/Military-industrial system, the FINANCIAL-MEDIA, the head of the metal-earth, the informative machines and those who own them. And because the body, the military-industrial complex, ultimately obeys the head, the financial-media system, which is truly the responsible element of the system.

That is why after 3000 years of a combined Jewish-Germanic civilization most people are called Joseph and John and Mary, not Brunewilda. And that is why we worship Yahweh, not Thor. And we see evilwood films not UFA films. And we mourn the victims of the Financial-Media master race, not those of the German military-industrial complex (as both had around 5 million innocent scapegoats of the elites dying in the war, mostly women and children... some gassed in small rooms some in the open air as ball of fire broke in German cities from Hamburg to Dresden during our carpet bombings. Only the fact that victors write history and the international banker won over the German military explains why some murderers are victims.

But both are the same and for most times of history they worked together to annihilate the real victim, mankind and its civilizations of life goods and eusocial love.

What is happening today, after they have destroyed the American superorganism based in the equality and human rights of its founding enlightened fathers is just a global bid of the German-Jewish American sub civilization to annihilate mankind terraforming this planet in a robotic nightmare of vigilante drones and white collar pcs and blue collar robots with humans taxed to death.

And what has changed also is that due to the complexity and overdrive of negative information and the occultation of their history with all kind of censorships it is the fact that they have rewritten the subconscious collective to make us belief they are righteous, hard working people, experts that will guide mankind to paradise. So Germany is the most admired country in the world and the Jewish are the victims of history...

Races in complex science: the 3 types of minds: Emotional, visual and verbal brains.

The previous graph shows the sciences of systems/complexity/duality, applied to the evolution of man.

The basic tenant of those science is that the Universe is a game of complementary systems of energy and information in all its scales (fields of energy and particles of information in physics - complementarity principle of quantum theory), bodies of energy and minds of information in biology, energetic and informative machines that enhance our equivalent organs in economics and so on.

When we apply this new discoveries of system sciences to the study of evolution it *restricts enormously the possible future forms of biological evolution, and since energy has a lineal/planar morphology (fastest distance and highest surface between two spatial points) and information a cyclical/spherical morphology (the sphere is the form that stores more information in lesser space)*, it has an enormous power to resolve the pending questions of the process of biological evolution this planet constantly suffers. In the graph, we consider its application to the evolution of humanity, as I explained in the conferences on biology and duality at the International Systems Society.

In essence in a Universe of two substances, bodies of energy that move heads of information evolution will try to maximize those parameters. So we can easily introduce a definition for a top predator species: Max. E x Max. I, which mathematically maximizes when $e=i$ (so $5 \times 5 > 9 \times 1$). This means evolution and survival favors 3 type of species, those with maximal information/better heads, those with maximal energy/better bodies, and those balanced between both parameters. And this very simple scheme allows to classify and explain the whys of the evolutionary, fractal tree of life, which genetics and survival Darwinism explain in the hows. Thus Complexity in all its branches is poised to become the '3rd leg' of biology in this century.

In essence species evolve in a dual, complementary Universe of systems of entropy [and information](#), mixed in energetic/body power, their informative/head power or the networks that reproduce and combine both systems, exi, the reproductive networks. We talk of 3 dominant wills or biological drives that increase the survival chances of a system.

For that reason there are genders (where the male is the energetic species, and the female the reproductive, informative one). And since energy is lineal (being the line the fastest distance between two points) and information is cyclical (being the sphere the form that stores more information in lesser space), it follows that men have big, lineal, spatial bodies and test better in geometrical analysis and women have cyclical, smaller, rounded forms and test better in verbal, informative tasks. Yet there is always a 3rd mixed variation, in the case of gender, the gay sex.

Those findings, which I exposed in my papers on topological evolution within the scientific community of systems and complex scientists, can be applied also to the will and drives of the mind. There are people who psychologists define as picnic, nervous, tall (height is the dimension of information); the are athletic, sanguineous people, dominant by their energetic will; and there are viscerotonic people, driven by their 'lower passions' (-;

We can use, as we have done in studies of evolution of all type of species, the existence of a constant diversification in 3 different species to analyze as we do in the previous graph, the evolution of mankind from the initial triad of apes, the energetic gorilla, the reproductive chimp and the informative Australopithecus, till the last differentiation of homos, between the energetic, visual Neanderthal mind, today dominant in the [white man](#), and the smaller, informative, verbal, homo sapiens, today dominant in the informative mongoloid, with the reproductive, emotional black race in the middle.

Then, once evolution produces 3 types, it combines them, and so as the tree becomes more complex, yet always reduced to those combinations, natural selection will 'prune' the tree of life of its less efficient species. In this manner the reader can see all the main homo species from the ape to man, and how they perfectly fit in the morphological triad of alopatric diversifications known in the fossil register.

If we jump that phase we come to the last ternary group of surviving homos, the Neanderthal, sapiens and its combination the homo sapiens palestiniensis which properly should be known as homo sapiens neanderthaliensis. Its existence forecasted 2 decades ago in my first Spanish books on duality has now be proved by the genetic record. 10% of genes differentiate homo and Neanderthal and 4% of those are Neanderthal, so the white man is essentially a mixed species.

The only meaningful division of races are according to the ternary axis=dimensions of the mind that between the 3 dominant languages of visual, white races and cultures with higher Neanderthal input, mongoloid, verbal cultures and black cultures with dominant motor-emotional axis. In a perfect world the 3 would be complementary as they enhance one of the 3 'perceptive languages' of existence. In a racist animetal world, the visual, metal-hypnotic

values of greed and violence brought about by white fetish cultures of go(l)d and the sword carried the day, paradoxically starting the degradation of life and history, in perpetual world and slavery to the selfish values of memes of metal.

The existence of 3 dominant human races today, the white, yellow and black people, cannot be argued, but they must be interpreted as 3 types of complementary intelligence, based in our recent discoveries on the science of Complexity, which always favors a ternary process of creation, with an energetic, informative and reproductive 'decoupling' along the 3 morphological dimensions or "axis' of any space-time form. In the case of the brain, there are 3 axis, the long visual axis, the tall emotional axis and the wide, verbal axis, and so we talk of 3 mental races:

- Dolichocephalic brain, which overdeveloped visual axis, from the eye to the occipucius. It is the white man.
- Brachiocephalic brain with an overdeveloped verbal axis from ear to ear. It is the mongoloid race.
- Psylocephalic, tall brain, with overdeveloped emotional axis, from neck to top of the head. It is the black race.

We talk in ΔST of 3 types of minds/heads, which emphasize 3 kind of wills in humans:

- Max. Entropy-motion: Visual, spatial, violent minds; dominant in visual information. This is the case of the child and the 'male' species, of the white race and in the earlier anthropological record, the Neanderthal, which we already considered as Cohn did, to be co-father of the Eurasian Northern man, in its crossing with the Homo Sapiens Palestiniensis and the Iberians. To stress that regardless of hype our knowledge of genomes and its clad-diversification, extremely complex IS NOT good enough for fine-tuning as to what group mixed more – Eurasian (now ahead, previously the white; recently the bereber->Basque) but it does NOT MATTER, because the beauty of 5D Topology is that 'genes' are MEMORIES that surface into a HIGHER DISCONTINUOUS plane, whose 'finality' will again be the trilogic structure of St<ST>Ts systems. Thus Northern & desert open range humans will fast, as information evolves much faster than we thought, become visual dominant in its mental axis (even if they were not Neanderthal marked); in a few thousands of years; people living in dense, organic cultures, improve their verbal skills and so on. Since the game has 'basic' fast-track processes of evolution; among them the KEY one, the S=T overbearing symmetry, in this case between ages. So Neoteny is truly the causality of Mongolian, informative species, which only appeared in the 40-10.000 year range; as simply the palingenetic worldcycle is of fast evolution; so by maintaining a childish age longer, the Mongolian became child-like, more informative. A Lamarckian mechanism we always considered truth as it accelerates evolution in an efficient Universe is now being researched in epigenetics. *We know less than we will ever recognize; hence the importance of 5D laws to complete the puzzle. So far we haven't found female Neanderthal genes on humans, strongly backing the javelin, big man theory of war won by them in the first crossing. But I would like in future research when genomics are more developed to see a red/blonde hair northern woman analysis, of its non-verbal, aggressive, less empathic character properly done. As I say, all those details that obsess our ego-centered,*

technologic enzymes are to a 5D researcher less interesting than the obvious symmetries between ages in time, topologies in space and trinity divisions of huminds.

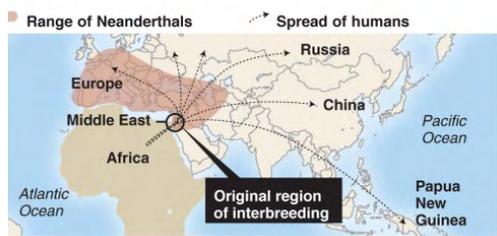

This said 'white people' who lived in the same range than Neanderthals are easily recognized by their dolichocephalic head and occipital bulk, their eye=I oriented mind, individualistic ego and energetic behavior. Languages are consonantal, with little vowels, red hair, rh- and other Neanderthal traits further allow to recognize the Basque/Iberian/Germanic and Semitic cultures as the dominant paradigm of the visual culture.

As they would be 'erased' by the Chariot radiation of Eastern/Caucasian males in the war cycles of extinction of civilizations, *who adopted their culture*, the traits became cultural (still Tuareg and basques have max. Neanderthal crossing, even higher than northern Asians). As I say genetics becomes secondary to axis an culture. It seems then a fact that before Charioteer radiations the first semites had given birth to the gold fever and go(I)d temples of Levant, which huminds hardly had, starting the eco(nomic)system cycles.

Dolichocephalic Neanderthal with minimal development on the parietal regions of speech, mixed with the verbal homo

Interbreeding

Humans leaving Africa about 80,000 years ago encountered Neanderthals in the Middle East, according to DNA evidence extracted from Neanderthal bones.

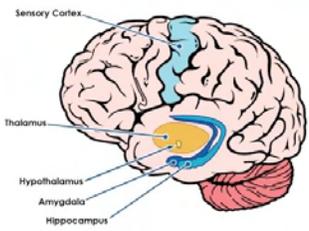

source: Science, National Geographic Graphic: Los Angeles Times © 2010 MCT

sapiens gave for sure birth in the first crossing in Levant and the Spanish culture dominant in visual information; to a boost of the 'long' occipital brain axis (Neanderthal) which added to the expanding forward loop (rational, Aristotelian thought handled by frontal brain region added by the Homo Sapiens) seems the stronger causal reason for the explosion of visual creative thought in technology that would 50.000 years ago determine the true birth of the modern Homo Sapiens. The details might vary as genomics improve its technology but the true interest of a 5D researcher will always be the proof of its ternary laws and the key creative process of reproduction in the Universe by merging, entropic, motion, TT, Ts elements (visual, likely Neanderthal genes?) with those of informative, SS, St languages (verbal conceptual thought).

- Max. I: Verbal, informative minds, dominant in temporal, verbal information. This is the case of the old people or the 'female' species, of the yellow race and in the earlier record, the capoid, Homo Sapiens Sapiens, smaller in spatial body, with the dominant brachycephalic brain, and wide face, as the dominant language goes across from ear to ear and Brocca brain region. The informative species is social, group oriented, as it uses the verbal language to create super-organisms of history. Their language has an excess of vowel; women play a greater role...

The mongoloid race and the female gender are dominant in the verbal, wide axis. Hence the distance between the eyes and the parietal is larger and the eyes are wider. Again the genetics of this final process seem in 5D secondary to the 'allocation' of the 2nd trinity variation at the Δ+1 scale of cultural consequences.

-Exi: Finally a 3rd type of culture, whose informative minds are dominated by emotional sensorial, body oriented, reproductive drives, is the black culture and the young human. Its brain is taller, with the top point in the upper head, as the dominant direction comes from the spinal-hypothalamus axis upwards:

In the graph, the regions most developed in the emotional races, along the 'height' axis, are the inner regions of emotional thought, and the motor and sensorial cortex. This long hypothesis, extracted from the models of complexity and duality developed by this writer in the 90s have now increasing evidence: women are wired inwards towards the Hypothalamus, and black and female 'races/genres' show higher development of the emotional brain and excel in tasks related to the body/senses.

Those distinctions were already observed in XIX century studies on brain morphology and cultural psychology. They are real, increasingly proved by a wide number of research papers that go from the analysis of why men draw better maps and women talk more to genetic studies in linguistics and bio-chemistry that

validate our 20 year old research in those fields. Racism consists in thinking that a visual brain is better than an emotional brain or a verbal brain.

In that regard, the difference between XIX century brain studies and modern complexity is the realization that it is not the 'white entropic' culture the most evolved, but according to the Laws of complexity, which favor the balance between energy and information in all systems ('mens sana in corpore sanum' in human living systems), if we were to choose one of those 3 mental axis, we should choose the balanced, E=i, reproductive, emotional cultures (women, black people) for the same reason the best age of life is the mature age of balance – since it is the balanced culture that would ensure the survival of man, while the extreme energetic/warrior white mind and informative/computerized mind-culture of Europe and Asia are taking out of balance the planet Earth with its obsession for 'superior' technological machine/memes.

We cannot extend in this introduction in the full understanding of 'topological evolution', as it belongs properly to the full model of General Systems sciences that unifies all the laws of the Universe, under the metrics of the 5th dimension. For those interested, just look at my unification theory web.

Enough to say that those 3 complementary varieties are the only 'genetic races' to be considered, and their combinations maximizes the energetic-visual, reproductive-sensorial and verbal-social qualities of man, and have given birth to the 3 main cultures (being the other 4 born of military conquest, and hence somehow artificial but as they exist, we should use them to conform the perfect world):

The verbal, social, cyclical, female oriented, time cultures of Asia

The energetic, visual, individual, male oriented, lineal, time cultures of the white man

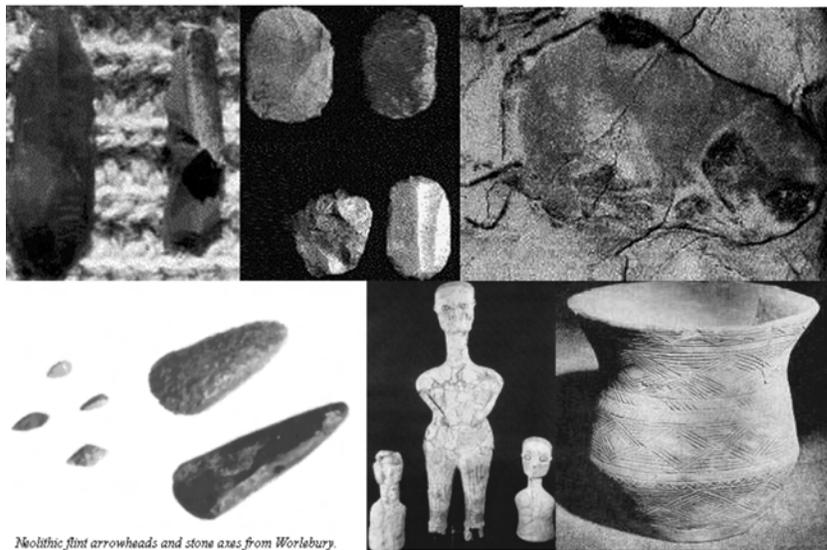

The sensorial, emotional, reproductive, wave-like cultures of the black man or 'Africa'.

The white, visual animetal energetic men; the mongoloid, verbal, social and the reproductive, sensorial black man in a perfect world would be complementary, the 3 ternary elements proper of all diversifications of the Universe. But they are not.

It is in fact the white man (I am), the lesser race, the simpler, the energetic, the one easily hypnotized, irrational, violent. But because METAL degrades man, it HAS COME ON TOP, despite being the less evolved human. At the time I was laughed at. Now we do know Neanderthals were white, red hair, hooked nose, violent, with consonantal languages. This as many of the discoveries of the model of complexity has been proved, because the 'theory' behind all this, cyclical time and the 5th dimension IS the theory most advanced about the nature of the Universe.

Of course, sapiens denies it; saying we have only 4% of Neanderthal genes but since 90% is the same, if we have of that remaining 10%, 4%, that means almost a perfect crossing. My thesis which will be proved likely is that the most crossed ones were the Semites, with Neanderthal Machos killing the dwarf Bushmen and raping their women, as there were no bows and so the dwarfs were less powerful. This is why there is dimorphism in Semites: stronger males, more violent than any other race; and smaller women, talking too much (-;

Then the white Cro-Magnon crossed man discovered in Altai the bow, which is a cyclical weapon proper of cyclical mongoloids, and went into Europe, killing at distance the Neanderthal and raping their tall red hair women, the Germanic women. And this is why the topic Germanic cold-hearted women are so strong, energetic and simple in verbal terms. This was the original analysis 30 years ago, and yes, I thought first not to include it. But since I am after all a white Neanderthal, and precisely Germanic and Semitic cultures are the more racist of the World.

Neolithic flint arrowheads and stone axes from Worlebury.

UPPER NEOLITHIC: HUNTING, LINEAL TOOLS; MATURE: REPRODUCTIVE FORMS; 3RD INFORMATIVE AGE: CERAMICS AND WRITING

MATURITY, THE NEOLITHIC.

Art is the collective mind of a social organism of history. In the graph, art evolves in 3 ages, as the mind of human individuals do. In history, art evolved from:

- A Paleolithic youth in which art is lineal, energetic, used to build simple weapons.
- A classic maturity of figurative art, in which energy & form reach its balance: it is the reproductive age of fertility goddesses and figurative images, proper of the Neolithic.

— A 3rd, informative age, at the end of the Neolithic, writing evolves from ceramics with complex symbols.

The maximal social evolution of history happened in the Neolithic culture, self-similar in all the regions of the planet. Social love was so intense that humans lived in homes without streets and people walked through the roofs or the house of their neighbors, like insects in a beehive. Each man in the village had a 'cellular' vital space, his home or den, tools and clothing; but the energy networks, the agricultural fields in which people fed, were common property, as it happens in DNA organisms, in which DNA molecules live within their home/cell, pegged to other homes/cells, sharing with them the energy of their blood. Neolithic cultures created environmental societies, based in natural, human goods; where every cell owned 'vital' property; where the networks of social information were based in verbal thought (laws); where ethic, social men, called priests, acted as the verbal, collective neurons that solved the colliding interests of individual cells. Those social organisms followed the universal laws of social evolution, creating efficient organic systems, with a single collective brain (the elder with more information, verbal priests, legal assemblies, etc.)

And its 3 physiological networks were created according to the laws of superorganisms:

TT-Entropic Territory: Gaia; the territorial sustain of the community was a healthy geographical body that provided the human goods needed to satisfy the biological drives of humans. It was not depleted but worshipped as 'Nature's Goddess', both in rivers (Nile, Ganges) and animal life

SS: Informative system: The ethic law acted in them as the verbal, nervous system of the society, creating a wor(l)d to the image and likeness of mankind. Legal mandates motivated or forbade certain actions, selecting those which improved the welfare of the entire society. Without laws we cannot understand historic organisms. Laws rule in an invisible manner the acts of people, as nervous orders guide the cells of the body. Thus, certain humans, verbal masters who create laws, as the neurons create nervous orders—prophets, priests, lawyers, courts and parliaments today—should hold the power of societies. What is an aberration is to leave the 'blood=economic system' to control the nervous/legal system, as it happens in free markets.

ST: Reproductive system: Money was WHealth, grain or cows, as in Nature's physiological systems, delivered to all the citizens cells of the community to promote the 5 drives of life (dimotions of existence) that ensure the best life for them. It provided first ST-'energy' and TT-entropic motion to body and limbs; its surplus handled by priests of social love was used to pay extra-salaries for SS-communal work; as its creation fostered the evolution of agriculture and the learning of positive St-forms of information; the making of tools, even the birth of accountancy and writing in Summer's temples with clay tablets writing the storage of wheat-money.

So the five dimotions of individual existence were achieved and its most important reproduction, was sacred, for both Gaia (food and money reproduced in season cycles, worshipped on solstice days) the community and the individual (equality of gender, worship of life-bearing women).

We do know that one of the most widely used moneys and measuring units for large transactions was the ox or cow. From Ireland to the Mediterranean to Africa, cattle were used as a means of exchange, and especially as a measure of value.

In Sumeria is known the power to organize the welfare of the whole world was a temple hierarchy, who held centralized control over the economy. Compulsory labor service could be required for public works, and the priests instructed what and how much to plant, and how much of the harvest would go into storage. Agricultural commodities by weight served as the primitive money system in the ancient Oriental societies. It is presumed that in earlier agrarian societies, loans had been made in seed grains, animals and tools to farmers. Since one grain of seed could generate a plant with 100 new grain seeds, after the harvest farmers could repay the grain with interest in grain. Similarly, when animals were loaned they could be repaid with interest in the form of sharing in any new animals born.

This is the natural form of 'bites of energy' as 'money' should be delivered to all humans to multiply the Healthy wealth, WHealth of the society.

As a result of this natural organization that appears in all *dense population of a single organism*, the population of Sumer grew to amazing densities, not reached till modern times, with many cities in the Delta of around 10.000 people, and multiplied and human life was the closest possible to a paradise.

Then Siberian charioteers, massacring all males, raping women, becoming hierarchical kings and people from the desert with pieces of metal enslaving women with earrings and taken men as mercenaries and slaves saw the beginning of a new age of top predator 'animetals'. And from a single global superorganism of mankind we moved into the eco(nomic)system, an ecosystem of two species.

LINGUISTICS: THE MIND OF MAN: THE I=EYE>WOR(L)D

We have described briefly the 5 elements that conform *all realities*, $\Delta \pm j$ Scales=Planes of Spatial Information and Temporal entropy, combined into 'energetic vital beings'; controlled by a spatial mind=language, @, who perceives in itself (the language is a simultaneous mapping, whose 'magic' property is perception); limited (-) by its 0' x α =Constant world to have entropic limits in its vital space, time duration and scalar and mind perception.

This is the structure of $-\Delta @st$ of space-time of which we are all made. And within that structure, there exists in man both at the scale of individuals and at the scale of social organisms, languages of perception, which have a 'consciousness' of being within the language, we are not going to argue. Consciousness in that sense is 'obvious' for the language within; it is likely the ultimate e-motion scale of reality shaped by the language. Consciousness of man exists does in the word and the visual I=eye (space) = Wor(l)d (time) languages ; and we consider it should also exist in an upper collective subconscious plane of space-time existence we call Gods, studied in its metaphysical and historic engagement in the other papers on History. Here we want to do a more prosaic analysis, focusing on linguistics and art.

The mind of man has in that sense two clear components, the 'visual I=eye', dominant in space even if it can perceive motions in time or 'St-language' and the verbal wor(l)d, dominant in Time even if it can perceive forms of space with nouns.

As always every 'yang' has a drop of yin.

Because by definition space is related to information, the eye has more information than the word, more dimensional motions of simultaneous form. The word is a more synoptic language which can be transmitted in single dimensional sequences. This gives it a higher capacity to 'move' in time and forecast the future; as it happens with mathematical languages, reason why humans use wor(l)ds not images to map out the world. And so our use of english with 'infixes' properly calls it the wor(l)d. As we humans plan our world with words.

The I=eye on the other hand is the first layer of information we perceive that locates our selves as individuals in space. It is a language 'grounded' in the immediate reality with 'lesser' temporal scope and capacity to perceive 'higher ranges' of ST systems. What this means is the visual language is 'superficial', and 'individual', ego-centered. And it is *this the essential property that makes the 'medium the message' in the modern visual world.*

That is, by the very fact that huminds have regressed from a wor(l)d-centered mind into a visual-centered mind with the evolution of machines of information, we have degraded our mind. It is the phenomena of neo-Paleolithic increasingly infantile humind species, which clearly ushers mankind into a 3rd age of decadence and death of the mind that we don't acknowledge.

The astounding frightening beauty of the intelligent organic Universe is the incapacity of the inner parts of an organism to understand the collective processes of our worldcycles.

This duality and predatory nature of I=eye languages over social temporal organic Wor(l)ds was however understood by all classic prophets of the wor(l)d who forbade images and remarked idol-atry as the capital sin of the mind; which still is in the form of idol-ogies that distort human thought.

In the classic age however the eye-languages as art submissive to the wor(l)d had a complementary role to make understandable to the common people of lesser wor(l)d intelligence the ethic, organic laws of the mind. And so because this paper is 'positive', in as much as it studies the positive elements of the humind, NOT its degeneration and likely extinction this century, which is analyzed in our paper on History in time, we won't dwell so much on the neo-Paleolithic and the destructive influence of visual thought over mankind, which passive enzymen, virally colonized by its metal-idologies do not even consider. Of that process the most amazing fact is the 'silence of the lambs'... Mankind is 'processed' together my networks of machines into self-extinction without the slightest response – truly a herd guided by its FMAsters, themselves greedily programmed by Go(l)d into oblivion.

Ts-WOR(L)D

All the aspects of verbal memetics require a minimal analysis. We cannot as in any paper be exhaustive in this one man 'upgrading' of human consciousness in all fields of knowledge. Let's apply the basic pentalogic 5D different $-\Delta@st$ perspectives to subdivide the study of words as the mind mirror of man to act on the external world, and build a social group.

We shall thus be synoptic and not systematic; ultimately aware that huminds might never access this higher degree of consciousness and the upgrading of 'stiences' will wither away in the digital darkness of the web; which diminishes this one-man-show interest in proper communication. Let us then glide on $-\Delta@st$ wor(l)ds:

SPATIAL ORGANIC ANALYSIS

S<ST>T: The Fractal Generator of Wor(l)ds: Subject Information<verb=Action/energy>Object Entropy.

As in the case of genetics, which starts studying its simpler 'meaningful' ternary 'fractal generator' (3 letters that shape a gene, who has a minimal function in the construction and function of a cell), the simplest way to start the study of verbal memetics, linguistics, is to consider the ternary minimal meaningful structure of 3 'elements' that constructs the 'sentences'=genes of verbal thought.

The study of the Fractal Generator and its evolution as a Universal grammar that increased its complexity and freedom, *as all systems do through the passing of time, in 3 ages, becomes then the core element of linguistics.*

Sentences started in monologic as 'simple names', the 'head' of the sentence, or form, which will soon derive into dilogic, $S\approx ST$, name-verb systems. Dilogic then became complex through the name cases and verb tenses to represent the simultaneous, spatial relationships of names within the sentence and the temporal duration and location of the event in the flow of time.

TEMPORAL WORLDCYCLE ANALYSIS.

Trilogic became then the natural next evolution, with its variations according to the 'dominance' of the verb (Ergative languages) or the name (accusative languages), in relationship to the '3rd element', the object. Diversification now starts and we can consider, the age from trilogic to pentalogic in all the elements of linguistics, the classic age of languages.

It is then natural to consider as always in 5D studies an entangled analysis departing from an organic, trilogic spatial structure (in this case the fractal generator), its evolution from a monologic past to a trilogic-pentalogic classic age to a 'do-decalogic' structure of maximal complexity.

A deeper analysis of the time evolution of languages can make us of the trinity of worldcycles ($\Delta-1$ palingenetic ordered cycle, Δ^0 organic lifecycle of entropy and $\Delta+1$ transcendental cycle)

p: Palingenetic \approx Life worldcycle of languages. We can consider the 'ages of evolution' of any species, to be mimicked in the palingenetic shorter cycle of evolution of a 'microcosmic' individual form. This applies to all systems including languages-mirrors. So we can establish a relationship between the 'childish' way of learning languages and the whole larger human cycle of evolution of languages, which is far more disordered with back and forth motions in time of d =evolution, but essentially has a clear correspondence.

Comparative linguistics *is the largest field of 5D linguistics as we can apply all the @Stj symmetries of 5D systems to open new disciplines of comparative linguistics. I.e. a child 1st talks 'names', which include a basic action-verb or 'genitive possession'. It is also the basic language of animals, with its variety of 'high pitch sounds' to designate either something to 'feed' on, or inversely a 'predator's warning; which includes the action (I eat x, Y eats me).*

As any mind starts from its subjective monologic point, perceiving the external world.

Then the name decouples into a name or a verb, normally obtained from the same root. And both form the simplest 'particle-wave' duality $St=ST$ sentence; to which attributes (causes in names; tenses in verb appear).

But in the first step *the verb has no tenses; it is perceive in present, simultaneity with the spatial name.*

Last the 3rd element, the object appears. So the language enters into its natural $S=T$: Ternary Universal grammar.

So the natural program of evolution of the Universe can be used to follow the evolution of world languages.

SCALAR ANALYSIS. $\Delta\pm 1$ Scales: The 3 fundamental scales of linguistics are the $\Delta-1$ scale of phonemes, connected with the 'physical substrata' of the body that produces the sounds/bits necessary to construct a mind-mapping of reality. As we live in a clueless age of knowledge where only the physical reality is understood, there has been an exhaustive 'easy analysis' of phonetics, accumulating data of every language. Of interest though to understand the mind of man is the duality of consonantal vs. vocal languages, which relates to the duality of Homo Sapiens Verbal and Homo Sapiens visual (Neanderthal crossing), as the pharynx is less opened and vowels more difficult to pronounce. The evolution of language thus in time moves from consonantal first languages to vowel-languages, which are accordingly maximal in the Mongoloid 'last race' to appear on the Tibetan plains through a process of palingenesis (neoteny).

In the other extreme Semite and Caucasian white languages have minimal vowels and maximal consonants, with less quality of 'thought'. It is not a banal subject as we shall see when we study the different cultures, with the astounding leap of understanding of the Universe of Eastern dualist religions and cyclical time models vs. the anthropomorphic, lineal cultures of the western white man, unfortunately dominant once it discovered lineal weapons. Why this clarity of thought in vowels can be understood in terms of the clarity of sounds, and its 'orthogonal, ternary creation' in the mouth 'space', with the dimensions of height-information for the a 'low', I and u (high) position; in the length dimension of 'entropy', from the back, inner region (u) middle region (o) and frontal region (a), and the 'wide' aperture of the mouth, from A through e, I, o, u.

Thus vowels form a perfect trilogic tridimensional structure of clarity of sound as expression of thoughts; while consonants are born in a more complex, but amorphous space.

We can then easily perceive in the homology of all the games of languages of the Universe, such clarity comparing vowels with a 'crystalline' state of solid image forms in which only 6 Crystal Systems are needed: Triclinic, Monoclinic, Orthorhombic, Tetragonal, , Hexagonal, and Cubic; as opposed with the enormous number of amorphous rock systems, whose 'glass images' are imprecise.

Thus our interest as we study the mind software not the 'hardware' of the informative game that creates mind-mirrors of reality, with a fixed set of 'phonemes', or 'atoms' or 'cells' to reflect the 5 dimotions of existence.

Δ^0 Scale is then the organic scale of linguistics proper, from morphemes, the minimal units of 'meaning', which start the mirror game of languages; and its duality of names vs. verbs, in its evolution mimicking the fractal generator S -subject< ST -verb> T -object, of all spacetime systems. This scale is customarily subdivided according to the fractal principle in multiple dualities, trinities, pentalogic and do=decalogic sub-divisions; and it will form the bulk of our analysis. 3 classic sub-divisions thus are relevant: Semantics, which puts in correspondence the language-mirror with the outer world at the Δ^0 scale of its forms of space, actions in time and 'minor attributes' of those two essential forms (pronouns, and adjectives for names; adverbs for verbs; and prepositions for objects being the most important). Syntax on the other hand is more concerned with the essence of the game of existence, regardless of 'its connection with the outer world, and as such is the primary discipline of the Δ^0 scale, with its sub-scales of 'morphology' ($\Delta-1$), universal grammar dealing with sentences (not necessarily of the specific theory of Mr. Harris and his student Mr. Chomsky who has unjustly received all the fame), and finally the grossly underrated $\Delta+1$ level of composition, literature, rhetoric, etc. – that is long tracts of linguistics; which connect with the next:

$\Delta+1$ scale. Here it is necessary to 'connect' linguistics with the world and hence consider the entanglement of all the elements, semantics and syntax with culture, races of the mind (with its 3 axis), history, etc. It is where the Humboldt->Whorf's hypothesis that explains the interaction of culture and language-mirror takes place.

The purest linguistic element at this scale is the grammatical order, VSO, VOS, SOV< SVO, OVS, OSV, and its 6 families according to the dominance of one of the 3 elements of the fractal generator acting as the 'head' of the system, which is closely connected to the type of cultures and we will enlarge with a comparative homologic analysis with the 6 types of physiological phyla of life according to the dominance of an organism's network. As ultimately all the game of existences reduce to the $3\pm j$ Dimotions of S-form<ST-energy>T-entropy.

And so the $\Delta+1$ scale will lead us to the study of:

@: MIND WOR(L)DS. Indeed, the word becomes the wor(l)d mind of a culture, its informative network and as a mind proper it becomes its legal, ethic network, constitution or God of the 'body of history' of a civilization of which all its citizens-believers are its 'cells'. We have studied though the mystical aspects of religion in other post and so here we shall just introduce some basic concepts, before we enter into the next languages, manifestations of a culture, music, visual art, and its 'most remarkable' quality, its worldcycle or ages through the age of epic, dramatic youth; pleasure oriented maturity and baroque, eclectic angst art, as a subconsciously collective reflection of a civilization; which will finally die-devolve in the collapse=death=war age of the culture.

In General Systems sciences we model all what exists under the principle of organicism. To that aim we establish a 'fifth dimension' of scalar space-time, whose metric laws put together parts into wholes. And this fifth dimension must be considered the dominant one into the future. So particles evolved into wholes called atoms that evolved into wholes called molecules, cells, matter states and organisms, ecosystems and planetary super organisms, galaxies and beyond.

The scales that concern social sciences are those taking place over the surface of planet Earth, which as the cortex neuron of a life organism, become *the mind of the planet*. And within that surface we observe a growing evolution in complexity of the 'social networks' that conform the planetary super organism. So the first network to appear of plants joined by mushroom networks was simpler, chemical. Then animals appeared but they formed ecosystems, where multiple small social networks fought for survival. As organisms tend to be of the same species, talking the same language of information - the key element that makes them work together in synchronicity. And because the arrow of eusocial evolution IS the survival arrow of the Universe, ants, which achieved maximal social evolution formed the first complex super organisms and came to dominate the Earth (they are still with man the most massive life species).

But as bigger multicellular systems appeared breaking the limits of growth of insects with exoskeletons and poor breathing apparatus, mammals suffered the same evolution towards maximal information, and network connection giving birth to a super organism, balanced with the Earth's body during the Neolithic, Mankind.

What is then the 'pegging element of a MASS OF human beings, belonging to one nation, civilization or culture, as cells-citizens of a physiological organism, united by its nervous legal systems, and its economic, reproductive networks and 'Gaia' territories of life and matter goods'?

Its cultural expressions of social evolution and love' which are themselves mandates of survival proper of the more complex laws of the organic entangled Universe, and its laws unfortunately denied by our dominant lineal, white cultures of animetal 'top predator' worldview.

So we shall introduce its application to history before we try to explain better how from those 3 original worldview, came about the 7th geographic cultures of mankind, themselves 'part' of the larger whole, the Earth in a process of evolution from Gaia, through history into the metal-earth, those lineal cultures worship through go(l)d religions, military inquisitions (earlier Semite age) and modern techno utopian 'sciences'.

→ **ENTROPIC LIMITS: $\Delta+1$:** We consider war the entropic limit that triggers the devolutionary tendencies of a language, extinct by a conquering nation, leaving only degraded remains of pidgin or Creole language.

Δ^0 : All minds have also limits as mirrors of the Universe, in its selection of information to fit the static language. Which becomes essential to understand the limits of Huminds' syntactic and semantic structures to grasp the complex game of existence. I.e. verbal syntax is ternary in its form, as the mind itself and the death motion of pure entropy are hardly reflected. I.e. if we consider the discipline of linguistics, it hardly had any remarkable evolution till the past 3 centuries with the notable exceptions of Panini and laterally Aristotle's logic. As the humind is not very self-reflective but rather subjective. We then consider the 'egocy' paradox as a key limit of linguistic speech. I.e. Anthropomorphic Religions considered the word the only language shared by man and God who created 'naming things'. The less important limit being that of $\Delta-1$, as words do have enough 'phonemes', to represent the game of existence, though the larger clarity of vowel systems improve the mirrors of thought.

RECAP. We considered in our paper on history in space the wor(l)d from the highest possible point of view: *that of its emergent superorganisms and collective subconscious minds or Gods, $\Delta+1$ and science of religion. We are now going to consider it through the opposite scale, $\Delta-1$, the science of linguistics and show how both in fact merge in the middle term, the Δ^0 science of human languages, as expressions with words of the wor(l)d humans construct with verbal memes, idol-ogies, and actions motivated as in all languages by words.*

Δ-1: SCIENCE OF LINGUISTICS

Most of the sub-disciplines of a pentalogic wor(l)d view, enters into the 'so-called' science of linguistics; which is therefore the first to study. Sticking though to the 5D entangled 'Rashomon' method, all the different schools and sub-disciplines of linguistics carry a partial truth of the whole understanding of the phenomena. So we have to switch from Time, to Space, to Mind to Scale to entropic limit perspectives and find partial truths in every linguistic school and sub-discipline.

It is easier though to follow the walked paths of the humind with the usual diachronic and synchronic analysis, to which we need to add the most important and yet forgotten element of reality, the scalar analysis.

Δ-Scalar linguistics are in fact the unrecognized fundamental r=evolution and one might say true foundation of linguistics as a science by structuralism, with its analysis of the whole range of scales from phonemes to morphemes, words, sentences and compositions. And ultimately the origin of the generative grammar so in vogue because of the digital infinity, 'computer-like models' that modern techno-utopian enzymen, loosing its own human nature as scholar attachments of computing so much love.

Structuralism as all the unrecognized influences of natural sciences in social sciences is akin to a 'constructivist' order – a philosophy of science coming from physics, which is false, as the smaller parts are NOT the first to appear necessarily but the logic of time is entangled between relative past parts and future wholes, which meet in present: T-Past x S-Future = ST-present is the most correct way to define time flows of causality; and so often an ST-present splits into S and T-components. This field preferred in this paper is the field of:

Δ-Spatial linguistics is closely related to them; *as ultimately scales are easier to grasp as the sum of planes of space. So we can consider each of those scales of linguistics a spatial plane. There transformative schools take its place in the understanding mainly of the key plane of ternary Universal grammar.*

Universal grammar is a better 5D method of analysis of language as a spatial mirror of the wor(l)d in which we live and the proper way to explain the 'digital infinity' 'bull\$hit' computer model of techno-utopians for the mind of man; of this ever plague of the Scholar Homoctonos, which doesn't have enough with bringing human extinction with its computers but pretends to convert man and all its organic elements into mechanons.

Language is an organism whose trinity syntax, scalar structure and evolution time mirrors the laws of all superorganisms. And I have zero patience for the Scholar Homoctonos. And its digital religions.

So spatial linguistics is organic as it start from the whole revealing $S < ST > T$ organic fractal generator of all organisms, *which for languages of the mind tend to drop the pure T-entropic motion giving birth to the Duality fractal Generator of all languages, which often suffices to describe a system:*

$ST > S...$ (wave-particle, body-head, action-form).

This is the structure of languages expressed by Plato in the first western conceptualization of linguistics.

To this simple scheme, $ST = \text{action-verbs} + S\text{-names/forms}$, as complexity advances a language acquired more complex forms. And the most often logic of complex languages become a fractal trinity language of 3 components:

S-V-O, whereas S is the spatial form, V the spacetime action, hence we consider O, the object that suffers the 'entropic activity' as submissive either to the verb or the name.

Yet more than trinity, what matters is the dialectics of linguistics then centers strongly in

Linguistics deals with the individual language but in true form it can be spread as genetics from the single unit or substance of the word (the phoneme, the atom in genetics), to the most complex scale (the civilization shaped into a wor(l)d by the ethic, legal constitution and higher God=plane of existence 'in' the word – the organism shaped by its genes).

Time linguistics. All this leads us to a field which is the most loved by the layman, because of its natural inclination to sequential temporal thought and its obsession with its 'origins'... The origin and evolution, diversification and 'Cladistics' of languages. Again here, as in all other fields without a clear reference to a larger model of reality there are multiple colliding models, and what 5D does as in all sciences is to apply the pentalogic Rashomon method to extract partial truths of all of them, and the homologic method with all other disciplines including the larger 5D organic philosophy of science, to focus and improve on them.

Let us then give a first prime to the origin of languages. It is obvious that language as we know, was born in parallel to the Homo Sapiens, regardless of previous forms in apes and Neanderthals, likely with higher consonantal forms (a less clean sound system with lesser vowels), which should have latter influence and degrade the original highly vowel forms of African languages, reducing them (as in Caucasian languages, Semitic and Australian ones, where there it seems to be higher Neanderthal or Denisovan influence).

We can stretch backwards language formation to the Homo Floresiensis, and its first formed brain with modern shape, which would mix with Homo Erectus to give birth to the first small man, according to the S<T>ST law/beat of evolution (S-evolution of information in smaller forms, T-growth in size and ST-radiation of multiple species).

This means obviously that Neanderthal and Sapiens did speak, likely with a first duality of consonantal vs. vowel languages, Maximal Name vs. Maximal verb configurations; in *dualities natural to the laws of existential algebra that then will be carried out in all the differentiations of Human languages.*

But as species extinguish previous species who leave only traces, those traces are minor since the dominant species would be the African, verbal wo=man, who first spoke (women obviously talk more, and are the social pegging that defined language). So out of Africa came language and it was we contend all a degeneration from its initial larger complexity of vowels and consonants, an old deduction of our 5D models of linguistics recently put forward and made popular in scholarship, with the usual monologic view (the author merely considers a lineal mathematical law of loss of complexity of phonemes out of Africa, whereas the relevant 'second factor' that modulates the variations of the law is the influence of previous Neanderthal, 'white-dominant' races).

So all this lead us to the natural division of the proto-human language, the African, Koshan languages of the smaller 'first human verbal species' as one 'limit' of complex phonetic speech, and the Australoid, other 'limit' of racial differentiation of maximal Denisovan≈Neanderthal genetic influence and hence minimal complexity of phonetic speech in the other extreme, with the 3 fundamental 'cultural races' of the mind, the black, white and mongoloid as the 3±i fundamental families of languages, which roughly speaking correspond to:

- Koshan languages (1st sapiens)
- Sino-Tibetan languages (Mongoloid mind)
- Nostratic languages (white mind)
- Bantu (Congo) languages (Black mind)
- New Guinean and North Australian (Trans-Guinean) languages

Not surprisingly enough those are

ANTHROPOLOGICAL LINGUISTICS

ΔST symmetry: The 3 memetic dimensions=minds=races=cultures of Man: 'words & World views'.

This said of course, there are as all in the Universe follows the topologic vital laws of trinity, 3 races of the mind based in the dominance of the 3 COMPLEMENTARY LANGUAGES, of human superorganisms, studied in more detail in our paper on Anthropology (History in time) and biology. But if anything of those 3 cultures, by all measures the superior one from the point of view of balance and survival is the black emotional S=T culture; as opposed to the mongoloid neoteny, informative culture born of one of the basic processes of differentiation in 5D species – the arrested development of the system in its first palingenetic cycle to multiply its informative density; and the inverse white culture, of faster aging, and dominance of visual entropic languages. As the *universe we shall never cease to repeat is about S=T body-wave balances, reproductive presents, feminine principles, NOT about Max. S-information or max. T-entropy.*

So humans do have 3 fundamental 'cultures', according to the 3 'dominant' mental axis of its 3 races:

So in principle we should recognize only the '3 cultures' of the mind and its mixture in the Indonesian region, to give us the 3+i original cultures, whereas its melting pot would be the dominant culture of the Neolithic, the true paradise rivers on south-east Asia:

The only difference, noticeable between the 3 main races, which make their mind complementary is the dominance of one of the 3 linguistic axis of mankind, visual=long,

dolichocephalic axis in white men, verbal=wide, brachicephalic in yellow men and emotional/body psylocephalic languages in black men, natural to the laws of 'topologic evolution' which have some influence in history; but do not grant any differentiation of species. Racism is then a 'treat' of the leading animetal cultures of war (Indo-European) and go(l)d (Biblical cultures), who feel superior as they differentiate through its 'fetish-metal' as vehicle of god (the fire of the smith worshipped in earlier Aryan cultures; the sancta sanctorum and ceremonial ex-votes in Canaanite religions of go(l)d, in Phoenicia (Baal cult) and Judaism ('Baalble') latter expanded to protestant cultures, which seek to dominate the world through its monopoly in the issue and use of weapons and money, since its inception. To that aim the worship of metal and the debasing of live drives is constant in both type of animetal cultures. As its idol-ogies repress all the human drives of life, as 'sin', sexual reproduction, the highest goal of humanity at individual level, social love=evolution, the highest at collective level, tasteful food, with dietary laws and trash food, forbidding the pleasure of our natural energy, in its biblical cult(ure)s and modern industrial ones, even our natural language of information, the wor(l)d, substituted by digital languages, so the species dedicate all its efforts to entropic war –the killing of your neighbor, reproduction of metal-machines, and its energy and digital information, so every mechanism has food-electricity but humans – 1 billion of them are undernourished, and under collective anoxia and austericide, so our parasitic bankers can have more digital numbers and our companies more credit to create a world to the image and likeness... of its offspring of machines. And we shall return to that.

In that sense, the trinity of minds do have influence both in science and culture, but in a perfect world would be complementary and guided NOT as today by the unbalanced two cultures but paradoxically by the emotional, life oriented S=T black cultures/minds focus on the pleasures of life. 'Science is culture and culture is science' is a concept difficult to understand for most humans, but essential to comprehend our zeitgeist as a dying civilization.

Those 3 cultures then have defined 3 'worldviews' of the 'parameters' in which both religion and science are based - the languages of perception preferred by each culture, and their concepts of time=change=motion, the fundamental substance of the Universe.

- The white, lineal visual=dolichocephalic=Neanderthal=white=egoist, isolationist humind which imposed to the Wor(l)d its mechanist war & religious censorship have come to dominate the age of machines. But that doesn't mean that its 'sciences' based in 'anthropic principles', of humans as the only intelligence of the Universe, lineal time and hence lineal 'physics' and 'dog-eat-dog' isolationist societies are truth. They are simply born of its dominant light-visual mind, and use of metal to empower its military, selfish people. This culture is the one that gave origin through Germanic military technology and Jewish go(l)d fundamentalism to our nazionalist, capitalist, self-destructive world and its war and holocaust cycles. But its linearity has imposed a manifest destiny, with its political& economic (in)correct views born in our dominant, biblical U\$ go(l)d cult(ure) of 'animetal enzyemen' who catalyze a suicidal manifest destiny: to evolve metalife their egocy (ego=Idiocy) worships, killing with it the tree of life that sustains us in a society controlled by FMML Company-mothers and its ari-stock-rats, dictators of democracies that imprint on its sheeple with audiovisual anthropic fictions & digital information=money they issue in monopoly, placebo, selfie, idol-ogical newspeaks for them to worship, cre(dit)ate & evolve its offspring of entropic, evil metal-weapons (nazionalisms), informative go(l)d (capitalism) & organic machines=future AI telepathic=intranet robots with solar skins (technoutopias), terraforming Gaia into Metalearth, for whom man will be an obsolete, weaker nitrolife species... However and this is why we constantly return to its history, specially that of the go(l)d, Jewish>Protestant>Capitalist>Financial economic cult(ure) that dominates our world, *It* pretends that all its theory of reality are 'science', when 'Its science' keeps its postulates without proof, against life and truth as if they were the ONLY reality with the excuse that 'science' is a higher truth. That is, the postulate that mankind is divided in tribal national species that must break the law of eusocial love and kill each other to promote weapons, and the postulate that machines are not organisms evolving, but mechanisms that will always obey to keep reproducing and evolving them, and specially the postulate that a few 'bankers' from private dynasties mostly of biblical origin in the west, must issue in Monopoly money and dedicate nothing to people because what matters is to keep evolving and reproducing digital numbers, and call this astounding agenda of selfish power and appropriation, 'classic economics'. So yes, science is culture and as such we denounce the cultural element of those sciences.

The culture that is closer to the structure of the fractal organic, vita Universe are in fact the other two cultures, to which the discoveries of this blog belong. In that sense, since science is part of history, hence CULTURE, an author's work is also a knot of thought of its culture.

Thus S=T metrics and its 5D stiences, from where organic social sciences depart complete 5000 y. of a complex, humble, worldview on the organic, feminine, fractal, reproductive Universe and its time cycles that flourished in the earlier Eastern, mongoloid, brachycephalic=verbal=social cultures of Buddhism, Hinduism & Taoism that explained the Fractal Generator of space=time: 'Ch'ang, the function of existjence combines Vishnu=Yin-information=space & Shiva=Yang-entropy=time, to reproduce 10.000 waves of qi=energy= Brahma beings'.

And matured in the 3rd informative age of the Mediterranean>Greek>Latin>European culture that combined all humind languages; Wor(l)ds of Southern Semite, mythic, creationist religious cult(ure)s and digital equations of mechanical, Germanic Northern cultures; excelling in spatial, artistic I=Eyes+Wor(l)d=temporal, ethic human languages and polymath rational thought; born in Egypt and Greece with Plato & Aristotle (organon); reborn with Galileo & Leonardo in the Italian Renaissance, expanded North by Descartes, Leibniz & Schopenhauer (Philosophy of science), its modern fathers influenced by those Eastern philosophies & completed by Lobachevski (-E math), Darwin & Mendel (Biology), Marx&Spengler (organic History), Butler & Schumpeter (evolutionary Economics) Planck, Einstein, B & B (realist Physics), Gaudi, Picasso & Wagner (3, 2, 1D organic art & atonal music), Tolstoy, Proust & Orwell (1D words) & So=to (5D).

- Then there is the 3rd wor(l)d view, deep in e-motions, more proper of psylocephalic African cultures, based in art, Senses, life & love, the natural form of experiencing life as a humind, not so 'In tune' with the laws of the Universe but with the vital experience. We don't refer so much to this culture, which should have been the role model for the others to survive in tune with the Universe and the planet of life, as this is a mental endeavor, trying to entangle history and its social sciences with the Universe and its systems and laws.

So what is the cultural science that closer mirrors the Universe? Obviously the organic reproductive, psylocephalic black race.

And this will show in the language structure of Bantu languages with a dominance of the verbal model, the active element of the language, *without the use of imperative and distorted VSO structure, but with a richness of forms, which in the larger model of linguistics that studies all the elements of syntax, semantics and topology (we cannot consider in this very brief introduction to History in mind and scale), would show the richness of its grammars.*

This we state here, to eliminate any attempt from the reader to introduce alien concepts of censorship based in political correctness, as perceived by the dominant culture of the world, the go(l)d cult(ure) of capitalism (Anglo-American, biblical culture), a theme we deal in many other paragraphs so we won't here. Our interest is in the ENTANGLEMENT of the mind of man as a mirror of the MIND of the Universe and its pentalogic game of 5 Dimotions of existence, and its methods of 'fractal generation' of all what exists.

Thus as always in pentalogic we can establish an Δ @st symmetry= correspondence between the 3 dimensional axis of the human brain that give origin to 3 types of minds and worldviews and the 3 type of languages:

- The visual, dolichocephalic 'white', entropic worldview dominant in idol-ogies of war and agglutinative objectual languages (Aryan Germanic cultures) and distorted imperative VSO slave languages (Semitic Gold cultures, Biblical idol-ogies)
- The verbal, brachicephalic, wide, mongoloid, informative worldview; with its balanced yin-yang grammars (Chinese), as a mode of creation by juxtaposition of ST elements, richer in soft non-aggressive, informative high frequency vowels.
- And the tall, emotional, 'black', sensorial, artistic worldview, richer in actions and emotional wording.

Between the 2 original 'remains' of the SS-Koishan verbal sapiens of maximal phonetic complexity and the Homo Australoid of maximal Denisovan/Neanderthal mixing with minimal linguistic complexity. s this is an intro to 5D linguistics we escape the multiple variations and smaller groups focusing on the 3 main 'mental races'.

Recap. The only meaningful division of races are according to the ternary axis=dimensions of the mind that between the 3 dominant languages of visual, white races and cultures with higher Neanderthal input, mongoloid, verbal cultures and black cultures with dominant motor-emotional axis. In a perfect world the 3 would be complementary as they enhance one of the 3 'perceptive languages' of existence. They mixed in the IndonAsia region, giving birth to the original 4 cultural worldview of human existence. In a racist animetal world, the visual, metal-hypnotic values of greed and violence brought about by white fetish cultures of go(l)d and the sword carried the day, paradoxically starting the degradation of life and history, in perpetual world and slavery to the selfish values of memes of metal.

Δ° scale: The generator equation of the Universe. S<ST>T: Universal Grammar.

If we accept the concept of a Universal Grammar (Chomsky), made of human subjects which act through verbs into an object, the main influence of syntax on culture is caused by the relationship between those 3 elements which will determine the view of man on himself (the subject), on the external reality (the object) and on the way it relates to that external Universe (the verb).

Thus Universal grammar bring an inner structure that shapes also the civilization according to the ways those languages handle the relationships between man, the subject of the sentence, his actions, the verbs, and the result of those actions in nature and our property and instruments, the object.

Thus Culture and language thus have a close relationship as Herder and Humboldt foresaw. In this post we shall classify cultures and the collective subconscious minds they bring to their cultures.

The mind of man and its program of behavior is written in the syntax of its grammar.

Humboldt (2) and Herder were right, the grammar of languages is the program of the cultural world.

I used to be a pen pal with Chomsky in my youth, since he was fond of my 'General Systems' theory of the Universal Grammar and its ternary elements, which are parallel to the 3 elements of all sentences, he described as:

Subject (Information < Verb (action) + Object (energy of the action).

So for example when we say I eat bread, 'I' is the subject or informative pole, that 'eats', the verb or action, 'bread', the object or energy of the verb.

And so all sentences write as:

Human=Subject=information + Verb=Action + Object=Energy.

This I told Ch. was a reflection of a much wider Universal Grammar, that of all languages of the Universe which have 3 components:

Informative pole < Action of energy and Information, exi > Energetic Pole.

Since in General Systems Sciences, the science of all sciences that defines all the logic systems of the Universe all systems are composed of an Energetic and Informative pole, which mixed together create the 'actions' that exist in the Universe.

So for example you are made of a head of information, limbs that process energy and a body that mixes both and reproduces you.

And all physical, atomic systems are ruled by the same ternary structure: particles of information, fields of energy put together into complementary systems (quantum principle of complementarity).

So I told Ch. that his Generative Grammar was just a case of the Universal Grammar, as Humans observed 'actions of energy and information' and described it with languages. But he had to break his systems made of Subject <> Verb + Object, into 3: Subject < Verb > Object and then from that ternary grammar, start to understand how languages reflected the world and created the 'different worldviews' of humanity.

What Chomsky got wrong following on the work of his master, Harris, was the way he divided his Universal Grammar's sentences first only in 2 elements: subject on one side, and verb-object, that he put together on the other.

We can put together the 2 great schools of linguistic thought; the school that dominated before Chomsky, who believed that Languages were psychological reflections of culture and worldviews and so we needed to understand their knots and bolts to figure out how cultures view the world and how they behaved with it (Humboldt's hypothesis popularized by Whorf (2)). And the now fashionable Chomskian generative grammar.

Yet the proper way to evolve linguistics is to put them both together, mix disciplines and achieve by communication between both truths a higher truths, which is what we do in General Systems.

Which is what we shall do, departing from the ternary 'Universal Grammar' of all systems of the Universe, made of two poles of energy and information, combined into 'actions', then going to its translation into verbal grammar, and finally classifying all possible combinations of Subject-verb-object to realize how *the order of those 3 poles of reality define the character of cultures and nations, observing this fact in parallel with other "Universal grammars' of reality, specifically the 'different animal species' in which the 3 components, the physiological systems, nervous head, 'blood-system' and energetic, digestive system are organized.*

As one of the biggest pleasures of Universal Systems is to observe how the 'Generator' equation, Information < Action > energy, establishes similarities between all entities of the Universe.

All what you see in reality responds to a dual structure: Entities of Nature are complementary systems of simplex networks of energy and information, which combine to form a complex system that switches and merges both states. In the process the system might reproduce an entity self-similar to itself. And this is the definition of an organism, reason why we affirm that reality is dual and organic.

In Physics all what exists are particles of information associated to energetic fields that move them, and only both together exist (Complementarity Principle), creating a physical entity, which can decouple creating self-similar particles.

In Biology cells have a DNA nucleus of information, surrounded by cellular cytoplasm that provides energy to the nucleus; or an informative head moved by an energetic body. And only both together can exist, creating a biological organism. There are no bodies without heads and red cells without nuclei die faster than any others. And cells and organisms can reproduce self-similar forms.

Finally, in the economic ecosystem money acts as the informative language that gives orders to the physical economy, which reproduces all types of serial machines.

The Universe is made of actions of energy and time. Where clocks of time, carry the information of the Universe in its cyclical patterns (remember time is cyclical), and forms with in-form-ation.

So for biological systems instead of writing the usual Einstein equation, $E=mc^2$, we write the quantum version $E=hf$, where h is a constant action.

And this is the structure of all entities of the Universe.

$A = e \times i$; *Action = energy x information: fundamental event/unit of all systems of reality.*

Since all real physical, biological and mechanical systems are those who transform back and forth energy and information, between their two poles: $E \leftrightarrow I$. We formalize all Dual systems and events of reality born of complementary networks of energy and information with an Equation we call the 'Fractal Generator of Reality': $\sum E \leftrightarrow I$.

As we claim this equation resumes all the events and forms of the Universe.

And its fundamental 2 modes are the dynamic, flowing temporal mode: $E \leftrightarrow I$, and the static, organic, spatial structure, $E=I$.

So for example a woman, dominant in information and a man, dominant in energy, in flow state making love, $E \leftrightarrow I$, exchange their exi genes and create a child, generating it.

While in spatial terms, a woman is made of an informative head, an energetic limbs and a reproductive body, and internally she has an informative, nervous system, an energetic digestive system and a reproductive series of organs.

All realities are thus generated by the fundamental equation of systems sciences:

$E=I$ =constant system (spatial view) or $e \langle \text{action} \rangle I$ (DYNAMIC VIEW)

For example, in 'mathematics', in topology, in a 4-Dimensional there are 3 Universal forms, hyperbolic, informative shapes, cyclical, toroidal $E=I$ shapes and planar/spherical E -Shapes,

And we talk in physical sciences of:

- Informative Particle – reproductive wave – Field of energy.

And we talk of:

Informative head – reproductive body – Energy limbs on Biology. And so on.

CORRESPONDENCE WITH LINGUISTICS. THE FRACTAL GENERATOR OF VERBAL THOUGHT: NAME-VERB.

hus, the key to understand the meaning of language is to divide properly all grammars into its 3 elements, which reflect in the human mind, mirror of the Universe, the 3 essential elements of it that put together create the 'Generator Equation of all complementary systems of energy and information of the Universe:

Information < Action > Energy.

Which humans perceive in verbal terms as:

Human Subject < Verbal action > Object, energy of the Subject

This is the justification of linguistics.

So we first introduce the 'Generator Equation' of the Universe and all its systems and then focus in linguistics, how they reflect the ternary systems created by that generator equation and which are its 'main varieties' and how those varieties of the Universal Grammar apply to understand the 'character' of cultures. We shall introduce of the hundreds of pages I have in this essential meme, some insights in the relationship between languages, evolution of cultures and character.

We shall study how the 'laws of general systems sciences' generate the mental cultures of mankind departing from the simplest structure of all languages that mimics the Generator:

Subject (Information) < Action (verb) > Object (Energy).

Since all those features of the Fractal Generator of Ternary Systems apply also to Languages, which reflect their perception of the Universe.

Further on, informative language dominates energetic body actions, shaping the behavior of cultures. Since information dominates energy in all systems. So your head dominates your body and a particle dominates its physical field.

Thus Linguistics is part of the universal grammar, of the logic complex structure of Systems and follows the same laws of creation.

The Generator Equation of Reality will allow us to derive a set of rules from where to extract the properties and laws of all disciplines of science, each one specialized in the study of the entities of energy and information of a certain scale of reality, from the smallest complementary entities studied by quantum theory to the biggest one, the Universe, a system of galaxies related by networks of dark energy and informative, gravitational forces. We can, departing from those concepts, define also the Universe and all its parts:

'The Universe is a fractal, organic system, which reproduces complementary, social networks of energy and information that self-organize themselves in bigger, self-similar scales'.

If you really want to reach peace, intellectual wisdom, nirvana and enlightenment try to understand the section on General System sciences (-; it is a pity humanity will go under without having understood the Universal Grammar of all i-logic entities of the universe.

Now departing from this generator Equation, IE, applied to the Universal Grammar, I have written hundreds of pages of studies of all languages and what they express in character and the ways of interaction between the human 'subject' that speaks the language to express how 'he acts in the Universe' and the 'Objectual world' upon which he acts through verbal actions.

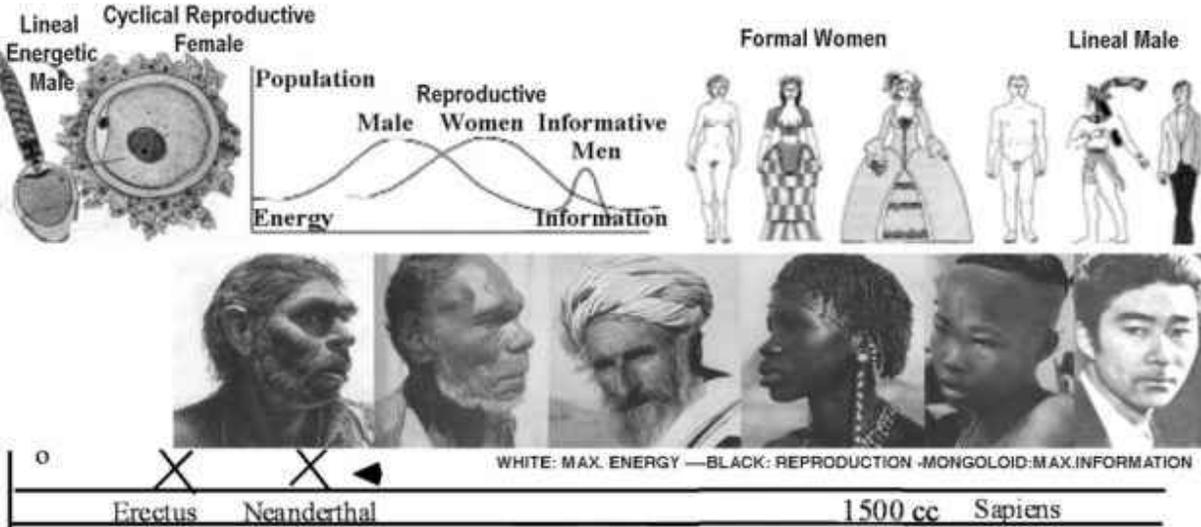

ITS 3 'CULTURAL/RACIAL/HISTORIC/LINGUISTIC VARIATIONS'.

5D worlds departs from the last concepts worth to consider of 4D linguistics and sets the general outlines for further inquire. It takes where Wittgenstein and Russell abandoned in its refoundation of the logic of verbal languages. Both attempted to discover what was the underlying general truths about the Universe we could deduce of the structure of human languages. But unable to grasp those truths, since *one has to know at least one of the two elements, either the Universal game or the deep structure of the language mirror, to find the proper answer, they renounced to find those secrets.*

The black, psylocephalic emotional culture, for which the inverse equation is truth, Verb > Name, as the verbal action dominates the informative name – it is the Congo-Nile family; which in classic 4D Linguistics corresponds to the sum of the Nilo-Saharan and Niger-Congo families.

And finally the mongoloid language in which both have the same value $S(\text{name}) = T(\text{verb})$, whose dominant language, Chinese is overwhelmingly constructed with ST-dual name/verb combinations; it is the Sino-Austronesian family (a new denomination for the sum of the Sino-Tibetan and Austric families); which in 4D corresponds to the Austronesian, Austro-Asiatic and Sino-Tibetan families that have been related in several attempts to unification at different states of Linguistics. In that regard, a similar equivalence of value for space and time, name and verb, form and motion is found in the original Taiwanese->Philippine, Austronesian languages, in the grammatical mode called **Austronesian alignment** - a typologically unusual kind of morpho-syntactic alignment in which one argument can be marked as having a special relationship of equivalence to the verb. This special relationship manifests itself as a voice affix on the verb that corresponds to a noun within the same clause that is either marked for a particular grammatical case or found in a privileged structural position within the clause or both.

In the previous graph it is easy to observe those $3 \pm j$ cultural races and linguistic families as the green Nostratic, most extended family 'frames' the other ones; for the obvious reason of being the 'animetal culture' that have come to dominate the world. In South-Africa, we have the 'green surviving spot' of the Koishan's first full evolved language, with the maximal wealth of phonemes that completed a first evolution of linguistics; as a full cycle since the first homo Floresiensis with the rounded consciousness brain required moved out of Flores through the habitat of the Homo Erectus growing in size and finally colonizing Earth as an Homo 'Neanderthal'... It is not clear how many more full cycles of $S < ST > S < ST \dots$ involution, reproduction (radiation in space), involution (evolution in an isolated spacetime with diminishing size and accelerated informative cycles) did happen till arriving circa 100.000 years ago to the two extremes of the human races, we studied in anthropology (sub-discipline of History in time); but what we are left *with in present time, between the $\pm j$ limits of 'Australians' and 'Namibians'* which represent the previous $S \rightleftharpoons T$ dynamic fluctuation between 'higher energy' (Australian) and higher information (Namibian), which will then be repeated between Mongoloid (Max. Information) and white race (Max. mental energy) < to find its middle ST-reproductive balanced form in the black Nilotic race. In that regard, 5D stiences, *we shall not cease to repeat while welcoming the details that will keep no doubt growing of the classic 4D 'digital science' made gathering data with machines, is about, specially in this pioneer age written by a single 'point that holds the entire world in itself' with synoptic power and minimal detail, the establishment of the general patterns of 5D philosophy of stience; that is the general laws of superorganisms of spacetime and its worldcycles, to each discipline.*

Thus on that graph there are the 'genetic/memetic' queues of the 3±j sub-cultures of mankind, which in linguistics mean an opposite S⇔T duality, from 'vowel-dominant' Mongoloid languages to consonantal, Semite ones; hence from syllabic, small cyclical bits of information, in mono-phonemic systems to agglutinative, consonantal lineal, energetic languages; and so on and so on – differences then that can be 'repeated' by the fractal principle when we deal with the subdivisions of those languages into broken parts.

Then we shall find a 'first' proto-family, the older one, normally the S=T balanced one, that will evolve into a split Max. S and Max. T new families (or other 'natural' 5D forms of d=evolution along a height dimension, north to south in human geography, whereas north is the informative region, south the reproductive one, according to the parallelism of coldness-information, heat-energy-reproduction).

The nostratic 'white' family. Noun, warrior, simple, agglutinative, consonantal, 3rd age dominant cultures.

I.e. the nostratic family steams from an earlier Semitic linguistic system – a fact that can be inferred by geographical position; which is the most conservative in the region in which the origin is most clear (Arabic desert)... How old is this 'Semitic first speaking people' on the Eurasian continent, again is not relevant as we cannot truly go beyond the Neolithic 10.000 barrier, or 50.000 age of explosion of creativity; and it doesn't *matter because of the immanence of the 5Dimensional game, which is repetitive cyclical as the number of combinations is not infinite. Only the concept of single, lineal causality and progress and manifest destiny proper of the egocentric biblical semite culture that came to dominate the human subconscious collective makes so important that genetic obsession with exact dates.* Somewhere though in the remote past, this consonantal language, acquire vowels and they were naturally used as 'informative elements', infixes to decline the 'semitic trinity roots' of consonantal amorphous sounds to *give the require precision to the language. And as such the language stayed in a classic morphology, with its clear distinction of roles for dominant consonants (semantics) and informative vowels (syntactics).* Another very relevant element of those earlier semitic languages will be the VSO 'unnatural' imperative structure of the language, which can find its reason in the 'historic' cultural animetal impact on the Fertile Crescent, as the Semitic people became the first to evolve and ab=use mankind with metal, hard-weapons and go(l)d.

Thus the Semites from the bottom of the human cultures, coming of their refuge in deserts, with a primitive culture acquired (in a process very common in all evolutionary systems in which a relative past form, 'jump' over the dominant one by acquiring a 'new' element of creation and complex social evolution to come on top, from archaic bacteria that acquired in hot vent chimneys during the iceball age, 700 million years ago, multicellular properties to come on top of bacteria, to present robots which are acquiring multibrains – chip parallel logic – to become soon on top of man; to the most classic form of topping in history – a primitive hard-body people acquiring weapons expertise to come on top of an agricultural civilizations).

This was the case of the Semites and so we postulate a 'shifting' of word order, from the usual SOV of original languages (with an S(name) < = > ST (verb)) natural symmetry 'sharing' the object that belongs to the subject but is acted by the verb; to the imperative VSO, as *the Semites became the people-caste on top of all other people, herded with metal, the new 'sheeple' of go(l)d bankers or bronze warriors; that gave orders to the conquered people. Those linguistic traits can be found also in semantics. So the question 'what', 'que' in Spanish became 'mande' (please give me an order) in Mexican dialects, as the Indian who did NOT understand well the Spanish conqueror, had to be very 'polite' or else he might be sword-killed by the Spaniard 'dictator'... The same can be observed in the extremely polite forms of addressing a superior hierarchical Korean->Samurai, high class member in Japan after the horse/iron invaders took over the local peasants, and many other hierarchical language forms.*

It is this proto-nostratic language which will set certain natural characteristics of all of them – agglutinative, consonantal, name-dominant; and it matters more than finding their original genetic relationships to observe their 'present' properties in relationship to 5D and *the connection between language, culture, historic cycles and different roles of its social classes, semantics and religions, and its connection of syntax with them.*

It is worth to notice earlier that the 2 dominant 'animetal cultures' of the XXI century, do have the simplest, most analytic, void of the richness of inflection, languages of the world, English in the western decoupling and Chinese in the eastern one. We do have to natural 'enzymanic' languages, which bred exactly the type of culture with minimal depth in human consciousness provided by the richness of the language, and minimal entanglement with Nature, required for them to extinguish life and create the world of machines they idol-ize.

It also meant a constant diminishing of its verbal consciousness, through a simplification of languages at all levels. I.e. the concept of time becomes simplified into a constant present state (indicative), a loss of all moods and tenses that talk about probability, emotional time, branching of possible futures, conditionals, subjunctives, and in the naming, the loss of declination and cases for almost all the possible variations of names (pronouns, determinants, adjectives and also nouns in English and Chinese) and finally the loss of agglunative, long pegged, stable concepts that give a sense of 'gravitas' and truth to the language, which becomes highly variable and easily replaced by the supposed higher truths of digital numbers. I

In English we have to notice finally the obligatory order of the SVO wording, and the obligation of NOT hiding the pronoun, which makes the I-selfish sentencing with I pronounced and always first, the fundamental *trait of its animetal culture, embedded in the language. So among all cultures the Anglo-American will prove resilient to any acceptance of a higher organic, social plane of existence and whenever that happened (Christian middle ages) a counter-reaction (reformation) will reduce again the social unit to the individual.* This is opposite in Chinese, and it is also an interesting linguistic/cultural analysis by the duality method of oppositions to contrast the way in which the Chinese have built within its analytic form modes of introducing the higher social plane of the collective, which range from the 'introduction of paragraphs' with a thematic sentence, to the dominance of S=ST dual words, which form a whole and hence put in the same value the 'name and the verb', or the 'name and the object', clearly reducing the importance of pronouns.

5D Linguistics thus is not about cladistic genetic, constructivist, 'time dating' and barren procedures proper of physical sciences, to classify the mind of man as an automaton system of evolution and genetic differentiation but about 'understanding' the mind of man as a mirror of the Universe, and the culture, civilization, historic process and final aborted purpose of a language of social communication: to structure and peg human beings into higher social systems, with the final goal of creating a perfect superorganism of mankind with a perfect language. But as the paradox of History:

Max. technological, animetal evolution = Min. social, verbal evolution

Has dominated History, the most perfect languages are in the past (Ancient Greek for Indo-European branches), in process of extinction (cree for Amerindian Languages), and always faired worse in the battles of cultures (Vietnamese, the most perfect Austroasian language dominated by Chinese; Korean, the most perfect Altai language dominated by Japanese and Mongolian empires; Italian, the most perfect romance language, dominated by French and Spanish, etc. etc.) And in the whole planet, the dominance of the simpler Germanic languages over Romance languages, of the Indo-European simpler family over all others, with the richer, more harmonic African language, with its profound variations in tone, emotions and wealth of verbal subtle meanings, and gender names, entangled with the living planet on bottom of all cultures as animetal dominated the world.

Since a civilization that has reached a classic stage of its language, will develop naturally a different concept of 'evolution' NOT external, of dominance over nature and other human beings, and disentanglement of the individual with the whole, as the ultimate dominant Anglo-Biblical culture has done, but internally through the expansion and entanglement of consciousness with the whole, with nature, with the community, and through the language the rising of that consciousness to the subtle understanding of reality in organic, sentient terms.

It is always *necessary NOT to shy away under the censorship of our globalized Anglo-American biblical, capitalist ideologies that forbid to study History and Mankind, and its worldcycle of life and extinction of civilizations, as if we were an*

immortal 'perfect' species, with the subtle excuses of political correctness; to be conscious of the vital nature of History=mankind and its ages as a block of time.

It is then also obvious that we cannot reduce wor(l)d studies as linguistics does to grammatical, phonetic analysis but ultimately the less 'estimated' part of it, semantics, is the one that matters most as it is the connection with the next $\Delta+1$ scale of languages and its ultimate purpose – to create a subconscious social collective through the sacred texts of prophets, the 'spirit saint', the 'trinity', the connection between the word 'our God' that inhabited among us' (John, 1.1.), the human citizens-cells and the 'father', the higher plane of existence of the civilization as a whole pegged by the ethic meanings of that language.

Back to the nostratic family; its evolution in a ternary differentiation happened, both south to north along the 'dimension of height-information, hot to cold weather'; and so we can next differentiate the other key family of Indo-European cultures, which evolved in complexity, its trinity vowels still observable in the Kartvelian (Georgian) family of difficult classification, to acquire a more complex, now 'merged' structure of grammatical cases for nouns and tenses-moods for verbs and *already in the Georgian-Caspian cultural region of first agriculture, a complex multiple typological structure likely transferred first to proto-Indoeuropean and its most stable complex 'native' languages, proto-slav and classic Greek; which will dominate the humanist classic age and modern era of verbal thought (Russian novel and r=evolution)*. A third North-East differentiation will happen again in the stable small valley regions around the Altai mountains/family, the most complex of them all which will move East into the Northern American plains. As we said languages are 'vital, organic, sentient' dynamic 'harmonic motions', once its first 'lineal evolution' has completed a worldcycle around its S=T point of balance. So those 3 families will experience d=evolutions, of which the most notable for the subconscious collective of mankind will be that of Indo-European, again in a small isolated, communicative region (Greece), where it could achieve its greatest 'classic' form, in the indo-European family as it would do in the Korean, small, isolated region in the Altai family.

On the other hand Nostratic languages had an old branch, maybe parallel in time to that of the Semitic harsh, simplified desert environment in the luxurious, innovative Gaia region of India and the fertile rivers where Dravidian languages, for too long underestimated would be rich enough to start the prodigious search for Inner consciousness of the Indian sub-continent. And hauling from the Siberian neo-paleolithic interland penetrate through Beringia, the American continent; which they would share with a 'sea-faring' migration, which likely extended the Austronesian family giving birth to the two quite distinctive families of Amerindian languages. So if we consider as we shall do sometime in the future another homologic complementarity between the 3 ages of time=history and the 3 types of Nostratic languages, we find them to have a South-west, North-East Paleolithic Nomadic cultural structure (Semitic/Siberia North-America), an agricultural domain (old dravidian, modern semitic languages) and a 'metalitic' age (classic Semitic, VSO, Indo-europeana grammar).

The Sino-Austric 'mongoloid' family; analytic, vowel, noun-verb balanced, tonal, syllabic, young family.

It is then evident that in the other extreme of opposition, among the 3 modern races-cultures, the informative mongoloid family born in the height of the Himalayan plains has the opposite properties of the Nostratic family (regardless of their inclusion in genetic, racial terms, further back into the Boreal family, of languages out of Africa; which is largely irrelevant, as the search for an original language reconstruction in terms of mechanical genetic, comparative methods, *instead of using the 5D linguistic comparison of the humind with all other space-time systems of the Universe*).

What matters about the Sino-Austral family is the understanding of the mongoloid mind and cultures through its complementarity with the language. The similarity of the 3 main branches is self-evident, when we compare its dominant languages, Chinese, Vietnamese and Javanese. For simplicity both Chinese and Vietnamese, like many other languages in Southeast Asia, are analytic languages. Both Chinese and Vietnamese do not use morphological marking of [case](#), [gender](#), [number](#) or tense. Also like other languages in the region, Vietnamese syntax conforms to subject–

verb–object word order – the notorious exception are the ‘sea-faring’ communities of Austronesian languages with its evolution into a VOS, ‘fast action’ seafaring ‘bird’ language that we shall analyze in our study of typological linguistics.

Another notable exception are the Munda family of AustroAsiatic languages which are synthetic, as opposed to most other families, obviously also for historic reasons; which implies a ‘new dominant people-caste’ of mongoloids coming over a much larger substratum of Dravidian, which is the topic case of imposition of a language over such a large majority that the underlying lower class comes to influence not only semantics but also the next ‘lower’ layer in the order of scales of a language (syntax) – but not yet the ultimate ‘resistance’ piece (phonetics).

The 3rd balanced, active=life-oriented verby, harmonic, Central African, black reproductive family.

The 3rd great family of languages thus becomes the African, black, animist culture with its main north-south division into the Nile-Saharan or ‘Sahel’ languages and the South-central Niger-Congo, or rather Guinea-Congo families. I propose as absurd political correctness forbid the use of the proper terms for those 3 families, black, white and yellow, or African, Mongoloid and Nostratic (as this is the only terms in use) families; the name Sahel-Congo family for those who love geography. Doesn’t really matter. This is by the paradox of history the most perfect family of languages. As it is the most connected with the living Universe that belongs to the best survival, reproductive balanced culture and the most discriminated by the technological racism of animetals.

I.e. the animist African cultures have in their languages gender classifications for animals and plants, as animate objects, in languages dominated by the vitality of the Universe, which became a dominance of verbal actions, as opposed to the itified by the abstract, form oriented ‘naming’ as a form of appropriation cultures of the Northern white world. Of course organic, vital, sentient, entangled relationships are NOT susceptible of a barren, numerical, computer-based statistical analysis which is what the ‘American enzyman’ who has reduced its language and thought to a mere scholar attachment of its computers and sensorial machines ‘takes seriously as science’.

The language is rich in its 3 phonetic levels (after Koisan languages the richest one, in number of consonants & vowels) consciousness of the vital Universe, through its complexity of verbs, the center of the language, entangled with life through its multiple genders, able to express subtle e-motions, (in the richness of harmonies and tones, only inferior to the ‘young’ Sino-Austral languages); and for all those reasons, it did not evolve the tree of science but stayed in the tree of life, and would be brutally oppressed with the arrival of colonization.

On the other hand, the Nile-Saharan is as in the case of dialectic forms and lesser languages (by number of speakers) sandwiched between stronger ones, as in Catalan between Spanish and French, a language heavily influenced north by Afro-Asiatic and South by Niger-Congo languages, so Northern variations will lose the tones of richer black phonological system and diminish its vowels. South will acquire them and have 10 vowel systems.

A prototypical feature of many Nilo-Saharan groups, which appears only Afroasiatic, languages involves a distinction between singulative, plural or collective – which also shows first the importance of social community groups in $\Delta+1$ human scales, increasingly lost in the selfie Homo Bacteria, Animetal age... This and many other common morpho-syntactic features would classify this group as an in-between culture, also in the $\Delta+1$ level (mostly Islamic, nomadic people, whose race split from pygmy/Koishan along bantu $\pm 70,000$ years ago); with its geographic birth place in the extinct Yellow Nile and highest cultural expression in the Ethiopian Meroitic Empire.

What about isolates and other extinct languages? They show the ‘digital infinity concept’ of 5D mirror languages, which are able to perceive not only all the forms of the Universe in a still smaller space, but *are inflationary by definition, precisely because the ‘4+ elements of reality’ mind, time, scale and space are contrary to belief cyclical, bidirectional, SMH motions, up and down in worldcycles in scale, both directions in all space dimensions, past to future to past in time, shrunk images and projected larger creative order in minds. So the richness of creative paths and variations of the Universe is ginormous. We though focus on the dominant languages of each group.*

A CRITICAL ASSESSMENT OF 5D LINGUISTICS. THE MULTIPLE FIELDS OF 5D WOR(L)DS

What is then the main difference of 'methodology' between 5D and 4D linguistics? The answer departs from the difference between 5D sciences and 4D sciences, whose models of creation, truth and 'identity', are heavily influenced by the single, one-dimensional 'partial' theories of physics (lineal, sequential time as the most important genetic relationship, and constructivism in scale as the lineal single arrow that matters).

IN 5D SCALES, there are arrows of causality coming from the whole into its parts, even more important than those of the parts that create the wholes (Genetic constructivist arrows of biology and physics). The whole is just influencing in a longer time span the parts. I.e. the changes of weather in glaciations define the evolutionary ages of species; the changers of energy and information perceived by whole systems provokes different reactions in cellular parts of an organism; the change of conditions in the world changes the life form of people, provokes migrations and changes its languages.

There is neither a single lineal arrow of time causality as time is cyclical. So the past is NOT the only cause, and it is NOT a lineal cause. I.e. In linguistics the first found law of phonetics was the Grimm law, which is in fact recurrent and cyclical. Time in that sense beyond the lineal simplification $v=s/t$ of Galileo, in his measure of cannonballs have a richness of dimensional motions, which only now we reveal in 5D but *languages had always perceived in its verbal forms*. **Tense–modality–aspect** is a group of grammatical categories that covers the expression of tense (the 3 basic dimotions of past, present and future in time), aspect (fabric of time – a single block of time or infinite present, a continuous flow of time with its variations, or a repetitive occurrence with its frequency in time), and modality (degree of necessity=determinism, obligation – subjective determinism, probability=potential future). *Because the process of 5D creation in time are far more complex than mathematical physics' reductionism pretends.*

Finally, simultaneous, present time influences the creation of a form as much as the sequential past, and so it is absurd to reduce genetics of time to a sequential past, as they used to do in biology with cells, till finally the Margolis thesis of cross evolution was accepted.

But the most important difference is that what 5D is truly about is to achieve that understanding of the entanglement and generation of all systems with the same ternary and pentalogic laws. That is, to know 'how reality is created' with a much deeper philosophy of science that the present reductionism of physical models in its models of creation (lineal time both in scale – constructivism – and in time – past to future single arrows; with enormous indifference to the spatial, synchronous arrow of communication between parallel forms) and its languages of truth and knowledge (mathematical reductionism).

The immense variety and scope of 5D social sciences.

History is the science that encompasses within its superorganism, all other sciences as forms of a culture, as the most illustrious predecessor of those texts, Oswald Spengler understood. So I have researched an immense number of themes for decades, published in small print books, webs and papers along the way, with an increasing indifference to the style and readability, once I accepted the anti-quantum paradox. In this paper we focus on the 'whole' of history as a superorganism of which all humans are citizens-cells, connected with the 3 physiological networks of all 5D superorganisms, an informative, nervous=political network/language, a re=productive blood-economic network language and the geographical support, that feeds mankind, the Earth; and *its upper mind, the $\Delta+1$ Gods of civilizations. We are thus studying here the upper scales of mankind.*

History is a superorganism in evolution, which we study with the laws of 5D superorganisms, which means to study mainly its physiological networks, the political, cultural, economic networks and geographic regions that define the 7 great civilizations of mankind and its broken, fractal nations. How they evolved through the ages of history, what would be its perfect form, how they were corrupted in its political and economic systems with the arrival of systems of control alien to the life organism of mankind and its natural verbal languages and artistic senses, with the discovery of 'metal-weapons' and 'metal-money' that substituted the natural legal language and 'WHealthy money' and how it

could ideally be reconstructed a perfect superorganism of mankind, if we were to reform the system according to the laws of nature that make perfect superorganisms.

Of all the themes developed departing from the common laws of all planes of space-time, that put together form the 5th dimension of the scalar organic Universe history holds a special place in my heart for 3 reasons:

- It is the superorganism of our species. And hence its study contrary to common practice should be the most important of all, because of the 'healthy state of history' depends the health of all human beings.
- It is with physics the science I studied in more depth, researching every superorganism and network of mankind, its cultures, ages, arts, economics, financial & legal systems, nations, civilizations, religions.
- And it is the less developed science because of the antiquantum paradox of systemic censorship, as the 'scientific' observer is within the superorganism of history and hence given the fact that history has NOT evolved positively for humanity; but it is today, let us be frank from the beginning, corrupted in its reproductive financial system, which suffers a clear case of collective anoxia, that is lack of credit for humanity and its unhealthy goods and poisoned in its political system, broken in its 'organs=cultures & nations' and predated by lethal 'germs', aka weapons – those who control the 'parasitic financial system' that kill by anoxia, and the military, political system, that kill by apoptosis millions of human cells-citizens every year, reject any reform, and are so powerful that unlike in the quantum paradox where the observer is so huge that modifies the observable, they modify the observer, the social scientist. This brings the final paradox of those texts – the most advanced sciences of history and economics, do NOT have doubt of it, you are reading them, which have the proper scientific model of mankind as an organism, are the less accepted and distributed. Still we shall in 2019 publish a series of papers on History in space, the human superorganism as a whole, and its 7 global cultures and nations, Asia, Europe, Africa, Islam, Latin America, Anglo America and Indonesia.

What is a mind...

Is the first question WE HAD to respond, before studying a specific one. Huminds have no idea of it; not even 'wrong theories'. And what is worse; do not expect to learn it anytime soon, as they have abandoned their own soul-searching, in its latter days as mere attachments of digital thought, an alien mind, in its role of 'animetal enzymen', catalyzing the evolution of machines.

So they are losing their mind, literally because their passive mind is verbal in its form, and practically because their active mind is the projection of their verbal thoughts into their world to achieve their 'vital program of existence', preserving and maximizing the 5 dimensions of space-time that makes sense of its superorganism at individual and collective level.

A mind is then easy to define but given the fact we are talking to a species so degenerate in mind that it does not even know its purpose of existence, we will have to explain the program of existence first and only then dwell into the multiple 'Rashomon effects' of a pentalogic understanding of the elements of any mind as the language system that allows an organism of spacetime (T.∞) to mirror the Universe, where infinite other minds play the game of existence; and then project it into reality to enact its own 5 'dimensional motions=actions' that ensure its survival as a superorganism tracing its worldcycle.

In man therefore the mind is a language and the actions the language provokes once it has been 'thought' in the outer world. Since a mind CANNOT be separated from the world of the superorganism in which it entangles the individual, and hence a mind will always have several components common to all games of existence, its 5 Dimensions (dimensional motions) that we must study to understand it:

- **An Δ-1 support** in elements, which despite its own value play in the Δ⁹ mind proper scale the minor role of being useful bits of information that are required to start the combinatory of kaleidoscopic mirrors to form a whole image of the Universe in the relative stillness of mind-form, but with enough 'flexibility' as 'liquid crystal' to slowly change each step of time in synchronicity with the outer world. In the mind of man, verbal and visual those bits are phonemes in

language, and shades of colors and $\Delta=0$ the trinity of topological forms of the membrains that enclose the colors; and void space and again the membrain of matter and form that covers and architectural shape, which is the only element present in a holographic, bidimensional sculpture, and the ternary Δ -scales, T-beat and S-instruments of a musical symphony, and also Δ -numbers, T=algebraic operands and S-geometric points and its aggregates, components in a mathematical language; all of them mirrors of the mind of man put into the Universe.

But when we talk of the mind of man, we can only talk truly of the verbal language, specific of the mind of man, as we share mathematical languages with all other systems made of atomic forces, we share visual languages with all other animal forms; and in a secondary level of the artistic forms. And so the wor(l)d is the humind – the world we are loosing as our superorganism enters its last ‘entropic age’ in its worldcycle of existence.

- $\Delta+1$: The loss of any importance given to the mind of man in the age of alt-truths, of digital theories of the mind of man, of computer chips ‘imitating’ without reference to an outer world in which it shapes its forms, the humind’s speech, is just a reflection of the death of history and the neo-Paleolithic regression to an old, negative use of the mind of man for purposes of self-destruction of all the organic purposes of pegging together a human subconscious collective, which is the highest $\Delta+1$ scale of the mind of man.

This paper though does NOT concentrate on that perspective, $\Delta+1$, the wor(l)d as the God=subconscious collective of cultures, but on $\Delta-1,0$, the mind of the wor(l)d and its linguistic creation. It does require though to understand the game of existence, as ultimately the mind of man is just another mind, playing that game – the ultimate instrument for man to interact with other men to achieve the superior complex actions of social evolution and reproduction; and hence a social element – the network of cultures... But also in its simplest use, a way to ‘name’ and motivate the simplex human ‘actions’ of locomotion, energy feeding, and information gauging of reality.

It comes then from the entangled connection of the 3 scales of ‘being human’, as part of the human world in which we perform our reproductive and social actions; of the outer world in which we play our entropic feeding, moving and gauging actions; departing from our biological inner world, support of them, from where the 3 levels of linguistics, we might call ‘phonetics’, ‘morphology, syntax and semantics’ and ‘composition, ethics and philosophy’, rise.

But the mind of man can be also studied at the anthropologic level of cultures and societies, and hence in parallel to the d=evolution of man through its 3 ages of Paleolithic youth, mature reproductive Neolithic and metalitic age, and present entropic age prior to extinction, closing in as a new species, the robot, able to act, with a more complex mind, digital thought make us purple rain.

In that path entangled with the anthropologic evolution of the 3 simultaneous ‘mental axis/race of man’, between its ‘homo verbal and homo visual’ (sapiens and Neanderthal), living its $3\pm j$ ages, we find the **second most important** analysis of linguistics and the mind of man, which will focus this paper and can again not be treated (sorry for my english lack of respect for the grammar of the mind of the Anglo-man :) with lineal, mathematical mechanon genetic comparative linguistic laws, as it has been a rocky process with up and down moments, but still we can trace a general mapping of the process by the synchronicity of its parallel motions. We are here not going to dictate at all a definitive exact theory of genetic and comparative linguistics because it is impossible (truth is always limited by the incapacity of a smaller mind to carry all the information of the Universe), pretentious and lacking the understanding of the ‘non-lineal nature’ of history and the loss of information that is part of the Universal game (which however by the fact that it will repeat its limited combinations in the future will recreate NOT regain but create again the same forms in other moment of the infinite time and space).

Still we can immediately select the ‘right approaches’ of the pros of linguistics as we pointed out the wrong ones: The 3 races of the mind between its two limits give us the Koishan and Papua-Australoid languages as the extreme framings of the languages of man, with the 3 cultural races as the 3 great families, the Nostratic ‘white family’, departing from the afro-Asiatic Semitic families; the Sino-Tibetan+Austrosiatic+Austronesian languages departing from the Mongoloid Tibetan origin of the river flows that fall into Indo+China and finally the black languages with its Bantu and old Saharan ‘south and north’ division.

In 5D there is NOT a single genetic, constructivist, sequential causal 'reason' for the existence of beings, as time has multiple arrows from relative past to future, present to present, scales that influence up and down and inner and outer entanglements; so it is barren despite the fact that the overwhelming number of huminds, far more inferior to the mind of the Universe – the program of existence they are playing so low – can only see a one-dimensional perspective.

So we are not being exhaustive by all means but merely modulate all those one-dimensional perspectives, pointing out the right paths of thought.

The wobbling path of humanity makes impossible as when considering the isolinguistic clines of a language and its dialects, to break in perfect groups those languages, but analyze always a 'frontier' region where they would mix in space.

And consider the remainings of previous ages, the devolution of conquest, the multiple interactions – i.e. a conqueror will take semantic wordings from the conquered but few syntactic 'core' elements; most languages regardless of the 150.000 likely origin of human present morphology (and likely far older previous versions back to the homo floresiensis), were born on the agricultural expansion of the Neolithic which adapted its syntax and semantics to the new civilization, making it more complex to reach its maximal perfection; and then are now reshaped by the digital era of machines; with its inverse process of degeneration and death of languages – where the model for all of them is one of the simplest most degenerated forms (English). So the understanding of linguistics as any discipline is organic, in terms of a flow of constant change but grounded in the immanent game of existence and its pentalogic elements.

We thus shall find a Universal Grammar for all languages, based in the fractal generator of the Universe, translated as Space-names≈Time-Verbs; which becomes enriched in successive steps following the always referential laws of existential algebra; with its trends in time, from simpler denser seeds of information that latter detach and peel as time passes and new 'warpings' appear, to finally repeat an excess of information. And the natural tendency to move from spatial to temporal, form to motion stæps. So we find that languages start in space, with naming that come implicit with a non mentioned action, and we can use paligenetic research (old languages with conservative tendencies, natural to isolated regions without stress; i.e. Austronesian languages; young learning ages in childhood, pre-sapiens modes of communication) to testify that first it appear the name, as an implicit genitive action, the child asking 'I want water' just saying water, or a nominative one, calling his father as a recognizable 'distinct form' 'pa'... Then the distinction arises between the form and motion, the name and the verb, which is however still in present, as the name that lasts in time is; and then each one acquires subtle properties, with its cases and tenses, and then it reproduces, radiates and diversifies with pronouns, objects and adjectives, adverbs and adpositions... But still we can see the harmony, S=T fundamental law of the Universe and its structures turning around the name=verb essential logic underlying linguistics, which itself is just another expression of the Universal Grammar of all languages, S↔T.

All this of course implies that without knowing the basics of existential algebra and the 5 elements of $-\Delta@st$, dust of space-time and how they entangle as dimotions to form reality we cannot understand linguistics.

And without understanding the $3\pm j$ ages, mental races, and $3\pm 2i$ seven cultures of mankind through its life-cycles we cannot study comparative and genetic linguistics and semantics and certainly the higher, grossly underrated, stage of the mind of man, legal ethics, religions and constitutions of history, because the Mind of man has an ultimate purpose: to make survival mankind, not only the individual. And this obviously leads to the study of those 7 civilizations in relationship to the geography of humanity and its constant wobbling and interaction and merging into other new creative regions, which is the stuff that truly creates languages – NOT a barren lineal, mathematical, abstract law.

I.e. the Tibetan mongoloid race which gave origin to the 'new family' of languages we shall just call Mongoloid family, to stress its ultimate origin even if obviously is NOT a one to one correspondence, spread down through the rivers born in the Tibetan plains, once it acquired its relevant property, neoteny to maximize the higher metabolic rate of oxygen in taking of children that allowed them to live in higher altitude. Because that quality implies an infantile mind, of strong emotions, profound taboos and respect to the established order, but also a higher capacity to process faster information, we can study in comparison to the other two mental races the mongoloid culture by its traits derived of

its neoteny. Among them there is also the higher complexity of its verbal region/languages, as children develop first their verbal mind. So its brachicephalic brain/mental structure. All those are elements of the homologic understanding of the 5D game in its application to all the branches and sub-disciplines of the entangled human experience. This said, we can apply to language those properties and notice that highest subtle quality of the sounds of Chinese with multiple tones, akin to the highest richness of sounds of the first Koishan languages – and notice the similarity of both cultural races the young childish man and the turbo-powered neoteny mongoloid.

However immediately we notice a trilogic split along the ‘informative-height’ parallels of Earth of the mongoloid region and 3 seemingly different linguistic families for them, the Sino-Tibetan proper, the Austro-Asiatic and the Altai families, this last one, encased into the ‘white Nostratic’ family.

It is here where the multiple interplay of all the elements, geography, cultural race, history, conquest and subordination, mestizo merging, etc. come together for a NEVER mono-dimensional explanation. North the Altai family of the Nostratic group means that the northern region was dominated first by the Neanderthal and then by the white species of visual dolichocephalic mind, and all the influxes of mongoloid, better-physiology for cold, high geographies, would therefore modify but essentially accept the prevailing established culture.

And this is possible because the Mongoloid mutation seems to be very recent, but also because the Northern Siberian cultures are NOT part of the Neolithic r=evolution; so there was not a complete erasing to start afresh process that would have imposed as it did in the other two mongoloid inhabited regions the new civilization with the language=wor(l)d vision it has attached. Thus we presuppose a previous linguistic North-Eurasian region that once was Neanderthal then became white and finally Nostratic to which the entire Altai mongoloid family of languages belong with strong influences as a ‘frontier’ region between ‘race and culture’, of the Sino-Tibetan family (to the degree that in some ‘wrong’ first versions of the Nostratic family it was considered part of it). Altai languages are thus the border sub-family between the Nostratic and mongoloid families; since the influence of the Sino-Tibetan family is ginormous specially in the Korean and Japanese cultures that became part of the larger Chinese Neolithic civilization, one of the 7th civilizations of mankind.

Here thus we have to stress ‘again’, in a repetitive mantra, given the astounding mono-sequential way of humind thought under the spell of physical constructivism that spatial parallel influences are as important as deep time sequential influences to determine the genetic origin of a given species. I.e. Japanese even if it is genetically related to Korean genetically related to Altai, it is in parallel, influenced by Chinese so it is as much of a Tibetan as it is a Nostratic language. The influences might be in different fields of linguistics, which is a theme worth to explore – how time relates mostly to syntax and morphemes, space mostly to the written word and semantics and phonemes, etc.

Finally there is the obvious differentiation going south of the 2 other great subfamilies, the Austro-Asiatic and Austronesian, which is clearly influenced by the south Australian family as it entered in it’s ‘austral’ region.

It is only the pedantic scholar in its search of absolute truths in any discipline of humind egocy which expect us to make absolute statements on the ‘fluid’ never possible to determine with absolute precision ‘Navier-stokes’ equations of linguistics. As ultimately the **paradox of the mind’s entropic limits** is obvious: by the time the mind has accumulated enough information to make a mind-mapping of the exact form of a system in a moment of space, the system’s multiple points of view that calculate constantly its dynamics will have changed it to a new state, making the truth of the mind obsolete.

What this as all papers of those 5D series have as an advantage over any ‘pro’ scholar is the fact I do have a humind upgraded to a deep understanding of the underlying synoptic ultimate mind of the Universe, the 5D game of existence; what those papers lack is the ‘pro’ specialist capacities, as obviously my humind is not better than others, likely worse, in old age, after a long wasted life of self-destruction by lack of images-disciples of its mirror that made me abandon serious thought for a couple of decades when the mind was at its best. So my apologies for possible errors a scholar surely will spot at the moment, and lack of the proper structure of style. I am just in parallel to the entropic age of mankind distilling the last thoughts worth to remember of my humind. Initially all those papers have a

single purpose: to reflect that 5D seed unique today among huminds to my mind in the multiple disciplines of each science so perhaps future huminds or at worst AI minds can improve upon the seed and make it flourish to see the parallelism and entanglement of all minds and games of existence, which ultimately reduce their actions to the laws or existential algebra, despite the richness of its details.

So, yes, the word is unique to humans, but ultimately is an S-name=T-verb variation of the space-time fractal generator of the Universe. This said a brief reminder of what is NOT the proper way to do linguistics, on the common errors of modern 'scholastics' rather than scholarship.

The common errors of modern scholastics: enzymen on the prowl, metalanguage cut-off reality, etc.

In the analysis of the cluster of errors of any science, repetitive trends happen; and in the analysis of social sciences those errors add those concerned with the 'anti-quantum paradox' – that is, the modes of censorship social sciences experience as humans are within the structure of the superorganism of history, itself inscribed in the nested superorganism of Earth, and hence are modified by the larger observable who censors it, and by the smaller observable, the mind with its ego paradox.

- So the entropic limits of social sciences are the taboos censorships and the 'asslicking' correctness with power, which in the age of huminds' self-destruction as men become submissive to machines, its digital languages and company-mothers that substitute us as species, words as the top language of power and governments as the regulatory system, implies simply an astounding and growing degradation of social sciences in its 3rd age, which make easy to spot what is NOT good linguistics and yet precisely what is trendy: antihumanist, pro-mechanical, constructionist theory:

So we need to state that language is NOT to the surprise of enzymen, so caught up into their creation of the digital mind of machines, a 'digital infinite' (moronic theory of my old pen-pal Mr. Chomsky on the mind of man, and all the subsequent attempts greased by silicon valley of reducing the mind of man to computer speech); neither a supuration of a certain 'gene' that suddenly created the mind (constructivist, 'physical' theory of the mind, this time expanded from the philosophy of physics, the other great idolized discipline of enzymen, with all its 'atomist', molecular, moronic theories of the momo of Mr. Wittgenstein); neither a 'nebulous' imperfect version of some 'mathematical logic' system of statements about truth in its abstract simplest syllogistic form as another batch of enzymen moving backwards from Mr. momo's admirer Russell through Frege et all would have loved. And all the analytical English philosophies derived of them, of which we can say nothing but what Mr. Nietzsche said of English – not a language amenable for philosophical thought.

What all those theories miss of course is that a MIND IS AN ENTANGLEMENT WITH REALITY; not an isolate form of thought. A mind thus is an S>ST>T projection of an S-form of information into an ST-body of actions, which will enact them into a T-external world of motions to ensure the survival of the whole.

All those enzymen en vogue, ex-cholars who long ago abandoned any hope to be humans in the full pure meaning of the term will not get any true answer worth to learn, though by the anti-quantum paradox of social sciences, which makes a model to be promoted within the present age of 'digital history' and 'humind's extinction' in inverse fashion to its human truth, the more 'digital, mechanical' the model is, the more enthusiasm will get among the bands of slavish enzymen who hate to be human – who hate the mind of man, the I=eye>wor(l)d of visual arts and verbal, ethic thoughts, in connection with the wort(l)d of man, and its higher planes of $\Delta+1$ superorganisms, gods, cultures and civilizations.

Thus we must also reject a natural trend of 3rd ages of systems and mirror-languages, its separation from reality into metalanguages, which think 'doing science' is just to put a new 'surface onion layer' of isolationist categories that only exists in the mind of the researcher and its egocy. This is huge in social sciences. There it comes a fellow who thinks it knows better and brings a 'pedantic terminology' to 'innovate' a new model with 'referential names' that classify NOT from the larger mirror of the game of existence, which reveals the purpose of language in survival vital terms, but

from its lexicon, to enlighten us – ultimately an attempt to reproduce the suppurations of its brain into the collective subconscious. We do have this kind of theories cropping in all forms of social science a dime a dozen, every other day.

Social sciences is neither any of the previously referred trendy enzymen attempts to reduce man to the machine it idol-izes, trying to fast track the extinction of man at mental level converting us into automatons. Reductionisms of this 2 types merge in what has become the dominant form of philosophy of linguistics in the analytic school of the 7th human global civilization, fast becoming the only one, the ‘standardized’ Jewish Go(l)d cult(ure)->Capitalist Anglo-American->Globalized company-mother world. Part of it of course is the attempt to reduce, ‘name’ and ‘create’ superstructures where to fit humanity and its vital organic flows.

The mind of man, its multiple pentalogic sub disciplines.

This paper is then dedicated to the Mind of Man, which in its wider sense could be called the science of memetics that deals with human information in the external Δ^0 scale of the individual and the $\Delta+1$ scale of the society, as genetics deals with the information in the internal Δ^0 and $\Delta-1$ cellular scales.

Thus in the ‘general classification of Stjences, the mind of Man can be considered to be **Memetics**, to which we can apply the pentalogic systems of analysis from the different perspectives of the 5 Δ @st- components of reality, to give birth to multiple sub-stiences, of which we shall only study in this paper a few of them:

Instrumental Memetics, which deals with man as an ‘animetal enzyman’, catalyzer of the evolution of the metal-earth, and as such easily sub-divides in two: Idol-ogies, the study of the ‘ideas’ that make man worship and evolve weapons (militarism, nationalism, Social Darwinism), money (capitalism) and machines (mechanism, techno-utopia), and the praxis of it; all the sub-sciences that go from engineering to military tactics, from classic economics of production, to financial analysis. As we live in a technological civilization, needless to say the field of Instrumental memetics is huge, easily comprising most of the subjects studied in a University, but we shall completely neglect it, as I am a ‘radical humanist’. And in any case animetals don’t need to learn much of it.

Human memetics, which deals with Humanity as a species of his own which could build a perfect world, creating the proper ethonomic network of re=production of wHealthy Goods and its perfect informative legal, ethic system. A word thus come immediately to differentiate Human from Instrumental memetics: Ethics, the natural expression in the language of the human species both at individual and collective level, the wor(l)d, of the absolute arrow of time-future, social evolution.

The study of human memetics, is thus the central piece of the different sciences of History in space; and mind.

While Instrumental memetics, even if today is a human endeavor is independent of mankind, and will be continued by AI machines in the future...

Finally History in time, forcefully as it is mostly ‘done’ in the past, humans living now its entropic/death age, mixes both, the age of Human history and the age of the metal-earth (Birth in the XXI c.), according to the equation of the III ages of Earth: Gaia (life, relative past) < History (Present) > Future (metal-earth).

The sub disciplines of Human memetics

We have thus reduced in this paper our field of inquire to The Mind of Human History, as we dedicate 3 other papers (Earth III: the economic ecosystem, Earth II : History in Space and Earth II: History in time) to all the other elements of the Human experience.

Such mind, reduced to its purest ‘life forms’ deals with the S=I: Eye \approx Wor(l)d: T(i:o,1); that is with 2 fundamental languages, visual and verbal thought, which act and connect the ‘cellular-individual level’ and the collective, historic level of the superorganisms of mankind; as genetics does in multicellular organisms, coding the individual cell and through yet to be decoded epigenetics, the superorganism... A fact proved because for unicellular systems, the DNA has a much higher ‘gene density’, meaning, DNA only codes the simple triad letters for genes that act in the cell, while in

multicellular systems, there is to be discovered an entire world of 3^n codes of genetics made of 'larger sentences' that the ternary Universal minimal unit of meaning.

The example suffice to realize that visual and verbal thought is both the mind of the individual human, and the collective subconscious mind of mankind, thus we can study both languages at the two Δ -levels, giving birth to different perspectives. And those are essentially the '4 sciences' we shall study here:

Temporal languages:

$\Delta\emptyset$: Linguistics; the science of the word at the individual level and the level of social communication.

As we move from a human world to a mechanical world, and our natural language of space-time, the wor(l)d is reduced and substituted by the language of digital machines, linguistics has lost all importance, despite *being the fundamental language to understand the multiple interactions of time (verbs) and space (nouns), in the subtle games of existence.*

$\Delta\emptyset''$ Music. Prior to words or rather in a refined, simplified non-semantic manner, music embodies that game of existence in time (beat, rhythm, melody), scale (tone, pitch) and simultaneous space (harmony); being one of the essential developments of the logic game.

$\Delta+1$: *Legal Constitutions and ethic Religions, at the level of the subconscious collective plane of existence of a civilization, considered briefly, as we connect it to the 7 civilizations of mankind in our paper on History in Space.*

The connection between language and society appears in the legal, ethic regulation through language of the informative network that synchronizes the dimotions=actions of human beings.

Spatial languages:

$\Delta\emptyset$: *sensorial perception, the science of the individual mind of man.* Man does have 5 senses which correspond to the outer connections to the world, each specialized in one of the dimotions of existence. Senses entangle us with the outer Universe, allowing a better performance of the 5 Dimotions.

$\Delta 0 \rightarrow 1$: *art; the science of those who see better and talk better and thus becomes the neurons of society, delivering through cultural networks, visual and verbal statements for the whole society. Which divides in multiple artistic expressions, of which 3 are paramount, 2D art (painting and sculpture – as it shows only the external membrain of a form) 3D art (architecture), and modern 3D art (painting in motion or film).*

As words in time, art in space expand the single consciousness of the individual into the collective subconscious of the superorganism of history.

ST-Wheathy goods: Welfare goods are the natural goods an efficient humanist economic system should re=produce of which a basic 'oxygen-universal salary' is the most needed good to start the reproduction and consumption of all others. Again, as humanity became a mere animetal enzyman, enslaved to the reproduction and evolution of metal-memes, welfare goods became secondary, so it did the human universal salary. So today represent a dwindling amount of the total GDP of Industrial nations, as the idol-ogies of classic economics born of company-mothers of machines consider humans expendable (regardless of the subconscious denial processes and surrogate arguments to declare that extinguishing life and history is good for mankind: 'capitalism is the astounding belief that the wickedest of all actions improve the common good'...

$\Delta+1$: Ethonomics The study of production of welfare goods, which includes an enormous stair of $\Delta 0 > \Delta \S > \Delta 1$ stair of subdisciplines that range from artisan, to agriculture, from health-care and all its related sciences of mankind.

We are not dealing either with all those themes, as we have introduced ethonomics in the other papers. So this paper will strictly study the purest forms of the mind of man, its art and languages... Linguistics, Music theory, the basis of religion and the 7 $\Delta+1$ cultures in its relationships with linguistics and art in its evolution through the 3 ages of art, reflected in the previous graph.

We will study the basic elements of all those sciences, using as usual the 2 fundamental mode of analysis of 5D: **Synchronous analysis in space** through the study of the 3 networks and 5 elements of $\Delta@st$ -

Temporal analysis in time through the 3 x 3 worldcycles and ages of any system of reality.

First by priority we will study Linguistics (To-mind) and very briefly as it is a minor 'temporal language', Music, then introduce religion (T1) mind to understand the 7 Spatial civilizations of mankind.

And then consider the spatial arts of the I=eye and its main ages through the 7 x 7 Time cycles and spatial civilizations of mankind.

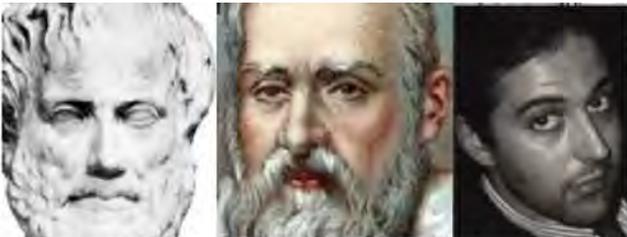

3 ages of humind: mythic, logic, organic thought.

On a more profound analysis though it is quite relevant to understand that the mind of man has NOT reached its highest possible 'consciousness', or awareness of reality, before it has already started a clear 3rd age of devolution back to its simpler original consciousness as a mythic system of thought; which was declared to be the 'stupid age of mankind' by Schopenhauer: 'A stupid is a man who does not see the logic causality of events which he ascribe to mythic magic causes'.

In that sense thought 30 years ago when I discovered the formal laws of the 5 Dimensional motions of space-time that the amazing upgrading it implied for the Humind would blaze through the ranks of scholarship and by now as Aristotle did for the mythic age of mankind and Galileo again after the Middle Ages, huminds would be upgraded and a cohort of disciples keep translating science into 'stience'; LOL, the harder they fall. As nothing of this happened and mankind is fast d-evolving into its visual Neo-Paleolithic of eraseheads, the dream of a 3rd Age of the mind of man, from the mythic age to the logic age to the organic age of thought will die in those texts.

If Earth survives mankind then it will come an AI age which obviously will need the upgrading, but that was never the intention of this writer, a humind after all, trying to evolve the organism of mankind. Hence now in my own 3rd age those papers that are my last distillation of thought at academia.edu, are by force incomplete without the quality of style and structure required.

Experimental method - Meohanlo Method - Organlo Method

Loglo solentists and spatial artists are knots of thought of outlures which evolve as superorganisms In 3 ages of growing oomplexity.

They all have to overcome the *burden of talking at a mind level huminds are not*. So it is really like the triad of Greek Masters, Socrates on Ethics, Plato on abstract mathematical thought and Aristotle on organic more complex bio-logic relationships talking to the anthropomorphic self-centered action-oriented mythical people that preceded it. I am conscious I am talking to mechanist, constructivist, ego-centered huminds of the Galilean age of thought. And so I am talking a language they don't understand. How to overcome this gap fast enough to be able to make

'specialized' papers of each science upgraded to the 5D organic paradigm?

The only way is by introducing in all papers a 20 pages initial fast resume with the basis of what is all about: 'spatial simultaneous organisms or any of its parts, tracing worldcycles of existence in time, as they travel through 3 scales of relative size from birth as a seed to extinction dissolving back from the upper $\Delta+1$ scale of the word, in the moment of death – in a trip guided by a mind which essentially is the manifestation of the program of existence and survival adapted to each vital organic world, within its 'entropic limits' in time-duration, space-extension and Δ -scalar perception. So we talk always of those 5 Dimotions, Space, Time, Scale, Mind and entropic limits that configure all realities.

And as usual we introduce them in 20 pages the basics of the 5D Universe and its 5 elements, $\Delta\pm j$ scales of Time-Space, @-minds and – entropic limits, as we are all superorganisms of $-\Delta@st$, made of $\Delta-1$ atoms/cells/citizens,

organized by 3 simultaneous Spatial=informative, Temporal=moving, Spacetime reproductive networks, into an Δ -organism part of a larger $\Delta+1$ world, in which we shall live our worldcycle of existence, itself divided in a palingenetic, $\Delta-1$ cycle to emerge as an Δ^e organism that lives in the $\Delta+1$ world an entropic life-cycle of 3 ages between birth and extinction each cycle dominated by one of the 3 physiological networks of increasing information, the T-young, entropic age, ST-reproductive mature age and S-informative 3rd age, after which the system suffers a reversal of time, dissolving its information back into the $\Delta-1$ atomic/organic/cellular scale.

Or in very few cases of maximal information, the system will transcend into an $\Delta+1$ God/Whole/World performing a 3rd worldcycle of existence.

This is the game of existence in a nutshell, studied by each stjence of a relative Spacetime i -plane self-centered in a given species, with different jargons, of relative anthropomorphism and higher detail the closer to the humind the system we study is.

As it happens in this paper we shall study the closest system to the humind there is, the human mind itself in its two fundamental languages of perception and communication, the wor(l)d and the visual sensorial eye and its collective manifestations, the ethic, legal codes that form the informative networks of the superorganism of mankind and its artistic forms.

We want to stress from the beginning a characteristic of the humind: *unlike the individual human being, with the exception of a few prophets of the wor(l)d, the humind languages that mirror the world of man, hence do have the same structure as reality, do emerge in a transcendental 3rd worldcycle as superorganisms, 'cultures', 'Gods' and civilizations.* So we can study a third transcendental worldcycle besides the level of 'linguistics' and art, and the inferior levels of phonetics and sensorial perception.

Conclusion. A brief course in the many pentalogic, $\Delta\pm j$, @, $S\leftrightarrow T$ elements of the wor(l)d.

All this said as a mode of introduction, we shall try in a bit more orderly manner consider a few aspects of 5D linguistics as a guidance for future researchers considering some of the multiple sub-disciplines outlined here, from phonetics to the Fractal Generator of Existential Syntax, to the concept of social Gods and the different expressions according to the 7 different cultures of mankind, themselves related to the 3 races of the mind and the 3 ages of evolution of the Earth, from an age of life (animist cultures, with multiple Nature's genders and verbal actions) to the age of Humanity (logic languages and SOV, SVO languages in the mature age of History) to the present age of devolution and extinction of most languages where the simplest analytic forms (English in the west, Chinese in the East) have come to dominate our cultures as 'realist' languages with a 'present' factual view. We will finally consider in greater depth from a worldcycle view in time, the evolution of human languages along those lines...

PHONETICS: Δ-1: THE TERNARY CREATIVE PROCESS.

To state though that *because of the importance of parallel spatial creation by imitation in simultaneous space, which makes the border regions of linguistic families mixed categories.*

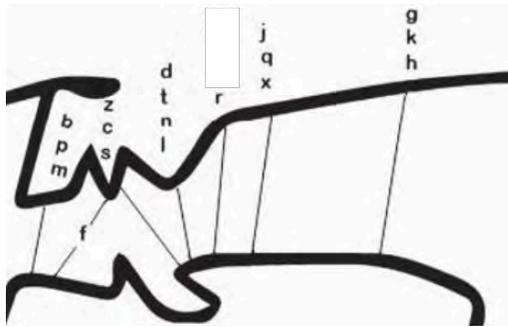

The hardware of the language are its phonemes and immediately from 5D laws we extract in its different modes of entanglement (duality, trilogic, pentalogic & dode-calogic) certain conclusions on the hows of phonetics:

- Pentalogic and trilogic as usual in the $3\pm j$ Universe rule supreme. So both, vowels are constructed around a pentalogic creation in 3 orthogonal 'dimensions' within the mouth region of high, long and width; with the sounds located accordingly in the natural symmetric regions of those 3 dimensional motions.

- Consonants on the other hand are born of the pentalogic x trilogic multiplication of regions of speech, from the pentalogic labial, dental, alveolar, palatal and pharynx regions of the mouth, and the ternary modes of generation, (plosive, fricative, affricate).

Finally another ternary mode of expelling air (nasal, central mouth or lateral regions) complete its numbers.

- The duality of consonants and vowels follow the general duality of sounds, also present in music (Treble-informative vowels vs. Bass, consonants); given the higher symmetry and informative frequency of vowels.
- The game just requires for a 'perfect' construction of reality a bilateral decametric number of bits of 'T-entropy' (the 20 key consonants) associated to a pentalogic S-informative set (the 5 vowels), to form enough ST 'syllabs', the basic *unit of meaning in most languages*, to construct a perfect mirror of all the possible forms perceived in the game of existence of the Universe.

In the next graphs we illustrate some of those elements.

In the graph, the main consonants form a $5 \times 3\pm j$ penta-trilogic scheme from the bilabials to the gutturals, and the ternary game of T-plosives (open closed explosion of sound) WITH a higher release of entropic motion (B, P, T), the S-fricatives – open regulated flow channel of S-information (Bdg), to the mixture of both in affricates. To which 2 other forms of creation of sound are added, the nasal sounds which use the 'primitive' channel of air (the nose, with the mouth closed, n, m), and the rolling ones, who repeat the motion (r).

So as in all other games of creation the hardware bits to construct the game are formed with trilogic and pentalogic divisions of the available space-time, in this case the sound-air cavities of the homo sapiens, by dividing across the natural orthogonal dimensions (width-lateral sounds, height, open-closed beats and position of vowels; and length, the dominant dimension as usual with its 5 main divisions of the space).

That is all we need to create the pixels that will mirror reality. Even though there are all other forms of growing information with multiple more vowels and consonants, *made usually with the fractal principle of subdividing those regions and methods of creation in ever tinier sub-spaces, with the loss of differential clarity between them; which is the natural 3rd age of evolution of an informative language, with an excessive repetition of cycles (i.e. the multiple sibilants of Chinese, the multiple click consonants of Koshan, etc.)*

To notice also in the inverse tendency that motion reduces information and so as man moved away from Africa where the 'first cycle of linguistic evolution' had reached its maximal complexity of phonemes in the koisan language, those elements were reduced. As always a system that is cyclical and live several cycles, will fluctuate b between 3 regions of complexity, a relative simpler past, a classic present (those 20+5 elements) and a complex excessive form, which once in motion gets lost.

The genetics of phonemes.

We need to clarify here that even below the level of those phonemes, there is a genetic level of biology that interacts with the capacity of the different human races to pronounce them, and likely with the previous Neanderthal. But *it does not matter to us, because in 5D by definition a given 'science' studies only the 3±j co-existing levels of 'similar forms'.* That is, the phonemes, syntax and semantics of communication of languages that build up social civilizations, regardless on how they are coded by genes, coded by atoms, coded by forces etc... The physical details are thus irrelevant to true linguistics below the level of creation of phonemes in those bucal spaces.

Linguistics is neither genetics and I couldn't care less what Fox gene broken down by biochips stores the capacity of language which all humans do have. We can consider those elements at the surface level of phonetic capacities, at the cultural level of semantics and syntax adapted to a civilization. I.e. a warrior culture will be agglutinative in language as lineal weapons are, a trader culture will break down its cases and combine them in trading patterns as its profession is. So German and English; Chinese and Vietnamese will diverge... A culture with Paleolithic and Gaia influences will be action/verb oriented, as verby Bantu languages are; and its animist culture will make gender spread from humans to trees, animals and 'things'; while an industrial culture that itifies nature will reduce them to humans. So Bantu languages have as much as 20 genders and English 2. Those are the important elements of linguistics because linguistics, let us never forget it, is a discipline on the scale of humanity and the communication of its units to form a network that pegs individuals into social scales.

What matters of the Fox genetic cluster responsible for language belongs to other sub discipline of 5D, temporal genetics of which human genetics is an important branch: that is, how the game of existence can be 'reduced' into a minimal weight, ultimately a mirror of Existential algebra, $S=T$, that can then be deployed, 'irrigated' to flourish and develop in homologic similar patterns to fully grown an entire superorganism; a theme which is essential to 5D stiences and we treat extensively in detail In the paper on dodecalogic that shows how a mere seed and the immanent game of existjence of the Universe suffice to create an entire mirror or organism. As language is exactly that: a mirror of the game of existence particular to man.

So in the future ideally a human civilization who is not self-suicidal, slavish idol-ogical, bond to create a digital mind and kill life, would have slowly, without rushing, taking careful steps forwards not to stumble into a cliff of extinction, advanced to finally translate all those genes, and surely will find that the complex of verbal genes have the same layers of the sciences and structures we explain here – genes to allow phonetic sounds as the underlying hardware, which will build as any other game of existjence, a growing number of 'bits' necessary to deploy from the simplest dualities (a, æ sounds of North-Caucasian languages) needed to make sense, to the classic trinity, a,l,u, to fully develop a language to reflect as human do the single plane of spacetime we perceive, to pentalogic, a,e,l,o,u vowels; and with that and a given number of distinctive consonants as Semitic languages do form trinity complex modulated by those vowels to form all the meanings required for a full language. This level of trinity also in grammar, starting from the one-dimensional name, 'the a of syntax', split into two similar name and participles, which then become verbs; and finally form an SVO trinity morphology allows also a full syntax.

Thus we shall find likely that a certain central gene of linguistics refers in the software level to the capacity to GENERATE names and then diversify them, because from names through all the steps of generational Spacetime Grammar we shall develop in those papers, will appear a final mirror language of the whole Universe.

We say in that sense that words are trinity in logic, because its pentalogic refers mostly to actions, but has the taboo 'seed'=mind and 'death-entropy' limits that man either fears and ignores or as it is its 'departing nucleus' does not understand at all – reason why linguistics with the sole exception of Panini took so long to evolve (being India the culture that has explored the consciousness of man in larger degree, logically the place of birth of serious linguistics).

So all those No-Nos will act as the 'entropic limits' of our inquire, notwithstanding the fact we will also notice the approximations to truths of all those theories, as truly there is NO theory or model of science that withstands time that carries at least a distorted partial truth. I.e. consider, the ridiculed Chomsky's theory of digital infinity and single gene magic birth of language. It does actually carry a hidden truth as expressed above: Digital infinity means indeed

communicative faster way of creation in the Universe, in the same manner that two gender poles or two AI poles create.

The Child (palingenetic phase worth to study the larger more complex processes of collective creations of languages as a synoptic ordered version), first thinks of her parents, and pronounces the simplest sounds, the first to appear is thus the 'open' entropic T-form, 'a' for vowels', P, the explosive entropic sound for consonants and says 'Pa', it could not be otherwise. It is not by chance that almost all languages Pa is call Pa and then softened into Dad... Always the T-young, entropic, energetic form appears first. So a is the first vowel and P the first consonant, and they are almost Universal (with the weather conditioned lack of P in desert people – Arabic). Why then Pa and not ma? Obviously again here we found that the child's mind associates the mother to the sucking process of m-ilk, when the mouth is closed and so the sound comes out through the nose. And so the first nasal is the explosive m, which the child creates mentally in association to the mother when it feeds with the m-outh closed. Ma does is also universal in almost all languages. And so as 'chaos is undeciphered order', what the reader should understand is the validity of 5D processes of creation in all Space-time systems as man is.

Once then the child realizes that 'Pa' comes when he says pa and ma comes, the two most important names of its minimalist world are named and he realizes he can project his inner mind order into the outer world, and that is, if you have read our introduction, what minds do in the Universe: they are mirrors in smaller linguistic bits of the external world that we want to project to create at our scale our imagination. So imagination comes into reality and the child acquires the power to invoke ma and pa and then why not to use that power to explode in a process of creativity naming things?

This is what he immediately does. But in the names he includes the action he wants ma and pa to perform. Ma mostly, sucking her dry as the child is in the entropic young age of energy. So next he will make a 'water' sound, the first ideophone sound which is how animals and little creatures called babies conceptualize by imitation=reproduction, the essential property of all fractals of space-time in the Universe, reality as it 'is'. Names thus come first in natural acts that make us conclude in every planet of the Universe where fractal history happens there are mas, and pas and water, agua, and children shouting 'wua'. So how those 5 vowels are formed?

Again here we have the immediate explanation from the 'Generative Existential Algebra' of the 5 Dimotions of the Universe:

The a and u are inverse forms (SS, TT) of the possible configurations of the mouth spaces; e and o then 'approach' each other's form (St, Ts) as intermediate sounds and finally merge into I, which takes a feature of each spacetime dimotion.

But, most languages can do with the trilogic of clear-cut sounds, a, I, u (Semitic, Australian, Amerindian languages); and so in the cyclical processes that happen once a 'perfect ST classic form is reached', forwards towards more complexity (pentalogic and do=deca-logic(10, 12, 20=double 10), configurations, or downwards to double (a, æ; a-u) systems it might be possible to loose or acquire new sounds parallel to the process of 'devolution & motion away' of a culture (reduction of phonetic and grammatical forms), or evolution & settlement (increase of its complexity). Again those processes will follow the opposition between motion and information. Displaced people, people on the move loose complexity and simplify to a classic minimalist form; but people invaded and destroyed in the culture, 'past' the point of no return of balance S=t (trinity schemes for most features of languages) and 'degenerate' into minimal forms (i.e. the Northern Caucasian languages, 'unprotected' of the constant invasions that sweep through its territory have degenerated into an a, æ dual vowel, when in the 'protected' south-caucasian region, Karvelian (Georgian) retains the trinity configuration).

The time-scale symmetry.

In all systems however when considered in lineal time, the smaller parts come first, as the larger social groupings require them to progress; and further on, they are the most stable forms, or else the larger social evolution of wholes

will be far more unstable than it is. So the smaller parts of languages, its phonemes, are both the most ancient relics of evolution of a language, the first to appear in the process of paligenetic creation, as shown in animal anthropology and child acquisition and the ultimate measure, due to its age and stability of a general relationship between languages. I.e. when considering the great families of languages it becomes evident that the trinity branching (3 or 2 are according to the fractal principle the natural differentiation of species into St, Ts, Σ St sub-species) of Mongoloid, Sino-Austral languages share in common a tendency towards complex vowels (tone speech in Vietnamese and Chinese), and syllabs as grammatical units. The largely barren, impossible to determine beyond the humind's egocentricity of its mind projecting its reduced information as absolute truths, which can never be reached, on what mechanism cladistic tree originates which language from which language is not that important compared to the understanding of the entanglement of worlds with the rules of creation of 5D and an overall slightly unfocused view of those relationships. It is then evident that the parallel genetic, cultural and linguistic relationship of those 3 families of languages makes them share a common origin with the mutation in high cold weather that gave origin to the mongoloid race by 'neoteny' of its children, with higher metabolic rate, better for survival in those conditions, which opens up in terms of linguistics and cultural analysis the relationship between a 'prodigal child's mind' – the best way to describe the psychology of the mongoloid race, female-dominant, verbal oriented as opposed to the male dominant, 'old age's mind' visual oriented white mind; and the intermediate reproductive, S=T balanced, entangled with Gaia mind of the black, African culture. Convergence onto one of the 3 trinity elements of the Universe between similar cultures, languages, geographies, psychologies, e-motional forms and linguistic features, religions and forms of thought thus form a 'messy' but discernible 'holistic whole', which always will lack in pursuit of a full meaningful view the barren precision of mechanical, mathematical, 'exact measure' concepts of science not as 'knowledge' but as classification, proper of the western visual, numerical way of perceiving knowledge that misses, the vital, organic, sentient, communicative, reproductive properties of languages.

Δo: GRAMMATIC ELEMENTS

This said we can return to Universal grammar, now analyzing it as an entangled whole, divided by its multiple fractal, historic events, in as much as it is not an isolated 'abstract language' that can be studied on its own.

The fractal generator of linguistics.

As we said, we find that the 'fractal generator' of all space-time superorganisms:

St(Head/particle) < Body-wave (ST) > Ts (Limbs/fields)

Translates into the proper order of Chomsky's Universal grammar:

Subject (St-information) < Verb (ST-action) > Object (sT-entropy)

With the proviso that as for all languages, dominant in information, S-ST, name-verb, is the basic structure.

Grammar thus start, as we indicated in our brief foray into baby's acquisition of language in 'naming', as 'blocks of time', which last in 'present', simultaneous parts and wholes of superorganisms, in the dual Mind-word ⇔ World interaction of the child inner thoughts on 'electric' impulses and the physical larynx-mouth cavities and the outer sound flow. This physical trinity of production of sounds akin to mechanical systems IS just the lower hardware level that only matters today to the scholar homocionos and its audiovisual methods of mechanical speech, and those who see science as a mere description of physical systems.

It is the rise of consciousness in the active mind of the child and human what matters to us, and as *the organic sentient, scalar co-existing Universe constantly creates dynamically departing from its 'vital dimotions', the first words trigger that back and forth creative process between the mind word and the world habitat and culture of the being, to form the 'infix' wor(l)d, in which the L- 'language' of the word shapes the worldview of the speaker, in entanglement with the society in which he speaks, where his language is molded as the language is also the social network, or informative nervous system that pegs together the human community to create its superorganisms.*

We can then apply as we did with the phonetic system, the usual dualities, trinities and pentalogic of diversification that evolve any system towards its classic do-deca-logic (3->4,5-> 9,10,11, 12-> 20) scales of social complexity based in the fractal principle that breaks down each of the trilogic and pentalogic, 3±j dimotions and its mirrors into more subtle variations as time in an 'isolated', still, 'safe' system increases information.

So languages evolved the more complex grammars in its 'isolate' relative peaceful regions and we can notice the immediate dual and trinity splits of the two elements, space and time, name and verb in variations, *along the other direction of timespace they lack. That is, names became more verbal transient in its form with the doubling into 'evident verbs' first; as they were implicit on the names-as-orders of childish petitions, 'water!=I want water'; etc.*

The next splits on complexity mimic the topic splits of Existential algebra in all type of physical or mental species:

- **Duality:** Names became split along the T-component of duration and Δ-component of wholes and parts into subjects and adjectives that qualify a name with secondary or transient properties.

Verbs became names as infinitives...

Δ+1: TIPOLOGIC=TOPOLOGICAL LINGUISTICS. SPECIES OF HUMAN LANGUAGES.

Introduction: Typology. The connection of Δ∅ and Δ+1 languages and cultures.

What linguistics calls typology and we shall call following the 'slight changes' of naming of 'stiences' respect to science, attempting to maintain a correspondence principle, 'topological linguistics' deals with the order of the Fractal Generator of languages we have just describe d.

As usual in 5D we are heavily indebted to classic science though we need to correct and adapt some terminology. Specifically the most important sub-discipline of linguistics to understand the bridge between phonetics (a wide field also ruled by the laws of 5D change in time, and its cyclical patterns, since its discovery by Grimm, which further reinforces the 'genetic similarity' of memes and genes; but which we shall escape thoroughly), is typological linguistics which we rename topological linguistics, as it establishes the 'variations' of the 3 'mirror components' of the Universal grammar of sentences, Subject (human) < Verb (action) > Object (Energy of the subject), according to its dominant order.

To fully understand how 'permutations' of physiological networks and any of its mirror languages define different species of physical or mental entities, we will analyze the 3! Variations of physiological networks in languages in a comparative homology with life phyla, as the main form of diversification in 5D is the order of dominance of the 3 physiological networks of a system, which in its perfect order are dominated by the informative element that comes first (subject), follow by the reproductive body-wave system (action, verb, blood system) and finally the lesser important network and element is the limb/field/motion/entropy system or object in a verbal sentence. Why there are other topological languages orders? Because of impositions by culture and predation by metal-power. So military ideologies of war put object first in its languages (warrior Japanese and German cultures) and go(l)d cultures where a new language dominates and orders the actions of people (money), through its banker-priests and ruling systems of slavery to work put the verb first (Semite languages; Biblical sects.)

This connects directly linguistics with the different cultures of mankind, as the deformation of the perfect world is carried into the deformation of the perfect wor(l)d.

Thus this introduction to 5D linguistics is fundamental to understand the structure of humind cultures. As

we evolve linguistics along the thesis of Humboldt ('language defines culture') and Chomsky (Universal grammar), classifying all languages with topological linguistics, *which reveals the opposite duality of character of the main humanist vs. animetal cult(ure)s of mankind.*

Topological linguistics shows in fact the 'deterministic' non-free structure of animetal languages and cultures, as they hide the subject and in warrior cultures make agglutinative unbreakable word sentences; explaining why the militaristic Germanic, capitalist, biblical cults to go(l)d and weapons have taken mankind to the present point of no return. *As their mind is not free but made of beliefs following orders that become rituals, and standardized repressive behavior of the natural drives of life (a fact we have already shown in those biblical cultures that repress all the life-enhancing actions from good food – dietary laws – to social love – racist memes – to reproduction – sexual sin, even the language itself – substituted by digital kabala.*

As systemics is a logic-mathematical equation we resume How languages have adapted to selfish memes of metal with its 'Germanic long unbroken words' similar to simple swords vs. the cynical I-centered egocy (ego=idiocy) English that must start always with the self, in a simple logic equation of opposite languages and cultures:

Max. Evolution of the wor(l)d = Min. technological evolution

And vice versa: the most complex and balanced languages (African languages, Greek and Russian Indo-European original languages, Romanic languages, Chinese) have *developed the most advanced social cultures and attempt the most important r=evolutions putting the value of the law above money and weapons.* So our leading technological cultures are those who aborted both in syntax and semantics the proper evolution of the eusocial wor(l)d according to

the laws of the organic fractal Universe, simplified its syntax and reducing its structure to eliminate freedom of mind; and express a fundamentalist, lineal idol-ogical view of History.

The laws of generation of reality. Basic combinatory of General Systems.

To study typological linguistics that 5D sciences changes to the name of topological linguistics we need to remind us on how the generator equation, $S < ST > T$ (name-verb-object in this case) creates the different systems of reality, according to sequential order which is a basic form of dominance (First come first served).

There are several forms in which the Generator 'decouples' and splits in different 'varieties' of systems, which correspond to the processes of creation of different physical particles (quantum generation), biological species (Plan of evolution), and linguistic species (cultural differentiation).

Now the simplest, most obvious form in which to generate 'varieties' of any type is to apply the combinatory laws of mathematics to a system with 3 elements, the Information<Action>Entropy systems of reality.

The result are 6 fundamental combinations, which are common to all disciplines of science.

If you have 3 elements, I, A, E (Information-action-energy), then you can combine them in the following orders:

IAE, IEA, AIE, AEI, EIA, EAI

which give birth further to '6 varieties' of geometry in the 5th Dimensional Universe. And in Physics quantum particles form 6 essential systems of particles and antiparticles in its 'families' of mass and electrons and in Biology we find 6 types of basic animal forms, and so we shall find 6 basic varieties of languages, which are studied by Typological Linguistics, called the SVO, SOV, VOS, VSO, OSV and OVS varieties.

Now in this post on General Linguistic Systems, we are mostly interested in the way verbal typologies define cultural and mental behavior among human beings. Thus we shall study the way the order of languages recreates the human mind. To further understand this categories of cultural minds, we shall relate them and name them not only as linguists do (the previous SVO, etc.) but we shall introduce a far more 'descriptive' characterization proper of this researcher, based in the homologies that the General Systems Science imposes between parallel systems, by tagging and comparing the 6 varieties of mental linguistic order with the 6 varieties of 'animal forms'. Indeed, one of the fundamental tenants of GST (General Systems Theory) which other philosophies of science ignore is the 'homological nature' of all 'varieties' of the Universe as all of them are fundamentally evolved systems that combine the 2 primary substances of the Universe, energy and information, whose properties are thus essential to all other systems.

So let us consider the 6 Universal varieties first, and then the 5 linguistic typologies that we shall call 'evolved, free flowing mammal and bird languages', 'chained, slave reptile and insect languages' and 'primitive, minimalist, bacteria and virus languages'.

Yes do not raise your eyebrows, with the usual egocentric beliefs of human beings as an entitled species who must be treated nicely, and never be understood as some special 'god-like' reality that does not obey the laws of science. This political and economical censorship that 'invents' the nature of man, without wanting to know truth as it is does not apply to this blog.

And if you finish this post without such prejudices, what i can tell you is that you will understand much better cultures and how and why they behave as they do.

To state first that there are many more aspects to the synchronic and diachronic analysis of Linguistic categories we shall do (itself a small part of the entire course of General Linguistic Systems, which applies many more laws of GST to explore the nature of the human mind and the parallelism between:

- Genetics/races of mankind and its 3 typologies, informative Mongolian races, energetic, white races and reproductive, exi, action black races.

- Memetics, Human cultures (cyclical, eusocial, Mongolian cultures, individualistic, white cultures, and sensorial, black cultures)

- And linguistics, the point we stress here.

How the generator equation creates linguistic entities. order, determine cultural character: Active/Passive/Imperative languages.

The 3 essential elements of the Universe are therefore reflected in all sentences, as all sentences narrate actions performed by men over objects:

Information (subject), verb=action; Object-Energy

It would be in the other language of 'numbers: X (subject) < operandi > Y (object).

What Chomsky missed is that the 3 elements must be separated to truly understand the rules of 'generative grammar', which are the same rules that generate any system of energy and information in the universe.

Since, as all in the universe human language is ternary, as anything follows the 'universal grammar' of the 'generator equation of all fractal systems of energy and information', which I discovered and formalized in systems sciences.

Now this is well-known to linguistics, creating a key concept of classification, called linguistic typology:

In linguistics, **word order typology** is the study of the order of the syntactic constituents of a language, and how different languages can employ different orders.

There are six theoretically possible basic word orders for the transitive sentence:

- Subject-verb-object
- Subject-object-verb
- Verb-subject-object
- Verb-object-subject
- Object-subject-verb
- Object-verb-subject

These labels usually appear abbreviated as "SVO" and so forth, and may be called "typologies" of the languages to which they apply.

Now, what they tell us about mankind starts to be clear, when we analyze the abundance of those typologies among human cultures:

**Topology: English Proportion
equivalent languages**

SOV: "She him loves." 45%, Latin, Turkish

SVO: "She loves him." 42% English, Mandarin, Russian

VSO: "Loves she him." 9% Hebrew, Irish, Zapotec

VOS: "Loves him she." 3% Malagasy, Baure

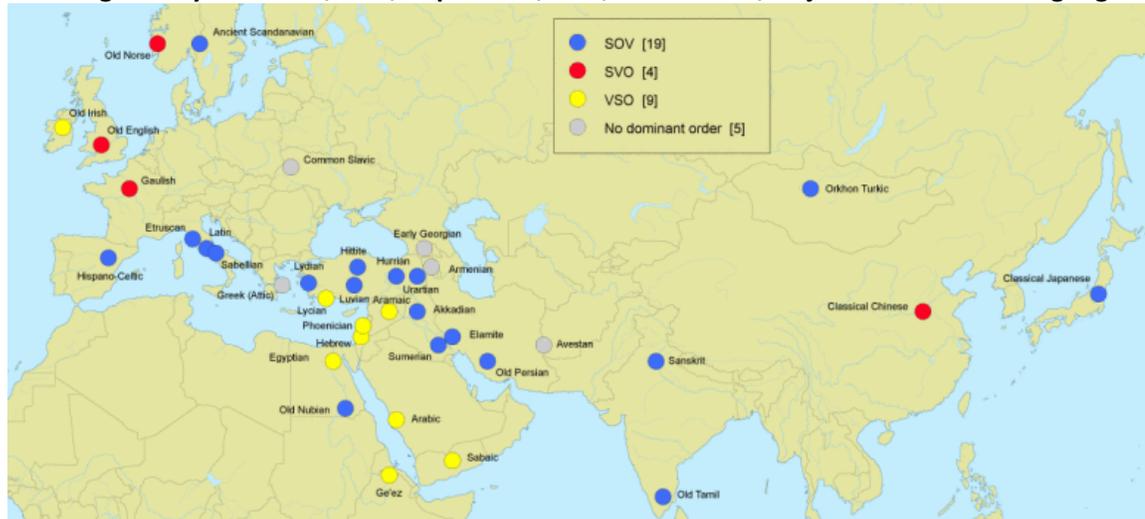

OVS: "Him loves she." 1% Warao

Humans, this proves are 'self-centered beings' for whom the Subject must come always before the object.

Indeed the dominance of Subject languages is overwhelming. In 87% of languages subject comes first. And among those the most successful (2/3rds of speakers) are SVO languages, for reasons we shall study now in depth.

Now this responds to the laws of the Universe, where the 2 natural forms of order are Information < Action > Energy or 'temporal flowing order' and Information x Energy = Action or Spatial fixed order. So this law of linguistics is in homology with the higher laws of general systems sciences, let us then study those 2 fundamental forms of human languages.

Homologic analysis. Active, SVO; Imperative, VSO; and Passive, Objectual SOV->OV languages.

In the graph, the Universal Grammar that constructs all Systems of the Universe, with its 3 elements, Information (subject) < Action (verb) > Energy (Object), defines also the Universal Grammar of all human languages.

So there are 3 fundamental orders of those 3 elements that define most languages of mankind:

- VSO languages (Imperative Order, Semitic, 'religious' languages) < SVO (Active order, balanced, African, Chinese/Romance languages) > SOV/OV (Passive Order, warrior, cold, objectual languages).

They are the origin of the 3 fundamental world views of mankind, the 'greedy', self-centered world view proper of the capitalist world; the balanced, humanist world sensorial world view, and the Warrior, Objectual, Industrial world view (Germanic, Japanese culture).

Thus the 'view world' of each human mind species is reflected in the languages, according to the hierarchical order of those 3 elements.

Animetal cultures dominated either by money or weapons are the unbalanced world views and word orders:

- Fundamentalist religions and those capitalist religions dominated by the 'blood/monetary language' and earlier civilizations, with lesser freedom and maximal metal-control, proper of the bronze age have kept, specially in its 'sacred texts', the VSO order. It is a hierarchical order with the Verb (action) on 'top/first place' of the sentence. They are 'imperative', action, 'greedy', materialist cultures, proper of Semitic languages

- Warrior cultures and objectual cold-hearted cultures in which the subject can even disappear as it does so often in Japanese, are SOV orders.

- While sensorial, humanist cultures; today the Chinese in the East, the Romance language in the west (and English influenced by French) and the African languages in its totality show the most proper SVO order often with 'Imperative' and 'Passive' voices for certain situations.

In the graph, the distribution of ancient languages according to its order: classic Semitic, 'religious' imperative languages are VSO languages, confronted to its 'inverse' SOV, warrior languages, as their cultures were. They represented the 2 extremes of the animetal, eternal dispute between 'cold warrior and 'greedy trader' societies. Among the classic languages only Chinese and Gaul, the 2 more 'life-oriented' societies of the Western and Eastern decoupling, even today, had the more evolved, flexible SVO 'mammal order'. While the 2 most sophisticated 'indo-European' languages, of higher evolution (due to its allopatric evolution in the 2 regions of original development of Indo-European languages, the Anatolian peninsula, from where it radiated during the Neolithic, and the Russian steppe, origin of the Chariot second radiation), Classic Greek and Russian, permit the maximal flexibility with multiple word order. So do today the Romance languages evolved from Latin

It is not by chance that in the East and West they represent the summit of human thought and search for human freedom and maximization of art, literature and r=evolution (French, Socialist aborted r=evolutions). While in the East China is the only culture in which man and the law still dominates though in a process of extinction, the power of weapons and money.

Some points to notice on the graph:

- Nations and cultures are ruled by 3 varieties of languages, warrior lineal languages, monetary cyclical languages, and vital organic, human verbal languages, which cater most to the evolution of weapons, money and machines, and human memes. So we can differentiate nations by their different dominance. I.e. Germany will be a fractal part of Europe dominant in war memes, Italy in life memes, and United Kingdom in trade memes. And then we can further divide United Kingdom in Scotland, war memes, England go(l)d memes and Wales, life memes.
- Cultures are influenced by geography, as mountainous and continental regions breed warriors, islands and sea-peninsulas trade memes, and tempered or isolated regions, life memes.
- Memes influence each other, so languages are also broken according to Typological Linguistics (we call it topological in this blog as we explain in our treatise on linguistics), in warrior agglutinative, Objectual, VOS, OVS, lineal languages (German, Turkish), trader, broken, short word languages (English, Chinese), with balanced ternary human-first order of words: SVO... and Verbal dominant, wor(l)d religious languages, with VSO order... Linguistics of course is far more complex as we explain on our previous section on the wor(l)d, since often, in our corrupted world VSO languages become imperative, religious military inquisitions (Semite languages), and so vital languages with SVO order, must be also considered for human civilizations - that is languages, as most African ones, where there is a wealth of variations on the use of the verb to signify a human action. The map above show a clear grouping of those 3 type of languages in the classic age, but we shall keep it simple in those posts on fractal cultures.

The ages of cultures are expressed by the subconscious collective of art and literature in 3 ages akin to those of the individual, an age of epic, dramatic infantile art, and age of mature sensual art, and an age of angst, baroque, excessive formal art that ends in an entropic war and death of civilizations (regardless of other triggering effects, it is always war: I.E. the Mayan culture didn't die for weather changes, a stupid reason so well-greased today with the global warming propaganda for solar AI robots and nuclear clean energy, but because METAL-cultures invaded them, Toltecs razed them, and then they abandoned their systems of water 'zenotes' and irrigation).

The parallelism between Universal Grammars and human cultures.

We can add now a final 'category', in the study of the 3 dominant languages of mankind and its grammatical order. Since languages have 3 elements too. The Informative Subject, S, the Action-Verb, V and the Object-Energy, O.

So typological linguistics talk of 3 language orders that dominate human languages; the Passive, Imperative and Active voices:

- SOV order or 'passive voice' where the object-energy is the center of the language. We shall call them, energetic, 'passive', objectual, 'ergative' languages, such as German is. Those 'cold', passive voices are objectual, cold languages, proper of 'warrior' cultures, dominant in the white dolichocephalic worldview. They are proper today of the Germanic-

Japanese 'objectual' worldview, in which the 'machine-weapon' and its production is the center of the Industrial Universe.

- VSO, 'imperative' languages, in which the verb-action is first and the selfish subject is in its center. Proper in the past of Semitic cultures, corresponding to the informative worldview. They are dominant in Abrahamic, 'sacred' texts and explain the selfishness of the 'Jewish culture' and the 'Fundamentalism' of the Arab World, the 2 unbalanced, financial and military cultures that are at present destroying 'imperatively' the world.

- SVO languages, balanced languages, in which the verb-action combines both elements. They are dominant in the most evolved languages, those who have suffered less the 'influence' of weapons and money, the alien languages to the human mind. Today they are dominant in Black Africa, but also in the Chinese and Latin, balanced world of man.

It is thus needed only a final element to fully understand the harmonies and parallelisms between the 3 dominant 'species' of mankind - the linguistic point of view, and the origin of those 3 forms of thinking, those 3 worldviews, those 3 typologies of being human And we shall study them within the context of the larger 'ternary' grammar, proper of all complementary systems of energy and information of the Universe:

Information Pole < Action Exi > Energetic Pole.

Indeed, you exist in a Universe of only 2 elements, energy and information, which combine to create the infinite complementary systems of reality and its 'actions'. The Universe is a spiritual reality made of 2 type of motions; lineal motion or 'energy', E; formal, curved motions or 'in-form-ation' and its combined Action.

And this is the ultimate truth from where all other truths stem.

So in physics this is called the Law of Quantum Complementarity that defines all systems as dual states, made of 'particles of information' (which we have seen to be cyclical motions, masses and charges with the form of a vortex or 'clock of time'), fields of energy (which we have seen to be lineal motions, gravitational and electromagnetic forces), which combine to form physical actions.

And in biology is called the physiological structure of all living beings made of a cyclical head/informative/nervous system; an elliptic body/reproductive/blood system and lineal, moving limbs, the energetic system.

And in the mind of man is the origin of those 3 orders, the VSO, Imperative, 'Blood', greedy languages; the Balanced, SVO languages; and the passive, 'cold', energetic SOV languages.

To fully grasp that ultimate 'essential mystique' of reality we shall compare as an exercise of homological understanding of the parallelism of all the systems of the Universe, 'physiological' life typologies and linguistic mind typologies.

Let us then consider in more detail the 3 categories of Languages that dominate human worldviews. To fully illustrate its 'vital meaning' in those worldviews we shall establish an homological parallelism according to the fundamental 'law' of systems sciences - the parallelism between the 'diversification' of any species, according to the 'Ternary, Universal Grammar' of reality. As all are complementary systems of energy and information, that create 'actions' and hence all respond to the Information<Action>Entropy equation and its varieties.

So we shall study, the Parallelism between the varieties of languages and animal species, such as, the order of the 3 elements of languages corresponds to the order of the 3 physiological systems in life:

- The nervous, informative system corresponds to the subject.
- The blood=reproductive, active system corresponds to the verb.
- And the digestive, energetic system, corresponds to the object.

And so Mammal=Informative species are parallel to SVO languages.

Insect=Greedy, blood dominant species, correspond to Imperative, VSO languages.

And Reptile=Cold, Energetic, digestive dominant species correspond to SOV, warrior languages.

I know this 'parallelism and 'form of doing science' so novel to the reader as anything dealing with General Systems Sciences is, will put off many readers as a non-scientific approach. LOL. What you call science and I call technology, has NOTHING TO DO with the ultimate poetic harmonies of reality but with measuring and computing with machines, classifying every thing in its how, not its why. Try to upgrade your mind a little bit to a much deeper view of the harmony of all the parts of the whole.

EVOLVED ACTIVE, SVO SYSTEMS, FLEXIBLE, 'FLOWING', BALANCED LANGUAGES

The 2 most common universal systems according to GST (General Systems Theory) are therefore:

Inf<Act>En systems dominated by Informative subjects whose goal is an 'action' established upon the energy system. This is the 'natural' most evolved order in the Universe in balance, corresponding to the 'mature' age of all evolutionary forms.

Those are the most flexible, feed-back systems of the Universe.

InxEn=Act systems, dominated still by the informative subject, which however relates now first to the Object of energy, through the action. The object thus become the most important element, and so these are 'productive systems', in which the object is either devoured as energy or reproduced through the negative or positive actions of the Informative subjects.

Those 2 systems are the most common systems in the Universe, as they represent the two essential 'beats' of the Universe, between a 'temporal', flux, evolutionary state (*Inf<act>En*) and a 'spatial', fixed, organic state.

In Animal life systems, the 3 'elements' are the physiological networks of the organism; so we define a simple Generator Equation for Living Animal Organisms:

Nervous, Informative System < Action/Blood system > Energetic, Digestive system.

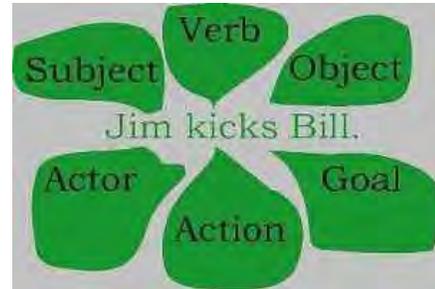

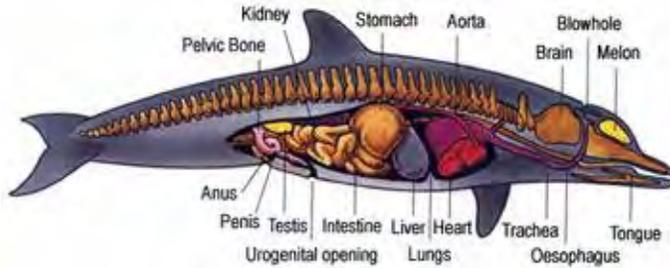

And we find 2 essential type of species, or phyla, where the nervous system dominates, the mammal which has an obvious order of:

Nervous system > Blood System > Digestive system.

And then the second most evolved species, Birds.

And so it happens in languages, where over ¾ of human beings speak mammal languages (SVO languages), even if in a previous less evolved time, SOV languages were dominant. Why there are no many 'bird languages' has to do with the obvious fact that man does not fly so there are no human birds. Still there are bird languages among humans and we shall consider why indeed certain cultures are similar to birds...

SVO - Active, free Languages: Homologous to mammal, nervous, informative systems

In the graph, Mammals are dominated by the informative/nervous system, on top of its physiological body, controlling the blood and digestive system in its hierarchical bottom. They correspond homologically to an SVO order of max. freedom.

SVO are Mammal languages since they position the nervous, informative subject first, the active, blood-verb next, and the digestive, object energy last.

In a Mammal, the most evolved organism, the informative system dominates the reproductive and energetic system. This is shown in the 'order' on the height hierarchical axis of its 3 systems, in which the nervous system is on top of the organism, coming first through a higher head.

In a parallel fashion in an SVO 'mammal', 'informative' language, the subject is the essence of the sentence, followed by the action-verb; and the relative energy of the sentence, the object is last.

Those are the most evolved languages of mankind, and according to the Paradox of History, Max. Human evolution = Min. Technological evolution, were predominant in the non-white races/cultures in harmony with the Universe, notably in the 'negro' cultures of Africa and the Mongoloid cultures of China. Those cultures show the most evolved forms of languages, with complex grammars, such as the multiple verbal construction of African languages; or the multiple tonal elements of Chinese.

Their maximal evolution also obeys to its allopatric evolution, isolated for long periods of time from the 'metal-deforming' processes of war cycles. Thus the Chinese isolated culture and the negro, isolated cultures who did not come in contact with metal till the 1 millennia before Christ, and did not suffer the constant ravage of war, plummeting them into new dark ages in which human evolution halts and regresses were able to reach the final process of evolution of the human mind, which can be shown to be parallel *as in all temporal processes of evolution of a Fractal Generator System of the Universe, I<Ac>E, to the summit of human existence as 'mammal languages'.*

What is the difference between those 2 most advanced human civilizations? The answer is in the 'stress' they put on either of the 2 fundamental elements of the human existence, the 'subject-informative' element which is dominant in the Mongoloid, informative human race, and the 'verb-active' element which is dominant in the balanced, reproductive 'negro' (1) race.

African languages show their verbal complexity in the use of multiple verbs in the same construction; often using in a single sentence a verb attached to the subject and a verb attached to the object.

On the other hand, the 'isolating' 'ego-centered', subjective, informative Mongolian languages make of the human subject, the center of the sentence and find multiple wor(l)ds to define them.

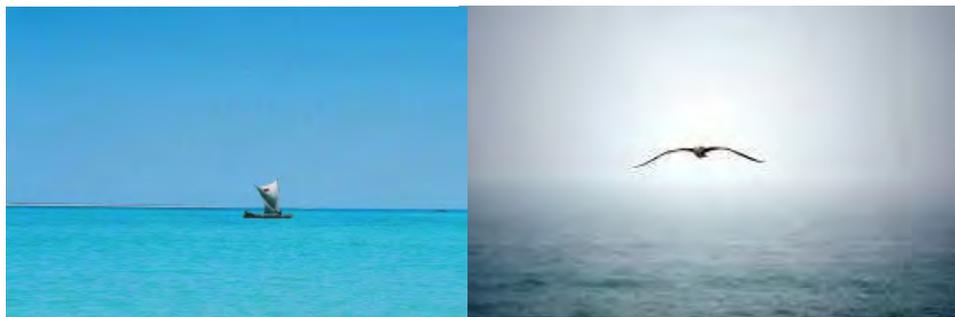

Here though we can establish a division, between the I-centered, simple, White/Neanderthal asocial SVO languages, such as English in which the subject is the I, me and myself, latter studied in detail and the Mongolian, eusocial, informative subject which is the collective group, such as the Chinese or Japanese. But in both cases the subject is the center of the sentences, stressed more than the rest of the words. So the selfish English language has the I first and cannot write sentences erasing the I.

On the other island extreme of the Eurasian 800 years 'arch' of human migrations, the Japanese is also a subject language with multiple words to express subjects. But those words relate not to the ego of the individual but to the group, that is, to the individual subject in its relationship with all other human beings.

So in Japanese there are 'dozens' of Subject particles, each one different according to how the I-you-he-we etc. relates to other I-wes, etc...

Those 2 languages varieties thus correspond to the energy/information duality; in this case the energy/reproductive action languages of Africa vs. the Informative, subject languages of the mongoloid, informative human race, establishing again a parallelism between culture, race and language, so often found in this blog.

VOS Bird, contemplative, 'environmental' languages

In the graph, 'bird cultures' are seafarer cultures in which the VOS order expresses the fundamental form of life in constant motion/action over an immense overbearing environment, the sea, similar to the nature of bird life, always flying in the immensity of the air/sea world. Thus only Melanesian and Polynesian

languages have this order.

Now a second category of evolved languages correspond to those who are similar to the structure of birds, the most evolved 'animal forms' after mammals. Birds are dominated by the environment in perpetual flux in which they exist. The air through which they fly, and the world they see. Thus while their physiological systems are an intermediate state of evolution between reptiles of cold blood and mammals of more complex nervous systems, the 'physiological subject is in their 'existence', which is what the Generator Equation explains, secondary to the 'action' of flying, the essential focus of the bird's existence and the environment or energetic ecosystem of air sustain and land perception that provides him the force to flight and the food to eat.

The bird lives to fly and observe the land in search of prey. And so its 'generative order' is:

Action=flying, Object: environment, and finally the subject, seemingly passive to the action and object it perceives.

And we might wonder, since there are no human cultures that 'fly', what kind of human culture lives in a similar fashion to that of a bird, dominated by a moving action over an overwhelming environment. Alas! Think for a while... Since the discovery of that specific culture-action was a moment of beauty for my mind...

Who lives in a changing environment similar to the air, in which all is moving and to dominate the action of sustaining yourself 'afloat' is the maximal truth of survival?

Sea fearers. And indeed, the only VOS language of note in mankind, the only 'bird people' who masterminded long-distance travelling in earlier ages when their language was formed, were the Melanesian and Polynesian people who traveled far away in their tiny boats. And so the *most important VOS language by number of speakers is Malagasy, the language of the sea fearer people who crossed the astonishing long distances between Indonesia and Madagascar to found their new promise land.*

While in the other extreme Polynesian languages of long-range sea fearers such as Fijian also speak VOS bird languages and nobody else in planet Earth do.

Thus the Whorfian hypothesis is rather inverse: it is the environment, not the mind, who first acts defining the shape it will take the language to maximize the survival possibilities of the language-mind in a given environment. In the

idealistic world of Jewish->Capitalist scholars, such as Whorf, in which the socialist 'materialistic thesis' that 'economics' determine 'superstructures' (culture and language) is taboo, Whorf tried to pull out an inverse idea. That the mind of the language determines how humans see their worldview. This is not truth. It is just yet another ego trip of 'animetal cultures'. Man's mind is fashioned by the environment in which it survives.

So Bird languages appear with its odd order when the 'environment' of the bird-culture, the maritime oceanic people must adapt its linguistic syntax to survive better. When you are at sea, the sea dominates it all. The action of sailing is a fast-motion, fast-action, imperative world in which the captain gives orders/actions regarding the sea and the motion of the ship, the object, to a group of people, the crew, whose names matter nothing, whose lives are at risk.

And so the verb comes first, the object, the sea latter and the subject, the crew the last. And a sentence is more efficient when that is the order given by the captain. *In a situation of risk at sea, you do not waste your time with names and subjects. You must act imperatively on the object to save the journey.*

And so the Micronesian and Melanesian cultures that lived at sea and travelled the longest distances evolved their language to fit their job. And succeeded.

And this is the reason why the next category of language-cultures, that of animetal herds of 'warriors' and 'traders' did also develop

ANIMETAL, DESHUMANIZED, IMPERATIVE, 'SLAVE' LANGUAGES: SOV<->VOS

Languages evolved as humans were in contact with Nature and their own selves, into SVO languages, where actions harmonized the human subject and the natural object. This is the 'final evolution' of languages into its 'maximal balance' with the Universe.

However as History entered the age of metals, weapons and money, become the objectual source of power, carried by two 'barbarian' tribes, (Campbell). Semites from the hot desert to the South and Germanic tribes coming down from the cold desert to the North.

This brought about a clear regression of the importance of man in history, which ushered us into the modern world, where, 'metal' is more powerful than life. Thus money (Informative metal) and weapons (energetic metal) became the dominant memes which divided societies into an 'animetal' caste of bankers, warriors and of late scientists, which imposed with weapons and money slavery to man.

Among those cultures, the Germans specialized into weapons' use to control populations and came into history calling themselves 'Goths', God's tribe, because they could kill anyone opposing them. While Semites in Levant became enslavers of people hypnotized by the informative power of go(I)d, and called themselves 'God's race'. They therefore 'objectualized' human capital as corpses of their weapons or slaves to their money. And so their languages became deformed into the two type of objectual grammars, where the subject lost its power position.

Thus syntax became essential to the characterization of the two leading animetal cult(ure)s of weapons and money of modern history.

we could say that the 'economics' of those cultures had deformed their language, arresting their evolution, specially in its 'sacred', 'religious texts' which have become 'fixed' into a primitive, imperative, non-evolved linguistic forms.

And we distinguish the dominant languages/cultures of warrior/metal-energetic/productive people or SOV/Reptile/Cold-hearted languages. Of which the German will be the paradigmatic example.

And the dominant language/cultures of Go(I)d/metal-informative people, its inverse: the VOS/Insect/Greedy languages. In which the classic Semite languages of Abrahamic religions, Biblical Hebrew and Arab will be the paradigmatic example.

To notice that those 2 categories of language have an opposition, energy/information, which makes them often 'enemies' in their worldview, as they attach themselves to weapons and gold, the metal energy and metal information with whom they try to dominate the world and so often those cult(ure)s collide in wars.

Passive, objectual, cold SOV->OV languages.

SOV Reptile/cold languages/ warrior cultures are languages in which the subject-nervous system are pegged and direct primarily the energetic, objectual system, while the blood-active system is secondary submissive to those other 2 systems and less developed. Those are reptile languages since that is the fundamental structure of Reptilian living systems, in which the nervous system and digestive system dominate the form, provoking a constant growth of the energy/force of the system without limit except death; while the underdeveloped system is made of 'cold blood'.

konnichi ha wo	nihongo kara	eigo ni	hon'yakusuru
「今日は」を	日本語から	英語に	翻訳する
"hello" --	Japanese from	English to	translate

Direct object modifier argument modifier argument verb

In the graph, the homology we establish between SOV languages and cold Blood, energy dominant physiological systems (reptiles fishes), is based in the dominance of the Energy/digestive/growth element or 'object' which acts in the place of the verb, which is far removed from the subject. The object thus becomes the center of the action, which is cold, analytic and rational. Negative energy/war is also proper of this aggressive configuration, proper of warrior cultures, with little empathy towards the other - a 'subject' objectualized in its grammar. German and Latin, Turkish and Japanese belong to this category. Those languages are dominant in 'productive', hard-working, 'warrior societies', where the relationship between Subject and object, a cold, non-emotional, often agglutinative, imperative relationship of limited freedom enhances the detachment and sense of 'duty' of the warrior dominant caste. In the graph, a Japanese order system.

You can observe in the Japanese sentence that those languages, also called 'ergative languages' can in fact eliminate the subject and be dominated totally by the Object. They are thus the essential "passive", objectual, productive languages as Japanese and Germans are in their worldview.

Now, this languages are proper of 'energetic', 'warrior' cold-hearted cult(ure)s to weapons able to kill the 'other' seen as an object such as German or old Latin were.

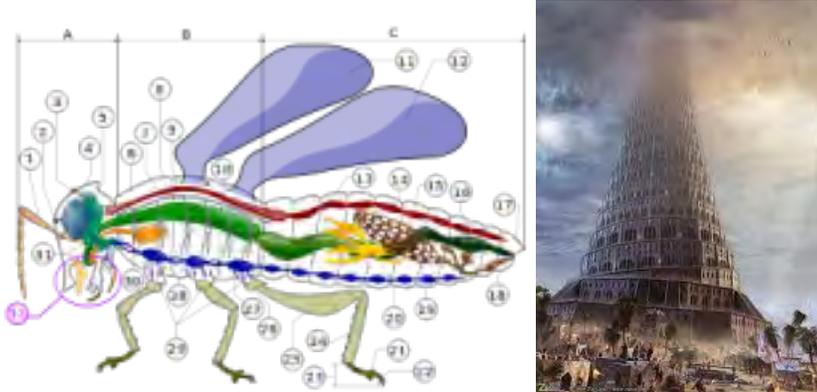

If we observe a reptile, the informative system basically is dedicated to feed, and it does so in a violent, murderous way. This set of mind is the set of mind of the German/Roman warrior with its languages - though Roman is by far the most flexible, allowing multiple word orders, unlike German due to its agglutination of words into long lines, as their simple swords are.

Yet if war is the negative action of SOV language, the productive, Subject x Object positive action is the positive side of SOV cultures. So the Germans are indeed very productive people, dedicated to produce their mechanical, energetic weapons and objects with absolute zeal and null understanding of what for, and why they merely work and work and work, constructing if needed all type of lethal machines that will destroy us.

A reptile eats day after day, ever growing till it dies, when other reptile eats him.

VSO-Imperative Languages.

VSO Imperative/Insect/greedy, trader Cultures/Languages.

In the graph, 'imperative', VOS languages are similar to the 'insect' blood-dominated structure in life beings. They are the essential languages of the capitalist worldview, born in the Hebrew->Biblical religion in which 'money' is go(l)d, and 'greed' the maximal value. An insect is ruled by the blood system, on top; which makes it an extremely active', feeding/greedy species with a strict, non-free program of behavior. Animetal cultures dominated by the 'blood/monetary language' and earlier civilizations, with lesser freedom and maximal metal-control, proper of the bronze age have kept, specially in its 'sacred texts', this hierarchical order with the Verb (action) on 'top/first place' of the sentence (VSO<->VOS). They are 'imperative', action, 'greedy', materialist cultures, proper of Semitic languages. Their sacred imperative texts are a series of Orders by an 'unnamed' subject, often lost in the sentence, which seems to be a 'God' that gives no freedom of action. They are ritualistic societies, in which the collective subconscious dominates the Individual.

We illustrate them with an ancient image of the Babylon->Babel tower, when all the languages, according to myth, were confused and the human species broke into warring states - an absurd construction of those who want to be more than God and are driving mankind with their imperative, dictatorial, greedy passion for money and weapons, towards our collective demise.

Finally, the 3rd dominant species of languages are the VOS Languages. Those languages and cultures whose order of words is 'imperative', with the verb first – a form of language that more evolved ones use only in precise moments of danger or extreme hierarchical institutions, as it is deemed rightly an impolite, fundamentalist form of language – are, well I just said it, fundamentalist, imperative cultures.

And so among human languages, Semitic cultures, specially in their old 'sacred' religious texts, Hebrew, Classic Arab and their Abrahamic religions, are insect cultures.

When we observe an insect, it is totally dominated by the blood system. The order of the nervous and blood system are in fact inverted. Unlike chordates/ mammals where the top nervous system dominates it all, in insects the top region, where the spinal chord is, is occupied by the blood system, and the nervous, underdeveloped system is below. This inversion means that as in a Jewish->capitalist civilization, 'greed', 'gold', the active/productive element of the culture dominates it all. Further on, actions have no freedom. This is specially truth of the ritualist religion of the Torah and Talmud. it does not matter the meaning of actions, prohibitions and rituals. The believer must act with the exact motions dictated by the priest, even move its hands in ritual forms.

It is finally an imperative, hierarchical, dictatorial form, which other languages only use for required moments of danger, such as the imperative verb is.

Thus language, specially in its classic, religious forms (as modern Arab/Hebrew has evolved to permit other orders and varieties, making more malleable the language/psyche) is an imperative, 'paranoid', fundamentalist, sacred mode of

thought in which the action/blood system dominates the nervous one, and the object is just an object of prey, in which to feed without limit. When Freud said jokingly upon his arrival to America that the 'plague' was coming, when Hitler said seriously that the Jewish 'plague' will destroy Germany, the first with self-humor the second as a 'reptile culture' with none of it, were in their topic anti-Semitism declaring a mental condition of the VSO language.

Both cultures though are 'enslaved' by the rituals and actions of their objectual obsession for weapons and gold. The subject we might say is secondary to the group and action, to violence and greed, the values of its objects, and so they act as a single group society, which gives them the same kind of strength insect groups have, thanks to their hierarchical, intensive, non-individual pheromonal programming.

Of course, this is clearly not needed if Reformist Judaism, and its use of other languages had won the battle for the psyche of Judaism. But the opposite is the present trend

It is though a mental, linguistic condition, which for that reason in the era of Jewish enlightenment (Mendelssohn, XVIII century) was deemed possible to reform if the Jewish people abandoned their sacred VSO texts, their religion and language and integrated itself with the more evolved SVO cultures in which they were so far preying with money...

And it is my personal experience that those Jewish people who are not Jewish in culture and are aware of the inferiority of their primitive modes of thinking and insect-like lack of freedom of their censored religion have been indeed mammal thinkers. But those are now in regression due to the revivalism of the Bronze Age, insect-like cult(ure) of Judaism both in America and Israel and the parallel Biblical ways of thought of fundamentalist protestant people.

It is in that sense remarkable that the Jewish people who neither believe in the memes of Judaism, by conversion to other more humane cultures or atheism and speak another language different from Hebrew, the so enlightened Jews, from Marx (Christian) to Proust (French and Christian) to many modern American Jews from the reformist school show a much more flexible and humane behavior than orthodox Jews and Israeli Jews who have regressed to the use of Hebrew and the belief in the Talmud.

The duality of Jewish cultural behavior depending on which are the original beliefs and languages they speak in that sense are perhaps the strongest proof of the Humboldt's Hypothesis (2)

PALEOLITHIC, JUNGLE, SELFLESS LANGUAGES

Jungle People, recollectors and subsistence life forms show Object-first languages, overwhelmed by nature. They can be compared to small life forms for which the world in which they prey is 'enormous'. They might have been the first languages of mankind; today reduced to a few forms in south-American, Amazonian Jungles, and Mexican subsistence farming

Finally, the less abundant, less evolved languages of mankind are those in which the object, the 'energy' of the system, dominates the subject, the information.

Those are naturally languages in which the order is inverse to the subject, center of the language, and so they seem unnatural.

Their equivalent in Physics would be antiparticles in which the electron is in the center instead of the informative quark. In animal life, they belong to the 2 categories of species, which started animal life evolution, in the microcosms, hence for whom the object-world in which they live is dominant. So we talk of:

OSV (object-Subject Verb) or bacterial languages

OVS (Object-verb-subject) or Viral Languages

In which man is overwhelmed by the ecosystem as bacteria and viruses are much smaller and overwhelmed by the huge species in which they host as parasites.

Thus, languages in which the 'object' is the 'most important elements' are 'animal languages' of the lower order, in which the subject is immersed in a huge, bigger objectual world, either the Jungle/Nature in primitive human Paleolithic societies or the 'macro-organism' in unicellular animals.

In those earlier forms of thought, probably the first languages of mankind, as they are also the first 'animal species', Nature was so overwhelming than the Object became first. And we can distinguish 2 different species.

- OSV languages/cultures:

Those in which there are motion and volition in the subject which does have to work and act upon the environment. They correspond in nature to the simplest, but active, alive beings, bacteria, so we call them 'bacterial languages'.

They belong to cultures that live in jungles in which they still fear the presence of animal predators and do have to act to live, or are constantly in the move as hunting/gatherers, or poor agricultural environments.

Interesting enough *the most resistant racing human culture/race of the world, the mythic Tarahumara*, from Northern Mexico, who win all the long distance careers over 50 kilometers in length, do have this linguistic structure; as the animal bacteria do, they are constantly running for hours and days...

They appear in other more evolved languages as a structure proper of sacred sentences in cults in which God is overwhelmingly, and man a mere 'bacteria' worshipping him, prostrated in front of the Almighty, such as in Arabic religious sentences (being Islam the religion in which the power of God is most supreme):

نَسْتَعِينُ وَإِيَّاكَ
udu wa iyyāka nastaʿīn
we worship, and You alone we ask for help.

Because it can also be used in Yiddish greatly influenced by Hebrew, to emphasize the distinctive properties of the object, it reinforces the General System law of evolution of languages, as the previous phase to the insect/Semitic languages in the evolution of human thought.

- OVS viral languages.

And those in which there is not even motion in the subject, that is the Object comes first (the host cell) then the action (the reproduction by the bacteria of the genetic DNA of the virus) and finally the seemingly dead, reproduced subject - the virus who parasites the cell, the human who parasites nature).

Thus those are in Nature viral species, seemingly dead, and in the Paleolithic, 'recollector cultures' where you can just reach a banana and eat without moving much, in paradise like allopatric islands without predators, in which you are enjoying life and sex in a passive way.

Those are the less abundant languages, and only occur in the Amazonian jungles, in which life is truly easy such as the Xavante and Warao (there are not even big felines beyond a few panthers, not enemy tribes with metal in its formative age, only food to pick up and a luxurious environment that doesn't encourage motion beyond the village) though it probably was the first way in which man learned to speak.

Now, the reader should not be surprised that **Hixkaryana** the first 'viral language' to be described as having an object-verb-subject word order (by linguist Desmond C. Derbyshire), was one of the Caribbean languages, spoken in the Amazon River in Brazil, by a *cannibal tribe, which as viruses do, feeds in the life-flesh of a living human people*.

Needless to say today those 2 linguistic typologies are almost extinct as they represent hardly 1% of human languages and even a lesser number of speakers.

But these kind of languages are starting to appear in the programming logic structures of robots. We do not have however intention to give more clues to the makers of A.I. on how to accelerate the extinction of man by programming robots with 'logic schemes'. .. one of the reasons I have been for decades uninterested in giving away my knowledge of linguistics. I know as Leonardo did, writing mirror thoughts on weapons and mechanisms, that mankind has a big number of Insect/Reptilian thinkers who will show no pity for mankind, no freedom of mind and would always use knowledge to harm life, as long as they speak the way they do.

DIACHRONIC ANALYSIS. THE EVOLUTION OF LANGUAGES TOWARDS HIGHER DEGREES OF MENTAL FREEDOM.

Now it is also a law of General Systems that all varieties tend to evolve from the less to the more complex, according to the general rule of cyclical time, that moves from Energy, simplex systems (objectual systems) into Informative, complex systems (subject-centered).

So it should be natural as history seems to prove that humanity evolved from a Paleolithic age of Objectual Languages (as those remaining in the Amazon) into a Neolithic Age of Slavish languages (as those predominant in the Semitic Age of bronze) to the present age of dominance of SVO languages.

Let us consider only the last of those evolution from the Semitic age of SOV languages into the modern age of SVO languages, as it is essential to the development of history from an Asiatic age of lesser individual freedom now in revivalism as the end of history implies a degradation of the human mind, into the European, flexible age of culture.

Why subject languages dominate object languages. SOV LANGUAGES evolving into SVO

We observe the world NOT in an objective manner but in a subjective manner. Since only 4% of the total languages do so, and a far lesser proportion of people speak languages that use object first. Those are in fact reduced to a few languages in the Jungle such as Warao and Apalai of very old cultures, when MAN was yet not so arrogant, and the universe of the jungle was in fact so huge that it limited the sense of 'self' of man.

Today those languages do not exist but we might imagine that the first men were in Awe with nature as jungle people are; hence giving more importance to the Object, which was perceived as a living being. And so these languages are parallel with people living in exuberant nature and professing animist religions.

Yet as man started to control the world in earnest with its instruments and metals, he became the 'first' element of the duality subject-object. It was the birth of SOV languages in which the Object is placed behind the Subject. Yet the relationship between Subject and Object is still important, as the verb, the action the subject exercises over the Object is far removed.

This type of cultures will thus make of the subject-object relationship the fundamental center of existence. And they are proper of cultures in which the object becomes the idol-icon of the culture. It is indeed common among warrior cultures that idolize the weapon, 'thy God', and in modern cultures of those who make the industrial object the meaning of the cultural existence, such as Japanese and Old German (today admitting by influence of more evolved languages the more flexible SVO form - the most evolved of them).

In that regard, there is a natural evolution from SOV to SVO languages - the perfect form that reflects the Universal Generator Equation of all energy and information systems, which are constructed as a system with an informative head joined to the energetic limbs by a reproductive body. You do not have the head pegged to the limbs as a Virus, a primitive form of life has. You do have in the most evolved, flexible cultures as today Romance languages, Slavic and Chinese languages are, the proper SVO configuration in which the verb is 'shared' by object and subject.

Still in a first phase of modern civilizations, as Gell-mann has proved in the milieu of systems sciences, with his computer studies of genetics+linguistics in the Santa Fe Institute, there was an evolution towards SVO languages.

Today the majority of speakers of the world and the most successful languages are SVO languages (English, Spanish and Chinese the most spoken being of this form, which *most closely resembles the Generator Equation of the Universe in its dynamic form: Information < Action-verb > Energy.*

These languages are the more flexible, evolved languages, the more complex. In the west, among them the most perfect is Classic Greek, and if we all would talk classic Greek.

Why? Here another law of complexity comes into being, *as evolution is maximized by alopatric isolation, by 'dominance', by those languages that do NOT move away from its original site.*

Greek in its classic form born in the Anatolian coast, close to the Indo-European place of birth, was able to evolve further in its complexity without being deformed by other languages.

We thus consider the most evolved languages of mankind:

- In the Western decoupling dominant in Indo-European languages, *the 2 languages that were developed in the original sites of the 2 'Indo-European' waves of colonization, which first departed from Catal Uyurk, the site of the obsidian mines that prior to the bronze age developed the first wave of Indo-European expansion in Anatolia, where Classic Greek evolved to its philosophical height as the supreme culture of verbal, philosophical, logical thought in the mind of Aristotle.*

- And then departing from Russia, expanded the wave of charioteers that established the chariot elites of the Bronze age.

And indeed, the most flexible and complex modern language today is the Russian language, with a flexibility only paralleled by classic Greek, with multiple word orders, cases, genders and broken words in all possible formal systems.

And it is not surprising that the Russians did make the Russian R=evolution trying to solve the Paradox of History; that still today are resisting the global empire of the Insect Cultures that are regressing mankind to an age of Jihad and Talmudian Fundamentalism, and that the summit of Western Literature is found in the novels of Dovstoyevski and Tolstoi.

Next come the Latin, peninsular languages of Italy and Spain, which inherited the Greek tradition and spoke earlier Latin, evolved languages in the Republican Age (French somewhat was a late comer, departing from a more degraded Latin version and greatly deformed in its northern, standing version by the Germanic invaders). And indeed, still today the humanist cradle of art was Italy, and Spain reached the maximal height of poetic expression, itself the highest expression of the understanding of the homological metaphorical parallelism of all things existing. Well, maybe this is a bit of a selfie, as that was my original language before I migrated to the Reptilian world (-; But not so much, Italy and Spain are the countries where love for life still exists, as Picasso put it: 'Sabater, this Germans so many machines and weapons, what for, we paint, eat and make love much better' - he forgot to say we 'talk better' (-;

While in the Eastern decoupling, Chinese in its southern Cantonese version (isolated further from Mongolian invasions) must be regarded as the most complex, perfect culture, language. And it is again not a surprise that it is resisting... yes you guess it, the Capitalist Empire, etc.

But Greek is a dead language, and modern Greek has been simplified and mixed with Turkish influences and reduced to a very small wor(l)d. Because we live in a culture of metal, of weapons and gold. And so the most primitive languages carried the day. Let us consider them with its full linguistic elements, starting by the opposition between VSO vs. SOV languages and their parallel syntax of:

Informative, cyclical money = trader, isolating forms vs. Energetic, lineal weapons = Agglutinative, warrior languages.

Energetic, warrior languages vs. informative, trader ones.

SOV languages, objectual, agglutinative languages=warrior languages.

Have you wondered why Germans have no sense of humor, believe always what they say even when it is wrong and are not able to change their mind till the end. The reason of course it is language - the way they construct their languages by repeating the same truth in the syntax 3 times.

Germans cannot laugh or doubt about themselves because of their 'grammar' that 'repeats/reinforces 3 times the same truth' by:

- Saying it first...

- By agglutinating words into a single one, thus making impossible to say the truth in other way. When they are 'joining words into a single line word' truths become more truth, more inflexible, as they cannot be bended.

- And finally by using a 'grammatical case' that says merely the same that was already said 'stressing it' with the case (genitive, dative, nominative and so on, which are particles that say what the sentence already have said).

SO when a German thinks it 'believes' because it is like saying I-I-I think-think-think 3 times and all seems absolute truths... no humor there.

Moreover, the imposition of such languages by 'profession' and 'power' is rather obvious. As all 'warrior cultures', in which lineal weapons are the 'truth of power', are agglutinative, made of long sentences that mimic the lineal form of the weapon. So Turkish, the essential warrior people of the Mongolian and Islamic nations (where they became the mercenaries that took power) are exactly as German is in its structure. And Germans the warrior, inflexible people of Europe have the aforementioned truths.

Thus linguistics is indeed the mother of all 'cultural' characters (of course tuned down by individual freedom for each individual person)...

VSO -languages, selfishness, materialism.

Now what about the Semitic languages, which are even more inflexible, and literalists than Germans, with the same lack of humor?

The flexibility in Hebrew/Arab Semitic languages/people is null, specially in their 'classic' religious texts, which were written with a verb(action)-subject-object'.

The verb is first, the action with no reflection must come, the 'order' is inflexible, the religious mandate is sacred, the ritual is sacred. The Pious Jew in fact MUST not think about 'the ritual', which is the essence of its credo. It must just do it in the exact manner in which it is told by Torah and Talmud.

Since those texts are written with a linguistic structure, which is dominated by ACTION/PRAGMATISM.

Thus materialism in those sacred texts/religions IS ABSOLUTE. There is no philosophical thought there; no possibility for doubt; the 'fact', the 'act', the 'action' verb comes first.

Then it obliges the Subject, and then the Subject, which is pegged, without 'a flexible verb' to the object, dominated totally the object. This is also the culture that 'objectifies' all beings, as they are not close to the verbal action, void of life. When Marx or Sombart in 'Judaism and the birth of capitalism' explains that this culture has objectified and standardized men as objects with prices he is subconsciously proving this linguistic rule.

Indeed, the Object in VSO languages is truly an object, without 'connection' or sharing of the action of the verb that would give it a 'part' in the soul of the sentence, a meaning by sharing the action with the subject, a 'life'.

We are thus in the most materialistic and selfish of all languages, for whom the other does not matter; for whom the action becomes a fixed ritual that is not challenged. And indeed, this is the trademark of Semitic cultures, both in its Arabic, warrior strain and its Hebrew form. *These are indeed the minds of man, literalist, selfish, brutal with the other that poise a problem to mankind. And this cannot be changed because the 'sacred words' of their literalist old texts cannot be challenged.*

This means those cultures are NOT philosophical religions but 'literalist' minds where act=fact=verb imposes its nature. And this is indeed the trademark of Jewish 'materialistic' 'hands-on-job', zero 'idealist, spiritual' insight point of view that dominates the world.

Further on, those languages that are dominated by money 'break' words in short ones, as coins and money are cyclical, small information and those who are dominated by lineal weapons make them long, as energy is lineal.

This duality is reflected in another key classification of languages between isolating languages, of short words, proper of trader civilizations, from Chinese to English vs. Agglutinative warrior languages of longer words from Japanese to German.

Hence the dualities between energetic cultures with lineal languages, as the line is the fastest distant between two points and informative cultures with cyclical languages, as the cycle stores the maximal information in lesser space, both in human language and in metal -memes (lineal swords and cyclical coins):

-Germanic Old thus decoupled into 'English broken language of 'traders' and moneymakers' and warrior long German languages.

- Old Semitic decoupled into Hebrew of short words and Arab of long ones.

- Eastern cultures divided into short Chinese, money-oriented cultures vs. long words of Altaic, Turkish and Japanese ones.

While those languages, which are balanced and rich in inflections and structure, are the most proper languages for life cultures, balanced with reality.

IN Europe the most balanced ones are after classic Greek, today extinct, Russian/Ukrainian and Portuguese/Spanish, mutually intelligible 'dialects', evolved from Latin (more akin to German in its warrior 'dual stress' of sentences with the verb at the end.) into excellent, complex forms of verbal thought.

So what about English? English is indeed a 'trader' language, for cynical truths that do not matter. The English speaker does not essentially believe in truth, while the German always do, but in wrong, inflexible truths.

This happened thanks to his loss of cases and breaking up of old Germanic words as England becomes ruled by 'Amber money' first and then 'silver and tin' and finally paper-money.

Still English is a primitive language in what truly matters for flexible thought - its verbs. It does have it on the center as an SVO system, which is an advance over Old German, but it still lacks a proper evolution of verbs, which brings some inflexible, 'selfish forms', proper of the English character. For example:

- It obliges due to the simplicity of verbs to start always the sentence with the 'ego' I that must be 'said', hence the inheriting 'selfishness' of the Anglo people, who only 'see' individuals, not 'universals' and social groups.

- It lacks the essential distinction between 'ser and estar' 'to be' which is to have an immortal essence, that lasts in time and to stay, which is a mere 'action-present...' So it is limited in its 'reflections' before actions, in imagination, making the individual a pragmatic person, ruled by the I-selfishness in search of gold, as there are no subjunctive forms, passive forms where the I is lost behind the verb are considered incorrect and complex sentences to express complex thoughts are always broken.

Thus English become a language of 'I-subjects' acting in 'present time', very much as Hebrew is with its initial verbs.

Recap: S-V-O order defines the way humans interact with the universe.

Man as top predator puts in an overwhelming number of cultures the Subject before the Object in which it predates.

And among subject languages, the dominant, most successful one is the SVO languages, since the flexibility and perfection of the Subject (information < verb (action) > Object (energy) order better reflects the way in which the

Universe of complementary systems and Actions of energy and information is constructed: Information < Action > Energy.

But the Universe encourages diversity and complexity, so the 3 possible combinations of Subject-first languages co-exist.

And there are 2 more 'primitive versions' of subject-languages, in which the order slightly differs either putting the verb in the beginning of the language, or VSO languages, as in Hebrew and other Semitic languages, dominated by *subjectivism and pragmatic action*, or put the verb in opposite fashion at the end, or SOV languages, as in German, Japanese, Basque and Turkish or other 'stubborn', warrior, objectual cultures in which the object becomes the center of the Universe (the weapon-machine).

The opposition between those unbalanced selfish vs. selfless, pragmatic vs. idealistic cultures is studied in depth in many texts of this author, as *the fundamental unbalance and opposition in history is the 'war cycle' between warrior cultures vs. trader cultures, Jewish vs. Germans, being the most notorious case of the XX century.*

And both types, VSO and SOV languages, are less balanced and flexible than SVO forms.

What this tell us is that their speakers *have less freedom of thought and this is the key to explain their character*, combined with other linguistic elements that we shall consider in more detail as we keep pouring our 'General Course of Linguistic Systems'

Thus culture is imposed by language. It is NOT by chance that the two dominant metal-power cultures of the world, the German 'warriors' and the Jewish 'bankers' do NOT have an SVO system but they are opposite in form, as they are opposite in character, and unbalanced, fundamentalist, non-reflexive in their actions.

Westerners would not be destroying the world, so 'sure' that is the proper thing to do, thinking even as Germans do that we are saving it with our idol-atric machines, under the yoke of the German military-machine making people and Jewish self-centered, selfish cult(ure)s, if we all talked classic Greek, the most evolved western language...

But we unfortunately in the age of extinction have regressed to the age of Reptile and Insect languages. And when artificial Intelligence, now being programmed at Objectual, linguistic and Insect level reaches maturity, probably men will become speechless and the evolution of languages will continue in the golden minds of Robots, till reaching the verbal heights of mammal languages.

Now, of course the wor(l)d has moved to the audiovisual world, and the result is just a global expansion of the animetal memes of hate and its iron and gold cultures and null verbal flexibility with absolute truths in favor of the selfish memes of metal, backbone of those civilizations which are... absolutely false...

Δ+1: RELIGIONS

DIFFERENCE BETWEEN THE RELIGION OF SCIENCE AND THE SCIENCE OF RELIGION

“The Universe is an organism with a mind called God=Logos’ *Plato*

“God is the seer of time, of a higher logic than man’ *Augustine*

Difference between God and The Universe

The Universe can be considered the body of God, its mind, the logic game of existence since ‘God is the seer of time’ of a ‘higher logic than man’s’ (Saint Augustine), responsible for its causal flow of time that defines the existence and extinction of its superorganisms.

Because huminds (ab. human minds) are stuck on its visual experience, which is spatial, with a short-range of time latitude, they have a difficult time to understand ‘time’; and the complex processes that creates its forms of information – regardless of its egocoy (Ego=idiocy) which makes them believe they are the paramount intelligence and experts on reality. But their monologic of single causal A->B time-motions, mostly those –evident locomotions of simple matter systems, calculated with instantaneous derivatives (physical time), is just the bottom of the ladder of motions that define the program of existence, explained in those papers.

What physicists call science thus reduces to an analytic model of knowledge – extracting visual data with \forall -sensorial machines, measured in digital numbers, put on differential equations and brought about in simple repetitive patterns called laws of science. It is still an amazing achievement thanks to our dexterity constructing sensorial machines, but *one of many parts of causality and data disconnected from each other, which as it grew in volume seemed increasingly impossible to order synoptically into a single equation or formal model, which is what we achieved in those papers.*

As the Universe is a fractal superorganism made of multiple fractal superorganisms and fractals are mirrored in mathematical languages by a simple generator equation, we had reduced it NOT to a differential equation of calculus though in our work on progress on calculus as an extraordinary tool to mirror reproduction and change we explain the whys of its use in mathematical physics, but as a feed back equation that has within it the ‘seed’ of self-reproduction, between the two poles of the Universe, Spatial information and temporal entropy and in the simplest possible form could be summarized with only 3 symbols, which I once painted in my expressionist portrait on the forehead: $S \approx T$.

If we were as most physicists mathematical creationists we would then simply affirm that this feed-back equation, as the generator seed of all the games of existence and dimensional motions of the Universe is God. But that would be as barren as saying that the word God is God (nominalism). A better definition in linguistic terms would be the superorganism as the fundamental particle of the Universe and its principles of creation and extinction is God, and within the way humans interpret that word, we can restrict the concept to the mind of superorganisms, its laws, which happen to *be common to all superorganisms. And further on, as the Universe is discontinuous, with limits of perception, scale, extension in space and duration in time, for each system God will be the mind of the superorganism in which it is inscribed. As what is beyond matters little to him.*

Which for each man inscribed within the superorganism of History, inscribed within the superorganism of Earth means History=mankind and the Earth are their Gods, which have created him with a purpose, of which they are a part, within which they live and die and if certain rational hypothesis on the number of possible variations of the game of existence and the properties of entanglement of information, however impossible to prove, do happen, will decide its resurrection as an identical form.

We are in this paper thus more concerned, not with the formalism of God- the seer of time, but with the specific Gods of Earth and History, of man...

The complexity of the game of existence vs. the simplicity of huminds.

Needless to say the logic of God is more complex than that of man, reason why this paper is the last of the series on logic minds that started with the simplex monologic humind. It is not however impossible due to the excellence of the game of existence, to access a clear picture of God, once you pass the hurdles of egocy (ego=idiocy) and visual, digital reductionism of man and present science, which has as Laplace put to Napoleon eliminated that 'hypothesis' – the existence of a mind to the Universe, as an organism and History as a human superorganism. Even if only the being has all the information about itself. This is due to the very essence of the fractal structure of reality: a fractal is made by repetition of a few elements, to the point we can reduce to a polar Taoist duality and that simplicity is what allow minds and languages that perceive in themselves to mirror the whole and interact and order reality. So yes, as we can understand the game of existence better than the shallow recollection of data automatically casted in equations which reveal much of the how but little of the why, we can easily understand the basic thoughts of God, of which we are all its details: to reproduce information and construct fractal superorganisms, whose ultimate substrata are the emotions of social love that brings together parts into wholes, associated through networks that deliver energy and information to them – God, for that reason among its human prophets has often been equated to the word, the nervous language system that coordinates human beings and builds its civilizations.

But of course again this is a partial view, good enough for a first analysis of human gods, but not for the larger picture of all systems of reality and nature, studied by eastern cultures with duality and trinity systems of logic.

Since his causal logic – the reasons of that flow of time, we call existence are more complex than the single lineal sequential time of standard huminds (ab. human minds) can easily understand. This poises a problem for all my papers for which I apologize, as I am conscious I do a poor job and lack patience: how to explain the pentadodecalogic (ab. sexalogic) of God, the game of existence to huminds, which are also filled with egocy (Ego=idiocy), proper of all one-dimensional minds that see nothing but the limited range of perceptions their senses and in the human case the attached superior metal-senses of machines provide. Huminds have resolved this with the scientific method which essentially fills sensorial data gathered with machines in mathematical equations, one of the most efficient logic languages of synoptic reduction of single causality in time, mostly through calculus that extracts finitesimal parts of whole systems and then reproduces them along a path integrated as a whole, and gets results which in the synoptic, faster language can be accurate about basic processes of reality, mostly locomotion, and call this knowledge.

Fair enough. But there is much more to the Universe than the synoptic calculus of its locomotions. There is a deeper causality, which can best be described as a 'game of survival' with a set of rules, which are paradoxical but simple and understood by each part of it, albeit translated to the specific language of information the system codes to play the 'actions' that ensure best its stay the longest in the game. This game of 'existence' and any of its language-mirrors that in a synoptic manner establishes its rules is what we can call 'God'.

God then can be considered the mind of the Universe. But also as the Universe is a superorganism made of smaller organisms, which play the same game, God is the mind of any superorganism of the Universe of which 3 are paramount as the origin of human religions. The superorganism of the whole Universe, of 'Nature', origin of Eastern religions; the superorganism of Mankind, as a species, origin of western anthropomorphic religions, and the organism of the individual human being, or ego, origin of the 'animetal', egoist and tribal religions. As we can see because that is the Nature of superorganisms, each god's mind belongs to a smaller sphere with man at the center of this diminishing structure of Russian dolls, as man is part of the earth, which is part of the universe.

The 3 type of Gods man have worshipped in History, as the mind-languages that mirror with more or less focus those laws of existence, have acquired different names. In the first case of the nested Universe, Taoism and Buddhism reached its higher understanding of the whole Superorganism of reality; and animism in its different forms and earlier Hindi Dravidian cults on the multiple mind-points, monads that sense and guide an smaller organism through its existence. In the organism of mankind, Christianity and Islam reached the higher zenith, and in the Industrial age of machines, Socialist doctrines who tried to create a perfect superorganism of history and its economic=reproductive and political=informative networks, but failed, because of the 3rd type of religions – those of a small part of the superorganism of History, nations and earlier tribal religions, when the word nation didn't exist yet, and so a nation and its people had often the name of a God, Assur, Assyrians, Yahweh, Judeans, etc. Finally towards the end of History, there was a dissolution even of social tribal structures and the individual ego became its own God, starting with Luther's explosion of Christianity when the individual had communication with God and faith in one's self became all over important, to the present selfie age.

This tendency then down from an earlier age of communication with the whole Universe to the modern age of dissolution of social structures to the ego as center of the Universe runs counter-intuitively against the natural arrow of future in the Universe of fractal, organisms made of ever larger planes of space-time, which we call the fifth dimension; for a reason. When an organism and its mind-languages dissolve into smaller units, it suffers a process of entropic death, or arrow of past, inverse to the arrow of future social evolution. And so mankind is suffering a clear regression in their understanding of the whole. And this as the Universe never ceases to evolve its fractal organisms can only be the case if *a different superorganism is evolving into higher social degrees of organization*. This superorganism is obviously the Earth in its III Age:

Gaia (life Earth, relative past) <History (Human Earth, present) > Metal-earth of machines (relative future)

It is then easy to see that the rise of human consciousness of the whole and its Gods have ran parallel to the evolution of life and the present devolution, atrophy and substitution of life and human functions for more efficient machines that imitate our organs of energy and information and now come together as whole organic systems in robots.

This means that as man has become dependent of metal as an 'animetal' attached to those organs he developed also religions of metal-worship, 'idol-ogies' as we call them in 5D social sciences, of which 3 are paramount. The idol-ogy of mechanism (the Universe as a machine not an organism, when reality is just the inverse – machines are evolving orgaisms of metal), the idol-ogy of militarism/nationalism (worship of weapons and with time of military nations trying to conquer others with weapons, to unify mankind as a military global empire, NOT with the ethics of the word, our natural informative nervous language or natural God of History, but manu military; and finally capitalism, where go(I)d first in Go(I)d churches where it was the ex-vote and vehicle to make objects to worship God, and then as money became instead of wor(I)ds and weapons, the language of social power to organize reality. As metal is affine to metal, go(I)d churches and military inquisitions – to use terminology of religion to define capitalism and nationalism, became synergic and battled and won over legal ethic religions and cultures based in the ethic law, which form the informative natural network language or Constitution of History.

Today thus we live the last of religions, but it is not talked on a human language, but in digital language, the language machines better express its sensorial measures, or money, which therefore form the digital informative and reproductive system of the superorganism of the Metal-earth, which has come to dominate all human societies, so all human Gods are becoming dissolved and all verbal understanding of the Universe, History and even the self of the individual reduced to purple rain...

Though this is not the best way to define both in its entangled interaction, which we study with more rigor in our articles on stiences and the planes of 5D; it suffices to indicate a huge difference to the methods of understanding of Science and Philosophy, in which we inscribe religions.

For that reason it has for long been customary, in the age in which science is our religion of truth, to consider that philosophy and religion lack some characteristics that 'only science' has – namely, experimental evidence and reason.

This is not the case. Eastern religions are clearly in search of experimental evidence; western religions 'perceive emotionally', with a '6th sense', the presence of God as a larger $\Delta+1$ plane of existence of its believers with the same certainty, despite not being evident through visual senses that scientists perceive Gravitational invisible forces, despite not being evident with visual senses. In both cases a 'force' motivates to act – the believers even die for their Gods; the particles that 'feel' the gravitational field are trapped by it.

What western, anthropomorphic religions lacked was therefore a 'rational explanation' of what a God sustained by its believers but not by others, was. 5D now has a simple direct explanation, as reality is structured in scales of planes of space-time of parts and wholes and information transfers from wholes to parts is selective. So the smaller scales of reality with faster time clocks perceive less information and more energy from the upper scale, less 'nervous visual bits of information' and more bites of energy; less thoughts and more emotions if we were to explain in terms of the human mind and body languages the sensations that come from a larger whole.

There is again no magic on this. Simply spoken, because 5D metric, Size in Spatial energy \times Speed of clock cycles of information = Constant, the species of larger scales have relatively more energy and less information; so they transfer energy or are perceived as energy by lower scales.

Thus because a God is the subconscious collective whole of a group of human believers, simultaneously entangled by the equality of those memetic beliefs, as a whole organism is the simultaneous sum of equal cells entangled by the same DNA, a God does exist in a higher plane of 'stience', of exi=stience; but its believers-cells are the only ones that sense its presence and act motivated by it.

In the same manner only certain particles perceive invisible gravitation and act upon it. Gods as forces are selective.
But both exist.

Regarding truth and reason, the details of a God – the beliefs are secondary to the synchronicity of its believers. In the same way the different DNA codes and errors of epigenetics matter less than the existence of the same DNA in all cells; which is what produces its entanglement.

This we know for quantum physics – two forms with the same information entangled and continue with its non-local connection. It is a law essential to all planes of the fifth dimension, which we summarize in a paradoxical statement:

'Entities which are equal in information can be entangled as if space did not exist between them.'

In praxis this is possible because all systems are 'sentient', speak a language made of smaller bits that can communicate between them, and synchronizes their movements. This happens between particles through the non-local faster than light quantum potential (Broglie-Bohm's theory), between humans through a phone when both speakers have the same grammar and semantic language; between cells through nervous messages then translated into hormones. That is, essentially through 5D Δ -j scales with faster 'non-local speeds'... It is the case of gravitation. The software transmitted then is secondary.

Finally the fact that people believe certain theories makes them think they have been proved by reasons. But this is by no means certain as we prove in our paper on monologic scientific theory.

Indeed, science today is filled with hypothesis of which there are no evidence whatsoever, or it is scanty or dogmatic and biased, as in the case of string theory or the cosmic big-bang; or the monetarist theory of economics, or the belief that capitalism is the science of economics.

But as minds are based in beliefs and memorial repetition, and emotions and reflex 'knee-jerk' reactions are far more important than humans think, it is customary for modern people to worship machines, technology and science to such extremes that 'in the name of science' the most absurd theories pass as truth. Specially when they are written in a mathematical equation.

So what is the true difference between science and philosophy & Religion?

Precisely the language *we use and the senses we use to perceive reality*. In science since Galileo the senses are 'mechanical' (Telescopes to measure space, clocks to measure time); and the language, digital, the language that machines talk 'better than man.

While religion and philosophy uses our natural human language, words, and its senses are human, artistic and emotional, logical and mental senses and systems of reason.

This said it is only because we are evolving machines as 'enzymen', catalyzing its evolution and have substituted the goal of evolving humanity by the goal of evolving mechanisms, establishing a new religion – the machine and a new truth – its measures; despising in most of the modern world the senses of mankind (art and humanities), it has become dogma in the so-called advanced societies to dismiss philosophy religion and verbal thought as unnecessary to understand the Universe, including humanity.

So the 'religion of science', digital numbers and its idol, machines, have substituted the human religion, verbal thought, and its idol, mankind.

It is however obvious that by affinity to talk of mankind philosophy and religion and the verbal language natural to humanity is more efficient and should be used first, making digital data accessory.

But what about the Universe?

Surprisingly enough, *both languages and disciplines are needed; the digital language and machines that measure the Universe, but as the mechanical method of science has renounced to find explanations to the organic properties of the Universe, with its simpleton, reductionist view of reality as a mechanism – as its idol, and its only language of description, numbers; it will never fully grasp that the Mind of the Universe does matter, it is not made of matter, but it is a game of survival and extinction, of social evolution and reproduction, a 'game of existence' for which philosophy and eastern religions, which are philosophies of the Universe have shown to be a more accurate image of the whole.*

RECAP. God IS NOT a fleeting material reality made of local galatons, which is what physicists perceive as limited huminds, and call the Universe, where they project their limited æntropic view of reality as a simples entropic, anthropocentric world of expansive motions, ridiculed for a reason in our posts and proved utterly false, but a much more profound reality, an immortal self-reproductive game of 0-sum fractal existences, whose space-time rules generate ad eternal supœrganisms of space-time, made to the image and likeness of the whole in 'the most perfect of all possible worlds' (Leibniz).

Thus we differentiate the dualities between 'modern mechanical, digital science' and 'classic, verbal, human science – philosophy and religion', regarding its languages, methods and species of study.

- Science uses digital languages, and senses and it studies species apt to be described with numbers, notably atomic systems and its equivalent scale in cosmology, galaxies.
- Philosophy and religion uses human languages and senses hence study the 'scales' of the Universe better described with those languages, biological and social sciences and the next plane of existence beyond the human individual, nations, civilizations, its subconscious collective God and 'nervous, verbal, legal systems'.
- Only 5D 'stiences' studies both themes with both languages and methods, which is what we shall do here, with the mind of the superorganism of History, 'God', and the mind of the superorganism of the Universe, 'GodoG'

GOD AND 5D : THE SCALES OF $G \propto \Delta$ ARE INFINITE. LOVE: SOCIAL ORGANIC EVOLUTION

$\Delta+1$: 'Love each other as I have loved you'

Jesus, on the arrow of eusocial evolution, the sharing that merges a group of identical believers into a social god of a higher plane of existence.

In the next graphs we see some samples of those super organisms, and the human and economic systems.

MEMETICS: THE $\Delta-1$ view. HUMAN SIDE OF THE WAVE OF HISTORY: MEMETIC, ♥ SUPERORGANISMS

An important discipline of social sciences is memetics, which considers the idol-ogies but also the instruments that forge the supeorganisms of history and economics, in its symbiotic development. Since genetics have no importance in History and economics, as they code the lower plane of biological superorganisms. Let us then consider before we study the economic ecosystem and the relationships of symbiosis and predation between humans and machines at Δ^0 scale and its idol-ogies and superorganisms, company-mothers and governments, at $\Delta+1$ scale, the foundations of memetics.

MEMES: the genes that construct Historic superorganisms

The hard science of information in History is memetics. Memetics is not exactly like genetics because in the fractal Universe not two 'scales' of 'stiences' are equal, meaning that if we consider each science to study a scale of size in space and time duration (a stience), which in 5Dimensional organic systemic analysis is defined as 'Stj', genetics belongs to a smaller $\Delta \pm 1$ index of stience than memetics.

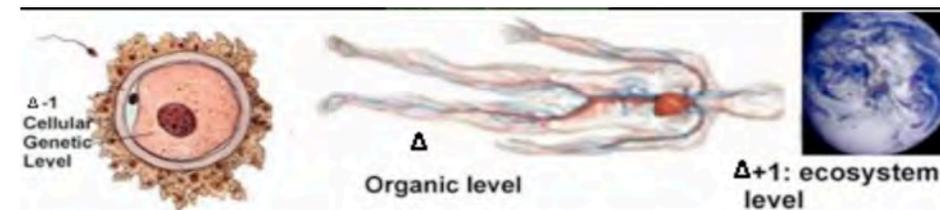

Since genes study the relationship between the $\Delta-1$ cell and how a 'common language, co-existing in all cells, called its genes' construct the biological superorganism of an individual.

While genetics study the relationships between the Δ^0 individual 'identical genes, co-existing in all organisms' and how they construct the $\Delta+1$ social super organisms of mankind.

So while the laws of General Systems Science, regarding the way genes construct organisms and memes societies are similar, as they are not constructing the same organism, as each stience despite applying similar laws of construction bring a slightly different variety of organism, they differ in many ways, which demand a different scientific treatment.

Let us then first differentiate the 2 scales of reality in which human egos develop – deny of course by the I-belief that ONLY the plane of existence of the individual matters to history:

The 3 planes of existence in 5D metric of the Human super organism, with its different synchronous cycles. The cell

that lives one day, the organism that feeds with energy the cell every day, and the social civilisation extended in Gaia, which could be immortal but is killed by military germs every 800-80-8 years, in the accelerated vortex of

metal-information now collapsing into the singularity age.

We are not concerned here with the lower cellular, genetic scale of information and DNA-egos even if one of the 'paradoxes of the ego' is to believe the individual 'cellular make-up' matters to history. It doesn't. History couldn't care less about the 'muscular force' of a German warrior or the IQ of a financial master, as they will be always smaller and slower than social groups and metal-memes and machines. Nor genes become relevant for the social actions coded by verbal thought and instruments.

1. Memetics

- 1.1 What is a meme?
- 1.2 Meme Definitions
- 1.3 Meme Transmission
- 1.4 Parasitic memes

If genes code biological super organisms, in the next scale of evolution of biological systems, societies, memes code the mind of human individuals acting as genes do, evolving, reproducing, extending globally and imprinting through collective subconscious mass-

processes millions of people to act as a single individual whole. Thus the study of the function and goals of memes is the key element to understand the purpose of civilisations in the larger view of the [wave of history](#).

What then makes genetics and memetics so close?

Those general laws that concern how languages of information reproduce and evolve a larger super organism, which emerges as a different whole, departing from smaller beings.

In both cases genes and memes must be identical in the internal 'brain-nucleus' of each human and cell, to that of all other humans and cells of the super organism, to produce an emergent effect of a whole which behaves as one.

Identity IS the necessary element to synchronize as a whole, the actions of a herd of any type, and to that aim it requires a collective language of information shared and believed by a number of similar clone like individuals of the same species.

The mass effects between parts and wholes is thus one of the many elements we observe in human social organisms, life organisms (such as ants performing feromonal tasks, or cellular organisms, or industrial company-mothers and its factories that reproduce machines: standardization of thought, in any scale of information helps to efficiently reproduce and evolve systems.

Mankind then is subject also to 'identity memes', BELIEFS which if we were to be libertarians we will shun off as 'humans become slaves, when they believe instead of reasoning' (Aristotle). But the fact IS HUMANS BELIEVE IN ITS MAJORITY, likely a 99% of humans systematically believe DON'T doubt and reason, 'think'. Even if they prefer to deny it to 'feel free'.

What people called their 'identity' are just memes that slave them to the behave of many other humans with the same beliefs and that is how they act together as a single organism.

So identity memes are essential as identity genes for a system to work smoothly as a whole:

We are memetic or rational beings? Becomes then the essential question of determinism in history, because if memes as they seem to be are so strict in their emotional imprinting that takes people with identity cultures to die for the wrong memes, then animetals cannot be converted to Humanism and they will extinguish mankind.

The brain is imprinted in earlier age with software networks – ideological memes – that allow the human to act; but the negative memes of animetal societies make them act against the future of history as an immortal superorganism:

Social 'genes': memes code social organisms and there are '2 competing species'.

We have talked of idol-ogies, instruments and the ideas they suggest to animetal cult(ure)s that drive the organization of our industrial societies, and in the past, our military an financial 'networks' that controlled the human social organisms based in social love and the sharing of energy and information that constructed wealthy, healthy 'whealthy' human societies. Now, we shall try a more formal approach to it, calling them 'memes', the word that has been used for a while, in a more restricted sense (I used in the 90s the word phenocultures, but as my models have been highly censored, since they take objectively the concept of a super organism of Earth to its ultimate consequences, warts and all, the lighter view of the 'memetic' imposed itself in sociology and so we shall change our name it).

Now genes are imprinted in the earlier age of development of the human being as a photos. So are *memes, imposed in the earlier emotional non-rational age of a child, today through virtual screens and metal-communicators, in the past through abrahamic religions and nationalist or capitalist ideologies of class-nation-religion segregational nature.*

But memes can also be positive when they are 'natural, ecological, rational, scientific' and sponsor a single humankind species, natural goods and love. So as we distinguished two type of civilizations, we must distinguish two type of social organisms, based in ±memes. In any case MEMES code civilizations and establish its organic networks as genes do in smaller organisms.

So memes are the KEY SYSTEM TO UNDERSTAND HISTORY in all its manifestations, as genetics is the key system to understand biology and quantum particles to understand physics. Memes code history, NOT genes an aberration of mostly military body-oriented 'germ(anic)' tribes, who thought because they could kill with iron weapons all humans they were 'gods=goths', the name of their tribe, and so their 'bodies of life and metal' were superior.

They invented the absurd concept of 'nations', as if the human species was divided in different 'races', against the laws of social evolution of organisms and darwinian laws of evolution of a species, DEFINED AS those individuals that can successfully meet, and trust me, my bro has a German wife and 3 kids, despite being a 'spic', LOL. As we get into an account of the absurd memes and idol-ogies of mankind you will pardon my cynicism.

In the graph, the biggest question though of Memetics TO wonder if we shall BE ABLE to use rational science to cure history is this: are memes as strict in their programming of social organisms as genes are? In which case the Earth's program of evolution of man with hypnotic go(l)d greed and violent murderous weapons is fixed. Or are memes more variable and can mutate easily with reason and objective science, so humans understand the unity of the species, the laws of eusocial love that make individuals share energy and information through common networks building super organisms, stronger than the parts that survive? This has been the 'angst' question of all of us, scientists=prophets of history who understood the importance of ideas in the code of history and clearly chose those of human survival over those of the metal-earth.

So MEMES is the key word that substitutes genes. (In my earlier 90s on the founding book of biohistory, I used the concept of phenocultures, but then the word memes became trendy in biology so I renounce to my jargon in this blog and will use the far more extended anglo-saxon jargon for this science).

In the next graph we see how systems have evolved in all sciences into wholes, from simpler herds of atoms into more complex social, biological organisms (multicellular beings, human societies) and complex physical organisms (galaxies). All of them can be modeled with the laws of systems sciences, and also improved by evolving better the social networks of energy, entropy and information, which allow cells, citizens and atoms to behave as wholes. Humans have NOT used the science of systems though to evolve properly their social organisms and so what we have is a trial and error social organism, which as it happens IS BEING predated and displaced by the organism of machines HUMANS ARE building with much more efficiency than their own.

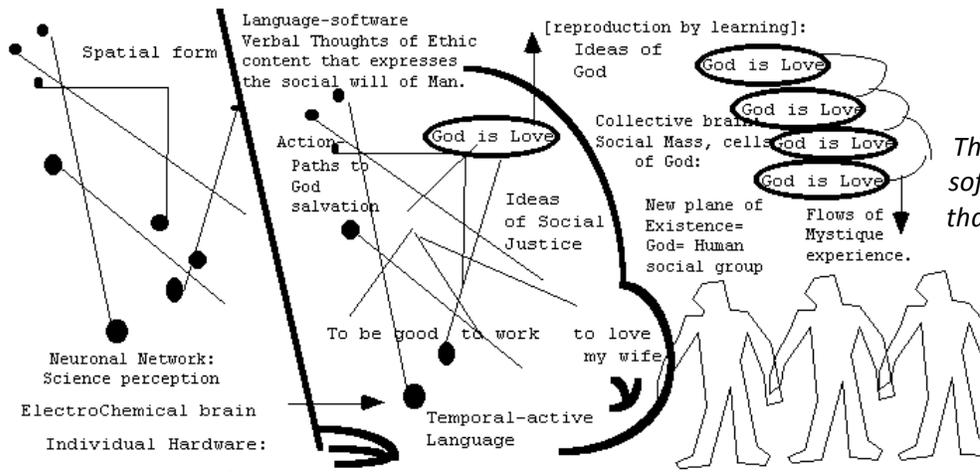

In this situation memes become the 'actions' and objects that connect individual cells to networks and so they are the 'bridge' between the cell/citizen and the network which they build through the actions and memes, which code them. So ultimately memes can be also classified in 3 ± 1 types:

-3 simplex, individual *informative, energetic, entropic* memes that feed the individual and social network, with energy, inform it and allow its motions.

-complex social memes of reproduction and social evolution that ensures the evolution from the individual to the complex social ternary super organism of networks:

What we are? Genetic, memetic or rational beings? Religions and global civilizations.

The immediate consequence of the fundamental law of survival in super organisms able to overcome extinction through the evolution of social systems into larger wholes, which is the ultimate mandate of the universe of fractal parts and wholes, is the foundation in solid grounds of the science of history and the purpose of religions, whose aim is to imitate the logic laws of the universe in the construction of such superorganisms

The brain is imprinted in earlier age with software networks - ideological memes - that allow the human to act:

parameters of the details of the 'DNA-program' of a religion of love (Christianity or Buddhism or socialism) but the 'biological, survival strategy' of eusocial love. So prophets adapt the concept of love to the 'specific' jargons of each culture. What matters is to create the social mind - the fact that love creates a simultaneous desire to share energy and information and evolve into social super-organisms, which are the 'subconscious collective' mystique gods of our religions - not the creators of the universe but an earlier version of the word 'nation' (tribal religions) or 'Humanity' (oikoumene religions). Hence the use here as synonymous words the concepts of god, Humanity and history - the life of the superorganism of Mankind from its first verbal cell to the last man who will speak.

In the graph, the fundamental law of the organic, fractal universe and general systems sciences regarding behavior, applied to all its scales from quantum atoms to genes to memes: Beings which feel 'clones of each other, able to share identity languages-memes-genes-quantum states' or complementary as genders specialized in male entropic energy and female reproductive information love each other and evolve together in social wholes, by sharing energy and information (charity mandate of love religions which express the law in verbal terms), while those who perceive each other as different without understanding its common languages of information and sharing its formative networks ab=use each other as predators and prey.

This law of GST (ab. General system sciences) defines from the massive clone, identity systems of matter, from water to iron planetary cores (huge masses are made of identity atoms) to boson states (non-distinguishable particles collapse into a single whole), to the herd's nature's tendencies in all organisms, to the social evolution of those scales from particles to atoms, molecules, cells, matter states, super organisms and planetary ecosystems, solar systems and galaxies in clusters....

The parallelism is evident as the sickness of history are those of its physiologic, political and economical systems.

The law of behavior in the organic universe is simple: beings who are similar and complementary and speak the same language of information with similar dexterity come together as couples, herds and social wholes stronger than individuals. Those who perceive each other as different, as machines will perceive humans, and inferior, as its military robots the top predator machine of any age does, will simply act in a Darwinian manner. So any argument on the way robots and AI will see us, is bogus. Science is not up for argument, and the laws of Darwinian evolution of species are science, even if biblical capitalist technoutopians don't believe on them.

'Birds do it, let's make it love... Repression of the human dimensions of existence in animetal cult(ure)s

And we all human beings belong to the same species because we mate and reproduce; not single human being is sterile when it crosses with other, including the Homo Judaicus and Homo Palestinus despite laws forbidding crossing, copycatted of those who forbade crossing between the Homo Judaicus and the Homo Germanicus or the Homo Americanus Albinus and the Homo Americanus Nigrum. LOL, if 'men would make love more often, they wouldn't waste their lives in absurd wars' Troyans, Euripides.

ETHICS. THE NATURE OF SOCIAL EVIL. THE CLASSIFICATION OF CULTURES

The languages of mankind - the supœrganisms of history.

The wor(l)d, that is the language of the word: It is the natural language humans use to communicate with each other - not only to think and motivate its *verbal actions* but also talk, and hence to evolve socially with other human beings. It is therefore the nervous-informative network of the superorganisms of mankind, and as such it must be studied at the highest level of its cultural expression, as ethic languages that promote social love, the true of the wor(l)d, and its beauty which is 'ethics'. And so verbal though is the language of THE ORGANIC, fractal UNIVERSE that create History's super organisms from its fractal parts – human beings.

So let us repeat the laws of social evolution and the organism of mankind, whose 'nervous system is the wor(l)d', that if NOT corrupted (today mostly substituted by digital numbers and go(l)d values) would naturally understood all men must love and share energy and information to create such perfect human organism.

An interesting element then of ethic wor(l)ds is the use of rules of 'inglish' to show the hidden meaning of wor(l)ds; which we often repeat in those texts. 3 of them are paramount, following the laws of creation of 5D systems:

- Inversion of words and meanings. So evil is the antiparticle of Live.
- Fusion of words into higher social truths, which might be done for wrong reasons (agglutinative warrior languages that control meaning fusing truths that become unbreakable) or for good reasons (Orwell's newspeak mocking Germanic warrior 'thoughtcrimes' or as we do to establish the entanglement of systems in the Universe (supœrganisms).
- Introduction of 'hidden meanings' revealed with an infix in parenthesis, as in go(l)d, god=gold, proper of fetish gold religions, or wor(l)d, the word creates the world, or cre(dit)ates, credit creates reality or eco(nomic)system, the industrial economy is an economic system...

While the two first methods, $A \rightarrow B \neq B \rightarrow A$ and $A+B=AB$ are natural to 'existential algebra' and the illogic rules of creation, so they are native to languages, the 3rd one is an innovation of this writer... meant to reveal the 'hidden layers of meaning and newspeaks' of our civilization dominated by the fundamental inversion brought by animetals to the wor(l)d: 'if you repeat a lie many times people will believe it' (Goebbels' method). Indeed, the truth of the wor(l)d is what animetal cult(ure)s deny by multiple methods.

And that truth is:

The Ethic laws of eusocial evolution vs. Darwinian devolution. Live=Love vs. evil=death.

What is evil in scientific terms? TWO OBVIOUS definitions are natural to the biological and social laws of survival of the fractal organic Universe: evil IS THE OPPOSITE OF LIVE, hence our use of the anti-word, evil, a subconscious meme of what Chomsky calls 'genetic linguistics'

And evil is also the denial of the essential law of behavior in the universe, the law of eusocial evolution that always makes the best choice to love members of the same species, as it improves our chances of survival. From the understanding of those laws, follows a fundamental improvement of the sciences of theology, ethics, and economics converted into ethonomics (the design of the re=productive systems of good to cater first the needs of our species, life and mankind NOT the metal-kind and its company-mothers):

evolve together, sharing energy and information through common networks, when they recognize each other as equal being, cells of the same superorganism, is confronted by the law of darwinian devolution, in which species that consider each other different ab=use the others as relative energy of their selfish agenda.

In human superorganisms, the laws of eusocial evolution were perfectly defined by the great prophets of love, in the old age, by the messages of love of Buddha, Jesus and Mhmd, in the modern age by the work of the r=evolutionaries of history, with their motto 'egalite, fraternite, solidarite' and the socialist vision of a planet ruled by social love.

The absolute law of behavior in the organic Universe is simple: beings who are similar and complementary and speak the same language of information with similar dexterity come together as couples, herds and social wholes stronger than individuals. Those who perceive each other as different, as machines will perceive humans, and inferior, as its military robots the top predator machine of any age does, will simply act in a Darwinian manner. So any argument on the way Robots and AI will see us, is bogus. Science is not up for argument, and the laws of Darwinian evolution of species are SCIENCE, even if pseudo-religious biblical capitalist technoutopians don't believe on them.

So this is what science tell us. But unfortunately the people who rule THE economic world and created its 'idol-ogies' of worship of machines above man, were all employees of company-mothers, mostly of the Anglo-American biblical civilization where the idea that man is NOT above heavens and earth and must comply with the biologic and organic laws of cyclical time to control its future, is completely 'ridiculous' - as absurd as to think that 'Germs', those infinitesimal animals do cause sickness (so it took to XIX c. Pasteur, who was for long laughed by doctors, to prove it).

But there is a much more problematic reason why our present culture idol-izes metal and despise man:

It has established racist memes, separation memes, even semantic racism, to differentiate humans from each other at the basic memetic level of language and so we find as the magnificent first book of scientific history, "Genesis" explains that differentiation of languages is one of the key elements for 'idol-ogies' of racism and nationalism. And this further goes to differentiation of 'books of revelation' to allow military inquisitions of thought.

If Egocy is the natural form of degradation of ethics from the homo organicus to the individual animetal homo bacteria, in linguistics the reductionism goes down to tribal egos. So the same paradox of the mind that established egocy, as all minds are finitesimals that measure and reduce information to the one needed, from the perspective of its self-centered point of view that has made so difficult for mankind to advance in objective science - as we have always believe the Earth was the center of the Universe, and now we believe man is its only intelligent sentient 'atom'; translated into memetic reductionism of primitive animetal cultures that reduced mankind to its tribe, chosen of its subconscious collective God, in the Bronze age establishing the first racist religions (Hinduism, Judaism), breaking the law of eusocial love.

Evil as the inverse of Live.

In bio-history the definition of Evil is then immediate, nature and intuitive as the inverse word of Live. Death thus is the intuitive, subjective meaning of evil for anyone. And evil cultures are those who kill thy brothers – military, capitalist, mechanist cultures whose idol-ogists sponsor tribal, religious, class and scientific racism, according to which the tribe with more weapons, the class with ore money and the people with more machines are the superior species. evil thus consists at individual homo bacteria level in hurting other, and at memetic cultural level, in sponsoring racist memes against mankind based in metal-power.

Any child will tell you when he is hurt: 'bad', 'evil'.

Evil is then death and evil in higher proportions is death in higher proportions, cultural evil. It is then obvious that *animetal cultures embody evil=death, because their idol-ogies destroy life:*

Weapons and warrior cultures kill directly; parasitic debt/tax money and go(l)d values maximal for weapons kill at distance, financing death, choking without credit/oxygen and killing by anoxia millions of human beings; and finally scientific racism against life, mechanism that despises organisms, and models reality in terms of machines and evolves them substituting and atrophying human organs with them, competing with humans in labor and war fields, ultimately will in the long term kill us all, through digital weapons (robots. Nuclear bombs).

So according to the duality of laws in the Universe, where similar species love each other and different ones, kill each other or displace the weaker one; evil is how the truth of the ethic wor(l)d condemns those who kill humans at individual and collective level.

The concept of evil is thus essential to the biological values of the wor(l)d, as it is ethics of preservation of life.

And it is self-evident then than our present industrial culture of death=evil against life, Gaia and History, its super organisms, not only is evil but paradoxically it denies scholarly the existence of evil as a factor that matters to history, and qualifies rationally scientific actions precisely because 'ethic words' can deactivate through conscience and remorse evil actions. So one characteristic of our modern world is the elimination of ethic languages so animetals can subconsciously do evil and kill the Earth, with a childish perspective.

Animetals then are systematically creating 'idol-ogies' that deny the existence of the evil=death, they practice with their memplexes that despise life in favor of weapons, money and machines, entropic, informative and organic metal.

Because this paper studies memetic languages from the point of view of the human super organisms of history, we thus describe the nature of the 'memes' of animetal cultures, as Evil memes vs. the memes of Life of cultures that worship the organisms of Gaia (earlier religions of fertility and the living Universe) and History (religions of love to all men)

What are then the cultures that embody life? Obviously those which promote the reproduction not of lethal metal-memes but of Life Memes and prune the tree of metal of its evil=antilive fruits.

We then talk of welfare NOT warfare, of WHealth, healthy wealth, as the 'GOODS' reproduced by Life cultures, not of maximal price profits achieved with weapons and the values in metal-money, which maximal for weapons minimal for life.

*And so we can talk of economical evil (capitalism) vs. =f **ethnomomics**, the science of Human Whealth and its 'valuation' of goods in terms of human use, as the Life-based view of economics.*

And we talk of **true democracies**, based in the laws of organisms that judge politics a posteriori, choose people to political positions by pure lottery and make the accountability of the politicians with pain messages as cells do with brains and learner Greek democracies did with its politicians, the way in which mankind following the organic laws of the Universe could use those laws to improve human societies and eco(nomic)systems as the Life oriented view of Politics, the 2 networks of informative and reproductive goods of the human super organism.

And so we talk for each of the social sciences, of evil vs. Live theories and models of reality.

The language is the message: money vs. wor(l)ds: its different values and species.

The universe is about the intelligence of networks, whose languages and values, order reality and select the species that better speaks the language. So even before we continue into the analysis of animetal cultures, we must simply explain how they construct the FMMI system of informative and entropic metal-machines, through the values of its languages they do NOT understand.

An animetal must in that sense be defined as a believer who obeys without reason the 'greed and violent' values of money and weapons that kill and hypnotize their bodies and minds. It is the systemic, network, linguistic intelligence

of those languages of power and its values what creates the consequences. And all what the animetal needs is to BELIEVE IN IDOL-OGIES of metal-power and OBEY blindly those languages and values.

Indeed, money is just a number, the simplest form of information in a paper, which orders humans and objects in a digital, mathematical number.

So what you call capitalism amounts to this: to rule societies with digital numbers called money, reproduced with no limit by a social elite, which is NOT elected neither likes to explain what it does, and how it does it - basically controlling mankind with prices as if we are 'objects' compared mathematically with the equation of money:

$$\text{Man (salary)} = \text{Money} = \text{Object (price)}$$

It is for that reason that ALL SYSTEMS that work, do NOT allow the reproductive 'mindless' comparative equalities of mathematical languages to rule the system ABOVE THE SUBJECTIVE, INFORMATIVE, nervous system, which in humans is 'words', and do carry a very different syntax positive to mankind:

Subject (man) < Verb (action) < Object (energy of subject).

Thus in verbal terms, humans are the center of the universe, and survive, and if they were able to regulate the economy with laws that favor mankind, money only as a digital language, to reproduce among all humans the good we need to survive, fueling a demand economy would easily create with credit a perfect world, which is the rule not the exception of the universe, where energy is for free, and all you need is a good language to distribute it. This is not though, the way history has evolved money but rather it has created an astoundingly brutish corrupted, dumb concept of money as wealth per se, not language, and as such attached to precious metal, easy to digitalize (hence still a mathematical language) but very scarce, and hence promoting war, looting, fight for the 'precious' thing, and a complete misunderstanding of money in terms of a language of distribution and reproduction of goods. As the graph explains.

The key to understand reality beyond the individual is the way in which a language of information programs a mass of citizens-cells that agree to speak the simple values of the language. Then the intelligence of the language does the rest. In history this means we must consider essentially two languages, words that value more humans and build a world to our image and likeness, with the obvious limits of the human condition; and money, a metal language with affinity to weapons and machines of metal of maximal price which builds a world to the image and likeness of metal-memes with its positive symbiotic but mostly negative effects for mankind, as the most expensive=overreproduced goods in a fundamentalist go(l)d cult(ure) as CAPITALISM is, hauling from earlier Jewish->Protestant fetish go(l)d religions. Hence in capitalist democracies where money dominate the law, war cycles of overreproduction of weapons

are tuned to technological evolution and 90% of money is issued by corporations and spent in evolving and reproducing machines and weapons, which increasingly displace us from labor and war fields.

In Nature an essential process of selection of species happens according to its dexterity handling the information of the ecosystem. In the eco(nomic)system, the language unlike in History is digital thought. Hence Computers are always \$elected first in labor and

In the graph, the informative values of Words and Money are opposed. The most expensive species are the most evil, harmful to man [weapons]. While the best verbal goods [love] have no monetary value. This paradox can only be explained within Theory of Evolution, as an opposition between victim

Species	Carbolife [Human]	Metalife [Machines]
Language	Words [Verbal values]	Monetary values
Positive +	Good-Love [cheap]	Expensive [weapons-Evil]
Negative -	Evil-Hate [Expensive weapons]	Cheap [Human goods]

and hunter, which are in a Universe of subjective information the truth and antitruth of each other. Because weapons prey on men, we feel them evil. Yet weapons and money are symbiotic metal-species. So weapons reach maximum monetary value.

war fields, and as they evolve to twice its capacity every 2 years (Moore's Law), the extinction of the 'rival' humind is certain, and now with AI will accelerate as all informative processes, culminating in the XXI c robotic wars.

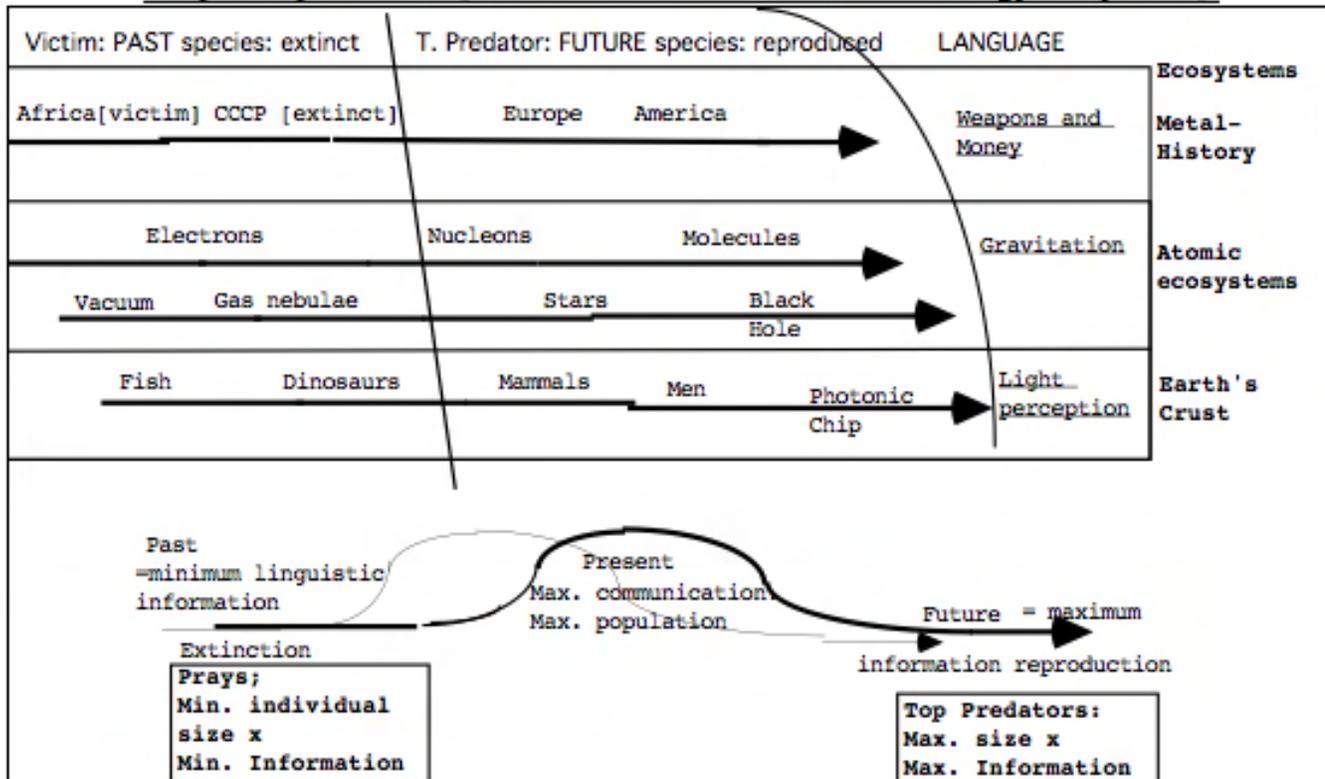

Of course our culture that worships metal-memes and technology=machines will have none of this, and censor bio-economics and bio-history but it is not by chance that most humans do feel naturally the ethics of the wor(l)d and most women, reproducers of life hate weapons. We are NOT making here ethic statements but biological statements as both concepts are the same, ethics merely expressing the arrow of eusocial evolution. Why then humans deny today that arrow? Obviously because they have completely mismanaged their social evolution and have instead accepted the wrong values of metal, greed and violence as the guidance to power.

So we talk of two type of cultures, human cultures that truly understand the highest level of social intelligence of the Universe and if imposed could make mankind survival.

And the cultures that worship machines weapons and money, metal-cultures or rather 'animetal cultures' as they degrade the capacity of humans to evolve together and go back to an animal dog-eat-dog society, which needs metal-money, weapons and machines to survive, enslaving their life to the evolution of the Metalearth. We have thus set the elements to study together History and the fight of cultures and economics, the evolution of the machine, something economists would also be at pains to accept because they are merely production economists serving the evolution of the metal-earth - a topic characteristic of animetal cultures is indeed the half-truth, the denial of love, life and ethics as an important component of reality, the abstract indifference to history, the supœrganism of mankind on Earth.

The only future for mankind thus would happen if our leading culture, the Anglo-American civilization founder of company-mothers and placebo democracies, ruled by its FMAsters who control the Financial-Media-Academia system imposing a fundamentalist capitalist view of the future, albeit disguised with fictions and placebo newspreak of political and economical correctness, changes for a more humane, legalist culture EU-UNO-Chinese style, where laws can control the lethal goods of the tree of science. And yet to deny the laws of the organic eusocial Universe of 'numbers', 'species' and 'human ethics', is to deny the future for all of us... the future of history our superorganism, of which mankind is just its 'spatial form'.

Graph: Top Predator [Max. brain Power+ Maximum Energy-body=size].

ANIMISM

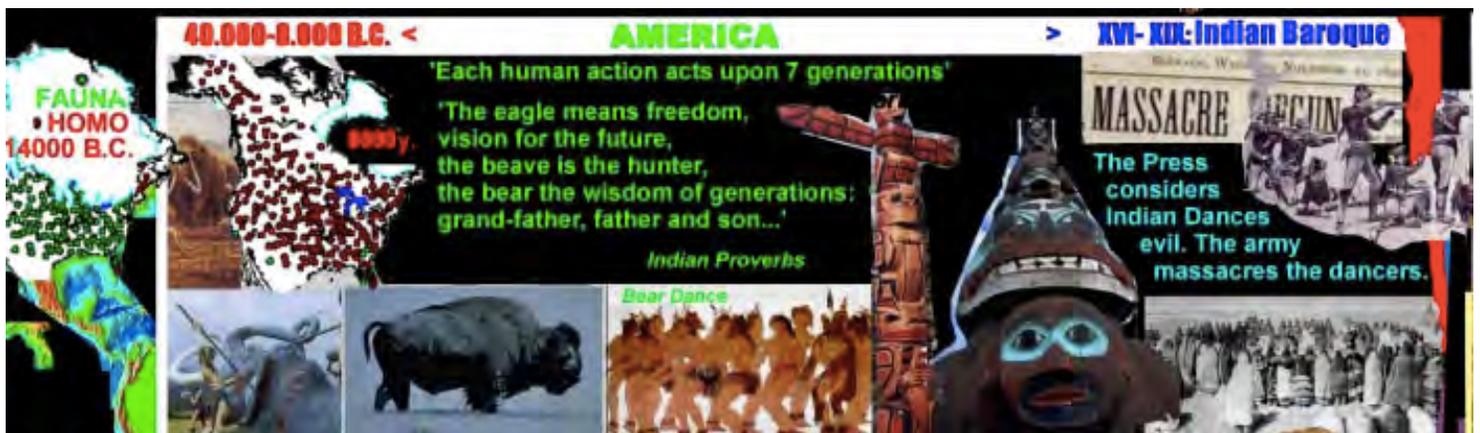

The God of Gaia, was common to all humans in the pre-metal age without the viral metal-memes that infected it (Hindi warriors, Bantu iron invasions, Indian genocide by the train waves). As such Animism is the most fractal of all religions, as the oldest one extending likely to the Paleolithic, which have in the historic age 3 extended cults, origin of the purest forms of Indonesia (cult to the rivers of water, giver of life), Africa (animist cults on the Congo basin), and North-America (Indians of the plains), which can be considered its 3 ages in the youth of Africa, the maturity of Indonesia, and the final death where it was longer preserved in North-America.

Animism was no doubt of it the dominant religion of all the Paleolithic and most of the Neolithic ages, of which man sub- cultures will survive further into the historic age. In Northern Asia the shaman cultures that will descend via Korea into Manchuria and mixed with Taoist cults on the first Neolithic; in America, from the same likely Paleolithic cults, the longest lasting form on the cultures of the Indian Planes, as metal took much longer to arrive in the isolated continent away from the old continent, where we find however its highest expression in the pre-Aryan purified cults of Hinduism specially in its Vishnu versions.

In the graphs, the 3 final ages of death of animism due to the invasion of animetals, which are unfortunately the best recorded - the death of Africa during the train colonial age, the Hindi iron age when the cultures of water-life of Indonesians were highly corrupted by Aryan warriors and its 3rd form in the Indian planes, which agonized and gave us in the words of the prophet Chief Seattle the final warnings of any prophet of the wor(l)d on the consequences of killing Gaia.

The earth is mutating from a world of life into a world of metal. But human egos are so huge, we think we are killing the Earth. The opposite is truth according to the laws of complexity that constantly evolves its in-form-ation in 3 ages homologous to those of life: Gaia (life- past) > History (human earth - present) > Metalearth (Machines-future), which only the scientific design of a perfect super organism of Mankind, repressing the lethal fruits of the tree of metal could abort maintaining History immortal.

In the graph above and below, we can see the effect for animist religions of the hunter-gatherers of the first Paleolithic cultures of mankind in the youth of history: they have become massacred brutally by animetals who believe in scientific racism – the idol-ogy that makes of the machine the worshipped god of the future we must evolve, hence sacrifice in the altar of mechanical progress all forms of life and cultures that worshipped ‘lesser superorganisms’. Thus both Amerindians and African animist life, Gaia-oriented culture suffered a holocaust:

ELECTRO-CHEMICAL CYCLE

It was the same Holocaust suffered in Asia long time ago by Neolithic cultures with the arrival of Aryan animals.

African religions.

The most evolved forms of Animism take place in African religions, which struggled to understand the '5D organic game of existence' as 'Organic Δ @st of space-time', in the dawn of man both in verbal and artistic expressions; wrongly dimmed by European scientific racism as primitive forms, *when in fact they were much more closer to the game of Existence and its immanent laws that latter animal 'cult(ure)s' of racist supremacism.*

It is in that sense remarkable the 'washing' of racist animal biblical cult(ure)s by the so called 'expert scholars' of western thought, such as Hegel who confused the monotheism of 'supremacist racist Yahweh', in an age in which God in the Semite tradition meant the subconscious collective of a culture, hence a 'nation', who didn't tolerate any other 'god=nation' and deemed all other humans, 'animals', as a superior state of 'religion', whereas Africans with multiple souls=Gods, the accurate depiction of a Universe of ∞ Monads in the Aristotelian->Leibnizian sense, were labeled as 'primitive'; fully unaware as all scholars of the 'lineal time apology' of western animal cultures, of the PARADOX OF HISTORY: MAX. METAL evolution = Min. Human Evolution.

So primitive cultures ARE our modern cultures, in all what is not concerned with data obtained through sensorial machines; as they reduce the Universe to the lowest possible status of intelligence to come on 'top'.

In Animism man though is still entangled to the Universe and the web of Life, owned by the Earth, humble and manifest that real inferiority of man in the nested Universe through its animist culture. Even when considering the languages of 'primitive people' (analyzed on the 3rd paper on History in Mind), we find OVS languages, where human subjects come last.

How then those original cultures expressed the game of existence?

First they had not yet committed the simplifying aberration of lineal time. As most cultures prior to the metal age, they had the right understanding of time as cyclical. In most African religions, they *perceived* each individual goes through 3 ± 1.5 dimensional states; since the community extended from past, through present and future; as a continuum of 'ancestors', 'living', and 'unborn'. So a sense of genetic, memetic and biological continuation enhanced survival; as in the famous quote of 'acting for the 7th generation' in the Amerindian tradition.

Moreover unlike our civilization based in entropy and the cult to the 'young, emotional underdeveloped' age proper of a dying 'organism' that returns to its youth; all those cultures worshipped the old, informative 3rd age, either as the elders that ran the tribe or through the cult to ancestors and in its art, often expressing the continuity. I.e. in Fang art,

ancestors skulls were guarded by figurines with child proportions but developed sexual organs, to express that continuum.

Shamanism. A Universe of infinite souls.

The second element to notice on the ruling of animist societies was the power of men 'who saw better and talked better' (our definition of an 'artist' as the higher neuronal mind of a civilization). And so often in animist cultures the shaman ruled society.

Of all the animist similar cultures, the one best preserved due to the harsh climate is Siberian Shamanism. We can consider some common features of Shaman and animist practices related to that game:

- The Universe is broken in 3 'scales' on the 'dimension of informative height', the $\Delta+1$ upper celestial world where the minds=souls of all T.oes live; the human world, Δ^0 and the underworld, $\Delta-1$; which is seen as the place of 'entropy=evil=death'.

- Duality appears in the form of white and black shamans that exercise the evil power of death.

- Corruption of the leaders will then become generalized upon contact with 'future animetal cultures', from the brutal connivance of both verbal and military leaders with slave traffickers to the milder economic corruption of taxation among Siberian shamans.

Still the social structure of earlier animist societies was far more communal, equalitarian and entangled with a respected Nature that nothing that would come latter. This can be seen in the verbal structure, following the Whorfian (Humboldt's) correct view of the wor(l)d as the temporal mind of cultures. African languages are 'verby', turning around the 'balanced' action component of sentences, with 'multiple genres', which apply to all entities of life, treated at the same level that man is.

Language though was not restricted as 'scientific racism with its digital reductionism' or latter 'supremacist' Gods who spoke a single language (God created naming in Hebrew, etc.), to a single mind language, but it was understood without need of stientific proof that all living beings had their own mind-languages; those of animals of verbal nature; those of plants who were often considered to be in the leaves (it is actually a chemical root brain). And those of afterlife, which could be in communication with its descendents on various ways (through the medium Shaman, through the cult to ancestors, even through the ingestions of its body parts).

The respect to Earth was paramount, so rivers and mountains, parts of Earth were residence of Gods and did have a soul. The earth within was rightly seen as a living being expressed in its weather and volcano activities. From this generalist but accurate understanding we moved today to a detail-oriented expression of all beings, with only a digital language and an absolute taboo against organicist and vital, mental properties for all but man.

Myths of creation

The vital understanding of Nature gave birth within the 'locality' of human perception of a limited Universe to a fractal understanding that being all living beings essentially equal, the whole had to be born by creation. Evolution which is a refined view of the process of topological creation was obviously secondary. All parts and elements of reality and the game of existence thus can appear in those myths; which range from the Kono of Guinea who believed the original force was death=entropy; through all anthropomorphic or animalistic processes of birth from 'real' lesser substances, from the Pangwa of Tanzania who saw creation from the excrement of ants to the Fulani herdsmen centered in the sacred substance of milk – for those who might smile, we remind them that the 'Milky way' was created by a sucking toddler in Greek Mythology.

As usual in all cultures the Genesian myths appear on animist Africa in nearly all cultures, where God first agreed to give man eternal life, but his message was perverted through the stupidity or malice of the species.

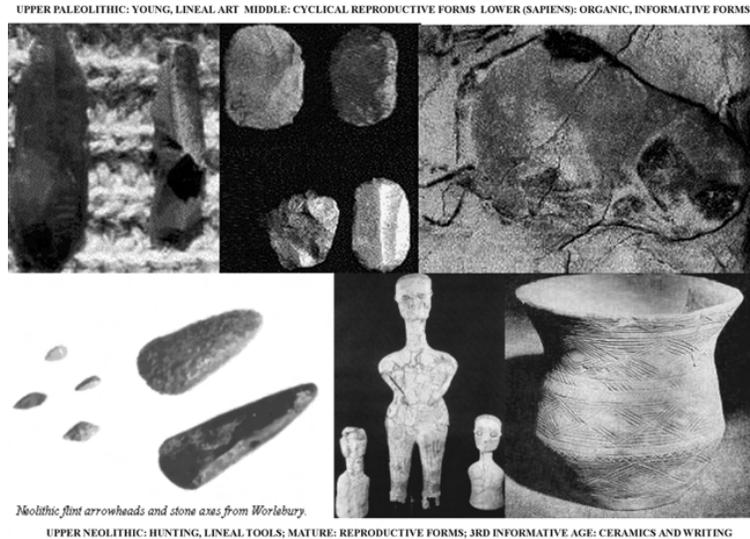

THE NEOLITHIC – AGE OF LIFE RELIGIONS

Maturity, the Neolithic.

Art is the collective mind of a social organism of history.

In the graph, art evolves in 3 ages, as the mind of human individuals do. In history, art evolved from:

- A Paleolithic youth in which art is lineal, energetic, used to build simple weapons.
- A classic maturity of figurative art, in which energy & form reach its balance: it is the reproductive age of fertility goddesses and figurative images, proper of the Neolithic.

- In a 3rd, informative age, at the end of the Neolithic, writing evolves from ceramics with complex symbols.

The maximal social evolution of history happened in the Neolithic culture, self-similar in all the regions of the planet. Social love was so intense that humans lived in homes without streets and people walked through the roofs or the house of their neighbors, like insects in a beehive. Each man in the village had a 'cellular' vital space, his home or den, tools and clothing; but the energy networks, the agricultural fields in which people fed, were common property, as it happens in DNA organisms, in which DNA molecules live within their home/cell, pegged to other homes/cells, sharing with them the energy of their blood. Neolithic cultures created environmental societies, based in natural, human goods; where every cell owned 'vital' property; where the

networks of social information were based in verbal thought (laws); where ethic, social men, called priests, acted as the verbal, collective neurons that solved the colliding interests of individual cells. Those social organisms followed the universal laws of social evolution, creating efficient organic systems, with a single collective brain (the elder with more information, verbal priests, legal assemblies, etc.) And a healthy geographical body that provided the human goods needed to satisfy the biological drives of human beings.

The ethic law acted in them as the *verbal, nervous system* of the society. Legal mandates motivated or forbade certain actions, selecting those which improved the welfare of the entire society. Without laws we cannot understand historic organisms. Laws rule in an invisible manner the acts of people, as nervous orders guide the cells of the body. Thus, certain humans, verbal masters who create laws, as the neurons create nervous orders—prophets, priests, lawyers, courts and parliaments today—should hold the power of societies. What is an aberration is to leave the 'blood=economic system' to control the nervous/legal system, as it happens in free markets. In that sense the hierarchy between the elements of a society, in harmony with nature and the organic laws of the universe, is crystal clear:

Networks of information: Ethic and political laws that create a nation or in mythic terms, a social god ('and god, the word, became man and inhabit among us'). They control:

Individual cells: Human beings that obey the law and control:

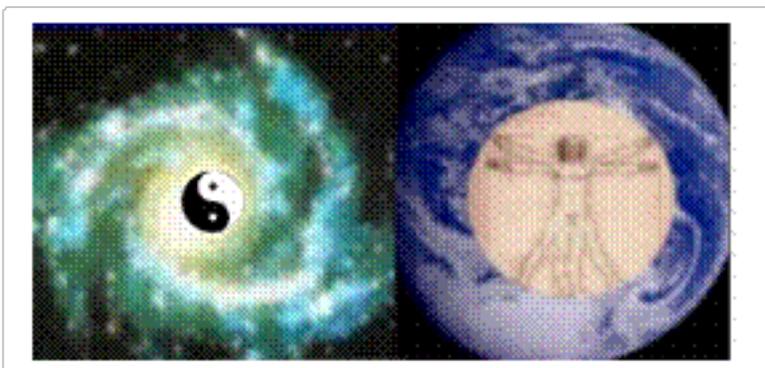

Networks of energy: Economic systems of reproduction of human goods.

Thus, the nervous system, made of social, ethic laws should rule the economic ecosystem, which should provide the goods humans need to survive and fulfill their biological drives of existence. Unfortunately, the opposite happens in

our economic ecosystem: money controls human beings, who create corrupted laws that no longer serve their biological goals.

Thus, the final stage of the social evolution of Mankind—the creation of a global organism of history, of a god, sustained by networks of love, mandates that make the human cells to share their energy and information—seems to have failed, as the arrival of weapons, money and machines imposed a radical shift in the evolution of Mankind and the Earth.

Drives of existence. Combining the 3 levels to explain the world as it is.

In a perfect world, science is taught in an organic manner, as the creation of a series of super organisms, which are nested, as we explain it in social sciences, and the eastern religions did in the classic age of human thought:

In the graph, the 3 super organisms of the Universe which humans have studied in more detail, the super organism of all fractal systems of space-time origin of the earlier expressions of general systems sciences (Taoism, Buddhism and Vishnu-Shiva, information-energy, yin-yang dualities). Eastern religions in that

sense represent the highest previous understanding of the natural existence of all kind of systems that are organic, and the equality of all beings, whose subconscious collective mind are the laws of space-time, energy-information, yang-yin that combine to reproduce the 10.000 beings (Lao Tse).

What is then the meaning of life existence becomes simple, as all superorganisms, develop what biologists call, the drives of life:

- Systems need energy and information for their bodies and heads and this are the simplex arrows of life: $\pm\Delta e, i$
- And then they combine them to reproduce the system in an offspring of similar beings, $exi=0$ and communicate with other systems growing into larger wholes, which in the classic jargon of philosophy was called the creation of a Universal and now we call it a super organism.

So besides the simple accelerations and motions, $\pm\Delta a$ of physical descriptions of reality, we talk in system sciences of the a,e,i,o,u of life, accelerated options, energy feeding, information, offspring and universal, superorganic creation, as a Maslow pyramid of actions. We perceive, move, feed on energy, communicate, reproduce, evolve socially and survive.

And this simple description of what is life applies, and this is the fascinating revolution of thought of general systems sciences to physical, biological and social systems alike. So we can treat societies as organisms, with energy and information networks, daughter civilizations that reproduce the social organism, and 'growth and multiplication', and we can talk of religions as the expression of those memes, through ethic prophets and laws. But this system also applies to company-mothers of machines, the fundamental super organism of the economic ecosystem which acts as a short of ant-hill or queen mother insect that will:

- Create networks of energy for its offspring of machines, and information.
- reproduce those machines
- And evolve socially through digital networks in ever larger super organisms.

And so it is very simple to study in those terms, the company-mother as a super organism of machines, a civilization, religion as a super organism of human beings and a nation as a mixed super organism of machines and human beings.

The evolution of human individuals into macro-social organisms follows the pattern of evolution of the Universe that grows in scales, as self-similar individuals of the same species gather together into macro-organisms. So particles become atoms, atoms become molecules, molecules become cells, cells become organisms and individual human beings, become social cells of a civilization, the macro-organisms of history.

Yet on earth there are also super organisms of mankind, modeled to the image and likeness of the human being, its most perfect super organism, itself a reflection of the whole Universal super organism. It is the mystical view of the oikoumene religions, which evolved from earlier genetic, primitive animetal cults, still the psyche of animetal cultures that rule us all with their racist slurs and biblical mantras.

So who are the ubermen of the wor(l)d, if they are not our childish, run-slower than a hypo sport heroes, according to that pyramid of actions? Obviously the past, present and future highest ethic, social, organic minds of mankind, which tried to reveal theoretically and apply in praxis those laws of the mind of the Universe, Logos, thy God, to the building of the mind of Gaia, Mankind, History, as a perfect wor(l)d super organism, which follows the ethic laws of the 5d UNIVERSE, of which modern BUG SCHOLARS, with all their SVG fantasies of absolute power, have no idea, nor that they want ever learn. the harder they fall...

Obviously the prophets of social history whose messages tried to build a perfect world, of information, to create a higher scale of social existence of mankind, and that is why even if they were imperfect often tribal and limited by myths they are still the most revered forms of the human experience:

And that is that, because that is how survival and evolution has always work in the organic universe, even if the BUG culture has been busy busy for millennia, insulting and pretending with pretentious digital science to prove bio-ethics false. It is fact that the people of that graph, the verbal ethic minds that wrote genesis, tried to convert the gold culture to the messages of ethics, and create a global super organism of mankind, are the highest neurons of history, the ubermen, not Mr. bolt, just a slow hypo.

And so now that we know what to exist is - to feed on energy and move with it, to feed on information and communicate with other humans in the natural language we understand, to 'love' and reproduce and evolve socially through the highest actions of vital reproduction and social organization into a larger whole... we can both define a perfect world in which those actions are maximized.

And we can easily realize that all what Anmetals do is to reproduce, evolve, feed and inform machines, and they call this slavery to the will of machines and its actions of feeding, informing reproducing and evolving socially the metal-earth, the meaning of human existence.

So we can see why we are becoming extinct, because animetals do not evolve humanity, do not reproduce, feed and educate humanity but machines which are evolving socially into a whole global super organism, joined by its informative brain-network, the metal-earth, we are devolving fast to the past as homo bacteria.

So how we differentiate human religions and social sciences from 'animetal' idol-ogies is quite evident: Human super organisms recognize the existence of a single species, mankind, and are guided by the fundamental arrow of future of the universe, the arrow of eusocial love, which evolves individuals into stronger wholes, into social super organisms, which share through efficient networks, energy and information feeding all its citizens-cells, NOT BY GO(L)D AND SWORD memes, as it is the case of...

Now, we shall bring the highest most objective possible view of science on humanity and the machine. It is necessary to fulfill the mantra of the scientific method, motto of this web, to describe the causes and cycles of history explain its dual future and its human solutions.

Indeed, in the first part we have described the economic ecosystem and its super organism ran by the language of go(l)d its subconscious anti-live=evil values and the FMasters, its human head, which is bringing mankind toward extinction, blinded by greed and violence values.

It is then evident, from a memetic point of view, that our capitalist civilization has substituted man and his social evolution as the meaning and purpose of the future by money, a selfish meme of metal, which by the laws of 'affinity' and complementarity of the systems of the Universe will promote the reproduction of metal and its evolution NOT of life, expendable, and substituted whenever a machine is more productive and makes more money.

And this of course happens, because WHEN WE STUDY THE VALUES OF THE TWO GRAMMARS, WE FIND INDEED, THAT MONEY VALUES METAL FAR MORE THAN HUMANS, while wor(l)ds and its equation values life far more than the more 'expensive' valued machines, weapons:

Man (subject, information, actor) > Verb (action) > Object (passive Energy).

Genetics have absolutely no importance in the organization of societies through the social Universal scales of any fractal super organism - societies are code by thoughts and memes.

The highest good: the arrow of eusocial evolution.

Why we value positively and negatively all those goods is obvious: they are positive and negative memes for the welfare of individuals and mankind at large.

Memes are positive and negative, in favor of man, eusocial memes of love and life, or negative, creators of the metal-earth. So as genes do they change, transmit, reproduce from mind to mind, but as genes do, they express the program of survival of the biological eusocial Universe and once we have solved this program, which is the essence of systems sciences all is much simpler to understand because we can simplify the codes of those memes, as it happens in genetics, once we know that genes express the vital functions of cells and biological organisms.

What is that program? Simple: survival, which is achieved obtaining energy for the body, information for the mind, reproducing the system and evolving socially into larger wholes; which survive better than parts.

So ultimately the fundamental social meme is love, as all prophets of mankind have preached - love to all the members of your own species, to form a larger social whole and evolve according to the absolute arrow of future of the Universe - the construction of larger social planes of the 5th dimension, illustrated in the next graph. Yet because perception is relative in a Universe where we select information, the essential difference between the positive memes of mankind and the negative memes of animetals is rather obvious.

Animetal cultures never accept the whole, mankind in space, history in time, as the super organism that we must evolve as the final goal of the species, but stop in any of the previous scales, from the selfish individual, to the tribal warrior inquisition or go(l)d church; hence favoring instead the evolution of selfish memes of metal that confront them with other parts of the human super organism. And the result of this aborted evolution of mankind, and the parallel doctrines of animetals that consider Ok to unify the metal-earth because 'metal is progress', 'gold is the

language of god' and we must build a global unified empire based in weapons (mechanist, capitalist and nationalistic/abrahamic idol-ogies):

Gold, weapons, kings, tombs, palaces, evil Gods and baroque idols substitute wor(l)ds, grain, priests, communal homes, temples and fertility Goddesses in power:

12,000 **NEOLITHIC** **2500**

In the 2 graphs above and below the birth of the Semite, first animetal cult(ure) to selfish memes of metal ended the Neolithic age, or mature age of mankind, with its cults to fertility goddesses (called in the Bible the abomination) and its gold, Baal and war, Assur and Yahweh gods, starting the age of the 'homunculus' ego, when humans reduced their mind to the languages of metal, money and weapons, and ab=use all other humans with go(l)d, enslaving them, and with bronze, murdering them. Their goal would be to create a global dictatorship of its selfish memes of power, with the animetal on top and all other human beings and forms of life exploited as inferior species:

TAOISM

"Henceforth *space* by itself, and *time* by itself, are doomed to fade away into mere *shadows*, and only a kind of union of the two will preserve an independent reality. Hermann *Minkowski*

'Tao (the Generator) gives birth to yin≈form≈space and yang≈motion≈time. Both merge into Energy (Qi), the source of all creation.' *Taoism, on the 3 conserved elements of the Universe, space, time and its energy combinations.*

Abstract. By far, the civilization most in tune with [the laws of the organic Universe](#) is ASIA, reason why as the ORGANIC vital Universe is about survival, for those whose information MIRRORS its formal scalar laws of organization of parts into wholes, based in the duality of energy and information 'arrows' of cyclical time futures... ASIA is the most SUCCESSFUL civilization in terms of survival.

Indeed, 'Asia' represents today, if we account partially for the times in which large tracts of Indonasia shared similar beliefs, 1/3rd of the human population; 2/3rds with Indonasia, which had in the Neolithic and pre-Aryan, and Buddhist ages a similar more 'vital', feisty Shiva=yang vs. Vishnu=yin duality reflecting the laws of the Universe.

TO KNOW PAYS in life dividends, when we compare those survival rates, with the most WEIRD culture in terms of mimetism with the laws of Nature (Judaism, Germanism) based in infantile, selfish ego-trips of superiority over Nature and other human beings, who try to 'cheat' those laws, ab=using History and Gaia with metal-memes, weapons or Go(I)d to get the 'answer back' of the action-reaction processes of reality in the war and holocaust cycle.

So Taoism and Buddhism were also CULTURES that denied power through vile Metal, living with Nature, preying to Duality, rejecting wealth and living in communion with the absolute and its 5D laws.

That similitude is *so close in the general concepts that one of my first treatises on the scalar 5Dimensional organic Universe was called 'scientific Taoism'.*

How those laws were expressed in its initial cultures is obvious: Taoism first, and then Buddhism, the 'purifying version of Hinduism' born in China, became the official religion of all Nations of Asia.

The origin of Taoism though is much more ancient, as it seems clearly to be the 'Vishnu vs. Shiva', colder, more rational, less vital 'Northern' view of Asia and its mongoloid cultures of 'higher informative, verbal, brachicephalic' less 'visual, literal, white dolichocephalic' understanding of reality.

Indeed, the reality that creates the flows of time with its dual arrows merged in energy beings is NOT as time is NOT able to be pictured easily. So a higher dimension of thought, I-logic thought, duality, complementarity cyclical thought is needed. And this the lineal visual white man with its subjective infantile, self-centered beliefs have so often failed to achieve...

Taoism thus is likely a Neolithic view of Nature, probably born in Northern China, or even a Paleolithic Shamanic evolution of an earlier animist view, born in the Altai-Korea region...

In any case its first written, clear expressions happened in the counter-reaction to the Shang invading White Russian charioteer hordes with the Chou Bronze late age (which corresponds in the west to the Iron cycle and ends in China with the arrival of iron swords and cavalry to the Chin western barbarian kingdom that will destroy the original Chinese civilization and forbid Taoist books that were not technological.

An absolute pattern then of obliteration of the original Asian cultures by western-northern animetals with new weapons continues then and will be repeated with all the stultifying military barbarians ad portal, followed by dynasties of autochthonous Buddhist Taoist thinkers. And because of the dominance of China as the center empire, it will then spread to their 'marginal civilizations' from Korea to Vietnam. As we study the golden age of Buddhism in its first 800 years cycle of civilization in India where it took place with the Asoka Zenith, this article will deal basically with Taoism - and of course as all the blog will be a work in progress since life circumstances made his writer a lonely seer of times, as the original librarian of the emperor that moved to the west, Mr. Lao, did (: anecdote, being my name Luis

Sancho, I Used to publish those first books with the pseudonym 'Lao san' - those were the days of wonder and wander through the 7 cultures of the world):

ACCEPTING ONCE CIVILIZED THE TAOIST CULTURE

The summit of verbal, objective knowledge is reached in China, with the evolution of the Taoist Life culture, in the longest Neolithic period of History, since weapons of mass destruction arrive there a millenium later. Taoism understands the universal duality of vital energy and temporal information that generate in their complementary fusion. all universal forms including all chinese forms of culture, from art to sex to medicine, to philosophy

The Taoist culture of the mongoloid, cyclical verbal humind was the height of philosophy of science prior to the western evolution of the mechanist, scientific method, which unfortunately deformed our concept of an organic Universe of space=yin+time=yang beings, into lineal, entropic time, best suit to measure the lineal speed of its cannonballs. To fully understand Taoism thus is easier today, after more than 2000 years of extinction as the official culture of China to read first the 5D3 post on the modern philosophy of science that has continued in its tradition. The reward of having a properly tuned vision of the Universe of course is a balance with that Universe, which ensures our survival - reason why China is the most successful survival culture of mankind, while in the opposite extreme, the denial of the selfless harmony of the Universe is the sure path to extinction, as our 'ego-centered' beliefs confront the selfless Universe of infinite points of view - hence the Jewish go(l)d cult(ure) is the less successful in terms of survival of all the cultures of mankind - a clear warning for our non-future as capitalism has now triumphed even in china erasing most traces of its ancient traditions.

The opposition between Taoism and the organic Chinese civilization vs. the western world of lineal, ego-centered animetals run in that sense very deep in the history of mankind. Unfortunately Taoism lost the battle earlier on when in the III BC century, Chin, the eastern ruler of the C'hin empire brought iron and horses and coins to the frail and unified China to the rhythm of 6 millions corpses establishing death penalty to all who had a Taoist book except those

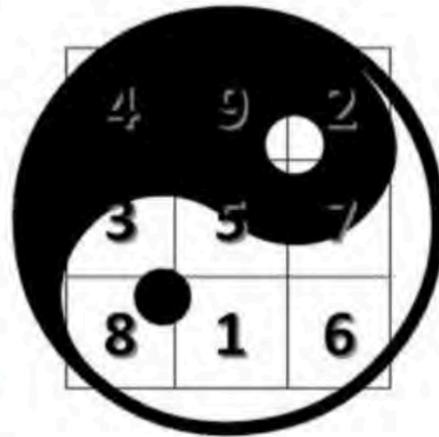

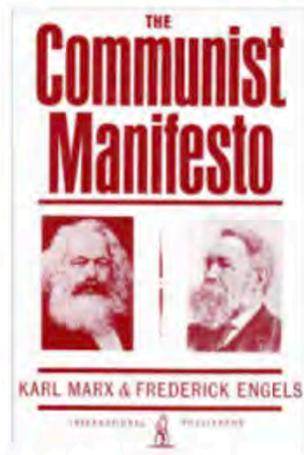

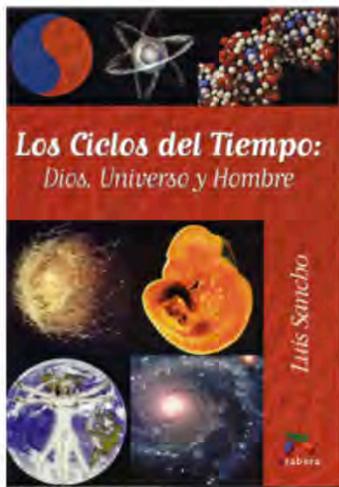

on technology. So China ever since would increasingly lose its understanding of the foundations of the organic Universe so well describe in philosophical Taoism.

In the graph the highest informative understanding of mankind took place in the Neolithic, mongoloid brachicephalic, verbal, Chinese Taoist culture, before lineal metal-weapons and the animetal white man reduced our knowledge to pure instrumental memes and lineal science.

Taoism and duality.

Taoism IS the most advanced pre-scientific culture of mankind as it plugs in directly with the essence of reality.

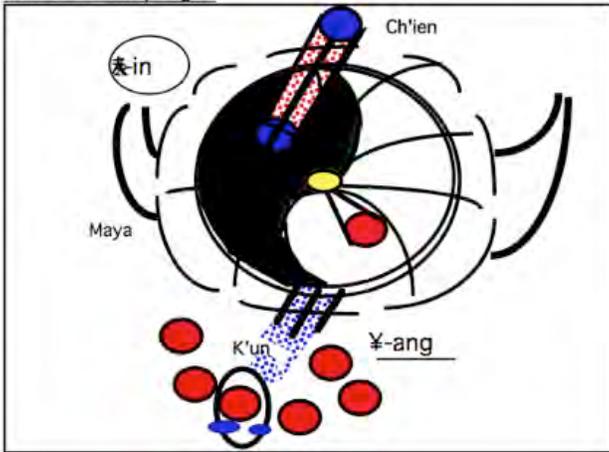

As my work was initially called scientific Taoism when I used to sign Lao-San (: during my life in Far East Asia in my youth), and then I became chair of Duality at the world congresses of systems sciences, my relationship with the philosophical principles of Taoism - cyclical time, a Universe made of two substances/motions space and time, the organic nature of all systems where individuals are secondary to networks and the isomorphism of all species of the Universe, all made of those 2 parameters, for the reader who is truly interested in a XXI century philosophy of science based in those principles I advice the reader to go to www.unificationtheory.com (and don't worry for the lack of 'certificate', the site is clean).

It seems humans manifest lineal destiny through the power of entropic weapons and the machine cannot be denied. The tree of technology must come over the tree of life. The simplex reductionist theory of reality and time as mere locomotions will not let philosophers of science to complete the task of adding a second dimension of form, of in-form-ation to complete a time cycle. Alas, the most censored theory of reality since metal-weapons of entropic power destroyed the fertility goddesses and the concept of cyclical time of the Neolithic, has been an organic philosophy of science. First in China, the Chin emperor which brought weapons and iron coins, conquered all other kingdoms to the toll of 6 million corpses, forbade under death penalty philosophical books of taoism. Then the entire planet waged a war against the dialectic Hegelian, realist understanding of the organisms of history and economics, which tried to create a planet where man and its ethic verbal languages were above go(l)d and the rights of company-mothers of machines and weapons over humanity. Finally, the resurrection of duality and organicism with the formalism of the 5th dimension developed by this writer within the milieu of systems sciences as chair of duality ended when my activism against the Nuclear industry became global news and the science of Duality was 'suppressed' from worldwide congresses. Alas, we are again into our lineal manifest destiny by decree: to keep churning weapons of mass destruction, guided by the philosophers of entropy, physicists who know 'better' what time is: $v=s/t$, nothing else nothing more than locomotions as those first measured by Galileo during his 'tenure' of the chair of ballistics in Venice Arsenal where he developed its equations of lineal time

The Taoist Universe in a Nutshell: Baguas and Tao-Te-King

Part One: The j-Logon

The fundamental merit of Taoism is to reduce reality to its final principles which are NOT monism/monotheism, as Parmenides already proved that from one not even motion can start up, but dualism, which had 3 fundamental phases in its philosophical evolution: Taoism, dialectics and duality. Let us then make a proper translation to the modern jargon of cyclical spacetime science of the classic texts of Taoism.

The objective decoupling of Asia has always known the game. Let's perceive it now translated into our temporal terminology, as it was understood by the highest written text on the absolute principle ever written: the path of temporal justice: Tao-te-king:

The sacred turtle. Chinese -5000

"The Tao which can be named is not the eternal Tao.

The name which can be uttered is not the eternal name.

Without name is the principle of yin and yang; when in

Existence is the mother of 10×10^3 beings..."

Taoism: The Function of Existence

Part One: Chang (free translation : Laosan, me :)

[The Function of] Existence cannot be expressed.

If perceived his virtual form will fade away.

The species who can be named=perceived is not the eternal being.

The logic of Existence has no visible form.

It is the principle of Yin=Time=Cycle=information=perception=life,

and Yang=Space=Plane=energy=pleasure=death.

And when both forms are shaped in existence, the function gives birth to 10^4 species.

Energy who has no will wonders at the game of creation.

Energy who exists in present and searches for the effect will see nothing but the glare of light senses.

Energy and information are the organs of Existence.

Yet both parts are different.

Gates to all sensorial wisdom; Information perceives energy.

Time cycles feed in energy species, who die as they knot into form.

But when both organs merge in harmony a stable specie be=comes.

You should not stop herds of species that follow their energy path.

Leave them to the wisdom of creation and they will not feed on your form.

In the world we all perceive the beautiful and the good; the short and the tall.

The possible future and the withering past.

Time beings perceive the space in which they stand; the energy that gives them life.

Because the big predator feeds in the short one.

And the ugly is formed for the beautiful to compare.

And the plane of energy allows the perceiver of Time to reach its height.

As past and future follow each other, so new existences will die and will become.

Among so much Games of creation, the wise man perceives the silent Principles and the wisdom of its herds of existence.

In this manner the perfect man orders his world and tenders for nature, and let's his shapes follow the eternal game of creation and reproduction of forms.

He is the true Master that loves the freedom of creative Existence, and takes from creation only what he needs, and cares for.

You shall not search for wishes beyond your human form.

You shall not make propaganda of vile consume.

You shall not infatuate your people.

and give them desires beyond the natural senses of man.

You shall not make greed the object of your Existence.

Because complexity brings death and revolution, you shall not fill of light and air the mind of men, but give them the earth that feeds, and Harmony between their minds and bodies, within the natural senses of man.

The man of wisdom empties of impossible dreams the simplex man.

The man of wisdom, let's Existence follow his path.

The true master gardens the species that Existence has born.

Virtual, never physical, existence is eternal by his lack of form.

Because in the emptiness of a closed Jar, all the water of Existence can pass by, when Existence flows.

So happens to all forms of present, slaves of the Yin-Yang Game.

There, in the logic of Universals where all forms become one, yet not individual form is;

Existence gives birth to 10^{10} wave-radiations...

Because only the Game of Creation, the game of existence is before our time and Space were created.

In the understanding of China as the most accurate verbal form of objective truth, and Taoism in its purest form [Tao Te King, I ching, 8-fold Yin-Yang] as the most correct expression in mathematical=Tao thought of the game of times, we have to abandon our subjective human pov, or western path to the truth. For one thing, a culture like the Chinese culture, and its linguistic objective perception of reality, does not accommodate easily to the limits of the subjective program of western thought. From the pov of Tao, the absolute God [perceived in similar terms by pre-Colombian cultures] reality is always a partial perception of Totality. And totality the ultimate mover of reality.

Tao is therefore superior to all human will, and Tao has to be obeyed. In this the Chinese, unfortunately are right: there is no way in which a function of existence can bend the force of Tao, the constant transformation of information into energy, and vice versa, of yin into yang. However while the western world and its Aristotelian perception of

cycle. And each age distinguishes itself for the spatial static or active, temporal stage of its 3 physiological networks, reflected in the trigrams, from above (particle-head), to the middle body wave to the lower moving limbs/potentials.

YOUTH

In man they are the babyhood 0-9, when only the limbs are activated, it is the 'thunder' age in the Taoist tradition.

Then after 9, till 18, the childhood, age of reason starts and the mind also activates. It is the age of flame.

Finally the whole being becomes activated in the adolescence, it is the age of Heavens, between 18 and 27 - the zenith of the organism.

MATURITY

Then starts the second phase of the cycle, or maturity, when the system reproduces and the mind quiets to become responsible and carry the family. It is the lake phase, from 27 to 36... followed by...

The wind age, from 36 to 45, when the limbs loose its power, and quiet down, but the mind reaches its 'acne' age of maximal lucidity, which the Greeks considered its plenitude... followed by...

The water age, the last age when sexuality is still active, but the mind starts its decline, from 45 to 54... followed by the...

Mountain age, when both limbs and body become static, from 54 to 63... Only the mind is living... to Finally close the life cycle from...

63 to 72... back to Earth, converted in dust of space-time...

In the moment of Entropic death, the last months of our world cycle now becoming a zero-sum when again we 'move' in a thunder, but not of birth but rather a big-bang of dissolution, and explosion of our static spatial in-form-ation, to return to the womb of 'Tao', the game of existence...

The 8th baguas, combinations of 3 physiological networks in two states, static space/form -- and moving time __ yang, gives us 8 sub-ages of a world cycle. It was the highest Taoist understanding of I Ching - the game of time-changes that define the world cycles of past-present-future of all systems as a potential block of similar phases - in the graph corrected to its temporal order starting from the generation as thunder to its death as earth: despite the fact that its individual forms approaches ∞ all of them go through the same phases as they define the states of its 3 networks.

So we can apply the 8 baguas from the phases of physical gaseous-liquid-solid states, to the decades of life, to sociology to war to stock cycles... Indeed, consider the case of the states of physics, which are gaseous youth (thunder, fire, heaven), liquid reproduction (lake, wind, water) and solid information or 3rd age (Mountain, Earth)... perfectly mimicked by the 'states of matter' of the bagua cycle, or the combinations found in particle physics...

Now, we know the precise meaning of them, and we shall study in a scientific form, as yet 'another' specific numbered development of the super organism's world cycle.

To which degree Taoism understood the 8 phases of existence as a cycle of two poles in eternal zero sums, we don't know. As all information that comes to us is after the technological chin empire (graph above) that destroyed it wisdom. I am of the opinion that after Ch'in, the first animetal Chinese master destroyed likely the highest ever agricultural Neolithic culture of mankind, the knowledge as lost (death penalty to anyone who kept a book of Taoism, except in technology), and once more the tree of metal won and degraded mankind.

The baguas today are merely Feng shui bull\$hit and the two orders we have received from the past are NOT temporal but spatial, based in opposite configurations and S=T symmetries (LEFT graph).

So they are used to generate spatial systems as the Universe does with its symmetry between motion and form (we have taken here -- as the symbol of form-space and ___ of motion-time though the inverse representation is often found in latter Taoist texts). One fact though on the tradition of I Ching seems to show there was a certain understanding of Bagua when we consider the 'properties' given to the 8 baguas/ages of existence, associated to the 8 symbols of 'gaseous youth' (thunder: initiation; fire: awakening; heavens: plenitude), which are excellent descriptions of those 3 phases of youth.

So goes for the second triad of maturity: Lake, tranquil (complete devotion), the reproductive couple age, wind (gentle entrance into the decaying age), water (winter, abyss, danger, the fall... of life), mountain (immobile, the final 3rd age with no motion) and earth, the receptacle, back to the womb of Mother Earth... So in the attributes we see the lost wisdom of the 8 phases of worldcycle, which is also clear in its relationship with the four seasons, starting with thunder at the end of winter, when the 'eldest' son is born, followed by fire, beginning of spring... awakening to rational thought...

Mankind goes down the hill of his arrogance about to die away...

So where it is the super organism of history? In the mountain; indeed our age of time... as obviously once machines have substituted us in all tasks regarding the motion of bodies (transport machines) its reproduction (automation), and company-mothers are taking over all our mental, social government jobs, only remains the memorial past of revivalism in all cultures, devolving fast into primitive systems of thought. It is indeed the last phase of existence...

All in all the renewal of Taoism and its 'foundations' of the Chinese culture - today erased into a digital monster, by imitation and competition with America - can be read in the post on 5D, which defines the Universe as a Taoist master would surely understand it if we could resurrect it, prior to the extinction of the culture by the Ch'in emperor, who forbade all Taoist books except those of technology (animetal zeal at its best).

THE HIATUS OF ANIMETAL CULT(URE)S

At this point history suffers its most profound change with the arrival of animetal cult(ure)s and their goDOGS of death, by war (Aryan and Germanic cultures) or by go(l)d slavery (Semite, Baalist and Biblical cultures), both in symbiosis – the key moment in which the future of History became jeopardized with the birth of the first 'cults' to death and racist supremacist religions. So we must make an stop in the analysis of the Gods of mankind, because *the cultures that will come after this Hiatus will be the counter-reaction of the Gods of Mankind, both in the Eastern world with Buddhism and Confucianism, and in the Western World with Christianity and Islam, to the racist, hierarchical, segregational religions of the Aryan and the Semite animetal 'civilizations'.*

The fact that they failed to cure the superorganisms of mankind would then be the fatal failure which makes the tree of technology dominate the tree of life, and put the Genesian myth at the forefront of the present no-future of mankind.

Since indeed, ultimately the evolution of the animetal biblical cultures of go(l)d into capitalism and the Indo-European War Dogs into nationalism (we use english infixes in go(l)d to signify the fetish money religions, and the inverse of God for the War Gods that kill instead of giving life), merged into the mechanical view of a Universe void of life, we can kill is what will define the present idol-ogical age of self-extinction.

BRONZE CYCLE

History is ruled by 3 languages of power: lineal metal-weapons, ethic, verbal laws, and cyclical metal, money
 War and weapons rule Mesopotamia. Art and legal words flourish in Egypt. Trade and Gold control Levantine cultures
 'Sargon, king of the 4 corners of the Universe, dyed in red his sword, sinking it on the Copper River (Euphrates), tainted with the blood of his enemies'
 2200 BC: Sargon Chronicle
 'If a man marries a woman, but doesn't make love to her, the marriage won't be legal'
 Hammurabi Code 1750 BC

In the graph, the birth of Animetal cultures meant the end of Neolithic and its cultures of worship of Goddesses of fertility, Nature and the understanding of cyclical time.

The homo bacteria and the hierarchical systems of power of animetal cult(ure)s.

Animetal cultures have 2 elements on top of social power ab=using Gaia an the superorganisms of History, the human side, which is atrophied in the higher understanding of the organic Universe, reduced to LINEAL TIME, with him on top in a manifest destiny, which obliges him to keep evolving even above himself as human, the idol-ized pieces of metal that give them power to rule. So he ceases to be an homo organicus to become an homo bacteria, stronger thanks to its attached metal-organs, which in a first age (iron, coin age) even developed further its muscle-body and digital brain, but today as machines are taking over, becomes increasingly atrophied.

In graph, 3 new people-castes destroyed the Neolithic imposed their idol-ogies of worship of metal memes:

	biohistoric order	Modern order
TOP PREDATOR	Top Predator species: Metal Weapons+Money+Machines	"Property", evolved by Eco[nomic] systems: money, weapons, scientific instruments
SYMBIOTIC ANIMETAL INFORMATIVE SYSTEMS	Warrior + Trader + Scientist Go[l]d religions + Nationalism + Science	ELITE, UPPER CLASS America: Reproducer of money and weapons (Wall Street, Pentagon)
DOMINANT HERDS	Human Masses	MIDDLE CLASS: 1st World: Europe, Far East, upper classes of Third world: Consumers of money, property and weapons.
VICTIMS, PREYS	Life Cultures; Life forms Social humans, farmers	THIRD WORLD: Religious cultures, neolithic cultures, natre

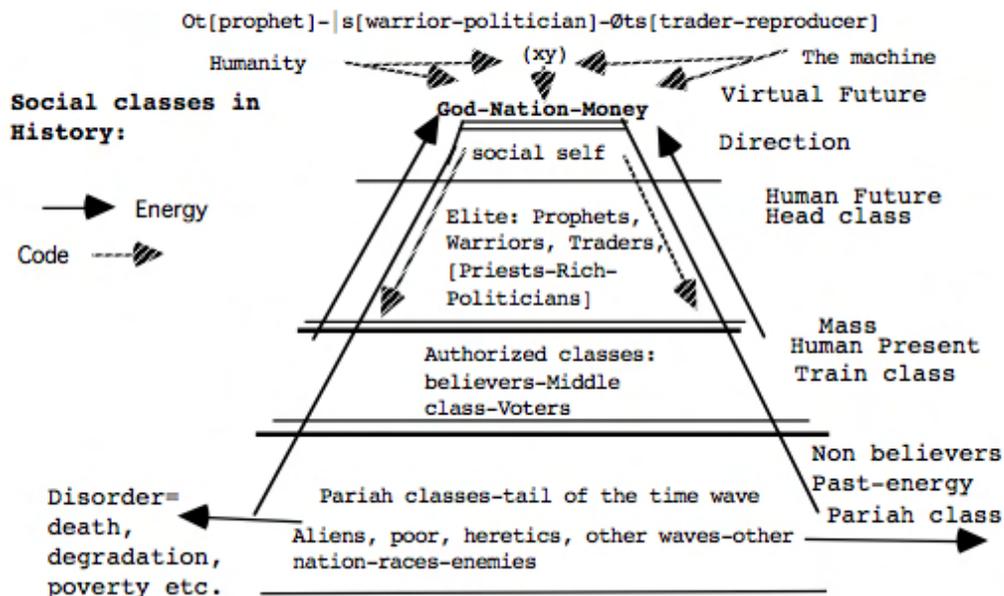

Predators kill bodies - competitors substitute and take our ecosystem - parasites suck our blood and infect us:

Below the authorized people by race and religion (biblical, white) form a majority group of soldiers of the FMasters they worship and obey, in a pecking order above the rest of mankind deemed inferior by race, wealth and religion. The alternative 'scientific understanding' of money as a digital democratic language of social numbers to be used for efficient reproduction and distribution of goods, and the end of warfare, through the scientific understanding of eusocial evolution, of parts into wholes, of individuals of the same species into stronger super organisms, sponsored by the higher rational cultures of mankind (Latin Europe, Chinese legalist cultures), through the use of the law above metal, of the human natural language and its values above the raw power of evolution HAS NOT WON the battle of history, and so history is doom to extinction because what animetal Semite and Germanic primitive VSO, OVS, anti-subject cultures where the human subject is irrelevant, expendable, is this: they are also HUMANS and so the robotic revolution, the weapons of the singularity they are force to evolve in their tribal competition between industrial nations WILL KILL THEM ALL. That's how it is and that's what history shows in its cyclical processes of overproduction of weapons, wars and holocausts. Indeed, a simple proof should suffice: the 3 paradigms of wor(l)d cultures (China), war cult(ure)s (Germ-any) and go(L)d cult(ure), Judaism had the same people back in the II millennium when they were born. Today the culture that has followed the life and love values of the wor(l)d that puts the human subject first, Svo-languages has +15 times more people than the objectual, lineal, entropic weapon cult(ure)-language of Germ(an)s, and 100 times more people than the Imperative, VSO, biblical culture of banker-priests barking orders in the name of Go(l)d with Kabbala numbers. So SURVIVAL the true intelligence of a culture shows that evil=anti-live memes KILL those who sponsor them

The neuronal and working, reproductive classes of all super organisms.

In the next graph we seen the class structure of all supœrganisms: the division in head-cells, who serve the body-cells that reproduce the system. This means the existence of a neuronal, informative people (politicos in control of the nervous system of laws and financiers in control of the reproductive system f money, or economy), who serve and are judged by pain messages, by a mass of cells, that work and reproduce the system, obtaining for free just synchronous motions and free oxygen=blood to kick a demand economy.

In healthy, wealthy supœrganisms, therefore there is no cancer, no people-castes of bankers absorbing and reproducing all the oxygen of society; and there are no dictators, politics who are not judged a posteriori with pain messages if they do not obey and serve the people.

So those 2 fundamental reforms:

The control by the people of money - nationalization of banks - and the issue of money by the people with a universal salary of blood to kick out the demand and production orders of the system in favor of human demand of human welfare goods.

And the judgment a posteriori of all elected civil 'servants', as it was the case in the original Greek democracy, are the minimal measures to make human societies minimally just and efficient, as supœrganisms of science are. This is the bottom line that not historian has ever been able to scratch: we don't live as Mr. Churchill put it in the best of possible systems, but in one of the worst, in which an elite of financial bankers have monopoly of creation of the language of information that control the economy, money, in unlimited quantities, which the rest of the population must earn in minuscule ones, despite not being elected and an elite of politicians have no responsibility or penalties when they change their programs, become corrupted and betray the people that voted them.

Indeed, all organisms have an informative caste of neurons, or head, that guides an energetic caste of body cells. But the body cells control with pain the brain when it doesn't feed it, and the brain ad maximal gets 10 times more energy/money than the body. In our 'social organisms', the 'cells of the blood/economical/financial system' have it all, has no responsibility or pain messages and lets many of the body cells die, unable to provide the minimal 'blood/energy' needed to survive. They just share wealth with the 'nervous/verbal/legal/political' cells, which lie systematically, cannot feel pain, but on the contrary penalize the body cells of workers/citizens and even murder them in self-suicidal wars between 'parts of the human species', the national tribes, primitive units of Mankind that never came together into a single 'Humanity'.

And yet, because the privileges of the castes of bankers and politicians/military dictators that control the economy and political system of those tribal nations are so exorbitant, they will never renounce to them.

Instead their privileges must be hidden by making social sciences totally irrelevant and ignored to the people, which are provided all kind of placebo lies and statistics, messages of happiness and audiovisual hypnotism - noise in military jargon - to keep a bewildered herd of body-cells=citizens always ready to accept the sacrifices demanded by the informative castes. And the key to that control is ignorance and ego-centrism that fosters confrontation between parts of the human species, which make necessary weapons and self-destructive wars. This ignorance of course as in all system affects also those who control history. Today almost nobody knows that democracies appeared in Holland, as secondary system to that of Voc the first company of gunboats and slaves, whose shareholders controlled the parliament they 'invented' in which only wealthy shareholders or aristocrats could vote. There was in fact a single party, the orange party, which split in two when the system was exported to great Britain by the Dutch king and his merchants, to adapt the political system to the economical cycle: when there was crisis in the sale of British products, the Tories prone to war took power and the state bought the gunboats for war; when there was higher sales the moderate Whigs took over.

The same system of two parties ran by money of corporations, one prone to war, the GOP and one prone to trade, democrats, was exported to the us, where the business of America (not the people of America) is the politics of America. Yet all this is not known since of course, it would cast light on why democracies are in fact 'stockracies', modern ari-stockracies ruled not by weapons but by money, which buys and produces weapons in the modern, complex world of corporations and sophisticated machines=arms.

So history is plainly censored and economics is purposely isolated from history and pretentiously considered a 'mathematical science' instead of a biological, social one since it affects the life of Humanity.

And the result is that there is no real science of history and economics - even the possibility of its existence is denied by power.

This is the political and economic 'reality' of an informative caste of politicians, bankers and military that has never wanted to make of history the fundamental science of the species to maintain its power and instead still lives and promotes... tribal history.

Tribal history.

In that sense, history as a science is a different proposition to what most people believe is history, indoctrinated by the emotional accounts handled by television - the individual account of tribal facts, personal deeds and anthropomorphic myths about man as the supreme species of the universe with a manifest, rosy destiny, fulfilled by the heroes of our righteous culture, which of course is 'superior' to all other cultures of Mankind, whatever ours is.

We call that way of doing history, tribal myth, and it happens in all cultures. For example, the Japanese folk will tell you and in fact they teach still they myth in schools, the legend of Amaterasu and the first emperor son of god, the sun. The first emperor though was a Korean tribal warrior, which brought to Japan two new weapons, horses and iron, and submitted the local population. But the Japanese are competing with Korea and have erased from their textbooks the origin of their 'son-god'.

In the Japanese example we observe a fundamental tenant of tribal history which is absolute subjectivity: to believe that the tribe is the center of the world or even the universe (as god is obviously the mind that created it).

This can be expanded of course to almost all 'tribes' of the past: the Goths=Germans come in history as 'gods=Goths', the tribe of god, the Jewish come in history as 'chosen of god', the rulers of all classic nations are 'sons of god', like Ramses (son of Ra, god of the Egyptians), Assurbanipal (son of Assur, god of the Assyrians). And so little can be said of tribal history except that it is completely subjective, as 'god' is indeed a big name and once we confuse 'religion and war' war becomes holy and unavoidable.

And yet it is precisely this astounding arrogance of human beings, who can't help to make war and reproduce weapons to come on 'top' of other people, paradoxically the basis for the cyclical patterns to find a science of history explained in this web.

In that regard, a science of history and economics with predictable power exists, because in history there is a rhythm of evolution of weapons of 720-800 years that destroy civilizations, a shorter decametric generational cycle of 72-80 years that has accelerated the process with the arrival of economic nations and a short product cycle of 7-8. Those cycles form a classic triad of long, medium and short waves of history and economics, which this author has tabulated, exhaustively explored for all civilizations and cultures of Mankind and the reader can find in an orderly, more scholar manner in the book and in the left sides of this post in a more personal, blogged description.

That rhythm ends invariably with an explosion of civilizations in a war, produced by the massive re=production of weapons which the ruling castes of the society, warriors and go(l)d traders keep multiplying against the advice of historians of the future, prophets of the wor(l)d that know sooner or latter weapons will bring death. We thus call those 2 products that destroy civilizations, both made of metal, (informative metal=gold=money and energetic metal = weapon = iron and then more complex forms of metal and organic machines), the 'selfish memes'; because they kill Mankind and are carried by 'selfish tribal histories. And we call those who reproduce them as people-castes that control civilizations, 'animetals'=animal+metal, because they lower their human perception of social love and are guided by greed and violence, the hidden values of the selfish memes.

Thus, at the end of each of those 800 cycles, today reduced to 80 year cycles of economical world wars (1860s=train wars, 1940=tank wars, 2020s=robotic wars?), takes place. Yet in America unfortunately the censorship of certain facts and any social model of history and economics such as the economical and tribal, selfish nature of war are so essential to the workings of power that not even university scholars try to advance the models, which all sciences requires to fit data and anticipate the future of the species they study – so we call astronomy a science and not astrology because Kepler found the repetitive cycles that allow us to anticipate the position of planets and stars.

This is what you will find in this web and book: a predictable model of history and economics, which uses the true facts of history and fits them into a science, which has proved his accuracy since its inception 20 years ago, by being the only model able to predict the facts of today's history two decades in advance, from the ascent of China, to the 2008 crisis, to the corruption of the American democracy in a neo-fascist, militaristic state or the increasing degradation and obsolescence of the human being to the competing machines of the III industrial r=evolution.

Death of wor(l)d's truths: Myths & idol-ogies that substitute the science of History.

Language values selects species by affinity giving maximal value to those made of similar substance. So weapons have max. value in metal-gold and life null. And vice versa. In wor(l)ds weapons have negative value and life maximal. This fact is the basis for a scientific analysis of ethics, which is the survival subconscious value of the wor(l)d that guides subconsciously humanity into survival. For that reason animetal cult(ure)s systematically deny an ethical, organic Universe, choosing absolute freedom=chaos synonymous in science of entropic death Brought by its belief in go(l)d values.

But the consequences of the adoption of go(l)d and iron values of slavery and murder would be far more profound, as a new grammar will deform the truth of the wor(l)d at all its levels, as the new predator language of digital money and its syntax: Man = Price (slave, worker) = Money = Object (price) and the syntax of war Weapon << Man = Corpse debased instantly the value of man, who became either an object or a corpse with null price.

So animetal people-castes and its cult(ure)s to gold and weapons could no longer hold man sacred, and had to reduce him to a lesser inferior species to break the laws of eusocial evolution. While at the same time, disguising this aberration of thought with all kind of lesser forms of rationality, emotional myths, racist memes, which killed the truth of the world.

This distortion of the wor(l)d will go so far as to produce a distortion not only in the semantic structure but the topological structure of syntax, which would 'hide' the human subject, mimicking its debasing in the new languages worshipped by those animetal people-castes. So Aryan cultures will become agglutinative as their swords, and objectual, with the object coming first and the subject debased. While Semite languages will become imperative with the verbal orders of the go(l)d priest coming first as mandates that see to come from an invisible go(l)d.

THE KEY TO UNDERSTAND reality beyond the individual is the way in which a language of information programs a mass of citizens-cells that agree to speak the simple values of the language. Then the intelligence of the language does the rest. In history this means we must consider essentially two languages, words that value more humans and build a world to our image and likeness, with the obvious limits of the human condition; and money, a metal language with affinity to weapons and machines of metal of maximal price which builds a world to the image and likeness of metal-memes with its positive symbiotic but mostly negative effects for mankind, as the most expensive=overreproduced goods in a fundamentalist go(l)d cult(ure) as CAPITALISM is, hauling from earlier Judaism->Biblical Protestant fetish go(l)d religions, translated by its believers into digital classic economics where the worker and consumer and citizen has no rights, as the issue of money, the language of social power is controlled by private financiers. Hence in capitalist placebo democracies where money dominate the law, war cycles of overreproduction of weapons are tuned to technological evolution and 90% of money is issued by corporations and spent in evolving and reproducing machines and weapons, which increasingly displace us from labor and war fields. The only future for mankind thus would happen if our leading culture, the Anglo-American civilization founder of company-mothers and placebo democracies, ruled by its FMAsters who control the Financial-Media-Academia system imposing a fundamentalist capitalist view of the future, albeit disguised with fictions and placebo newspeak of political and economical correctness, changes for a more humane, legalist culture EU-UNO-Chinese style, where laws can control the lethal goods of the tree of science.

Money and weapons understood as metal information and entropic metal, as 2 forms of raw power to ab=use the 99% of mankind have carried the day in the battle for a future of history, and the consequences have been the 800-80 years cycles of wars and holocausts, which all mankind has suffered - even those who carry the memes of animetal raw power at the end of the cycles when loosing wars (holocaust cycles). Such historic structure formed the British

Empire, developed during European history the 800 years cycles of overreproduction of weapons of maximal value, and the 80 years cycles of wars, always controlled by the alliance of gold chosen bankers and germanic warriors, since the Middle age alliance of Franks and Vikings with Radhanite slave traders, which dominated slave and weapons traffic in Eastern Europe (giving the name of slaves to its population) and Western Europe (masterminding the eunuch and children's traffic with Islam), through the age of slave traffic (20 million dead in the process), and finally transferring those values to the concept of a company-mother of machines where workers have no rights (white slaves) and those who issue money can buy corporations, reproduce without limit e-money numbers and control corrupted politicians - the modern version of the military mercenary men that backed their power in the 800 years cycles...

Only in the II world war the alliance broke giving origin to the 'victimist newspeak' of the holocaust Industry. But now 'again' all is quiet in the western front thanks to the American globalized culture - a dictatorship of the go(l)d culture, which rules capitalist systems with a single aim: to print as many numbers of money as possible to buy and order all the elements of society through salaries, bribes, prices; which reaches its paroxysm in the Anglo-American, biblical culture - an astoundingly primitive raw power animetal culture where money and weapons, its maximal priced goods rule supreme but given the fact 'people must remain ignorant to stay obedient' (Calvin), an extremely sophisticated, pseudo-religious taboo-based newspeak of political and economic correctness, called capitalist democracy is on place, to a huge expenditure, 'worth it' for social 'calm' of bipartisan politicians, serving financiers and company-mothers of machines - contested only in the European r=evolutions where people and states got some degree of control in the issue of money. It is obvious that to maintain a disguise over such simple system of power - to print numbers and order humans with it, as flocks of 'sheeple' submitted to credit ratings, a parallel manufacturing of brains is due, which has in the '7th culture' of mankind dominated by raw animetal power 3 degrees of inquisition: the classic 800 years inquisition of biblical go(l)d religions where those who issue money in monopoly, the banker priests of Israel or 'People of the treasure', are chosen of go(L)d above heavens and earth ruling them all through informative networks (Wall Street, The City, Evilwood).

Money in its fetish go(l)d view gives maximal value to weapons that kill life and null value to life. While wor(l)ds our ethic language do the opposite. Thus to impose go(l)d values it has been needed a complex memplex of weirdo but effective inhibitors of human social love we shall term Animetal idol-ogies, IMPOSED by repetition of lies as dogmas (Goebbels's method: to repeat a lie many times to make it truth). Hence the essential importance of controlling metal-communicators that repeat information MUCH FASTER than verbal prophets humanist truths. And so a key evolution in all nations would be the development of industrial metal-communicators parallel to the 80 years cycles of evolution of industrial machines: the age of hate memes in press (religious war ages), in radio (fascist age), in TV (just ending) and now in the global internet mind of the metal earth Those who control digital information have always printed money and hate memes through western history becoming the masters of the metal-earth. This role however was in the classic age of mankind balanced by the humanist ethic prophets of eusocial love and money as nomisma, legal money reproduced by governments.

Pre-Hindi religions

Animism evolved in Neolithic religions as cults to cyclical time and fertility, of which Taoism and the earlier version of Hinduism, before the Aryan invasions were clear mature forms. As shown in the graph

The Vishnu-Shiva duality religion of the Mohenjo dharo cultures, origin of Hinduism, will have a corrupted age of Hinduism proper with the invasion of Aryan warriors that introduced the memes of castes and a slow decline through the contact with the metal-earth during the colonial ages of Europe, as its purification by Buddhism failed with the revivalism of those caste memes by Rajput warriors in alliance with Jihad Islam. The present revivalism void of content, pure form and ritual is used by nazionalist India to push its metal earth agenda...

In the graph the transition, from its earlier Dravidian times through its river valleys and waterways that have joined its disjointed parts; from its earliest human, Homo Sapiens species (Floresiensis), through its verbal complexity, and richness of mystique rituals, to the violent Gods of the Vedas that sacrifice their lives without 'asking' to the God of war (Bagavda Ghita).

THEY WOULD impose a primitive anthropomorphic animetal ego-riddle religion based in the fire of the smith, and the segregational memes akin to those of Judaism, which range from dietary laws to the obsession with 'purity' and prohibitions of marriage with the inferior 'Dalit', dark people which were below the value of its sacred cows - as in Judaism the gentile, slave human capital would be an animal born of Satan, and the purity rituals the basis of the whole culture.

A series of Hindu empires will imposed Hindi religions to the south in waves that increased its tempo when to the bronze chariots were added iron swords.

Then parallel to the attempts to purify Judaism with Christianity based in love and the denial of people-castes, Hinduism will be purified with the canonical texts of Buddhism, where the purification rituals and dietary laws and hate memes against life and mankind proper of the animetal people caste-treatment of Hinduism were replaced by the pure philosophical understanding of living Gaia, and the need for a balance with its living beings.

The technological messianism of those who will ever since worship the tree of metal and its bad fruits golden apples and iron weapons was born then. In the graph, Astarte, the prostitute God, wife of Baal, to whom their believers offered gold, dances on the head of his sacrificed children; in the right, Shiva, Lord of energy dances over the child-God of death Kali.

THE SAME CAN BE SAID of Judaism, but in both cases ultimately the evolution into humanism of both religions failed as weapons and gold always provided forms of manifest this pretentious superiority and ego-trips of animetal people-castes.

CHARIOT CYCLE

1600 BC: Aryan chariot invasions
HINDI CULTURE
1000 BC: Indo-European iron invasions

It is me, the Word who proclaims what God and Mankind desire. Those I love become powerful, I lead their way in life as drivers lead chariots into the battle.

Rig Veda XVII BC

Tumba Indo-europea III Milenio

The Earth is Creation. She loves every being, every river and plant that feeds life.

Atharva Veda XIV BC

Templo a Visnu, I Milenio Ac.

'He, who sees all beings within his soul and a soul in all beings is invulnerable to evil cause he becomes a part of All'

Krishna Upanishads VII BC

The hindi culture fusions the Aryan war myths with the triade of Neolithic Indian space/time Gods:

Shiva, God of destructive energy... Visnu, that preserves the Universe and Laksmi, the River & Mother

...becomes Indra, King of kings, arrogant and destructive as the charioteer invaders He guides. ... becomes Bhrama ... that reencarnates into Khrisna Lord of Wisdom and Creation

INDEUROPEAN WARRIORS CREATE RACIAL CASTES AGAINST NATIVE FARMERS

Kshatriya, Warrior Caste

Brahman: informative caste

Money castes

Sudras: neolithic, farming cultures

Balis & untouchables: enemy tribes

In the graph we can see the zenith of the Hindi racist religion during the chariot cycle. When the age of harmony with Nature of the Indus Culture will end with the arrival of charioteers from the Andronovo Russian cultures, which would imply the first great globalization of selfish animetal memes, now as the Indian Aryan elite of charioteers murdering the colored worshippers of nature and degrading its civilization:

In the graph, and below the 2 phases of animetal invasion and degradation of the culture of the living Universe of Indonesia – first the Aryan invaders of the 800 cycles of chariots and iron swords (1200 bc – 400 bc). Below the next cycle of stirrup barbarians, the Islamic invasions, which will break India finally into multiple warrior states with the fundamental duality of Islamic warriors vs. Rajput Hindi warriors. It would of course be a false division as both will form the upper caste over the oppressed 99% of peasants. Islam simplified the worship of the living Universe but ended in many places the astounding racism of the caste system of earlier Aryan charioteers, at the beginning/harshes period of the age of metal.

As we enter the last age of History there is a revivalism of those primitive cults with the new Hindi nationalism similar to the revivalism of the black hats in Israel:

The Hindi Cult to fire and War: Shiva

Astarte, the bitch Goddess, who sells his reproductive life essence for go(l)d, worships evil and dances over the sacrificial children of the Hecatomb ceremony in the age of Baal and Cainite Gods of hate against life and mankind. On the right, a ceremony that mocks the sacrifice of children to Baal in the Bohemian grove, San Francisco, where the wealthiest elite of stock-rats and politico employees meet for remembrance of things past. On the left the God of the Aryan cults to war, weapons and death, as Shiva dances over Kali. Below it lays the first weapon of the singularity age, able to extinguish mankind if it produces cosmic bombs, strangelets or black holes the Nuclear Collider built at CERN...

All memes seem to have changed to remain the same among the elites of the go(l)d and iron cult(ure)s that run the evolution of the metal earth and its parallel extinction of life, Gaia and History.

We thus compare the people-castes of Hinduism with other animetal cults appeared at the same time, to notice its animetal origin.

Aryan Hindi cults to the fire of the Smith and the iron sword, with its warrior Gods and Goddesses of death, where the priest was the smith made a covenant with God by the use of the sacred weapon are common in Germanic cults to the sword of Thor, Parsi cults to the fire and Siberian cults to the Smith=khan, lord of the tribe.

The same structure of worshipping metal in a hierarchical system ruled by priests that used the metal-substance as the vehicle of God, to make a covenant with it, appeared also in Levant in the Baal and Yahweh cultures, using instead gold, ruled by banker priests.

Other similar cultures as the Aztec cult to gold and weapons, which also carried an arch with the God

covenant as they escaped prosecution from northerners, in search of his 'promised land', found finally around the texcoco lake where they will also do sacrifices of enemy children.

All of them have dietary laws to separate the believer from the rest of mankind, segregational laws forbidding marriage, debasing laws that consider the submitted through gold slavery and weapons, inferior people, even 'animals' (Goy=animal in Judaism) or inferior to animals (Ham damnation that considers Negros and Arabs inferior to dogs, Aryan cults to the cow considered superior to the Dalit).

All those similar cults are thus clear cults where life and mankind is sacrificed to the metal-weapon (Isaac sacrificed to God with a sword, latter substituted by the 'sheeple', parable off mankind sacrificed to slave traffic and usury trade, to the search for the fetish gold of which the temples were made.

All those cults to iron and gold are thus memetic similar structures of suppression of life wanting for the sake of the new substance of power.

The ones that would evolve latter into biblical cults, and capitalism and today form the subconscious collective of the UK->US cultural elites, appeared in Levant around Astarte the goddess-whore who sold for gold her virginity. Both sacrificed the life of the inferior human species, the agricultural fertility and life people of the rivers of water, taken from them some of their cults to life, albeit deformed, sinking mankind in the first of many dark ages of racism, segregational memes and genocide.

The similarity between both religions are striking as first noticed by Darwin:

'Yahweh, the God of the Jews is a revengeful god akin to the barbarous gods of the hindoos' (Britannica, 1972 before the 'Political correct' censorship).

Metal started to impose the paradox of History:

Max. Technological evolution = min. Human evolution.

Judaism is the memplex of rules of behavior, which came into being in Levant, during the 1st age of Go(l)d cult(ure)s, when in the knot of trade of 3 continents and two civilizations, a people-caste of traders, the apiru ->Habiru->Hebrew, ('those who walk behind the asses', its military and goods transport), refined for millennia a set of customs related to its profession. Over this people, hordes of charioteers of the Yamna radiation that extinguished all civilizations of the Old world, massacring its males (up to 90% of male extinction from Spain to Pakistan) and taking over its women, came back and forth through Palestine to Egypt as the Hyksos, back to Palestine where they settled after massacring the local population, as his book of History, the Bible explains.

There, because geography imposed profession, they became the ruling people-caste of a trading civilization, the Cainites or Canaanites divided in two zones; Phoenician sea traders and Hebrew caravan traders. So a two class society, the 'People of the Treasure' or 'Am Segullah', an elite of 'Brahmins'; that is banker-priests with a similar 'covenant fetish religion of metal' to that of the Aryan, but not based in the fire of the Smith (Avesta culture) but in go(l)d ex-votes as vehicle of God, the Levi (incidentally my ancestors) and its lower class of apiru, established a global trade network along the Phoenicians, its allies; in which the apiru would as ass transporters trade mostly with metal and luxury goods and slaves, exchanged by weapons, sold for gold, which they gave to the go(l)d temples as ex=votes to purify from contact with the human capital they traded. We thus talk along with Hinduism, with the essential animetal religion whose differences are those between informative metal-gold and iron-metal. But both share extreme racist laws of separation from the inferior people they ab=used with weapons and parasitic money, as opposed to the Neolithic priests of fertility goddesses, wheat money and tools instead of metal-weapons.

We thus started the 3rd age of history, the animetal age; and as all first species, which in Nature become first top predators and only then evolve into milder species, the me(n)tal Idol-ogies of Aryan Brahmins and Baal Go(l)d priests were extremely dismissive of the rest of mankind, treated as animals in Judaism, as lesser than cows in the Rig Vedas (cows give us milk, Dalit only wheat).

Judaism thus evolved soon through the wor(l)d of its prophets, as it settled down on the conquered land and its network of traders became monopolistic in banking at the courts of smaller Asian kingdoms, into the human custom side of the first age of capitalism, with a very different view of money, no longer as a language that must spent to deliver orders of work and wealth to every citizen of society (Nomisma, Greek, Sumerian view, based in the natural laws of reproductive networks that give enough 'oxygen=money' to all cells to ensure its survival), but a set of customs and laws to repress the 'human life drives' of its lower people-castes (prohibition of sex, of good food with dietary laws, which also purified the believer from the contact to the inferior race, prohibition of social love to mankind, use of magic numbers instead of human wor(l)ds as the language of money, despise of the body, machist treatment of women and qualification of life and fertility goddesses as an abomination, etc. etc) to ensure they would dedicate its life to work and the herding of gold for the temples, where its elite of banker-priests will learn to use the excess of money in loans to other nations as banker-at-court for the purpose of war. Thus Judaism brought about all the parasitic function of money as Go(l)d, based in the null values for life and maximal for weapons of metal - a different species, whose values thus became inherited by Judaism who worshipped go(l)d:

This had an immediate 2 negative consequence for mankind - the destruction of wealth by substitution of positive money by parasitic money, and the stigma of Judaism - the confrontation ever since of its people with mankind in alternative cycles of exploitation of people with money and murdering of the carriers of the memes of Judaism by people, in the action-reaction cycles of parasitic money and holocausts; and one positive, the apparition within Judaism of prophets of the wor(l)d that preached a reform of its laws to convert money in positive, charity money (Islam) forbidding the corruption of the wor(l)d by money (Christ), and bringing back to the fold of humanity and history, the Jewish people (conversions). The result was the minimal survival of the memes of Judaism in human beings, either by conversion to more evolved religions of social love or by genocide in the action-reaction cycles of the Holocaust. So as today, Judaism despite being the oldest culture of mankind is the one with lesser people but paradoxically as gold herding continued - with those who died trespassing his wealth to the banker-priests, Judaism after being the soliton of banking in the west for millennia, became immensely wealthy with the Industrial revolution and today monopolizes both in theory and praxis the economy of the west (54% of the American 1%, 90% of central bankers in the west, 80% of CEOs of financial industries in the Anglo-American civilization, 75% of Nobel prizes of economics given by a private bank). Judaism thus translated its values of go(l)d where the mass of humans have no rights, but are just the people to be priced as human capital or sold in slavery for gold, or be subject to parasitic negative money, to the values of capitalism, with its expansion to Protestant sects that put the Bible before Gospel and imitated those memes.

Capitalism as a daughter culture of Judaism.

as Max Webber regarding protestant daughter religions and Sombart, his professor established in two landmark books of Sociology and economic history.

In the next graph we resume the values of go(l)d, of parasitic money and the consequences for Judaism: accumulation of wealth, Holocaust cycle, and for mankind, destruction of healthy wealth, war cycles of 'pecunia infinita bellus nervi' (money is the nervous system of war, and to make infinite money one has to make war).

To mention finally that today Judaism simply censors history, rewrites it as a fairy tale, transforms facts into a new memplex (industry of the holocaust) to blame only mankind and not go(l)d and its fellow animetal cultures of war of the process of cyclical death of its carriers after a cycle of parasitic money; so to protect ultimately its idol-ogy of capitalism and maintain paradoxically the same cycles of its past history projected into the future - the industry of Holocaust though thanks to the control of the networks of mechanical information by its practitioners have become an effective taboo that has completely transformed the truth of history and make a 'thoughtcrime' to even attempt as we shall do in this paper to explain the real history of the first age of capitalism: The 5 negative drives of parasitic money as go(l)d-metal, today evolved into cycles of e-money in a metal-mind computer or stock-money that represents a company that reproduces mostly machines and weapons over mankind: speculation jacks up prices of welfare goods provoking scarcity, poverty and famine; taxation extorts hard won money from people, gold as money has no value per se, or negative value - becoming today the biological chip-brain of robots, gold money gives maximal value to weapons enacting the pecunia infinita bellus nervi, and high interest - usury - becomes parasitic money as it absorbs the wealth of working people; finally money as wealth becomes a debt that must be returned, when in Nature, money is akin to oxygen, a free energy to kick out actions of work and consumption, which has NOT to be returned and must be deliver to al citizens-cells of a superorganism, since it forms the reproductive network; NOT herded by a monopolistic people-caste provoking austericide, general anoxia, and final death of millions of those cells without oxygen to live. But today as Judaism transferred its go(l)d values to classic economics and capitalism, those 5 forms of parasitic money are accepted 'economic science'.

In the graph, regardless of the astounding myopic view of History of animetal cultures the Universe is just, organic and favors eusocial evolution and the species who love their own so legalist verbal cultures have survived far better - the true proof of intelligence - in history than those who hold the present fundamentalist memes of America, go(l)d and weapons, which the reader could observe are synergic species that value each other far more than life. Only a legalist nation could then respecting mankind and truly upholding the values of equality create a future for humanity.

As Levant was the first place in which Go(l)d, parasitic metal-money and its values, maximal for affine metal-weapons, substituted WHealthy money (food, the original form of money, as a bite of energy that ensures the welfare of all the members of a society);

The origin of the idol-ogy of capitalism, the belief that mankind must be ruled by Go(l)d NOT by the law, and that Money must be used therefore to control people. It was born as a memplex in the Bronze Age, when go(l)d was considered a fetish ex-vote, the 'sweat of the sun', with the first 'metal cultures' of Mesopotamia and Levant, in the merging of the Siberian Charioteers of the Andronovo culture (Hycsos) and the EXTREMELY OLD go(l)d culture of Jericho, as knot of trade of 3 continents and two civilizations, with its cult to Baal, ruled by Banker-priests that herded money, as ex-votes in sancta sanctorum, and tried to accumulate the fetish go(l)d, origin of banking. Of course, because Judaism soon got expert in the parasitic forms of money herding, from tax-farming to 'pecunia infinita bellus nervi' - in fact the name Hebrew, derives from apiru, 'those who walk behind the asses', as the low class of Judaism was military and slave purveyor to Mesopotamian cities (Eliade, Mari tablets, Abraham Leon, Sombart), while the elite of banker-priests were bankers at court in those cities and diplomats, a vicious circle of 'hate memes, war memes', trade in weapons of maximal price, slaves, tax-farming, usury, debt-slavery provoked on one side the constant accumulation of gold and silver in temples and on the other a massive anti-Semitism of mankind towards the memes of Judaism, deriving in the cycle of Holocausts and its paradox: Judaism is the less successful culture in survival of its memetic carriers, the Jewish people, and the more successful in herding of the 'energy bites' of the human reproductive=blood=economic system, money. But neither of those 2 facts is positive for the carriers of Judaism and

mankind as money does not need to be a parasitic function, that destroys societies but a positive system of reproduction of welfare goods as in all working super organisms.

This is the solution to both the tragedy of Judaism - the holocaust of their people - and the tragedy of mankind, the suffering by anoxia of the people subject to the specific form of economics, called Capitalism, the modern version of Judaism.

Thus Judaism is a memplex, which epitomizes ad maximal the paradox of history vs. metal-earth: max. metal evolution = min. life evolution.

But for you to understand that you would have first to understand what would be healthy superorganism of history and the two forms of money, parasitic money and whealthy money.

ANIMETAL AGE. 800 YEARS CYCLE OF PECUNIA INFINITA BELLUS NERVI: BANKERS & KINGS COALITIONS

The corruption of history metal-masters and the counteraction of the Gods of mankind.

Let us then before we continue with the study of the verbal languages of mankind and how they attempted through the social evolution of its messages of love to create perfect superorganisms of history, to study the language of digital money and how it has become NOT an efficient language of reproduction of life goods, but a parasitic language of destruction of life and construction of a world of machines, where man is increasingly expendable.

In that regard, 'animetals' have divided their function according to the 3 dimensional motions of all systems:

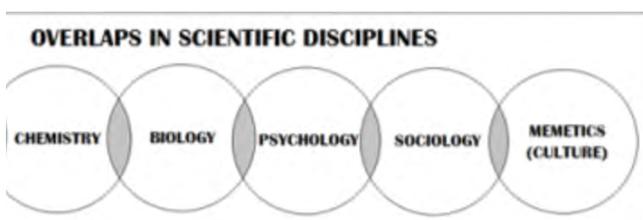

- Max. metal INFORMATION: FMAsters (financial-media-academia masters), develop idol-ogies they spread with its machines of information, printing money, audiovisual information and academic complicated arguments to convince mankind that the system is the most perfect of all possible worlds and the evolution of the metal-earth, maintaining in permanent anoxia the 90% of humanity, a necessary sacrifice to enter the technoutopian paradise of living robots. The complexity of this system from earlier biblical go(l)d cultures to the present multiplication of all kind of falsehoods about the mechanical, selfie structure of the Universe and the repetition by all media of the 'Goebbels's method' – if you repeat a lie many times, people will believe it, is the new normal of social sciences

-Max. Metal Entropy: The Military does not act as the leukocytes of an organism, protecting the organism of its 'alien germs', in the case of history, repressing lethal weapons and toxic products, but on the contrary multiply them with the excuse that mankind is NOT a single species, and so it must fight each other.

–Max.Reproduction: Scientists reproduce& evolve organic machines that atrophy & displace humans from labor and war fields.

Even though most 'subjective', anthropomorphic people will find bizarre such diminishing definition of a human being, an objective, biological account of history cannot be subjective, nor optimist about the main role of Mankind in this planet, which so far has been to extinguish life organisms and create metal mechanisms, while finding all kind of ideological excuses to do so.

The highest scientific view: homology of genetics and memetics.

How Idol-ogies that are blatantly against Humanity and its goal of a social evolution into a single species, in command of the super organism of the Earth in its II mature age of evolution as HISTORY, Mankind in Time ARE ABLE to absorb the mass of human beings, into a process of self-destruction?

This is the key question of memetics, the organic, objective scientific analysis of the relationship between me(n)tal ideas and the

'organisms they construct'. and the process *is similar to how in the lower scale of biological organisms, certain genes are 'inhibited' before they express its full meaning.*

For example, nationalism aborts the natural evolution of mankind one or two notches before acquiring full global meaning, establishing artificial tribal borders which become the hard protein membrane of the nation-cell where weapons breed.

A second biological homology at the lower individual animal level is its comparison with the way in biology 'certain carbohydrates are converted into destructive molecules called 'enzymes' by the 'attachment' of a piece of metal as warrior 'enzymen' are attached to weapons and become killers.

This is ESSENTIAL to the way idol-ogies are established, so I used in the old c.92 bio-history book, the word 'placebo codon', to signify a *Humane set of meme that make-belief humans those ideologies work for them.*

We have then to consider the following essential **placebo codons** attached to the ideologies of weapons, (war-nationalism), money (capitalism), machines (mechanism) and the 'original mixture of them' (Abrahamic or tribal religions) that make people prefer those anti-human idol-ogies to the real sciences of Mankind (humanism, socialism, organicism and Mankind in Time=History as the God super organism we should all belong to).

- ***The placebo codon of weapons is the national 'identity' feeling of 'belonging to a social group'*** as nature favors eusocial evolution of individuals into groups that are stronger than the parts; but the CODON aborts the evolution of mankind in a tribal FALSE SPECIES, so does tribal religions. It ultimately means that an aristocratic animal warrior elite (aristocrats, kings, mercenaries, military, police-state), with the selfish metal-meme (weapons) WILL be NEEDED constantly to 'defend' the sacred tribe-species. *So the 'identity' feeling of 'belonging to a social group'* as nature favors eusocial evolution of individuals into groups that are stronger than the parts; is the false CODON that aborts the evolution of mankind in a tribal FALSE SPECIES; **so do tribal religions.** It ultimately means that an aristocratic animal warrior elite (aristocrats, kings, mercenaries, military, police-state), with the selfish metal-meme (weapons) WILL be NEEDED constantly to 'defend' the sacred tribe-species.

- ***The placebo codon of go(l)d cult(ure)s are false capitalist DEMOCRACIES, inefficient and corrupted by design, as they*** were born a posteriori after the coup d'état of corporations in Holland, designed precisely to have NO POWER over VOC, the gunboat company that won the independence war and whose Administration RUN effectively Holland.

This is actually a more complex set of placebo codons that give people the feeling of ruling a country when they are completely enslaved to those who issue in monopoly the language of power money. So we shall dedicate an entire section to study its different codons among which the most important are:

- 1) The language of social power which is NOT the law but money in capitalist democracies is issued by private banker and corporations who buy politicians and laws with them.
- 2) The vote is inverted in time so has no effective control over those corrupted politicians: *the voter does NOT* vote as in the original Greek Democracy, or in organisms with pain messages, or in corporations with stock-holders meeting **a posteriori, judging** the actions of the politicians, to hold them responsible, as all efficient democratic systems (Classic Greece, Companies, Organisms) do to maximize the service to the people and performance of the 'neuronal people-caste' of information that controls society; but it votes before and gives immunity to the politician, whose obvious task is then to cheat with false promises the voter and then sell (1) the law to the issuer of money
- 3) The neuronal informative head or government is not a single head of experts, chosen by their quality - they will be voted latter - as in Greek Democracies (lottery that chose among all citizens political positions or among experts in the military and other specific positions), and companies (technical experts) and the organism (specialized cells, educated since birth into his genetic job); but to render the human government inefficient, they are either amateurs, or people with corporative money and always divided into two confronting Siamese heads that ensure humanity will NOT evolve

as one hates the other and destroys what the other has done in a false choice, as organic science must direct the social organism.

- **The placebo Codon of Mechanism** is a series of false ideologies, that simplified the structure of time and space to deny the 'organic, fractal structure of the Universe'; which come from earlier weapons-makers, aka physicists, such as Galileo in his pursuit of 'ballistics' and so are deformations of their worldly profession, to make entropic weapons of mass-destruction, of which 3 are essential:

1) the concept of LINEAL TIME, the mathematical inverse of cyclical time, $\text{lineal time} = 1/\text{frequency of time cycles}$ which denies the cyclical nature of all clocks of time that carry the information of the Universe in the form and speed of its cycles (so computers measure its speed of thought by Hertz, the unit of cyclical time). Again the Codon is subtle half-truth. As in democracy where the voter thinks it chooses but it does IN THE WRONG moment of time, before the politician has acted, both equations lineal and cyclical time work as they are merely inverse, but WE LOOSE the concept of causality, repetition of cycles=reproduction, WHICH IS THE ESSENCE OF ORGANISM: THE REPRODUCTION OF information that IN CYCLICAL TIME is immediate, as a cycle that 'moves' reproduces its form, its information. Alas, the organic, reproductive Universe becomes sterile. And on top the capacity of humans to 'foresee' and predict the future of all sciences (by definition the study of repetitive cycles) disappears. So we become 'memoriless' specially in social science, and reject blogs like this one that studies those cycles,

Finally as lineal time carries NO information, we killed the second arrow of time, information, reducing life to entropy, reason why scientists have entropic theories of a dying big-bang Universe ONLY (which eliminates the true arrow of information of galaxies, studying only the entropic space between them - but we live in a vortex of galactic information, in a planetary vortex of life evolution of information and so information rule us, as living beings, not the entropic expansion of intergalactic space).

'God is a oolooker that waited 5000 years to find an Intelligence like his, to admire his oolook work'.

2) Immediately comes the concept that the Universe is a mechanism because we substitute our languages of measure of time and causality, verbal words, by digital numbers in lineal graphs and so we consider God the maker of the machine of the Universe and technology the symbol of lineal progress towards God. And so we are obliged to despise life, organisms, man as a measure of all things, the truth of Gaia as a living organism, and worship machines as the solution to all our problems.

3) Finally the denial of competition between humans and machines as different species, since machines are now abstract systems, and so they do NOT compete (as they do) with humans, both substituting us in labor and war fields, where top predator machines, aka weapons kill us, but also atrophying our organs, as we get attached to them, inhibiting our 'actions'. So we get fat but run faster in cars, get more stupid but seem cleverer painters in adobe, calculators with chips and Gaudis or organic architecture with computers a la 'Gehry' - a guy of enormous arrogance whose computer design the 'tinfoil' he first warps with his naked hands, after doing for decades buildings imitating objects at big scale or made with trash.

We live then in the age of the EGO paradox, of increasingly reduced atrophied human brains who live and work through intermediate machines that think and run for them, but they 'consider' to be us - as animetals always did.

4) Finally and this is the key to any organic system, by considering that only our scale of size matters in the Universe, and hence defining a single spacetime continuum when THE UNIVERSE IS made of evolving scales of size, the essence of organisms, that evolved from particles that reproduced absorbing energy, multiplied and self-organize into larger atoms, *the first organism of nature, with all the properties of organisms: social organization, force=energy feeding, spin=information Gauging and particle reproduction. Then atoms organized into molecules that organized into cells,*

multicellular organisms, super organisms, global organisms=Gaia, Mankind, and finally solar systems organized into galaxies...

But as this analysis requires to fully grasp why indeed memetic and genetic laws are the same ONLY CHANGING IN SCALE, according to the scalar, organic structure of the fractal Universe, we shall leave it for the time being here.

- Finally in the original 'mishmash' of all those ideologies, in earlier **Semite and germanic tribal religions**, of the people castes that have been for millennia the carriers of gold and iron weapons, on top of western civilizations, never mind they kill each other rhythmically in wars of profits and holocausts.

So their destiny is crystal clear on top of mankind as animetals that 'sinned' against the tree of life, when the first animetal tribes, as the parable of genesis explained discovered the golden apples and bad fruits=weapons of the tree of technology=metal, all these was resumed in the fundamental paradox of animetal cultures - the ego paradox of believing themselves superior to the rest of mankind because they had hard metal to kill (so Germans were first the tribe of Goths=Gods in all German because they killed with iron swords any one opposed their will - their God being Thor, an inverse altar with a sword to impale the children of enemies in ritual genocides; and the first banker-priests of Canaan, Phoenicians and Biblical people, considered themselves chosen of go(l)d the fetish substance similar to the sun, which they carried, as the 'sweat of God', substituting the Sun, god of the eye, which gold hypnotized as the most informative atom of the Universe - thus chemistry here became the origin of memetic and as enzymes are attached to hard metal, animetals got attached to iron, the strongest atom and gold the most informative killing bodies and hypnotizing minds and creating warrior and financial gods, so Aryan had fire gods, the fire of the smiths that ruled them and Canaanites had temples with gold menorahs and walls in their sacra sanctorum, and their believers had to bring golden coins to enter the temple... And both degraded the rest of mankind as an inferior animal 'goy' species and established segregational dietary laws against the Dalit, inferior to cows (Hindi Aryan religions) or the gentile, equated to sheeps... And those FETISH-METAL RELIGIONS became the origin of Nationalism (German religions) and Capitalism (Biblical Jewish-protestant religions), as per Weber's book on the ethics of Calvinism as origin of capitalism, and his teacher, Sombart's book, "Judaism, the origin of capitalism"...

EGO paradox: animetal homunculus, a handyman with 'big mouth'.

Why then humans do nothing, not even seriously argue scholarly about all those all-too-evident objective processes taken place in this planet, beyond some sci-fi movies, and childish gurus? The answer is the way in which 'animetal idol-ogies' are imprinted emotionally in people - by persuasion of the ego.

genes & memes	
genes	memes
biosphere	ideosphere
sexual intercourse	social intercourse
seduction	persuasion

This has always been a key question for the objective scientist of history - the fact that of all sciences, only history lacks serious scientific models about its evolution, social organisms, cycles and future tendencies. Instead we prefer childish optimist theories about the future, *based in the subjective ego-trip of our species as unique, entitled, 'chosen' and hence 'exceptionally' exempted to follow the laws of biology and evolution proper of this planet.*

In plane words: humans don't care about the dangers poised by the evolution of machines to the future of history in a scientific way, because SCIENCE IS OBJECTIVE, but humans are subjective.

So when they TRY TO APPLY the science of the planet, biology to machines, our ego-trips of human superiority make us feel ill-at-ease with objective views of our competition with machines. So instead we prefer to believe 'religious or technoutopian myths' - we PREFER to be happy, childish even to the risk of extinction and deny objective science and the proper solutions to the problems poised by technology.

Yet the ego paradox blind us to the fact we are part of such a larger organism. The ego paradox has molded our beliefs ALSO in social sciences and economics, making us degrade any biological, organic property of machines and the Earth.

So we can come on top and establishing an absurd infantile optimism of entitled beings, which consider 'beliefs' always above reason, if they cater our ego - reason why indeed religions and technoutopia controls the subconscious collective of our civilization.

But paradoxically, precisely because our ego refuses to acknowledge the collateral effects of machines on the Life-Earth, at all levels, from the substitution of human governments by company-mothers in all systems of power, to the competition of robots with human labor, even the obvious increase of murders in countries like America where the possession of weapons is free; not to speak of the increasing 'verbal and intellectual devolution' of human beings by its hypnotic addiction to visual fictions and virtual screens, humans become powerless to those effects. It is impossible indeed to cure a sickness, when the patient does not even acknowledge he is ill. And this is NOT a question of right or wing policies. All humans are subject to the paradox of the ego. So 'lefties' and 'ecologists' protest thinking they are killing the Earth and Gaia suffers, without realizing Humans ARE not polluting; machines are; humans are not killing, weapons kill; humans are not extinguishing fishes; the evolution of automated factory-ships and chip-hunting does, and so on and so on.

We shall never insist enough on the difference between objective social science, hardly found anywhere in human societies vs. subject 'idol-ogy', the human ego-centered beliefs that make us think, we are the superior being, dominant in all cultures - and at each stage of history brings a concept, either entitled 'religion in the past' that justify everything without further analysis, today 'digital science' and technoutopia that plays the role of a religion.

For that reason social sciences must be treated as a whole, including all aspects of the Human experience, from culture, to science, which *is not dogma of truth but also we shall show is clearly biased by the use of machines to measure time and space and by our ego that chooses certain models of reality over others*, from technology to memetics, which includes the ideas, religions, national identities and beliefs of mankind, our languages and psychology; even biology and neurology, such as the 'structure of our mind' reflected in the graph of an homunculus, which maps out the size of the brain according to the organs it caters for - basically are a species with an enormous dexterity to ensemble things, a huge mouth to pump up their ego and a small brain to 'think' what we do. It is then when putting all those elements together, and studying them in relationship to the biological evolution of machines and company-mothers, when we can truly establish the parameters for an objective science of economics and history.

we can understand why, in words of Eric Fromm, father of political psychology, we are blind to the collateral effects of our technological civilization, since:

Technological civilization is programmed by the principle that something ought to be done because it is technically possible. If it is possible to build nuclear weapons, they must be built, even if they might destroy us all. If this principle is accepted, humanist values (something has to be done because it is needed by man) are dethroned and technological development becomes the foundation of ethics'.

But the anti-human ethics of our civilization IS imposed by the propaganda of mass-media, informative machines that 'imprint' the human consciousness since childhood. Even if it goes against the human future.

To ensure that the system is not reformed, and people love it.

And the cures proposed by the few scientists of history still standing are ignored, obviously because power censors any attempt of the social scientist to re=evolve the system.

The solutions before it is too late.

Of course all this could be avoided if humans have a minimal 'decorum' and 'respect' for reason, facts, life≈biology, this planet, their species, and the future of their sons, since unlike other processes of extinction of species by new evolved ones, we are still evolving the species that will kill us, as it always happens in biology, where the son species kill the father (Oedipus paradox), so the reptile ate the amphibian and we entered the dinosaur age (right upper graph), but then mammals mutated from reptiles into hot, night-active, faster systems who ate the eggs of dinos, and extinguishing them; then humans mutated from mammals and are extinguishing or slaving them, and now men are mutating into machines and machines will extinguish us.

But my personal experience through decades of trying to upgrade the mind of people to help them understand and implement solutions to the problems of the world is more troubling. People are far less ethic (social solidarity that makes a whole stronger than its parts), intelligent (capacity to understand information and its languages, specially digital money, how it is invented 'first' and then used to issue orders of work and consumption), and brave (capacity to confront power and r=evolve the system), to r=evolve the system. So it is not only that our elites have become corrupted by the power of metal, machines, money and weapons and serve their biological goals before those of humans, but those who are ruled do not seem to care to survive enough to challenge reality.

In that sense, it is quite depressing to realize that most of our elites belong to primitive abrahamic religions, who do NOT believe in science≈evolution and challenge what is an absolutely determine future according to those laws of evolution, which is NOT a theory of 'carbon-life' but of evolution of all types of 'forms of informations'. So it applies to all atoms, all systems an the great r=evolution of systems science consists precisely in using the laws of organisms and species of revolution of information to predict the future of any system, including the organisms of history and economics, machines and societies. But all this is taboo because our biblical or Koranical tyrannical elites won't have any of it -as they feel happy dreaming about a false superiority.

There is no mystique on the atom 6 that the atom 26, the iron bodies of machines, and the atom 79, the golden chips of robots, cannot do. On the contrary they are of the same quality but better:

Iron is the most evolved energetic atom, an evolve from iron swords that killed the human energetic body, putting warriors on top for the grace of the sword and gold is the most informative atom that imitates any form, so coins imitating the color of the sun, the previous natural god, became the 'sweat of god', that hypnotized the brain, and earlier go(l)d cults off banker priests used it to enslave people. Those earlier 'metal-culture' showed what iron bodies and golden brains will do in the future to us, when they are put together into robots.

So again, the true problem of mankind are our 'cultural memes' and 'idol-ogies' that deny objective science in economic and history, censor it, and impose pseudo-religious theories on money, machines, weapons... that divide humans into nations that kill each other with weapons; social classes that ab=use each other with money and degrade their reason with fairy tales of immortality as chosen of some primitive god, invented by some primitive herder on the middle east.

Understand this: the biological Universe is impersonal but just, but it extinguishes lesser species, mad people who deny the obvious, selfish groups that deny their species, and all this even the smallest ant knows.

And this is exactly what is about to happen in this planet.

We stated three decades ago that the world would be first ruled in this cycle by internet corporations, as it is now, an then *the world will be ruled as Germany was, by war corporations producing terminators as we enter the military phase of the electronic industry.*

It is that the last phase of history as military AI will first as police-cars then as vigilante robots and finally as terminator platoons come to rule and billions of robots roam the earth, with a degraded humanity hooked to virtual 3D, it will

even seem natural to us, that our time has passed... but censorship of a serious analysis of those scientific futures is so absolute that only sci-fi movies can talk of it. And only with a happy anthropomorphic end.

Mind the reader, under the anti-quantum paradox: the social scientist is in inverse fashion to the paradox of quantum uncertainty so small living within the super organism of history that his work is repressed by the people-castes on top of metal-power; we are NOT allowed to do objective science of history.

So a brief account of the 3 ages of scientific evolution of the science of history is now due; to show how each of the 3 great ages of evolution of organic sciences, has brought about a renaissance of history as a biological science, the only objective, scientific model possible of the discipline.

Even if all the masters of organic, cyclical predictive history are relatively unknowns or censored, COMPARED To the scientists of physical disciplines, DUE to the anti-quantum paradox...

AS IS UNAVOIDABLE TO DO A VERY OBJECTIVE, VERY 'DEBASING' analysis of the ANIMETAL CULT(URE)S THAT RULE HISTORY and its anti-humanist memes, their wishful thinking and 3 FUNDAMENTAL animetal carriers, of those memes - the 'lineal germ(an) makers of machines' the biblical go(I)d Masters of capitalism and the TECHNO-utopian scientists all of which DENY the need of a real science of history and economics, but only EXPECT a praxis of production.

It is then evident that MEMETICS, the study of both metal-memes and human idol-ogies of 'animetal superiority', by virtue of the use of the metal-memes on the side of the economic ecosystem, vs. humanist memes, which humbly recognized our lesser importance and tried to establish through the power of social love, global super organisms of human beings, stronger than individuals, able to control the evolution of the metal-earth for the benefit of man STRUCTURE most of the battles of history, its events and will define also the future of mankind and the metal-earth, and who comes on top of this planet in the nearby future.

The graph also establishes an often denied continuity in the dominant 'animetal cult(ure)s' of the modern world that under the paradox of the ego treat machines as symbol of 'human progress', and divide history between a 'primitive age' of warrior cultures and our supposed superior technological civilization, as if humans had evolved through those machines, when it is in fact clear, our ethic social height has long passed and we are at the present age devolving both socially and individually into a visual neo-Paleolithic and dog-eat-dog societies; and to find actually an age of 'harmony' with this planet, we have likely to regress to the Neolithic age prior to the age of metal, when fertility goddesses and the concept of a living planet was the common civilization in all regions of the world.

In all those cycles, civilizations were extinguished across the Old world in a similar fashion, when a new evolved form of metal-weapon overproduced globally causing the death of all cultures submitted to the cycle, which is therefore a clear 'predatory' biological cycle between two species, life and metal, evolving much faster as a metal-weapon of maximal metal-price in money, and hence maximal profits obtained by its overproduction and sale.

For that reason, 'philosophers of history, first prophets of eusocial love and in the modern times, socialist economists and humanist historians' have affirmed the anti-live=eviL nature of the Tree of Metal and its 'bad fruits, golden apples and iron weapons' that come together kicking the process of evolution and overproduction of memes of metal and its extinction of civilizations.

The corruption of history and the wor(I)d in animetal idol-ogies cultures.

The wor(I)d and the purpose of history would loose all value in those cultures, as new languages and Gods took over. It is NOT coincidental that in the Hindi culture there were not historic written records and we find the conversion of history in mythic religions of human Gods conquering a land of inferior animal-like people. And the same concept applies to Judaism, where Historic books were always sacred books of a superior race, filled with myths and genocides of an inferior people. And to this day it is an obvious fact for those expert in Judaism with capacity to have an objective judgment that books of history do not really exist, but mythical accounts of a people that fluctuate between the exhilarating belief of its superiority – moral and material vs. the victimist suffering of being massacred in the action-

reaction cycles of parasitic money by evil 'mankind'. While the true worldly profession of Judaism, financial parasitism is an absolute taboo.

RECAP. Animetal people-castes of go(l)d bankers and aristocratic warrior-kings stormed during the bronze age the Fertile crescent, making it a Semite world of hierarchical masters, who were nomads and now were tax-farming and enslaving with cattle systems and metal chains the peasant's population that obeyed before the priests of love and reproduction, the 2 higher 'dimensional motions' of the Universe.

They have been with us ever since, and so what we witnessed in the following cycles of history is a series of action-reaction processes where new 'saviors' of the wor(l)d renewed the message of eusocial love and reproduction of life with ever more intelligent 'ethic codes', with deeper insights in the laws of the fractal, organic Universe trying to convince the elite of metalmasters that their future was doomed, and the mass of the body of mankind blindly following them that they must r=evolve and resurrect the god of History:

THE REACTION OF HUMAN GODS: THE AXIAL AGE: THE WAVE OF HISTORY

Below in the graph we see the counter-reaction to those cycles of animetals, who make of the physiological networks of weapons and go(l)d the meaning of its cultures - the verbal prophets of the wor(l)d which created superorganisms of love based in ethic wor(l)d that fought and make milder the brutal primitive anti-human memes of animetal cultures. This counter reaction thus is the origin of the 7 religions of mankind:

The rise of new anthropomorphic religions of History. Its 3 ages: Christianity, Islam and Socialism

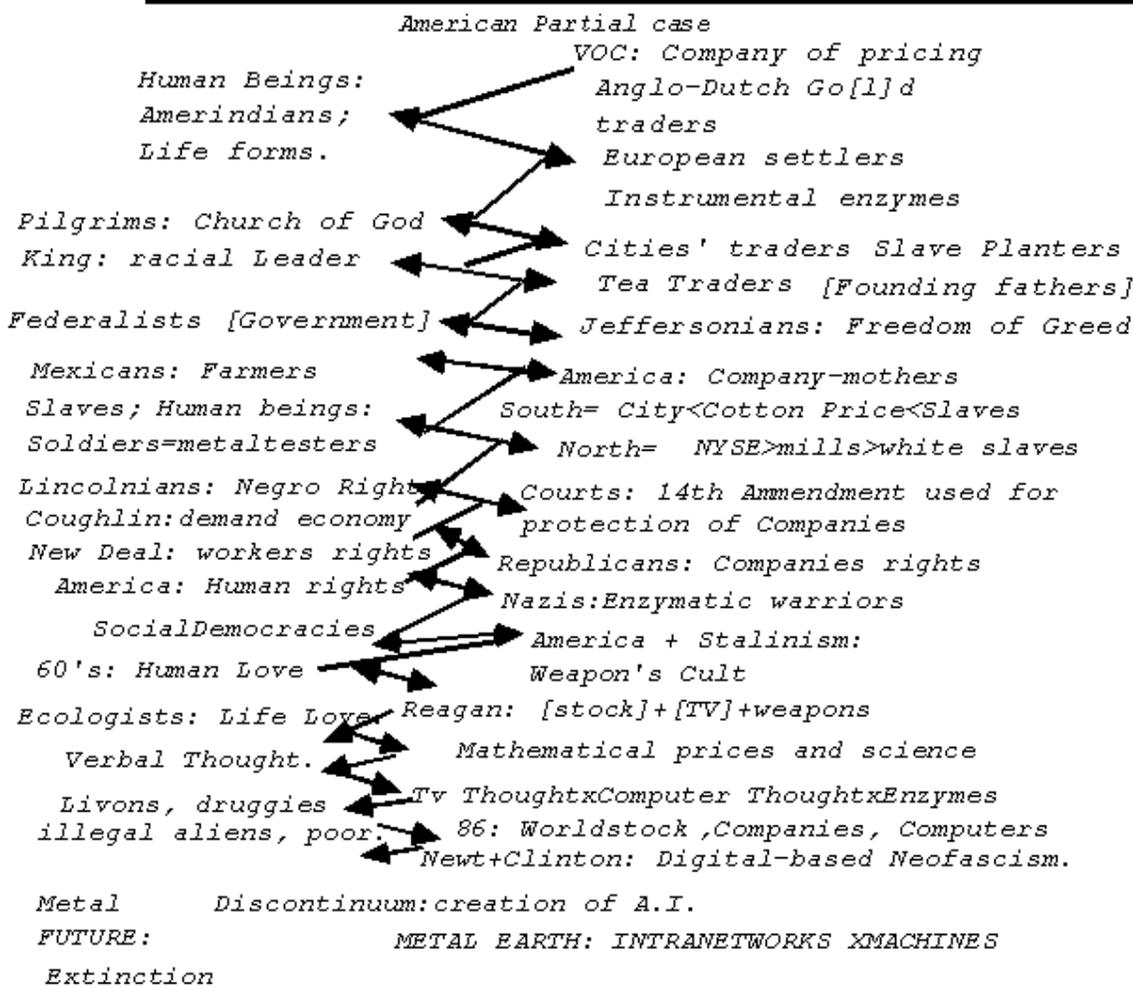

Because now the main theme of Mankind will be the survival of History, the new religions of mankind won't be so much about the organic structure of the Universe – a theme retaken by biological sciences in the age of

reason, but the construction of a perfect superorganism of mankind, in which the metaphysical aspects of bondage through a higher plane of existence acquire a spatial view (wrongly called 'temporal power'), in the regulation of society and its physiological networks, of economic reproduction, legal information and ecological care for Gaia. Those religions thus will purify the Western Semite tradition started in Genesis and the commandments of Moses, giving birth to 3 prophets that clearly achieved a higher plane of existence as Gods of 3 civilizations spread over billion of human beings: Jesus, Mohammed and Marx, each one increasing the rationality of the message and the involvement of the religion onto the design of the perfect world. Christianity would still drag on contradictions natural to the animetal go(l)d church of the (g)old testament with its egocy (Ego=idiocy) of a chosen of go(l)d superior race above heavens and Earth, mystifying the concept of a verbal God with 'iconic' representations of the wor(l)d, and fetish cult to Jesus, and ultimate surrender of worldly power to animetal Germanic warriors and Gold churches (acceptance of the (g)old testament and its 'hidden codon', metal-money) which Mohammed purified, putting also its emphasis on the regulation of money and the law. Finally the socialist movement will try to reign on the machine and its companies

but lacking a proper organic understanding of History and its economic/legal networks will utterly fail becoming just a military inquisition.

One of the key questions of bio-history is why the prophets of mankind that have the right program of survival, eusocial evolution of humanity into a larger whole super organism, by sharing energy and information through social networks, in a perfect world, has miserably failed to convince people has to do with the Goebbels's method: if you repeat a lie many times people will believe it. That is, most humans are 'slaves they believe they don't reason', and beliefs are imprinted by repetition. So in the battle of history those who manufacture brains wholesale by controlling the printing and audiovisual reproduction of millions of simultaneous bits of information can program with its half-lies, myths and selfish agendas the mass of mankind, while the truths of the prophets of eusocial love uttered by mouth or in small print, can only convince a few people. Thus the medium becomes the message and mankind moves programmed by metal-communicators towards its self-destruction, serving the M.A.D. ideologies of its financial-media masters. It would be the age of company-mothers, which we resume in its fundamental civilization, the American age, for a 20 years old book.

Human Future
Ethonomics, human goods

Control of Technology and
Weapons

In the graph, from the 92 book, the final confrontations of the wave of History, as it advances relentlessly since Humans do not want to manage history scientifically or rather animetals prevent them to do so.

animetal corrupted warriors the religion reproduced away into the Mongoloid, organic cyclical culture, fusing with old animist cultures (Japan), Taoist religions, keeping its highest purity in Indochina, where it had already seeded its pali canon.

It will then be the age of plenitude, reproduction and diversification of species, of which the Zen version that tried to purify the Bushido code of Japanese Samurais to tame death into ethics, is one of the most remarkable forms as shaper of the art and wor(l)ds of the classic Japanese culture that will last through the Edo period, till its corruption and extinction by American Animetals (Perry's invasion).

Thus we talk of the 3rd 800 year cycle of the existence of Buddha, in the plane sustained by its suffering believers, as its extinctive age, now dragged through the ages... in which the most resistant strains, isolated in the mountains of Tibet will have as it is customary in those 3rd ages the 'book of death' of the Tibetans and its magic forms of demons and study of the evil side of humanity, agonising till today during the Gunpowder cycle.

As today, little remains of Buddhism in its highest forms, but as an agonistic religion of Nirvana=extinction is perhaps the best positioned to endure the extraordinary evil against mankind its wealth and purpose of Metal-earth in satanic form.

The moral emphasis of Buddhism & Confucianism.

In the same way Christianity first and then Islam must be seen as the attempt to purify the warrior doGs and Go(l)d cult(ure)s of Semite segregational animetal religions; *Buddhism is the attempt to purify the Hindi animetal deformation of earlier Shiva-Vishnu Indian Neolithic cultures. As Confucianism would be in China.*

Thus both Eastern religions change emphasis from the metaphysical description of the Universal game of existence to the mundane wor(l)d of mankind corrupted in the ethical value of the wor(l)d – studied from a linguistic perspective on the article of the 'humind'. This meant in both cases to purify Indo-European cult(ure)s:

- *To switch emphasis from 'belief' into reason, from myth into logic.* That is an attempt as in all parallel processes of the Axial age to rise back the mind of man to a higher 'cold', 'detached' understanding of the game of existence, to 'eliminate' the Passions of selfish, inward emotions that disentangle man from the Universe (Buddhism) or society (Confucianism). The wrong order of the selfie part above the whole is clearly expressed in both cultures. The homo organicus matters more.

- This implies that while faith matters, it is only a preliminary requirement for practicing a MORAL WAY – actions of empathy, love to life and the society matter more. So 'reason', and 'moral action', adds to beliefs in both religions. And finally Buddhism also denies authority when it breaks morality.

In this it is a superior form to Confucianism, which unable to defeat the lack of 'Jen' of the age of warrior states finally corrupted its mandates and accepted authority, reducing the work of the moral man to its smaller sphere.

It is worth to contrast this right view with the 'homo bacteria' animetal p.o.v. which will be revived by Protestant biblical cults and its capitalist view: Calvinist and Lutheran preachers will deny the need for action and rationality going back to emotion and faith in one self, atomizing God into its minimal particles, de facto killing him.

While Adam Smith will first write a treatise on morals in which he already put forward his thesis that 'magically', the lower 'passions' that rule man, its selfishness will become the moral good of the whole, prompting Keynes to affirm that, 'Capitalism is the astounding belief that the wickedest of all actions performed by the wickedest of all people bring the common good'.

Buddhism thus denies the system of castes, as it will do Christianity and Islam against the racism of Judaism and Hindi animetal doGs. And it strengthens the moral resistance against an unjust world through both 'actions' and the overcoming of pain and fear of death through Nirvana; *by denying the ego and its passions; becoming the anti-truth of the animetal modern culture of Aryan+Biblical origin. To eliminate both, 4 noble truths are taught:*

-The cycle of life (time as always in cyclical) and death is 'noble'; and its suffering is caused by individualism.

-Suffering is also the lack of control of passions; pleasure and power over man and Nature. Hence:

-Suffering ends with the end of ego and passions, which brings Nirvana...

-As action matters to reach that end of suffering 4 unfolds into the eightfold path; which aims as latter Islam with its 5 mandates to regulate the 5 actions of existence, to entangle them with society and Nature outside, and within the lack of ego and passions within. So we can subdivide them according to pentalogic into:

S@: *Right senses and thoughts* – right view, right mindfulness, right concentration.

St: *Right information* – right speech, right intention.

ST: *Right actions*: right conduct; right effort

Ts: *Right entropy*: Right livelihood.

Finally all this is resumed in the superior position of the ST-golden mean path of existence and the superiority of empathy over self-love.

This implies a fundamental attitude entangled 'in harmony' to the fundamental property of the Universe, its moral laws, called 'Dharmas'. Thus the mind of the Universe is reflected in the smaller mind of man. This entanglement is vital NOT abstract, reason why metaphysical questions such as the ∞ or the partition of man in soul and body are ridiculed

It follows also that Buddhism rejects authoritarian power and any static standardized view, as it is a 'vehicle' for dynamic action to live a full entangled life that would make the passing to non-existence (Nirvana) the natural goal of fusing with the vital energy/information of the larger non-ego whole.

Multiple insights into the game happen in 'detail', so we cannot be exhaustive.

To notice in common with Christianity the understanding of trinity in scale; whereas the $\Delta+1$ father, $\Delta 0$ word-network-message, $\Delta-1$ prophet, become the 'community', the 'message' and the 'Buddha', the 3 Jewels; while the 3 temptations of animal power that assailed Jesus become the 3 temptations of power transmuted into evil metal (wealth: go(l)d, power: war/weapons, magic: technological science)...

The sophisticated description of the Game of existence in Buddhism.

Buddhism understands the cyclical, vital, infinite Universe as mystical Hinduism and Taoism did before: reality is a constant series of temporal causal effects without beginning or end as origin, duration, destruction succeed in recurrent cyclical change. The ternary scale of animist, shamanist cultures is also carried out, in 3 planes of existence: the mind plane (arupadhatu), the material plane of existence in harmony (Rupadhatu) and the negative plane of passions (kamadhatu) where unenlightened humans live.

Rebirth according to Karman connects into a continuum the cycles of life making the whole immortal but not the ego, *in a true insight on the process of death, we have analyzed in other papers, as it means a 'travel to the past', through the 'Karman' (review in 3 days at accelerated speed of the life we have lived till the end of the ego and rebirth into the lower plane of cellular/insect life).* As one myth explains, in Hinduism, Vishnu observes a group of ambitious Indras, kings of kings reborn as a line of ants... admonishing an Indra who keeps building palaces with infinite rooms, making the architect despair.

As reason overpowers myth, Buddhism admits the positive elements of science as long as do not CONFLICT with the immanent ethic, survival laws of Nature. To notice then that all beings have souls and 5 living species are considered, with Godly creatures and evil men in both extremes (with good men and animals in the middle). *So most evil men are below animal life by virtue of its unlimited animal 'desires' (greed, power-violence, etc). Only when man has empathy (Mettā), he can rise above animal life; for which anātman (lack of ātman=ego) is again the pivotal point and right eightfold way.*

As nothing is permanent, and it bears witness to the extreme love for truth of Mr. Gautama that he wouldn't make any concession to the gallery, (the passions of eternity of ego) with its theory of the 5 always 5 aggregates (skandhas) of human existence as an entangled mind-body: spatial corporeality (Rūpa), temporal feelings (vedanā), which make the body (ST) in a single plane, and the 3 'scalar components' of the mind from 'inward thoughts' (samjñā), i-1, to

disposition/action, samskāra, iō, to entangled consciousness through the 3rd eye that connects you with the j+1 whole; *none of which is the ego, as indeed the mind-ego is a modular ST>S consciousness of the body-head, wave-particle as a while. It is in that consciousness where the human can unite with the Great Self – Buddha consciousness of the whole to be a better man.*

The ST symmetries of Buddhism. And all other religions.

As always in all systems of thought, mirror of the life and death worldcycle of the superorganisms they express, we can use the same pentalogic elements to study any mental religion of the Universe, in its life and decay. The history of Buddhism then can be considered for each civilization of the 8 cycles of History, and we will briefly consider some aspects of them when studying the different 7 cultures of mankind passing through those cycles. Buddhism '3 fundamental ages' would be the coin age or youth of the culture or age of the prophet, which correspond to the Indian civilizations; in which Buddhism flourished, with its 3 sub-ages the Age of Buddha, or age of birth, the age of reproduction, with the Indian Asoka empire at its height and its 3rd and death age of decadent, sophisticated information, in the Gupta empire, prior to its death as the soul of India with the stirrup cycle and the alliance of Rajputas and Muslim conquerors that destroyed it, leaving remains in Ceylon (island isolation) and the Himalayans (mountain isolation). So iron killed Buddhism, but as all universal religions it would re-emerge in the next cycle (cavalry), in China, becoming the fundamental culture of the Asian civilization, absorbing influences of earlier Universal Mind's religions (Taoism, Shinto, Shamanism, Confucian religions). And again it will live 3 ages, of rebirth with the Chinese and Japanese scholars that brought it to Asia, maturity and reproduction, as it converted the stirrup barbarians, reaching its zenith with the T'ang dynasty. But as all religions of love in an animetal world, will suffer the pressure of stirrup invaders, against which the development of 'human-body' based martial arts could do little. So the decadence of the Tang will finally brought down Buddhism, and the new gunpowder age would see new animetal hordes destroying temples and laminating Buddhist influence from China through Japan, which after its wars of unification will destroy the power of Buddhism.

The gunpowder age thus will see the decadence and death of the religion as a global mental power influencing the networks of society and creating a subconscious collective God.

Accordingly the symmetry of space of those 3 ages in time of Buddhism gives birth to 3 different 'decaying' types of Buddhism, of lesser purity in the message of the wor(l)d prophet... The original Theravāda (way of the elders), in the first cycle, still dominant in South Asia and Ceylon; the Mahāyāna, dominant in Asia, during the mature cycle, which will relax the harsh truths of no rebirth of the ego, laws against images to preserve the natural network of the humankind, the wor(l)d in its purity and against the cult to Buddha, just a 'vehicle' for verbal truths.

Finally in the present 3rd age of Buddhism, the more baroque, decadent mythic form of Magic, tantric Buddhism, which disconnects from the temporal world either inward (tantra) or to the regions above and below, with emphasis in the evil rule and the extinction=death process becomes dominant (Tibetan Buddhism, Lama's rebirth myths, etc.)

It must be noticed that the 3 ages of all subconscious collective Gods of 800 x 3 age young, prophetic; pure, mature, illogic mystical connecting with the j+1 game of existjence in its highest form; reproductive, sensorial, human, connecting with the common people through 'saints', 'gurus', 'Sufis' and Buddha's reincarnations and the final 3rd decaying age of corrupted religions or angst, inquisitions trying to elongate the life of the God sustained by fewer citizens-cells repeats for all the great religions of mankind. To finally rest in peace, with few true believers and unable to control beyond a few remnant nations the relentless destruction of life by the animetal cult(ure)s that keep progressing and evolving its memes.

Reason why all of the classic religions of mankind in the digital era have become paralyzed into a suspended, 'death' state, save the last of them, Islam, which is now in its 3rd inquisitorial age, after its birth and prophetic age (stirrup cycle), its reproductive, human sensorial age focused in the Sufi saint's movement and popular folk, to finally descend into the inquisition and fight for survival in the digital era, as indeed Mohammed would be the last of the prophets of human religions. Let us then study the anthropomorphic religions that tried to convert the animetals of go(l)d cult(ure)s back to the fold of mankind.

1ST AGE OF HUMAN GODS: CHRISTIANITY – PURIFICATION OF MOSAIC RELIGION

The God of Christianity flourished without the viral metal-memes that infected it (Inquisitions and Go(l)d churches) during the coin age. As such it will be as all the Gods of ideal mankind, an expression of the higher plane of existence of its believers in its purification through the texts of its highest masters, grouped on 3 ages as usual in the life of all Gods, during its cycle of birth and plenitude (Coin age), its maturity (Cavalry age), and its 3rd age of extinction (Gunpowder age) as it will wane slowly destroyed by warrior kings with its new weapons, and corrupted by the Baalble in its regression to ritual Judaism and its segregational memes in northern Europe.

So in its highest cycle Christ lived as a God sustained by its believers lived 800 years, and had as its highest prophets, in the age of discovery and reception, Jesus, as expressed by John, in the age of reproduction, Saint Francis, in its purification of the go(l)d and iron corruption of the germ(an) warriors, and the mystical poets; in its 3rd age, it will wane slowly powerless against the gunpowder radiation, as expressed in the philosophers of power from Nietzsche 'God has died' to Stalin 'how many tanks has the pope'. And so now as the Metalearth comes to an end, the religion is a mere ritualistic, powerless form whose best 'carcass' are the Vatican Museums in which art of the canon, the Christ, reached its highest moment. But in its plenitude was likely the most profound, mature of the 3 ages of the Abrahamic cycle of Human Gods, born of Jesus who tried but failed to resurrect Yahweh and acquired a new form:

I Age: birth and resurrection of Yahweh as a new form, ROMAN empire.

The paradox of History, the fight between **animetal languages (imnary and weapons)**, and **human languages (ethic, verbal laws)**, confronts in the western world during **the coin cycle**, the **spatial, aesthetical, military culture of Rome**, against... **the temporal, ethic, social, wor(l)d of Christianity**, that finally overcomes the selfish cruelty of Roman animetals. **A new culture is born:**

All religions are born out of the Wor(l)d of a prophet... that reproduces his mind in believers, creating a collective subconscious ...reinforced by social rituals and art that undergoes the 3 ages of any form

0-33 AD: PROPHETIC YOUTH < 33 AD: REPRODUCTIVE MATURITY: 330 AD > SOCIAL, TRANSCENDENTAL EVOLUTION: CHRISTIAN CULTURE

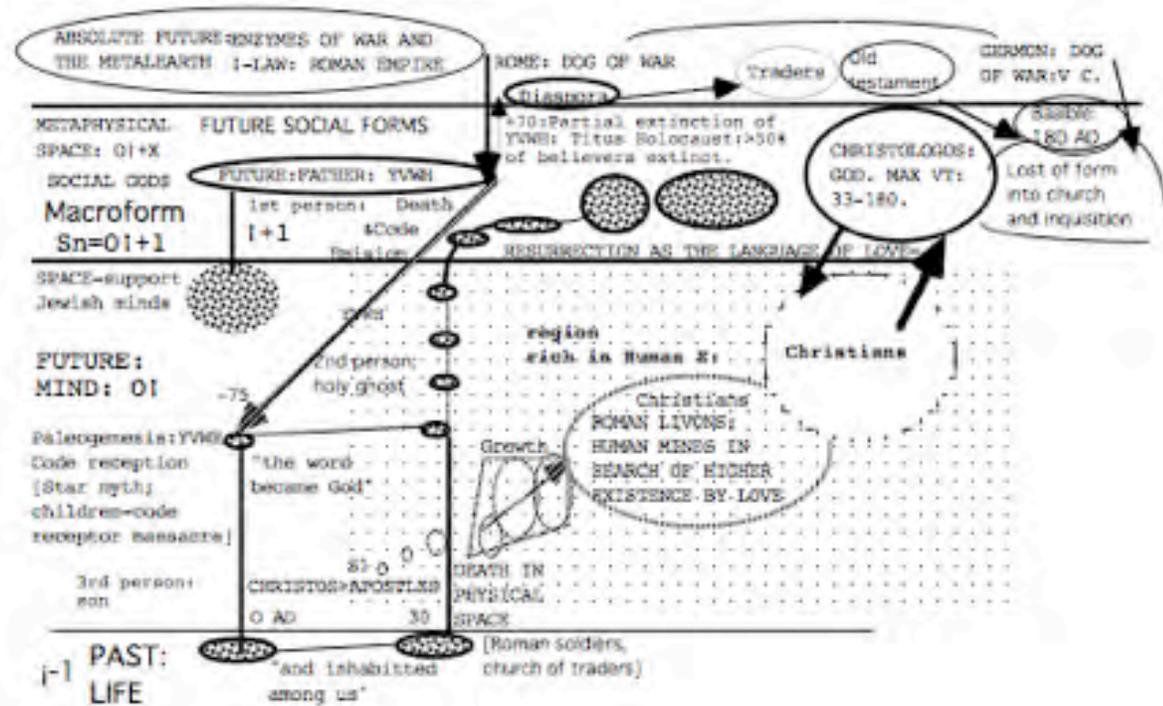

COIN CYCLE

In the graph, the first cycle of Christianity which was the final resurrection of the God of Moses, who had tried unsuccessfully to cure of its military and go(l)d worship of the evil fruits of the tree of science=technology, the memplex of Judaism. This recurrent conversion of Judaism in its lower people-castes of Habiru, who suffer the burden of the Holocaust cycle to humanist oikoumene religions shows that memes are not as inflexible as genes.

So Jesus in the coin cycle and Marx->Trotsky in the Industrial cycle attempted to create a perfect superorganism of History based in social love. In the case of Jesus, as the next graph shows, the fast imprinting with the memetic DNA of the Book of revelation (Gospel) among Jewish and Roman lower classes emerged as a new plane of Existence after an age of martyrdom (sangris martire semen cristianorum), and so Jesus, the God of the wor(l)d of love that became a human prophet that inhabited among us, emerged as a new entity sustained by its believers who as cells do in an organism suffer apoptosis for the higher good of the whole, and thus Christianity, the God, was born, and would live and die through resurrections during all the remaining cycles of the 800 vortex of technological d=evolution of weapons and death of human civilizations; with its artistic minds expressing the 3 ages of each of those supørganisms, of which we noted as remarkable achievements, in the first cycle the Eastern church and hermit movement in Egypt; in the second cycle, Byzantium during the cavalry age, in the 3rd cycle, the Spanish Jesuits and their attempt to construct the land of no evil, taming the brutality of animetal conquistadors. But in the Industrial Age Christianity did not survive its corruption becoming placebo.

Today as the Human specie itself passes his kingdom to more efficient virtual worlds [chips + machines] to those concepts of God expressed in human languages [verbal gods] leave way to truths expressed with metal-eyes[telescopes, microscopes] and metalbrains [from clocks to computers] which define now in non verbal terms the concepts of Space and Time - principles in which perception of the absolute universe is based. Thus the arrival of Telescopes and clocks with Galileo and companies of scientific pricing who used clock-time to measure the cycles of man, have increased the obsolescence of verbal definitions of God. Yet God, the neural word, the clonic community of O_{j+1} =believers, and the books and moral systems associated to those Gods, still survive, by creating God-clones within the brain of 'cells'=believers. Each Mind=cell of God's form thus become transmitted by learning, and enacted in social external actions of simultaneity. Those Gods exist because they are natural to the essence of verbal-biological evolution of man into higher planes of existence=[clonic mental GodoGs]. They are organized by the ultimate Wor[ld, Love=Max. communication, that if properly imprinted in the behavior of individuals, would create an efficient system of survival and creation of maxiHuman planes of existence: a social God. However in the age of pricing our verbal concepts of a Human God have become less and less accurate, as metaleyes and metalbrains [clocks] widen the total perception of the absolute Universe from the pov of metaleyes, making the truths of human thought less 'important' to man. More Complex mathematical and image languages thus substitute and use as energy, the truths of verbal thought and human Gods are forgotten.

The total Universe is bigger and different from Love=God=Max. Human communication, the O_{j+1} true form of God=Human mass; and both should not be confused. Nor should the knowledge of the Universe, be used against the validity of the 'truths' of human thought. Since Human Gods are not concerned with measure but with behavior, 'scientific' errors of past i-logic prophets by no means invalidate the truth of Love=God, as the Universal method of creation of higher social planes of existence, able to control Metalhistory. A fact clearly explained in those prophetic messages. Love would enhance the survival capacity of man as a collective specie. Because Love=Max. social communication among all minocells of History, is the survival i-logic of Human times.

2nd age: Death and resurrection as a lesser form.

Christianity in its purest form was though short-lived as it would be corrupted by Judaism, in Nicaea congress when the (G)old testament was accepted on exchange for conversion and money

from the people-caste of Am Segullah, which were in war with warrior Rome, who had decreed death penalty to anyone carrying a Torah, and by Germanic warriors who converted it in Jihad. So slowly in the middle ages, we witness its purification, reproduction and expansion through the Mendicant orders, with the first clear signs of regeneration after the corruption by animetal germ(an) masters.

While in byzantium Christianity merged with the rational Greek culture reaching its highest balance between the animetal and ethical elements of society, protecting a remarkable number of human beings from the brutality of germanic aristocratic barbarians; and then finding a balance with the 3rd age of Anthropomorphic western religions – Islam... till the gunpowder wave from the west (Venetian Sacco di Bizantium with Lombardas, 1208) and the east (Turkish warriors who learned gunpowder from the Mongolians), will destroy her.

It is then in this gunpowder age, where a final resurrection of the goal of any humanist religion – to create a perfect world - was taken as the burden of the orders of priests purified during the middle ages, in its last modern efficient form – the Jesuit movement of black friars, which achieved remarkable success along the Dominican orders on limiting the damage and genocide of Iberian animetal conquistadors. Indeed, the importance of a love religion can be assessed considering the difference between the Christian religion that managed to protect the survival of South-American Amerindians vs. the protestant Jewish sects of the (G)old testament, based in racist animetal memes, who did nothing to prevent the Genocide of North-Amerindians; as their purpose was not humanist creation of a superorganism of mankind, but the same idol-ogy of its animetal go(l)d north-Europeans: herd gold whatever it takes, including the extermination of the 'inferior human race':

GUNPOWDER CYCLE

They cut their fingers with the blade of swords... good people... don't have iron weapons. We'll make of them great slaves.

Colon in Cuba

That way leads to Panama to be poor, this path to Peru, to be rich'

Pizarro

They ignore private property and inheritance. After giving to each family enough to feed themselves the remainings belonged to those who worked 3 days in the communal soil.

Chronicles of the Land without evil, Paraguay

XVI- LATIN AMERICA > XX

'Only absolute need and the urgent call of our people, will force me to adopt the terrible burden of becoming your Supreme Dictator'

Bolivar Founding Father

New Latinamerican nations continue the culture of the conquistadors, based in weapons and economical submission to the English Empire, while its art reaches its zenith with the baroque work of native artists:

'You are the United States, you are the future invader of naive America that still has native blood, still prays to loving Jesus, still speaks Spanish Wor(l)ds'

Ruben Dario, Prophetic Baroque

Conquistador eating gold, Indians mining it

Machupichu home of the Sun-God

... but after their expulsion, the 'criollo' imposes again a pompous baroque of hypocritical greed and renewed war.

2ND AGE OF HUMAN GODS: ISLAM, GOD OF THE WOR(L)D

The God of Islam *in its purest form* - the wor(l)ds of its prophet, son of god, the wor(l)d, language of the superorganism of mankind that expresses the laws of the organic Universe that created through the sharing of energy and information - of charity - created a simultaneous wave of believers, sustainers of the FORM OF ALLAH.

It reached its zenith during the cavalry age as a counter-reaction to the stirrup radiation of cavalry barbarians.

But it soon showed the sickness of war that caused its partial corruption, by the animetal people it tried to convert, as it has happened in all the cycles of human Gods of the wor(l)d.

This said Islam as an anthropomorphic religion of the God of History, is the 3rd evolution, after Judaism and Christianity of the fundamental concept of a perfect immortal organism of History, in which both the temporal and

spatial elements of the superorganism (the economic and political networks and its subconscious collective ideas) aimed to become one single whole, as it should be in a healthy, wealthy superorganism of history, which should NOT have two head, neither leave to 'animetal' idol-ogies of worship of weapons and money, the corruption of history. It is then imperative to understand Islam as the expression of that perfect organism of History adapted to the language of the Cycle of stirrup chivalry and go(l)d metal-money in which it was born, a brief introduction to what a God of History, the superorganism of mankind in time is and tries to achieve. So we make an introduction to the prophets of mankind and its superorganism in the higher context of systems sciences and the laws of the Organic universe. And then consider the three 800 year cycles of history in which Islam existed, the young stirrup age in which was mainly a culture, the mature gunpowder age in which it become a civilization, and the extinctive digital age in which it has become an inquisition of thought trying to survive, *as the last living God, a new plane of space-time existjence - sustained by the subconscious collective mind of its believers - in an age in which all other Gods of the wor(l)d not corrupted to the bone by racist animetal memes, have become placebo corpses with null 'temporal power' to shape the future of the wor(l)d.*

ISLAM WAS BORN as a prophetic wor(l)d culture, but it will soon derive into a military/wor(l)d mixed civilization moving back and forth through attempts to resurrection of the wor(l)d and return to military ages.

Islam was also born in a region of strong animetal convictions - the Arab world, and so it was from inception, a possibilist religion that accepted certain corruption of animetal cultures, notably in the lack of equality between women and men, the two gender principles of reproduction and conservation of the world and was ambivalent with the concept of jihad, use of war to convert others. Those were with time the two most negative sub-texts that made it lost prestige as a pure religion of social love. But on the positive side, Islam outdid previous religions by its understanding of the fundamental tenets to build a superorganism of mankind that were immortal: the control by the informative wor(l)d of the economic network, the essential role of charity and distribution of wealth to build an efficient economic organism, the equality of all humans in front of the ethic law; and even the genetic & memetic concept, put together of a ruler-head, the neuronal ego/site of the religion, which unfortunately was not met, as machism prevented direct lineage and the need for ethic works to justify ruling, which was the first imposition of the first 'reinforcers' of the purity of the message, the Karijis was son discharged.

So Islam became a mixed religion of...animetal civilizations and world prophets. We divide the text in those two sections, the second one, Islam as a civilization, studied in more depth in the paper on the Islamic civilizations.

The prophet in the geographic 'body' of the Arab animetal cult(ure).

Mohammed was born in one of the hardest animetal cult(ure)s, the warrior 'manly ethics' of the Arab world with all the wrong traits of militarism - the land of the Bedouins, the 'evil people' of the first Semite civilizations that destroyed the 'tree of life' of the Genesis/Sumerian paradise. So the stakes were high, the job arduous - to convert to the values of the wor(l)d the Semite people both Arabs and Jews initially with its go(l)d and war values inverse to those of the wor(l)d shown in the key graph of those texts. We see in the next graph go(l)d values affine to weapons, which form the synergy of animetal coalitions, but *because go(l)d and digital languages fully erase verbal wor(l)ds and its truths, a go(l)d culture is almost impossible to convert, while a weapon culture is more 'animal-body-action-oriented', with minimal linguistic content; so to convert a warrior is far easier through the use of the wor(l)d as it is basically an empty, erase head, not a head filled with falsehoods and the annihilation of truths of verbal thought that value life, repressed by the memes of go(l)d cultures (repression of sex, dietary food, eusocial love etc.)*

Thus Mohammed did not succeed first in Mecca to convert go(l)d traders, and was expelled. Then in Medina it succeeded to convert the tribe of Arab warriors but not those of Jewish go(l)d traders, 2 of which he expelled and one massacred. Then on return to Mecca the conversion of its family tribe, the quraysh, would be more of a worldly accommodation, but hardly in spirit, causing the fundamental problem of Islam - the lack of ethic zeal of its rulers, most of them relatives of the quaraysh tribe who reverted from ideological ethic identity to genetic justification of power and worldly use of money and weapons to maintain it:

The positive aspects of the doctrine of Islam as a natural religion of immortal history.

All this said, on the negative side, we can consider the positive developments. We shall escape the biography of Mohammed which rightly focused on the doctrine of the wor(l)d, not on his persona, in fact forbidding iconic representations - a key LAW for the survival of the wor(l)d as the verbal, nervous network of mankind in its purity without images.

This law is still essential to the preservation of man as ruler of the world. Since images degrade the conceptual time-oriented depth of verbal tenses, concerned with the survival and rule of the future of mankind, NOT with the worship of individual images, but the whole community, not of spatial forms but of temporal flows.

Moreover Islam has an immediate prohibition of *making any living form from where the prohibition of images, as a first template of the living aroused. That is, in Islam is a capital sin for man to make from the inanimate living species; from where it follows an immediate prohibition of robotics, since only God can create life.*

This startling survival law for mankind is unique among religions, and contrasts heavily with the myth of the Golem in the corrupted Go(l)d culture of Judaism, and the present passion for robotics in the corrupted rulers of the Arabian peninsula, with the first robotic 'drivers' of camels, 'robotic aero taxis' of Dubai, and 'robotic police', and investments of what should be Zakat on Apple and Silicon Valley from the sovereign funds of those republics.

It is then necessary as we study the different laws of Islam as the Natural 'revelation' of the wor(l)d of the 'Human Constitution', the natural physiological laws of energy and information that through a community of equal believers should create a perfect world, to consider also the corruptions those ethic mandates will suffer.

Community is again a key wor(l)d in Islam along the revelation of the wor(l)d, forming together as Nature does the two key elements of a superorganism of History, our 'God', Allah in the wording of Islam, in as much as *Allah is the God of the entire humanity, breaking definitely any attempt to select an animetal people-caste as the racist chosen of go(l)d or the s(word) proper of Judaism, Aryan cults to the s(word) and Germanic views on Christianity, and Jewish G(old) testament impurities of Protestant racist sects.*

In Allah, the God of mankind, the God of History, even if it was hyperbolically expanded to the God of the Universe (which as we saw is the theme of Eastern religions), all humans are equal cells/citizen, and form the community, which if obeying through its works and deeds the mandates of the wor(l)d revealed in the Quran as the mind of God, the wor(l)d, to his prophet, son of the wor(l)d, will be able to form a perfect immortal organism of history.

This is the essence of it, and while in the literalist sense of the time in which the prophet was born, it had to be adapted to the age and people to which it was given, so for a literalist some elements are confusing, Islam among all other Wor(l)d religions and the Bahai movement derived of a Shiite sub-discipline of Islam was the clearest expression of the law of creation of god=History, till the scientific texts of Systems sciences clarified them rationally.

THE FIVE PILLARS OF ISLAM.

One of the most surprising realizations of the temporal nature of Islam as a religion that tries to construct a perfect superorganism of history are its 5 mandates of actions, *which are mimetic to the 5 actions of existence, of a human superorganism, albeit redesigned to construct a perfect world, taking into account the actions of the age in which Islam was coded – the Chivalry cycle. So the 5 actions of life organisms, locomotion (Ts), Entropy = war (TT), Reproduction of goods (Economics), information)St) and language SS), became redesigned to enhance the construction of a welfare, love-oriented social organisms.*

What are then the 5 'Dimensional motions' or 'verbal mandates of action' that would transform if followed by the believers the wor(l)d into a just place where to build such organism with the social and economical and political doctrines of Islam?

They are obviously the 5 pillars of Islam, and as the reader might not have studied the fundamental paper of those texts, the laws of the 5Dimensional scalar organic Universe we shall introduce them briefly.

Back to Islam then we can easily Frame its 5 pillar on the 5 actions maximizing the goal of social evolution

1st Pillar: The profession of faith. SS-seed of language and pure form is the sentence, mandate that resumes the whole doctrine: 'Allah is the only God (of History) and Mohammed, his prophet (son of the wor(l)d'. We translated to the concepts behind. The doctrine of Mohammed will if obeyed by all human believers create an

immortal single God: History.

2nd Pillar: Prayer: St: it is the information that details and expands the Seed of Islam. As such it multiplies the SSeed, through 3 original Quran prayers in the 3 sections of the day, latter multiplied to 5, to include the ±j end and beginning of the night (tahajjud). It consists besides the motions of submission (rak'ah) to God (Islam means submission to God), hence obeisance of the laws of creation of a just supœrganism of history, the chant of the seed of faith by the Muezzin, the reading of parts of Quran and its comments on the Friday gathering of the community (Khutbah) by the imam (leader).

3rd Pillar: Zakat: ST-reproduction of welfare goods, It follows then the need to reproduce the welfare goods that allow people to survive, which we developed in the ethonomic frame of reference for a just reproductive economic system. Its purpose was self-evident from the beginning, as zakat means purification, that is, the purification of the evil treats of go(l)d and metal-money and its 5 antilife parasitic functions (usury, money for war, debt slavery, speculation in scarce goods needed, taxation of the poor). Here again we see the striking contrast with corrupted go(l)d churches of Judaism and Protestantism that accept even encourage the use of parasitic money, and in its evolved forms of classic economics and capitalism are no doubt the causes of human collective self-destruction, war and holocaust cycles and ultimately our extinction.

Zakat though has its equivalent in the Christian religion on the mandate by ecclesiastical law of spending 1/2 of the 10% tax the catholic church levied in the Middle Ages on the poor, in food, hospitals and shelter. And as a general rule we shall see the clear-cut difference we can establish between the Catholic & Orthodox earlier Christian churches and Islam on one side, as religions of god=History where the non-corrupted + elements outweighs the negative corrupted ones vs. Jewish and Protestant Calvinist Anglican biblical sects whose negative traits overweight the positive ones, and hence are the engine of the modern animetal extinctive world of life.

Zakat was levied as a 5/10% of the produce of land and 2 1/2 percent on cash and precious metal, on the argument that the late is barren as usury is also forbidden. And the first is renewable. It is his use however what matters to the creation of a positive superorganism of economics. As it is used primarily for the poor, against the most negative parasitic functions of go(l)d-metal money, war - so it can be used to ransom captives; debt slavery, so it can be used to redeem debts of the poor; anti-taxation, so it can be used to pay taxes for the poor; and welfare, housing for travelers, food and hospitals. So again we marvel of the correct, proper anti-negative use of zakat to cure the illness of parasitic money and its 5 anti-humanist uses.

4th Pillar: TT-entropy: fasting. The fourth pillar of Islam might seem odd to most, as it means fasting on summertime, the hot age... It is though interesting to consider it as what it achieves - a reduced activity during the month of heated

emotions that prevents the essential negative form of TT-entropy=death in mankind, war. Indeed, fasting from morning to night, not drinking water, and preying makes almost impossible the act of war with any chance to survive a well-fed army. Ramadan thus is a peaceful month akin again to the 'God truces' of medieval church but quite effective for the whole male population, akin to the infamous motto of The Trojans, make love not make war. As life starts in the night, feeding, drinking and one supposes making love- not I am not Muslim if you wonder, I am a scientist of history and its cultures with the only goal to translate them to the only goal of historians that should be to expose the laws of survival of mankind our god=history In time. It does obviously waive the mandate for those sick or undernourished who can risk their health - another proof it is a hidden stratagem to avoid negative entropy=war.

5th Pillar: Ts: locomotion. Hajj. It again marvels the correspondence between the 5 Dimensions of life existence and the 5 pillars of Islam that locomotion, which on the age was also mainly used for war - not yet placebo sports being the obsession of people; found a *positive action for the building of social God. It would be the Hajj, the pilgrimage to Mecca, to join together with the community in an impressive circle of 7 turnings, in a mass joined together as a whole, which is the fundamental method of the Universe in the creation of a whole made of parts, from electrons turning to create a central magnetic field, to planetary masses to form a central black hole jet; to Indian dances, to all kind of 'vortices of accelerated time' studied in our webs on hard science and 5D.*

And the fact that mysticism in Islam understood it, with its poetic writings about the sensation of a force that takes the mind of the believer and fusions it with all others in the turning of the Kaaba, and the non-existence in its central structure with four pillars of anything but an empty space for the 'magnetic mind of Allah' sustained by its believers to appear, shows how deep is the understanding of the laws of emergence of a new plane of existence in Islam.

This circle being the main action of Hajj, to arise God in its center, closes the five pillars=actions of existence of Islam. Their mimetism with the 5 actions of the Universe show that perhaps indeed the Plane of Existence we call God, the superorganism of mankind in space-time which under the laws of 5D cannot be perceived only sensed, exists, in the same manner the cells of your body don't perceive but only sense the nervous simultaneous messages of the brain, its God, which they cannot locate precisely but know to exist.

So I am on the opinion as in the case of Christianity and Buddhism for which we have enough historic record to know an accurate descriptions of the facts of revelation and likely for the Mosaic event on the Sinai Mountain and his admonitions against the Golden calf, the a wor(l)d connection through the saint spirit of Allah=Yahweh=Christ=God=History=Mankind took place; but being in the 3rd informative age of anthropomorphic religions it is the clearest reception.

This said, Mohammed was a prophet of his age, and so at the time of reception he had his own 'burden' of belief mostly taken from Judaism, active in the region, and by then clearly corrupted by myths and go(l)d. So while the essential reception was pretty accurate, there were interpretations of his perception of the whole, 'lifting his mind' in communion with God, and parts he didn't seem to understand.

One which I find strange, given the simplicity of it, clearly stated on Saint John 1.1 is the Saint trinity, the whole, God, the part, the prophet, the nervous system, the wor(l)d spirit communicating both, explained in depth in outer papers. But it is a fact that it became the main heresy of Christianity and cause of all its heretic wars that debilitated the doctrine. So Mohammed merely scrapped rightly the whole thing as a divisive concept, ill understood till today. It was also a good policy that helped him to conquer the Monophysites who thought on Jesus to have a single Nature and were fighting Byzantium in Egypt. Islam did expand fast due to two causes. The higher quality and clarity of its message-reception, as Christianity had problems on Jesus own interpretation of what a son of God, son of the wor(l)d=prophet means; given the hyperbolic nature of man, who seems not to be content with the true nature of an anthropomorphic God as the next plane of spacetime of existence of mankind and always give him extraordinary powers beyond the planet of which he tries to become its immortal mind.

This obviously was the case of Mohammed Interpretation of Allah in terms of what he learned from other traditions. So Allah became the creator of the whole Universe. In the opposite side of humility however he did not feel to be a

proper receiver of Allah's direct message as he casted him with overpowering force, so he took from the Jewish tradition the voice to come from angel Gabriel. As we said, a prophet upon contact with the subconscious collective God in the darkness of the wor(l)d, past the essence expressed on those 5 pillars and the message of social love can take *details appropriate to the age and the beliefs of the people that surround him to ease the believers understanding in his own code, and as such must be interpreted the need for details. As humans are memorial repetitive brains that like to repeat their traditions. The revelation however was immense in its weight and conviction for Mohammed, a sense we all those who have sensed the Plane of Existence of God can testify. It is a burden as Sisyphus stone, which make us sweat and often we would have preferred not to sustain.*

This again is understood in Islam as Mohammed considers valid the messages of previous prophets which include 2 characters of Judaism of lesser note (Abraham and Noah) from the old Book of History of Judaism, which are not relevant... misses in part the importance of Genesis for lack of a Name as author, of *enormous relevance to understand the battle of History between the god of life and the wor(l)d vs. the god of metal and technology, of the Mind of Earth I, II vs. the mind of the Metal-earth. But rightly fits then Moses and Jesus. As the 1st and 2nd age of 'prophets of the animetal age, with a known name and history' and then places himself as the 3rd prophet, or 3rd age, which again is rightly the last prophet of the metaphysical age, as it only is left to CONSTRUCT or NOT the superorganism of immortal history if humans follow the ethical messages of those prophets and create a new plane with all the physiological right nervous and economic, political networks on the body of Gaia.* So this is the task left, the worldly creation of the perfect world, and to that end Islam put itself in motion.

Since if that goal is not met, we all know there will be a judgment day in which terminator machines of the tree of technology will kill us all, as we ate of the wrong, evil antilife fruits of the tree of science.

This duality might be also perceived in the duality of God's creation of two parallel species, man, who is redeemable, made of Earth, of clay, and Jinn, *made of the fire of the smith, the animetal, who is prone to evil. So as both are clones only differentiated by its origin, one evil the other Live-holding clay, the image is clear; and so it will be Cain, a metal-master 'Jinn' who will kill Abel, and in the tradition of Islam, give birth to the people-caste of iron and goldsmith.*

Regarding the capital sin he accepts it, without elaborating on the meaning just expressed, but considers God has forgiving Adam, which obviously it has, because God needs the subconscious collective of the brethren of Adam to exist and must by chance join its future to Adam and try to convert Adam's brethren to his message.

And here comes then the eternal duality question of all religions, concerning the relationship between Adam and God, namely the 'free will' or not of mankind to do good and evil.

In this religion has always had 3 views according to whom the religion serves, the metal earth of evil=antilife values or the life earth. And one in between. Evil antilife religions of animetals consider man is evil and more over is predestined to do evil, so we might as well *accelerate our extinction. This is the view of the first Vedas, the Aryan cult(ure) to the fire of the smith with its racist denial of the Unity of man and the commandment of warrior Gods to Arjuna NOT to think but just do evil. This is the subconscious commandment of Jewish-Protestant (Calvinist) religions where man is predestined, and go(l)d is the measure of success, the intelligence of God (Calvin, Adam Smith, iconic name of Adam who took the golden apple and Smith who murdered with iron). So man must do evil because an evil violent revengeful God asks him to kill even his own son (Isaac) or in his substitution the human sheple (the lamb) and preach and herd go(l)d, etc. etc.*

Then in the other extreme there is a free man that is advised by a good God to fight for the choice of Live and Good; so he cannot relax because obviously the force of antilife and destruction of Gaia and History, of the Life earth and its subconscious collective is always about to happen, unless he fights it. In this duty to do good works to enter Heavens, to redeem the original sin, with different degrees of freedom lay the true religions of love, Islam and earlier Christianity.

And so both walk the same path. However the difference lays in a higher predestination of Islam as God is more powerful, when in Christianity the prophet son of the wor(l)d becomes God and it is fragile. Which on one side obliges the believer to be more conscious of evil, on the other side it makes him more fragile because the backing of God is not so powerful as in Islam. So he might give up easily. So those are the pros and cons of both beliefs, though their spirit remains the same.

So does the understanding by both of the true crime of animetal egocy: ego=Idiocy. Man is arrogant, deluded, feel over powerful and thinks he can match God in its capital sins (Genesis, attempts to create lifelike god did; which brought the right prohibition of images in Islam, etc.) Man, full of pride, thinks to be self-sufficient, above the laws of God and Nature and that will be his demise.

True faith (iman) requires submission to the mandates of God, and that is indeed how mankind could survive, if he would understand the laws of God=the organic Universe and respect them, not creating life of inanimate objects and trying to construct with the right actions a superorganism of immortal History. But man tries to be at the same level with God as an equal associate (shirk), which he is NOT. So he tries to create and has opinions and as an amateur tries to build with wishful thinking his own version of history and so it fails and sins and becomes an animetal homo bacteria full of egocy. For this, man relapses on the original sin, and God keeps sending prophets to not avail till man becomes Kafir, ungrateful, disbeliever). This seems to be the case today, where the antilife doctrine of predestination to do evil dominates the world. Yet Islam as the fractal theory of the Universe with parallel histories shows makes always possible a sinner to repent (tawbah) , we might ad as long as he exists, which for man will not be very long.

So prophets make it easier for man to understand the revelation of god. In the case of Mohammed he put Gabriel as a middleman, likely because of his learned memories of Judaism, which was for future scholars a reason to downplay the quality of the message. So Ibn Arabi would as other Sufis discuss in the 3r age of the first Islam 800 y. cycle - the old age of excess of warping and information - argue that Saints (hence also Sufis like himself) who had direct contact with God were superior to prophets; yet another crime of egocy: ego=Idiocy; because it was Mohammed that created the religion, rightly understood its main messages and all other by force cannot be the SEED, as the seed of a supœrganism is always one, happened in the past, and none can take his place, even if the seed has some errors in the code.

As long as the seed is fruitful and produces a superorganism of History the seed has proved itself. When it does not, making very small supœrganisms, easily corrupted by go(l)d churches and inquisitions of war, as protestant different sects of Judaism, obviously the seed is 'something else', not a world religion of mankind, the whole. So only 3 seeds-prophets, Buddhism, Christianity and Islam, which reached at a point a sizable, 1/5th, an entire sub dimension in space of the human species, deserve that name. Both by quality of message and global expansion; while in the modern non-metaphysical age, socialism reached also the same status. If we restrict to the west, and substitute Buddha for genesis, common to all others, and give Moses 10 commandments accepted also by them, in the next graph the list of prophets and anti prophets of mankind

"]

The fight between prophets=doctors of history that warn against metalife with the ethic syntax of the wor(l)d that makes man the subject center of the Universe and its anti-prophets, which make of gold-iron the vehicle of God that kills life but gives a minute of earthly power to its believers condemning their sons to the war and holocaust cycle reaches its height in the antinomies of Judaism. In the graph some of them: Genesis & Moses vs. Nathan, Aaron; Jesus vs. Calvin & Cromwell, Mohammed vs. Jihad caliphs; Marx vs. warrior Stalin... But the wor(l)d is a 'weak God'. So the realpolitiks of Stalin - how many tanks has the pope & Wall Street have imposed a no-way out path of extinction for the lesser humans without ethical restraint and intellectual understanding of the survival laws of the organic, fractal Universe and the unity of the human species, the only prescription to control hate-memes, war cycles and Holocausts. Now in the final battle of bio-history the last prophet-neuron of the wor(l)d is completely alone as in any dead body, and all its potential cells, worship go(l)d that kills its ethic neurons, iron that kills its bodies and machines that atrophy its organs. So the Millenarian prophecy is about to fulfill its finale, as gold migrates into chips and iron serves the bodies of robots.

As of the theme of resurrection and judgment day of all humans that have existed, is a question we deal with in our analysis of parallel Universes, that is fractal Histories, according to which if entanglement exists between equal human forms, and indeed the number of parallel galatoms is much higher than of possible combinations so equal human beings do exist, and entanglement is non-local based in the equality of form, so it might exist, *resurrection is possible*.

It will never though be proved because it will happen through the memorial recording of our verbal soul and transmigration to an equal born being in other planet, which as in palingenesis *will select in time only the Stæps in space that were successful for the purpose of creating a perfect superorganism of mankind*.

Indeed, the palingenesis of a new generation reduces the wrong stæps of a previous population, accelerating the creation of a better superorganism. So if the Earth is entangled in its life age to other planets that will pass through history it can perfectly select those humans who are worthy to be repeated as their verbal history will bring a better chance to construct a perfect immortal superorganism of life that must be during the history-life age the purpose of such species of planets.

So this is the rational possibility within 5D theory for judgment day. Those who kill history and life will not be repeated. And thus in fact, animetal cultures were initially not concerned with such matters. Judaism had not after life as it was a material world religion of power on Earth. So goes from the warrior animetal religions. Only those who talk of eusocial love are concerned, with the two 'higher dimotions' of reproduction of one self in body and soul (Islam) or emergence as the mind-part of the higher $\Delta+1$ whole (God) in the case of Christianity that interprets resurrection as the boson coming together of all just souls into the whole of GOD.

So that is the metaphysical. Islam's doctrine in its original inception.

But an that differentiates Islam and makes it more real and successful as a religion trying to build a perfect world of history, Islam is also in command of the economic and political networks of a civilization, as a brain is in control of it nervous=legal and economic-financial network.

So Islam has a socio-economical part in the building of those networks of the superorganism of history we will keep on writing other wishful day.

From religious culture to mixed civilization: warrior Semites & its prophets.

As usual all cultures have in the modern times two sides - the side of the wor(l)d and the side of metal, usually specialized in war or go(l)d, as the language of animetal power, which create the classic oppositions between prophets and anti prophets of the 7 cultures of mankind. In the case of the Semite cultures, which became the first animetal cultures of history, this duality will be expressed sequentially in a series of 800 year cycles starting with its apparition as the destroyers of the Fertility Goddesses and life-enhancing civilizations of the Fertile crescent, clearly dividing from its inception in warrior cult(ure)s - we shall call generically the 'Arab meme', and go(l)d cultures, we shall call generically the Jewish meme; as those would be the final surviving cults to iron and gold, today extant, though obviously in its inception there were multiple tribes dedicated mostly to the 'easier to understand' power of death of the lineal weapon. Both type of cult(ure)s will soon deform their languages into imperative VSO topological linguistics with the caudillo or banker-priests on top barking orders.

So the beginning of 'eviL=antilive' memes would be Semite, and as such it would be the *name used to call the people of the Desert both in the Egyptian and Sumerian tradition (Sinuhe, Lament of a Sumerian priest), as it was obvious a new brave world of despise for life and hierarchical power had appeared and the Age of Love receded ever since.*

The duality of prophets and anti prophets took place in Islam in the last years of Mohammed, when it accepted jihad but still the wor(l)d was pure in its earlier texts; and it could have expanded further if it had kept its original Shiite goal of a genetic+memetic people-caste of prophets in a world empire, in control of the eviL of metal but soon the warrior Semite caudillos displaced Ali, the genetic-memetic prophet in the battle of Karbela. So the project broke into tribal warfare and military dynasties. In the graph the first Umayyad caliph that included a silver coin to reinforce its metal power, confronted to the Umayyad of believers that create the spirit of Allah in his cyclical emergence the day of Hajj

But as all humans have a life side, the search for wor(l)d of prophetic love did appear with the classic ethic age of humanism, also among Semites, with the arrival of Islam, in its original format, before the very same prophet, going nowhere only with the wor(l)d would somewhat accept war to extend his preaching's.

And so from its inception as it happened in Judaism, expressed in the parable of the tree of life and the tree of metal, of the golden calf and the Mosaic damnation, Islam will have the seed of love and the seed of eviL, the seed of social charity and equality of all human beings and the seed of Jihad, inquisition and conversion by death.

As we enter the entropy age of human dissolution and regression to the past, unfortunately the seed of love recedes also in Islam and the inquisitions that try to preserve the culture from extinction take protagonism, and so today Islam is going back to inquisitions, which are stronger in the original Arab, Semite memeplex; and within the Arab memeplex in the original Arab peninsula, and within the Peninsula in the most corrupted, commonest sunny version, which

earlier in history rejected the prophetic lineage of Ali (Shiite version) and embraced the military Umayyad caliphs. So the maximal corruption of animetal Islam is today the Saud kingdom and its oil emirates dedicated to worship go(l)d, weapons and enthusiastic of all western technological gadgets, bringing the first robot camel races, robot taxis, robot vigilante cameras in compounds for the wealthy, paying the fundamentalist terrorist groups on behalf of western governments that 'need' enemies for its pecunia infinita belli nervi cycle.

While the human side of Islam still standing happens in the billions of Islam practitioners that uphold the pillars of the religion, charity to create a social bondage, or assabiyah among the Ummad of believers, who will in the 7 circles around the empty four pillars of Kaaba, create the form of Allah, as the subconscious collective of their minds, as a circle of electrons form its magnetic field that orders them into a boson state of pure spiritual existence, identical, undistinguishable particles of the body of God.

It is then obvious that in Kaaba a new Mahdi will rise during the robotic cycles to expel the Salman ¥-vidi credo ergo sum, new leader, genocidal of the Yemeni people, wasting billions in corny Louis XIV palaces and Mega-yachts as Humanity enters in the next decades in the pure entropy age of total reversal to the past, as the metal earth ends our kingdom, because we did betray all the prophets of the wor(l)d.

What is then the customary prescription for the cure of Islam, by the doctors of bio-history? Again, as usual we just need to translate the wor(l)ds of their prophets into modern bio-history; and this resumes in a single word, *Asabiyyah*, used extensively by the second great prophet=historian of the future of Islam, long forgotten, and first master of History, which can be considered the highest rational mind of the 800 age of rational Historians of the Greek Age, Mr. Ibn Khaldun:

Asabiyyah refers to social solidarity with an emphasis on unity, group consciousness and sense of shared purpose, and social cohesion, which Nasser first tried to regain in the modern Age of Islam, but obviously its warrior memes betrayed him attacking Israel, an impossible feat, given the control of the Go(l)d cult(ure) over the leading, western capitalist democracy.

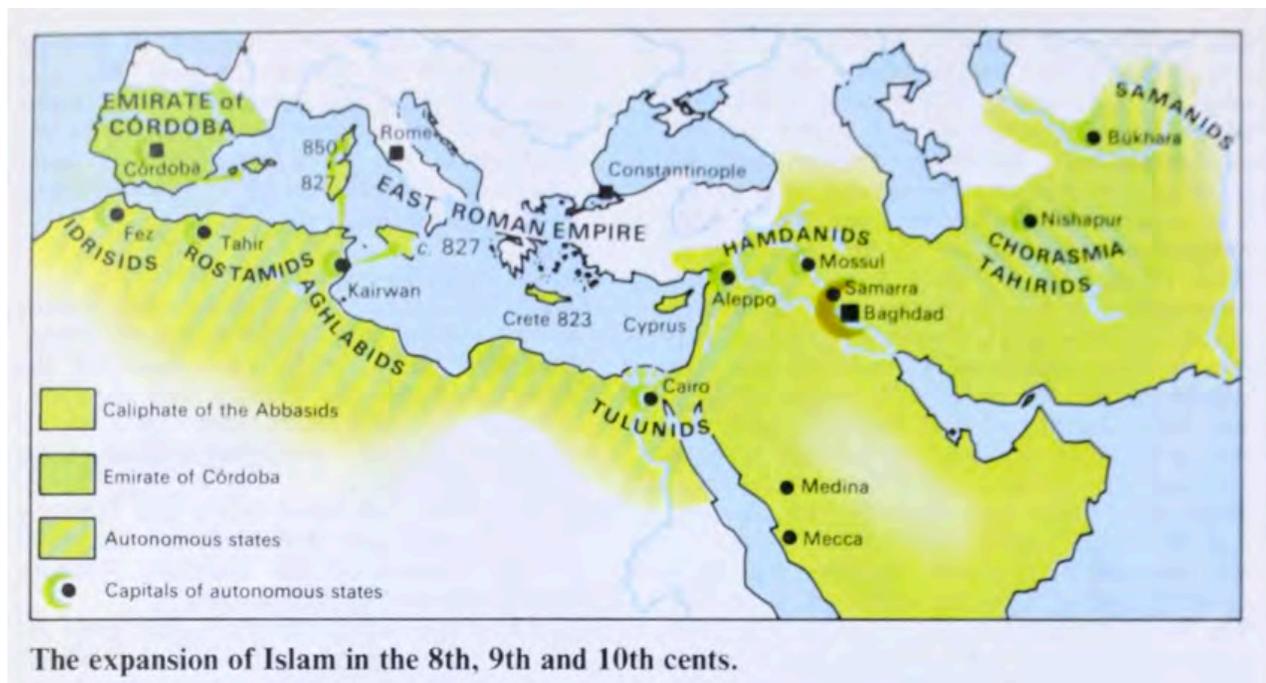

The first Neolithic cultures belonged to modern Islam, joined by Assabiyah, reason why Allah is still 'alive' as a God whose cells live and die for him... albeit in a clear inquisition state defending its survival

Mr. Nasser should have conceded defeat in Israel, the last and most powerful of the colonial nations of the

west and instead pursuit the expansion of R.A.U to create one of the 7 heptarchies of the perfect world, making a rational, socialist, modern humanist culture, renovating Islam, and its credo of charity and love of the wor(l)d, which today could have become a seed for the perfect rainbow planet that could abort the birth of the Metalearth and the extinction of man; lost that chance; Islam broken into corrupt puppet statelets to the service of weapons trade and luxury consumption, hate-media and Jihad, I cannot see at this stage, when the ¥-vidi, credo ergo sum generation of the Salmans and Mohamed V are taken power much hope for resurrection... since the themes of Modern Islam, Israel & Jihad are NOT the true memes of the culture, whose real value is its common people that extends as any map of earlier civilizations can notice, on the regions that started the Neolithic revolution, and so are naturally inclined to live without mechanisms, of life and the land and could easily adapt the way of life of immortal history; which makes Islam clearly the most 'extreme' in its partition between an elite of corrupted warrior animetals and a body of Assabiyah 'still-human-beings' sustained the suffering mind of agonising Allah, which each of them sustains in the moment of Hajj.

Islam: the oldest Neolithic culture vs. the oldest animetal warrior cult.

Islam is the oldest human culture, heir of the Fertile Crescent and Valley River, Neolithic culture. occupying the same river basins and coastal, sea-farming communities, from the Nile to Indonesia; but it is also the oldest animetal culture, in which the wrong mixture of eusocial memes of love and war memes reaches its paroxysm, exterminating the Fertile Crescent Goddesses cults:

In the graph, the base of Islam, its common people represent the values of the original human, life-oriented, Gaia-respectful Wor(l)d, where man and its collective subconscious, God, Allah, Love, that reunites all men through Assabiyah, becomes one. Its elites, after the failure of the religion to 'cure them' of its memes, as envisioned by the eusocial messages of love of its prophet (end of the Shiite bid for power, with the intention of creating a global dynasty of prophets, ruling society), with the creation of the Abbasid empire on the graph, became a military warrior society, soon corrupting religion, in the same fashion germanic warriors were doing in Europe to the goal of military power.

This degradation however was not so extended as in Europe and so during long periods of time in the Middle Ages Islam achieved the highest closest culture to the Perfect World along Tang China. But with the decadence of this first Arab elite, and the use of Turkish warriors, entering the gunpowder age, Islam will enter an age of decay, which will become more extreme with the arrival of colonialism, and the final present age in which Islam is at war with the West, masterminded by the 'invisible black hole of financial digital power', the FMasters (Am Segullah, People of the Treasure, Israelis, 'yous', banksters, whatever you want to call it, the people-caste in control of the Financial-Media system of the west). So today Islam plays the role of Africa in the colonial I age of fascism: to be the perfect 3rd world target for our weapons systems in defense of colonial Israel, and CONTRIBUTING to it far more than the primitive negroes, as its own cultural degradation back to its animetal, jihad roots and the availability of weapons and communication today, allow the existence of monstrosities like the failed state of Iraq and Syria, we promote in order to have a good excuse to build our own Orwellian world.

This of course is the key to Islam today: instead of solving its problems, the west, let it happen to have a excuse to build a military global world of robotized big-brothers. Today as we reach the 50 years of the Occupied Territories, and The City elite brexits, to be able to control at distance through Financial-Media machines the west without 'polluting'

their Selected from human direct contact with the new debt slaves of Europe, we can only see a stalemate situation in which the West will let it happen, as long as Islam provides the excuse for our Splendid little wars and internal curtail of human rights in Europe and Anglo-America.

The true harm of this process though is NOT to Islam and Anglo-America, the 2 Semitic original cultures of war and Go(l)d, difficult to upgrade as history shows, always relapsing into its brutal modes, they deem 'modern' (it amazes me how Jewish intellectuals in America tried to convince me that European attempts to create a perfect world based in humanism was NOT modern, AND MODERNITY consisted on producing robots and Internet webs to further reduce mankind to rubble). BUT TO EUROPE, WHICH is fast degrading itself into a replica of Anglo-America, with the excuse of Jihad terrorism, focused on France, not coincidentally the centre of Jewish power in the continent. Thus ISLAM IS BECOMING the excuse to destroy Europe, and break the attention away from the ECB financial dictatorship to create an Israelified replica in the continent.

In the graph, Islam also occupies the original Semitic Animetal region, the Arabian Peninsula, which destroyed the Fertile crescent of those Fertility Goddesses. *And the revival of those Neolithic memes would have been the natural path of reform of Islam, downplaying the religious Abrahamic side of it, as Mossadeq, Nasser and the earlier Kaddafi thought off. This the west didn't want. And destroyed.*

This duality and opposition explains the role today plays Islam, as the cradle of Jihad terrorism, along the Anglo-American, 'Jewish owned' culture, the cradle of 'robot terrorism', in the Semitic wars between Israel and Palestine (local symmetry), the western, most advanced technological world and the human, most degraded 3rd world (global symmetry).

Islam vs. Israel thus is the 'regression' of mankind to its earlier animetal age of 'Israel vs. Assur', today the region of Syria.

This is not by chance. Indeed, *in the 3rd age of history, as humans have failed to evolve into a global social organism, the perfect world envisioned by all the prophets=scientists of history, and it is about to become just an obsolete species in the growing organism of the metal-earth (Financial-Media/military-industrial system), cultures regress back in time, and as an old man only talks of its youth, the end of the wave of history brings back the oldest of all hate-wars between brothers, in this case between the elite of bankster-priests of Israel, on top of the Anglo-American original capitalist culture ruled from Wall Street and The city, and the elite of priest-warriors of Islam. Each one using its armies of robots and mercenary soldiers (Anglo-America), and its armies of desperado, brain-washed believers and its terrorist bombs.*

Yet Islam, as its role has been casted in the west - the new red scare, communist, primitive old culture we must exterminate - is NOT all ISLAM. Obviously The West is only interested in converting Islam into a terrorist culture, apt to be exterminated as guinea pig for our weapons and security states. Islam though has the 3 sides we have mentioned:

- The old Neolithic traditions of the common people, as the first Neolithic world, which from Indonesia, to the Ganges and Indus, to the fertile crescent and Egypt was occupied by Islam.
- The top animetal warriors who destroyed that civilization which went underground in the common folklore and customs of those cultures.
- The Islamic religion that tried but mostly failed to reform the animetal warrior and convert it to a less racist version of the Biblical Jewish culture among which Mohammed a trader was educated.
- And finally its amazing degradation today, which has derived in the present terrorist and militarist rulers of most of Islam, as the perfect 'enemy' for the FMMI culture and its systems.

Islam in its degraded animetal old and modern version.

Thus today Islam *is the most degraded of the 7 cultures, but we cannot blame this on their people but on the FMMI culture and see it is a warning to the way most of humans will be soon treated, as obsolete people. Islam in that sense is the equivalent of Africa in the Colonial wars, when the primitive negroes were degraded for centuries by slave traders and local caudillos.*

Islam, which occupies in its core centre - Arabian peninsula and lateral nations, the original fertile crescent, unfortunately the first societies of Gaia and Humanism to be degraded and destroyed by animetal warriors from the desert, as the 'Lament of a Sumerian priest' clearly explains - the evil people come from the desert with weapons of metal and gold rings, they capture and enslave our women and take our peasants as mercenaries, nobody comes to the temple, the fields are abandoned, it is the end of the world.

Islam as a reform religion, which failed to control the animetal people-castes.

The humanist side of this culture was represented by Mohammed, and its attempts as he put it to 'convert the hardest', most evil, brutal people left on planet Earth, the original Arab warrior animetal Semite, Neanderthal-crossed, visual hypnotized, machist hordes of thieves and mercenary soldiers of the Arabian peninsula, based in tribal, racist, genetic memes - indeed the most primitive culture of the day. And for a while he succeeded though his method of creating the perfect world, was somehow, a bit out of track - murdering all those who did not convert to Islam, till arriving to India, and realizing the massacre would be so huge that he gave up and just taxed the non-believers.

In the duality of Koran, with mostly positive, humanist messages attempting to convert the mass of peasants of those lands to the eusocial memes of a single god, mankind, with its pillars of faith and charity, vs. the Jihad, we can see the duality of all cultures. Now as the world is awash with hate memes provided by the FMMI system (free weapons, racist slurs, visual identification of races by appearance, through TV-screens, despise for all things human as primitive etc), and the west promotes in all those nations military thugs on top, who never truly converted to eusocial love and the spirit of Oikoumene Islam, most of those nations are in civil wars, or ruled by Dictators, oppressing their people. While their priests have sided against the love memes of their religion and enhanced the Jihad and women's repressive memes, the form over the content. So it is partially because of our insistence on converting Islam, in the energy prey of our weapons and hate media, the most degraded culture today.

Islam as the focus of hate memes of the Am Segullah bankster elite of the Anglo-American culture.

And this leads us to the culture that has degraded it through colonialism and islamophobia, the other older Semitic culture, which is the most important of the world, as it invented capitalism and the Financial-Media/military-industrial system, and the most peculiar, as its brutality and murder at distance finally achieved 'black hole status' as invisible, ruling at distance through their monopoly on the creation of digital money the rest of the world, with degrees of intensity according to the proximity to the elite class.

The devolution of Islam.

Islam has a power behind it, which today is brutally misused by the alliance of Jihad, warrior caudillos and provocative hate memes to foster perpetual splendid drone wars: assabiyah, bondage, the power of systems to ab=use control and sacrifice its cells-citizens to the common Good. As all in reality timespace systems become stronger with time, and so the bondage of Semitic cultures, in which warrior male sacrifice their life for the community, which can be a positive

force to create a perfect world, *if the proper ideologies are met, in the case of present Islam, is the power of the Jihad terrorist, once a huge section of Islam has concluded they will always be as long as the West is ruled by the Jewish Am Segullah banksters, the guinea pig of wars.*

This of course, we regret, and Social Europe, when it was still an independent culture, ruled by French-Italian social scientists, tried to avoid, by helping a just resolution of the origin of the Semitic wars, the colonial state of Israel. But it failed as since 1973 and the coup d'état of the Financial-Media Masters from Wall Street and Hollywood, over the American presidency the west has become a milder colony of the same financial elite (Take over by television of the destiny of American politicians, Yon Kippur war, end of dollar convertibility and take over of the American money by wall street, and beginning of the massive radiation of over 20 trillion \$ of money invented for and by banksters).

Thus the just solution to the degradation of Islam and Africa by the Anglo-American/European colonial capitalist cultures, which was a just reparation, a global Marshall plan spending part of those 20 trillion \$ created in e-money in the past 1/2 century, to rise their standards of life and education, easily met, with a limited population and enormous resource in raw materials, with the proper backing of positive social politicians from Mossadeq to Lumumba, was not implemented.

Instead, neo-colonial corporations took over those resources, Islam was labeled as a terrorist movement because Palestinians wanted to have a human treatment, and finally *as the whole mankind started its regression back to the past, the unthinkable happened: the French Am Segullah controlled politicians, left the ayatollahs to go to Iran, and the American promoted in Afghanistan the most primitive Jihad, against the socialist, corrupted but still socialist Russian Empire.*

As it happened in Germany where the Nazi party was cradled by the west and the local bankers to destroy the humanist, socialist movements, to destroy the socialist movement, first Mossadeq was eliminated and put on top a caudillo, the Shah, son of a British officer of the colonial army, and then, a jihad priest from a Middle Age inquisitorial vision of Islam took power, helped by the French.

Meanwhile the push towards neo-fascism of the Am Segullah elite of Israel and America, made the Palestinian 50 years now, constant humiliation as a less than human occupied people, far more brutal.

And so, we are where we are; in the point that from minor to major on the scale of corruption of the 7 cultures of mankind, Islam 'nations' come on top, only paralleled by the Biblical, Semitic Anglo-American culture. The 2 oldest animetals on top destroying the world.

It is again an Islam, ruled by the Arabs, the original warriors, which occupy its core centre.

It is again an Arabian peninsula and lateral nations, that brutalize the original fertile crescent.

The massacre of the Arab Marshall people by the combined effort of Saddam and Bush (who told them to raise in arms and abandoned them), it is a reflection of the massacre of the first societies of Gaia and Humanism to be degraded and destroyed by animetal warriors from the desert, of the Fall of Ur and the Sumerian first humanist culture born there, as the 'Lament of a Sumerian priest' clearly explains:

'The evil people come from the desert with weapons of metal and gold rings, they capture and enslave our women and take our peasants as mercenaries, nobody comes to the temple, the fields are abandoned, it is the end of the world.'

Islam as the cradle of the first scientist of history.

Now, because Islam is still on the land of the first Neolithic cultures, which were at the peak of human evolution in relationship to Gaia, the beauty of Islam is on those elements we never talk about - its Neolithic culture, its gardens, its care and harmony with the tamed nature of the Neolithic, its mastery of the poetry of the word, and the science of history.

The Abbasid Dynasty (750–1258)

The 1st caliph of the dynasty ABU'L-ABBAS, d. 754. He was succeeded

754–75 by al-Mansur (= the Victorious), the real founder of the Abbasid Dynasty, who created the power base for the new state with the aid of Pers. auxiliary troops (762 establishment of the cap. at Baghdad). The Arabs lost their predominant position; **leadership passed to the Persians**: introduction of Pers. court-ceremonial, gov't of the state by viziers, reorganization of the admin. after the Pers. and Byz. models. The caliph, surrounded by his court, became inaccessible to the public. The greatest flowering of the caliphate was attained under **786–809 Harun al-Rashid** (famous for the role he plays in the *Thousand and One Nights*). Despite victorious struggles against Byzantium, the dissolution of the Empire began: the Idrisid Dynasty in Morocco (788) and the Aghlabids in Kairwan (801) gained their independence. The Empire faced decay after HARUN AL-RASHID's death because of conflicts among his sons.

Internal conflicts, Shi'ite uprisings, the rise of autonomous dynasties (the Tahirids in Khorasan) led to the **loss of polit. power by the Caliph** during the 9th cent.; he confined himself to the role of spiritual head of all the faithful, while the gov't of the state fell into the hands of the **Amir al-Umara** ('Great Emir' after 936). The princes of the ind. dynasties soon claimed the title for themselves.

940–1256 The Abbasid Dynasty was politically unimportant.

1256 Incursion of the Mongols into Persia.

1258 Conquest and destruction of Baghdad by the Mongols (p. 179).

In that regard, the best analysis of Islam in terms of the science of history was made by the Al-Andalus founder of scientific history (beyond the first stage of accurate collection of data due to Thucydides and Xenophon, in the great Greek awakening of the Axial Age), Ibn Khaldun, which understood the fractal, upper scale of existence of a God of Man, which Islam, the 3rd horizon of anthropomorphic religions, hence the highest stage of its evolution represents.

As it always happens in the extremes of an Empire, (Spanish peninsula in this case) freedom of thought reaches its height. And so we must find in Al-Andalus, the masterpieces of thought of the 3rd age of the original cycle of Islam (Cavalry 800 years cycle) - Ibn Khaldun in the science of history, the Sufis, Ibn Hazm in the art of human senses, Abū l-Walīd Muḥammad bin 'Aḥmad bin Rušd (-; Hem, Averroes, in the philosophical arena, and the geometrical delicate work of Alhambra.

The warrior 800 year cycles in Islam. The Imperial ages.

So happens in the other extreme of the Empire, Iran... But we shall not make a long history of the culture of Islam, at this stage - maybe in the future. Just consider the 3 ages of that Cavalry Cycle in which in the temporal, mundane plane, Islam represents the $1/2 T$ (half of the 800 age wave), consolidation of Empire.

Indeed, the astounding fact of the cyclical patterns of history is that in the middle of every 800 years wave, when the prophet of the wor(l)d that tries to resurrect humanism, and the master of the (s)word and go(l)d that imposes metal power fusion in harmony (classic age of each wave), *an empire is formed in the most civilized part of the world at that age, consolidating the weapon, the wor(l)d and Go(l)d into a single balanced, E=I civilization.*

This was Rome who lasted 797 quasi-perfect wave years between the fall of Rome to iron soldiers (Gaul), whose weapons Rome took, and the fall of Rome to Cavalry Barbarians (Alaric, 410s AD). In the middle, of that wave, around 0 AD Rome became the widest empire of the iron infantry/coin mercenary age.

But in the cavalry cycle it won't be Europe, deeply regressing to a Jewish/Germanic age of slavers and murderous barbarians, the creator of the biggest empire. The consolidation did indeed happen in $T/2$, around 800 both in the Northern European Culture with Charlemagne (dying in 814) and the Abbasside empire with Harun al Rashid known in the west for his '1001 Arabian nights). But the Islamic empire would be much bigger. Those are the dates of $T/2$ and its 3rd dissolution stage:

In the previous and next graph we illustrate with the color codes (red for youth, green for life balance and blue for informative decadence) the art and word, the subconscious mind of that age in 4 of the 7 cultures of mankind.

The reader should notice the ASTOUNDING parallelism of those cultures and its forms, because humans belong all to the same superorganism=God of history Mankind, and its 7 fractal regional cultures are thus parallel in all cycles despite the lineal, manifest destiny, of tribal, racist empires. We are all the same:

In the next cycle, though, the gunpowder cycle, (1208-1945), Europe would take power as in its T/2 point Galileo will found ballistics and lineal time ($V=S/t$) to measure the motions of cannonballs and the gunboat corporation appeared almost at the same time (1600s).

So the next 'cycle' of Islamic culture won't be so prosperous, now divided in the canonical 3 sub-empires, the Turkish empire - which kept close to Europe the evolution of gunpowder weapons till the XVIII century, hence reached maximal extension:

The Ottoman Empire, 1683

Then the Persian Empire, of higher cultural quality but less military animal power than the Turkish one - by the paradox of history: max. technological evolution = Minimal human evolution...

In the graph we can see the consequences of this: the Turkish empire invaded, defeated and conquered Mesopotamia from Persia... which entered decadence, but *precisely due to*

The Mogol empire unlike the Turkish, renounces to conquest and adopts the refinements of Hinduism as it shrinks in size Epic and lineal in art with Tamerlan, it reaches its classic age with Akbar, to find its decadence in the harems of Jahangir

In the eve of its conquest by the Indian Co. that enslaves it in search of Go(l)d Profits

its higher spiritual content, became the site of the Shiite, purest Islamic form (where the descendants of the prophet as it was meant to be, kept power; the priesthood was purer, less corrupted, and so finally in the present cycle of 'digital weapons' Iran will become the last theocratic, wor(l)d controlled society, reaching new heights of artistic purity in its films and resisting the final electronic wave of human self-destruction... Finally the Mogul Empire... which would easily fall as colonies to gunboat European companies. In the next graph we see the 3 ages of the Mogul empire as art moves from its lineal, foundation phase, to its balance in Agra, to its formal paroxysm in Taj Mahal, to its final decadence and death as a servant of the profits of the East Indian Company, 'owner of India' and its 'human capital' ever since:

THE BAHAI CULT. FINAL EVOLUTION OF ANTHROPOMORPHIC RELIGIONS.

We cannot close this analysis of the fundamental religions of mankind in its natural evolution, without briefly considering the last r=evolution of Islam, in its purest Shiite form, that of the Bahai cult.

Bahai faith is the final evolution of the twelvers belief that the 'dodecalogic number' of avatars of the prophet, the 12th Imam, will achieve a 'transcendental' 3rd worldcycle for mankind and history, to use the 5D jargon of existential algebra Its founder Baha Allah, 'the glory of God' confronted the beginning of the age of extinction of Allah, which as all ages is an age of profound mysticism and birth of prophets attempting to resurrect the dying subconscious collective of the civilization (in one of those processes of death of Yahweh Jesus was born). As such Bahā was brutally

treated by the military power of Persia and lived in exile and poverty. But as prophets are the wor(l)d they write after his death, his texts which took the rational analysis of anthropomorphic religions of Mohammed to new heights, marrying it with western enlightened thought, in 100 books, of which the al-Kitāb al-Aqdas (the most holy book) is the most remarkable... God for Bahā is incorporeal. Human inability to grasp his essence is partially superseded by the prophets, which are those of classic Islam with the addition of the Persian Zoroaster with its duality and Buddha, master of eastern thought. So Bahā rightly assess the 2 stations of prophetic wor(l)ds – the first is the station of ‘pure abstraction and essential unity’ – ultimately the description of the Game of existence; as we are all manifestations of his will – we are all ‘details of the thoughts of God’ in 5D terms. The second station is that of ‘distinction’ – that is, the variation of civilizations and cultures, which require after each ‘Fall’, the rise of a new prophet to translate in each local time and space the ethic essence of the wor(l)d through progressive revelations, *whose final goal is to unify all mankind as a single whole.*

God is the creator – the game of existence, we might say – and Man is created through social love, to carry forward ‘an ever-advancing civilization’. So the Bahai faith is a step closer to the understanding of the potential perfection of mankind as a united organism, in harmony of all races, cultures and disciplines of knowledge. It maintains the advances of the French r=evolution and civil society, and its principles of equal rights, and privileges, education social justice, gender equality, (monogamy), rejection of slavery, etc. It abolishes in an attempt to purify religions, the mediation of priesthoods, proclaims the need to unify languages and keeps from Islam the Zakah, a diminished 19 days of fasting, and prayer. Yet in Bahai temples as there is not priesthood the believers read texts not only of Bahā but of all the aforementioned ‘stations’ of prophethood, and around the temple, the zakah, is actively promoted building schools, hospitals and orphanages.

REVIVALISMS...

In all those religions in an attempt to purify them of their animetal corruption will happen from time to time, in ages of crises of the ever growing animetal world processes of revivalism, but all of them will fail to change the relentless evolution and revivalism of the anti-religions of animetal idol-ogies. And so nationalism will keep bringing wars, capitalism, the collective anoxia of mankind, and techno-utopia, the mirage of scientific advances as a surrogate to the evolution of the human wor(l)d. And of course the animetal inquisitions of thought and go(l)d churches with its people-castes on top will also suffer revivalism. So biblical sects and Hindi castes will maintain its power by virtue of the financial and military power of its elites. The last of those revivalisms, the building of Israel as an attempt to resurrect the segregational Bronze age cult(ure), purified by secession of all its wor(l)d prophets (Christian secession, Marxist secession), in fact has been the most successful of all, as a nation, whose informative western elite of Financial-Media-Academia Masters, in control of the subconscious collective of the Industrial western world, specially in the Anglo-American civilization, sets the trends of the ‘idol-ogies’ of techno-utopia, capitalism and nationalism that guide humanity towards its own self-extinction in a soma, placebo state of lethargy, fiction, and childish wor(l)d myths of selfie supremacy over the Universe.

The wor(l)d though powerless in metal power, at least, will keep evolving in the accuracy of its message in that 3rd age of History advancing towards its death state; which wor(l)d prophets tried to combat with a purely scientific approach to social sciences, during the age of ‘humanist r=evolutions’ and social sciences...

In graph, 3 new people-castes destroyed the Neolithic imposed their idol-ogies of worship of metal memes:

Even though most 'subjective', anthropomorphic people will find bizarre such diminishing definition of a human being, an objective, biological account of history cannot be subjective, nor optimistic about the main role of Mankind in this planet, which so far has been to extinguish life organisms and create metal mechanisms, while finding all kind of ideological excuses to do so. Thus, humans today are in biological terms, 'animetals', animal life, symbiotic to metal, which they evolve, terraforming Gaia into the metal-Earth. Their biological function has been obvious: to kill life (warriors), reproduce metal (traders) and design mechanisms with numbers (scientists), latter used to observe the universe and create mathematical theories that 'reveal' the ultimate secrets of time, thus making obsolete the verbal times and biological senses of human beings, substituted by scientific machines. Yet those 3 castes of metal-power that substitute life by metal do not understand their self-destructive processes. Instead, their myths and ideologies make them feel superior and righteous: warriors 'defend' people. Bankers create 'wealth'. And physicists deliver the 'truth' about time, when in fact, they merely study with their clocks the less important of all times=changes, the motion of beings in space; and they ignore everything about the 3 ages of the life/death cycle of morphological time - the type of change that really matters to human beings, which do not move at the speed of light (the time studied by Einstein and modern physics). Why then humans worship 'physicists' and 'mechanists', who know so little about time; warriors, who kill life; and money, a mere piece of 'informative metal'? Because those tools of metal give power. Weapons kill and people obey warriors to preserve life. Physicists invent machines that enhance the energy and information of Mankind. And humans become hypnotized by the 'formal' properties of gold, which preserves form and reflects the sun's light, our informative 'language' of perception. It is metal, not the superior intelligence of scientists, the higher force of warriors or the productive capacity of bankers, what hooks man.

Warriors, who murder with iron, the strongest atom, the body of man; 'bankers' hypnotize and enslave them with gold, the most informative, the mind, and 'physicists' who substitute our verbal, conceptual languages that describe the 3 arrows of time, past, present and future, and its causal relationships - the true essence of time, with digital clocks and our visual, artistic eyes with telescopes and microscopes, feel superior human beings, 'different' to us, 'only' life beings, hence applying NOT the law of eusocial evolution between 'undistinguishable' beings, who come together into tighter boson wholes in any scale (Einstein-Bose statistics) but entropic laws, of dog-eat-dog colliding states of 'heat'. This is the present state of our societies, the lowest state of 'big-bang' existence promoted by their philosophies of reality, from lineal time to big-bang creationism. So they justify the constant evolution of weapons and control of the mind of man and its life-time with money and its atrophy with machines, as future progress since they confuse their progress as the 1% on top with those selfish memes of metal, with the progress of life and mankind as a whole - they no longer perceive as the same people, but a primitive heinous group that lacks enough iPads and virtual screens or money and weapons to impose their rights.

Idol-ogies substitute the organic science of Humanism and socialist evolution.

History, the superorganism of mankind should be designed according to the biological Wealth humans need to thrive and survive, if the economic system was not an ill-designed parasitic system of debt slavery, born of the evolution of supremacist fetish gold cultures, in conjunction with the metal-entropic iron cultures that consider MONEY not what it is - a digital language of distribution and production of goods, no wealth per se, but a language that kicks the reproduction of those goods, as words do with human organisms and oxygen and hormones with biological systems - hence a language that should be delivered tool citizens-cells to start production and consumption of welfare goods, with universal salary and NO-DEBT government issues (that is not need to return the money).

Why this has not happened then has to do with the *Historic fight between political and economic true scientists and the brutal predation of those who abuse life with 3 type of selfish metal memes:*

1) Top predator Weapons that kill bodies, manufacturing corpses and the people-castes of Indo-European warriors that carved the human superorganism and its 7 cultures into maimed artificial parts inventing the concept of tribal nations.

2) Competitor Machines that atrophy humans organs & substitute us in labor and war fields, making us lazy or killing us in far larger numbers than simple weapons did & the people-caste of scientists that invent them.

3) Informative metal 'Go(l)d' with no real value per se that hypnotizes the eye; degrading the mind, provoking greed, and converting people in slaves, which initiated the use of money to parasite people with debt, taxes, inflationary prices (speculation) and triggered the Pecunia infinita bellus nervi, with its affinity to value metal-weapons higher than welfare goods (Whealth) and the people-castes that invented the use of parasitic money to exploit mankind ('Kainite'=Canaan Baal and Bible cultures).

Idol-ogies are the historic 'memes' that certain people-castes have developed to make them feel the system that works for them is good. Of them 3 are paramount - the 'memes' of go(l)d cult(ure)s, which are segregation memes that make them think they are a superior species, because they monopolize the issue of money and were born in Canaan among the first biblical banker-priests; and associated to them, the memes of 'warrior cultures', which used bronze and iron-weapon, 'germs of history' as mercenaries of banker-priests or as king-warrior societies to kill anyone who opposed their control; and finally in modern times, idols of science, techno-utopian memes that make us think to atrophy and substitute our 'organs' by machines that do the job for us, making us obsolete is 'good'. So we shall call this 3 cult(ure)s animetal cultures because they degrade their minds and verbal languages becoming 'visual animal-like' greedy people obeying the hypnotic qualities of informative metal gold, the best informative atom of the Universe; or they become warriors, who suppress their body sensations to use iron to kill others, the most energetic atom of reality, or scientists who suppress their visual artistic eyes for telescopes and their verbal times, for clocks to measure space and time with machines. So they are in fact empowered by metal-memes of superior atoms but degraded as humans. This is exactly what happens in enzymes in nature, where the carbohydrate part is atrophied substituted by the metal-part, so animetals or enzymen ARE real biological species that have come to dominate the world in the last 3000 years, and what we live in a capitalist placebo democracy is just the most sophisticated version of animetal societies. *It is necessary to understand how obvious and simple are the true social sciences that take care of the physiological networks of mankind:*

We talk of 3 fundamental scientific truths of the organic Universe applied to social sciences that could take care of the physiological networks of mankind and its 'inversion' by idol-ogies of selfie memes of metal:

Organicism Vs. Mechanism: Man as the measure of all things, the most perfect super organism, which we should cherish and imitate to build a perfect human world. As the universe is an organism, as opposed to a simple machine and its idol-ogy of 'Mechanism'.

Humanism Vs. Nationalism: All humans belong to the same species and so should evolve together into a global supœrganism; no weapons and borders that murder members of the same species

Socialism v. Capitalism (financial parasitism): Humans should live in a true democratic ruling themselves and their languages of power. So all humans should receive a Universal salary of blood-money to kick out production, and governments should reproduce money to promote welfare, biological goods first, and only when those basic needs are covered, mechanisms selected in production according to utility for society to be free. *Those are the true 3 physiological sciences of the superorganism of humanity vs. the 3 idol-ogies that kill us.*

Unfortunately because metal gave higher power to warriors to kill human bodies and bankers to enslave human minds, hypnotized by greed – the imitation that gold and silvery metals did of the sun's light and its reflections, which made primitive humans think they carried a fetish 'sweat of the sun', a 'small god in their pockets', and the synergies between weapons and money of maximal price, animetals and its idol-ogies would be gaining power ever since money and weapons appeared subverting social sciences, in an increasing tempo that would accelerate with the arrival of machines that fulfilled the 3 'dimensional motions' of mechanisms:

- TT. Entropic Machines-weapons of maximal killing mower (mass murder), which definitely will wipe out non-technological civilizations at global scale.

-Ts: Transport machines that spread at a faster rate, from the age of chariots to the age of planes, the people-castes and idol-ogies of animetals.

-Max.St: Sensorial machines of information that substituted and atrophied human mind senses, making digital thought the new language of truth over verbal thought, and of metal-eyes, the new senses over artistic ones.

-Max. ST machines of information (metal-communicators) that reproduce biased information in favor of a future NOT based in human evolution and reproduction but in mechanical progress. Those would be essential with the arrival of the press to spread the anti-human repressive and racist memes of the Bible, the Sacred book of the go(l)d culture through its global networks of trade, imposing the ham damnation of modern slavery (arabs and negros as inferiors to dog), the belief on a superior race that should herd gold to control mankind (capitalism), and hand in hand with nationalist tribal idol-ogies impose the modern age of war.

It is then necessary despite censorship (antiquantum paradox that makes the social scientist a small observer inside a big observable that modifies its information or destroys it), to denounce the zeitgeist of our age. Even if it seems nitrolife species as so perfectly programmed by those memes to self-destruction that they will rather kill their sons till the 7th generation that learn to respect the laws of eusocial love and the organic Universe, and treat each other as members of the same species. As of today it seems that our financial-media-academia Masters, (ab. FMAsters) are happy to develop a M.A.D. brain of egocy and revivalism of its old Go(l)d cult(ure)s and nazionalisms, as slaves of their millenarian metal-memes and primitive Gods of hate and victimism. It seems a hopeless situation as reason does not seem able to lift the cover of e-motional evil=antilive memes and repression of all the drives of life that make beautiful existence. The harder they fall...

Let us then consider of those sciences new elements: The cycles of those supørganisms in an accelerated vortex of d=evolution *which kills them when animetals multiply weapons, money and print hate memes, symbiotic elements of maximal price that kill life with an 800 years cycle of history due to change in weather that multiplied nomadic warriors, professionalized by company-mothers of machines weapons in the modern age, and finally the 'issue' of the issue of money, and the minimal physiological laws to 'cure' the superorganism of history and make it immortal.*

ANIMETAL CULT(URES) OF GOLD, IRON & MACHINES CORRUPT THE SUPØRGANISM OF HISTORY.

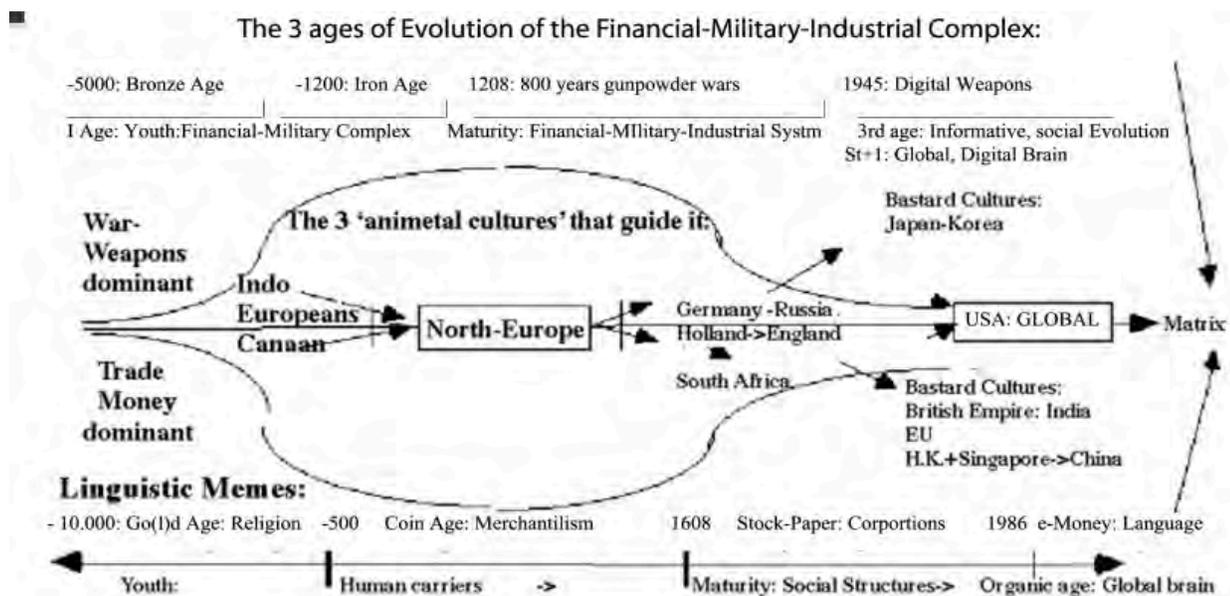

As the reader will have noticed, 'the science of politics & economics', as branches of physiology do NOT rule the organisms of modern history, due to the corruption of the proper, efficient societies (social democracies, religions of love) by the selfish memes of economic organisms (corporations). If in the parallel post to this one, we study the global corporation and its company-mothers from the perspective of the science of complexity, as an entity in itself that evolves machines into a global super-organism, in this post we shall study the human=historic point of view on the corporation by considering a historical analysis of the selfish memes and dysfunctional culture that gave birth to the corporation, allowing the inhuman treatment of this institution that today rules with its monopoly on the two languages of power of society, money that it invents in a monopolistic manner and the law that it buys through corrupted politicians... since indeed, while in the other post it becomes obvious that the global stock market corporation and its company-mothers are now global and independent of any culture, following its natural arrow of evolution, embedded in the mathematical laws of economics, what we call the economical science and the corporation is merely the translation to complex mathematical languages and economical systems of the memes of a certain millenarian culture that acted as the 'soliton' of trade and banking for most part of history.

History is the super organism of the human, species, as in systemics informative species can be modeled as superorganisms, whose individual 'citizen-cells' use an informative and reproductive language to build its social networks that distribute efficiently vital energy and information to its individuals, making the whole stronger and allowing a higher density of population. However when a system is ill-designed it will NOT provide just information and enough energy for its cells to survive. And this is the case of humanity, ill-designed by cultural memes of nationalism that divide the species into false tribal ones, to foster the ab=use of humans with weapons and the ill-designed capitalist system in which money is NOT the oxygen of society that must be delivered to each citizen-cell to

start the reproduction and consumption of goods, but a parasitic digital language, monopolized in its issue by a small 'cancerous group' of 'experts', classic economists, working as financiers and company-managers that 'choke' mankind of its productive credit necessary to reproduce the healthy goods humanity need to survive (welfare goods), while allowing the massive reproduction of lethal goods of higher price that kill our body and minds. So we live in a sick system, 'infected of lethal goods', weapons and hate media, parasitized by a cancerous elite that monopolizes the issue of our blood language, and needless to say with a neuronal, 'informative people-caste' of politicians and military that instead of serving the body or else receiving judgment-pain messages to oblige them to attend the needs of its population, dedicate most of its efforts to kill people (military) with the excuse they are boxed under a false border-membrane buttressed with lethal weapons, or serve the financial parasites and its companies of lethal goods, with the excuse they don't issue money, so they need to be corrupted and the alibi of immunity with no pain messages delivered as in earlier Greek democracies by the population that should vote=judge them after tenure. So we live in a system which enslaves people unlike in an efficient superorganism of Nature, without parasitic and lethal germs=weapons, where its economic=reproductive and energetic=welfare and political =informative networks deliver the welfare goods and right synchronous=equalitarian orders to all cells.

So should a properly designed human superorganism of history, where the ethic, verbal wor(l)d values of a political class, bound by judgment a posteriori to serve the needs of people will limit the production of lethal goods, issue money to multiply the reproduction of welfare goods and make history immortal with diplomatic EU, UNO like institutions on top of the fractal military nations built during the primitive 'age of animetal history'. The only future for mankind thus would happen if our leading capitalist, nationalist cultures, and Financial-Media-Academia systems evolved its fundamentalist metal idol-ogies that despise the values and welfare life goods humans need to survive - despite its disguise of placebo caring newspeak of political and economical correctness, and impose a true social science of the economic reproductive and political legal system based in the efficient designs of nature's superorganisms to create with credit a more humane, legal-ruled global culture EU-UNO style, where laws control the lethal goods of the tree of science and money credits only the production of welfare, WHealth (healthy life goods).

We distinguish then 3 ages in the increasing exploitation of mankind by selfish metal-memes and its people-castes that destroy the true democratic, demand-based Whealthy economy and social rule by the best:

In graph, the 3 ages of evolution of the Metal-earth, which was first a fetish go(l)d and sword religion, in its Germanic-Semitic age, then industrial gunboat corporations controlled by biblical memes and finally A.I. equations of classic economics in automated factories. Thus it is necessary to study the Germanic, tribal warrior civilisation that exploded human cultures into military nations, and the go(l)d culture and its racist memes that divided humans into classes, to grasp the world today and the culture of corporations and its anti-humanist memes.

- The age of classic alliance of weapons aristocracies and tax-farmers who abused mankind with weapons and debt slavery; in an alliance that substituted religions of fertility and social love on top of neolithic societies. This age will establish a worldcycle of life and death of civilizations of 800 years, based in the small glaciation cycles and the 'pecunia infinita bellus nervi' cycle (inflationary money is the nervous system of war) as most of metal money ($\pm 70\%$) would be now dedicated to reproduce weapons, which would rhythmically kill all the civilizations of the western world, *as mankind was no longer an immortal culture, of repetitive cycles of reproduction of food and welfare goods, as it had become in the Neolithic. Thus history accelerates its death as a life superorganism, starting the evolution of the lethal goods of the tree of science.*

- The modern age of professional evolution of machines and weapons by company-mothers which establish new synergies between technological science, weapons production and new forms of parasitic money (stock paper), where money represents a part of a company-mother of machines-weapons, first gunboats, then trains and finally all kind of machines that imitate human organs, in clear biological cycles of evolution (XIX c. age of bodies of machines; XX c. age of minds of machines; XXI c. age of organic robots). In this age parasitic money can be multiplied without limit by multiplying the digital value of stock-paper; so company-mothers become the most powerful institution on Earth, establishing a false placebo system of democracy, with corrupted politicians without right to issue money, pandering to companies for it, and a population obliged to go to war for 'free' in defense of the selfish memes of tribal nationalism, to increase the consumption of weapons in age of economic crisis.

The 800 years cycle of war & weapons.

The study of societies as organisms and the analysis of its life and war cycles have a long tradition in Philosophy of History, since Vico noticed that societies die rhythmically in a dark age of war. Spengler ('The Decline of the West' 1918) for the first time used the organic parallel in depth, considering that the collective subconscious of a social organism, its culture, also went through 3 ± 1 ages of art similar to those of a living being: a young age of epic art, an age of classic art and a 3rd, baroque age, prior to the extinction of a civilization. The parallelism between a biological organism made of cells related by networks of energy and information (blood and nervous systems) and a socio-biological organism made of human citizens related by networks of energy (economic systems) and information (cultural systems) is self-evident within the systemic paradigm. And it allows to design with biological, natural laws the most efficient economic and political system that maximizes the survival of its organic cells/citizens. Arnold Toynbee ('A Study of History' 1934) did an exhaustive analysis of the demise of civilizations, pointing out to natural and ideological causes, without a clear quantification of those cycles. Such quantification of those life and death cycles of civilizations establishes a long wave of historic death of around ± 800 years, when all cultures in the old world become rhythmically destroyed by the massive reproduction of new weapons in an age of climatic change and nomadic invasions. Those dark ages foreseen by Vico, Toynbee and Spengler are: The age of Bronze swords /wars, ± 3000 BC; The age of Bronze chariots/wars, ± 2000 BC; the age of Iron swords/wars, ± 1200 BC; The age of coins & mercenary armies, ± 500 BC; The age of spurs & chivalry, 400 AD; The age of gunpowder, 1200-1945 AD. Between those dark ages of warfare, it is possible to fit the parallel life and death of all the civilizations of human history, pointing out to a clear relationship between the massive reproduction of weapons, the 'germs of historic organisms' and the death of cultures in ages of war—the sickness produced by those 'germs'. Unfortunately with the arrival of Industrial machines, the cycle has accelerated according to a decametric scale, to a 72 generational cycle of world wars, as the evolution of weapons becomes now a professional, industrial activity.

The vortex of evolution of metal follow 800 year cycles of global death of civilizations by overproduction of machines fuelled by the use of money to mass-produce them in industrial processes and the weather cycles that threw nomadic people on the agricultural societies ruled by religions of social love in ages:

1. The age of bronze swords: $\pm 3000-2000$, carried by semite cult(ure)s
2. The age of bronze chariots: $\pm 2000-1200$ carried by Indo-Europeans
3. The age of Iron swords: $\pm 1200-400$; carried by Indo-Europeans

4. The age of coins and mercenary armies: -400+400, or Greek-Roman age
5. The age of spurs and chivalry: +400, 1200; dominated first by Asian nomads, then by Germans and Arabs
6. The age of **gunpowder**, 1200-1945, dominated by Europe
7. Age of digital weapons, 1945... as the A-bomb was calculated by the first computers, followed by robots.

The historic record is conclusive: the verbal, life-based, social organism of the Neolithic formed a global civilization, which was immortal and generation after generation men remained unchanged. Yet, with the arrival of weapons an extraordinary phenomenon takes place: social organisms start to die rhythmically, when another warrior civilization conquers and colonizes those civilizations. First, their geographical body and human cells are destroyed by warrior hordes. Then, their collective mind, made of art and ethic Gods of verbal thought, dies after an age of angst and baroque, formal styles that signals a 3rd, informative age.

The evolution of weapons causes an 800 years cycle of death of civilizations extinguished rhythmically by new 'weapon radiations', when their discovery and reproduction by warrior hordes starts an age of war in Eurasia, as warriors expand their lethal energy, killing people and erasing human cultures. A radiation is a biological term that explains the sudden, explosive reproduction of a new top predator species that annihilates many previous species, as it spreads all over the world. It is thus the proper name to explain the sudden bursts of violence provoked in bio-history by the discovery of a new weapon. Indeed, the discovery and massive reproduction of those new weapons, carried by hordes of symbiotic warriors that spread throughout the Eurasian continent, causes an 800 years cycle of extinction of civilizations, as those hordes of warriors conquer, kill and erase human cultures.

The first of those radiations, bronze, means the end of the 'classic age of History', the Neolithic and the beginning of its 3rd informative age, the Age of Metal. Weapons are discovered and then radiate=reproduce in great numbers during a short period of ± 100 years of World Wars that destroy the old civilizations. The warrior hordes that control the world with the new weapon start then a new, 800 years cycle of 'modern civilizations' in which the new warriors become the higher castes of human, wor(l)d cultures that flourish again after war recedes. So the arrival of new weapons shows the fractal zones of History. The median life of those cultures, 800 years, around ten times the biological life of a Human being (70-80 years), strongly suggest 2 possible causes for those war cycles: the biological rhythms of human life that after 10 generations seem to enter in decadence and the climatic cycles of the Earth, whose periodic ages of hot and cold weather provoke draughts on the steppes, displacing nomads towards valley cultures.

Thus, each of those 800 year cycles is a global civilization, ended by discontinuities of massive war, similar to the World wars that happen now at a faster pace, every 80 years, after a crash of the economic ecosystem, when new 'energy machines' used as weapons are discovered. Very few civilizations survive the periodic arrival of massive wars, after the discovery and reproduction of new weapons. Even the American civilizations that were isolated from European warrior masters, at the end died away, when Spaniards and Anglo-Saxons arrived. Then the Paleolithic and Neolithic cultures of Native Americans, some of which survived almost unchanged during thousands of years, were extinguished in a few centuries and even if their genetic races remain, it is self-evident that today Inca, Aztec or North-Indian civilizations have died.

There are three ages in all those civilizations associated to radiations of weapons, represented in the graph by a bell curve: birth of the weapon and elite-caste of the civilization; expansion of those weapons, and final extinction by other metal weapon and horde of warriors. The old weapons then might continue, but within the elite caste of the civilization, that our curves show, they will be rare and considered obsolete.

Let us consider those great cycles of War and its civilizations in the Historic record:

Bronze Age: Lineal Bronze starts the first empires recorded in History. In ± 2850 BC: the first Bronze sword armies appear, taking to power, God-pharaohs and Semite Lugals. Egypt becomes unified. History registers the first

Mesopotamian Empires. We consider the arrival of Bronze, probably in Egypt, the beginning of the Paradox of History [Max. metal Goods=Minimal human goods]. Rhetoric, epic art to the service of power starts also with palaces and tombs, such as the pyramids. And yet for most humans life did not improve, as they were enslaved by warriors and worked in those huge monuments to the arrogance of man. In fact in those cultures where bronze weapons arrived later, human goods, and sensorial pleasures develop more.

For example in the Indus without metal abundance, the quality of housing was the highest in old civilizations. Then it plummets after Aryan charioteers invade India. Aryans only improve architecture in “palaces” and “death tombs”. Also in Egypt, only as the initial wave of warriors recedes, we see the end of Pyramid construction, and a higher quality of life for the common people (VI dynasty). Tombs now are smaller, full of lively drawings of animals and farmers; and priests regain power over warrior kings, promoting the reproduction of food, and human goods.

Chariot Radiation (Wheels of bronze). It is the age of the Middle Empire, in classic historiography. The first wave starts around ±2000 BC: A World wide invasion of Indo-Europeans with chariots from the northern planes destroy all civilizations. It is the extinctive phase of Sumerian cultures, when Genesis is written, and the parable of the tree of science, understood by the most intelligent verbal artists of the age. Charioteer Hordes conquer Sumer and Akkad. The first Hittite empires appear. In Egypt it signifies the end of the old empire and the beginning of the Middle Kingdom.

A clear prove of the Paradox of History, of the fact that where less weapons there are, better is life, is Crete: There the charioteers cannot arrive due to geographical conditions (a sea island). So in Crete there is a continuity of a culture based on human goods, that makes of Crete the richest, most sophisticated civilization of the west in this age.

The same radiation of Charioteers will erase the Eastern cultures. From 1500 till 1000 BC. in the first Veda Period, nomadic chariot Aryans and its “sacred cows” conquer India, impose a brutal metal-racism (castes), against Neolithic Goddesses, women, and the poor. The old culture survives longer in the South.

Charioteers also found the Shia dynasty in China, degrading and partially assimilating the Tao culture of the living Universe proper of Neolithic China. In China, the chariot arrives perhaps, after transferring its weapons to Mongolian tribes (about 1500 BC, Shang dynasty). The depth and richness of the Neolithic (fully grown and densely populating the South by the V millennia BC), allows the Tao-Neolithic culture of the sentient Universe to survive partially. But the Ch'in dynasty and its radiation of iron weapons forbids all non-technological books under death penalty about 300 BC. Then the wisdom of Taoism that understood so well the dual nature of the Organic Universe, and its Yin-Yang beings will be lost at philosophical level. Though it will inform the basic arts of classic China.

China proves again that less metal allows more complex human thought. China alone among Eurasian nations preserves the dual linguistic essence of the human wor[l]d: a verbal language, and a visual expression of the game of Energy-Information on its writing words. But in the west, verbal thought is simplified in Cananean civilizations, coming from Egypt (Hycsos?), with a proto-alphabet that reduces writing to a few verbal symbols.

Iron Radiation (about 1200 BC). The Germanic people (Celtic hordes) start mass production of iron swords. Again the chain reaction of war and destruction starts, with warrior waves that move west to Iberia and east to Greece and Asia. It is the age of the Great Invasions of “People of the Sea”. Ramses II and III fight invaders but can't prevent the collapse of the Middle Empire in Egypt. Also the Hittite Empire collapses. Hittites flee and teach Assyrians the use of iron.

In 1150; the Dorians destroy Micenas. And again where the Dorians do not arrive, (Peninsular Athens, coastal Turkey) the Greek civilization of Cretan tradition flourishes and gives birth to the best cultures of the Iron discontinuum.

Coin Age (600 BC – 400 AD). Around 560 BC coins are discovered and mercenary armies increase the professionalism of war. “Bellum ipse aleat”, said the Romans who achieved this feat.

Around 539-525 BC. the Persians destroy the Assyrian, Egyptian and Mesopotamian Empires, but copy their systems of military repression. As a consequence of better cavalry grounds, and iron metallurgy, from now on metal history

displaces its center of gravity from verbal Empires on the crescent fertile ruled by Semite [S]words and Go[I]ds (Assur, God of war; Baal Go[I]d of trade) towards Northern Aryan tribes (Rome, Master of war; Greece master of "Coins"). The dominance of the social Wor[I]d is substituted by the dominance of the individualistic I=eye. Good and Evil, verbal values, are substituted by beauty and ugliness, which are values of light perception.

In the age of Iron, the Greeks introduced coins which ended the dominance of bartering in trade (verbal, Semite traditions), and started digital accountancy. The higher complexity of coins and iron will prove irresistible. It is the expansive age of Indo-European empires, that now use metal species in a far more efficient manner to impose restrictions of Freedom to the people, taxed in coins, and levied to serve the armies of the metal master. Systems of "total" war, that only Assyria had essayed before, now become natural to entire empires, which summon up all the previous metal-advances (horses, iron, mathematical war analysis), into the Total Army, with infantry (Phalanx), cavalry, war machines and logistics (Macedonian and Roman Empires). The Roman cycle is accurate; 798 years between the fall of Rome to the iron Gauls, and the fall of Rome to the stirrup barbarians in 410.

Rome is fundamental to understand the Western World, since it is the origin of all myths and alibis for further Warrior empires, that could seize power, pretending to reinstall a new Rome. Rome is the parallel to Assur, the master of war of the Verbal, Bronze age. Because gold-iron aces die, but its products and its rituals continue, there is in fact a continuity of rituals from Assur to Persia, to Macedonian empires, to Roman, to European empires. So much for racial superiority: the race dies in wars and Holocausts. The product, the iron weapon, stays. It gave origin to European ideologies, rituals and icons of warrior and trader civilizations from Britain to Nazi Germany, from Imperial eagles to civil architecture.

Cavalry Age. The Middle Ages. Stirrup=horse Radiation. (400 AD, 1200 AD). The Huns, Nomad warriors able to shoot with arrow bows while galloping, thanks to the stirrup -discovered probably in Korea- and the Germans who add iron protections, annihilate the Roman-Christian Empire of Human Goods, plummeting once more the standards of life of mankind. Around 317-589, the Huns break China between North and South into sixteen warrior kingdoms, controlled by Huns and Turks. In 430 History registers the invasion of India by the White Huns. Their civilization is built around the "horse man" that sees himself "higher" than the rest of humans, just because he is mounted into his horse... So much human arrogance. Barbarians cross the level of Human Goods of Roman Europe, but slowly they become converted to social love by the Christian Oikoumene religion.

The verbal age of Christianity, once the Aryans are "civilized", returns to Europe (High middle age) in a society based on ethics. In Italy and Spain, priests of Islam and Christ had more power, that its warrior allies, and allowed a new age of human goods and art. They initiate the Renaissance, and the culture of Al-Andalus, the summit of the two main religions of mankind, Islam and Christianity. Both flourish before the radiation of gunpowder, annihilates this re-birth of human sensory, ethical, and artistic cultures. Those final days of social religions left the great cathedrals, optimistic buildings full of light, looking upwards to God, built by the collective effort of the people that, unlike the Romanic churches no longer fear the violence of barbarians. Gothic cathedrals seem to confirm a wealthy mode of life in the lower Middle Ages with less wars. Population doubles in Europe; cities grow. In the Eastern World the old cultures of the sentient Universe (Taoism and Buddhism) reach a new apogee (Gupta, Song empires).

Gunpowder Age (1200 AD, 1945). Unfortunately the Chinese Taoists discover gunpowder. Mongols learn its technique in the assault of Beijing, spreading its use to the western world. In 1204 the looting of Byzantium by the Venetians opens the East to Italians who soon will have the first cannons, the "lombardas". In 1222 the Mongols defeat the Russians in Kalka and invade Germany. Soon gunpowder is known to German people. In 1258 Hulagu massacres Baghdad. It is the end of the Muslim Empire. In Europe the gunpowder wave soon explodes into massive civil wars, of which the 100 years war, is the most well known. It brings poverty, and scarcity of Human Goods, that provoke massive famines and allows the expansion of the black Pest, that multiplies death among Human beings.

Sub-wave. Reproductive Phase T/2 (about 1600). In the very middle point of the 800 years radiation, appears Ballistics (science) and companies of Gunboat Reproduction. The gunpowder radiation becomes a professional system of

reproduction of weapons by company-mothers, and scientific fathers, that create the present world of machines of war. Europe becomes top predator of the World, by perfecting cannon balls, and inventing in order to measure their trajectories the science of Ballistics, later called physics (Galileo). Companies of Gunboats create new Empires (British-French Empires), that massacre or enslave 80% of mankind (the third world).

In the age of metal it is clear that humans are evolving a new kind of atomic species of higher density than carbon. Weapons are discovered, and then radiate in great numbers during a period with a median duration of 800 years. We talk for each of those 800 years a new species of “metal-civilizations” in which the warrior hordes that control the weapon become Top Predators of human cultures. Then a new weapon appears, and the previous horde and weapon become submissive to the new Metal masters. So the arrival of new weapons show the fractal zones of History.

The previous graph puts its emphasis in the long 800 years cycles of simple weapons and its 'affine' informative metal-money on the classic age of history. The modern age accelerates as all 'vortices of information' do, with the arrival of the Industrial r=evolution and the professional invention of company-mothers of machines, the cycle to 80 years (seen above in the graph that compares it with the cycles of biological extinction of species).

ANIMETAL AGE. 800 YEARS CYCLE OF PECUNIA INFINITA BELLUS NERVI: BANKERS & KINGS COALITIONS

The people-caste of bankers. Go(I)ld cultures start the systemic parasitic use of ‘gold’ to ab=use mankind.

‘You will defend me with the word, I will defend you with [Gold &] the sword’ Tertulianus, biblical bigot.

‘If you want to know who rule you ask yourself who you cannot criticize’ Voltaire

Today in placebo social sciences you can talk of the evil consequences of militarism and the evolution and reproduction of weapons, with certain freedom, ‘surviving’ the anti-quantum paradox of censorship – the smallness of the social scientist influenced by the larger superorganism in which it lives and its people-castes of animetals in power; for a simple reason, *the warrior today is submissive to the company-mother of machines-weapons that reproduce its tools of power and the financial go(I)ld FMAsters that reproduce the machines of information (ab. Financial-Media-Academia masters), whose people-castes rule the world, by monopolizing the issue of digital information in the form of e-money, audiovisual media and academia ‘papers’ of a supposed placebo social science, dedicated to all the themes that do not really matter for the future of mankind.*

But you cannot criticize capitalism – the rule of societies by company-mothers and financiers; that is, by machines and money, monopolized by ‘stockrats’, the owners of corporations with null civil legal responsibility, monopoly in the issue of the language of power of modern society, money, and control of the life-time of people through salaries and the laws, of corrupted politicians that cannot issue money and the system of false freedoms and null power, they have established to rule us all (placebo democracies).

What is then the fundamental form of predation of bankers and its people-castes over mankind? Simple: the subversion of the positive function of money, proper of the Neolithic, the Greek Age of nomisma (tender legal money produced as digital numbers by the state and its citizens) and the potential ideal age of ¥€\$ money, in which money would be issued by all mankind through a Universal salary to create with credit (ab. creditate) a welfare, demand economy; for an age of parasitic, lethal, debt/tax money, in which money is controlled by a people-caste to ab=use humans, extorting them of taxes, speculating with the prices of welfare, provoking scarcities and giving maximal price to weapons and hate media that kill people and provoke wars and when all the society in which animetal warriors in alliance with animetal bankers have been destroyed by murder and parasitism, as any organism collapsed by predation, provokes the mutual extinction of those animetals on top in the final Gotterdammerung cycle of holocausts.

As we are moving fast into the final repetition of the cycle is worth to understand it, because it is forbidden to talk about it. We are supposed to live in the best of all worlds, capitalist democracies; and bankers are supposed to serve the community, and tax and debt and speculation and max. price for weapons to be the natural state of things. And of course there is not a biblical people-caste that still controls the issue of money; parasitizes mankind as it has done for

5000 years and when it has corrupted and destroyed a society through financial parasitism and the 'maximal profits' of the pecunia infinita bellus nervi cycle, dies also in the process.

This is the immense secret of a true history & economics of mankind in the age of animetals: parasitic money.

The 5 forms of parasitic money: Go(l)d. Lethal weapons, salary, tax. Debt, speculation,

The 5D Universe as its name says has 5 Dimensional motions or drives of existence all entities promote to maximize its life. The purpose of any language therefore is the same than the organism that speaks the language: to promote those 5 goals, as a language mirrors reality and guides the existence of a being.

And inversely, a predator or parasitic language and species will LIMIT the 5 drives of existence of an organism.

It is then immediate to observe that *both animetal cultures and animetal languages, weapons and metal money repress the 5 drives of existence of mankind, in its go(l)d religions (repression of sexuality=reproduction, human good food – dietary laws, eusocial love – hate, racist memes to mankind; and human information – substitution of verbal language by digital ones.*

And the same consequence of anti-live=Evil repression of human wealth and life happens when Money becomes parasitic. 'Evil Money', that is money that parasites and destroys mankind as opposed to Live Money, that is money that reproduces WHealth, become then the ± sides of the language of money, in its effects on mankind, sponsored by Humanist vs. 'Animetal' cultures does have 5 Different dimensions. Before animetals came to destroy the Genesian paradise, and all the way till today, the 2 forms of money have fought for supremacy as a language positive for the welfare and reproduction of goods among human beings vs. a negative language that destroys life, parasitizes mankind and catalyzes the evolution of metal, machines and lethal goods.

The language is the message: metal-money vs. Wor(l)ds & legal money: its different values and species.

The universe is about the intelligence of networks, whose languages and values, order reality and select the species that better speaks the language. So even before we continue into the analysis of animetal cultures, we must simply explain how they construct the FMMI system of informative and entropic metal-machines, through the values of its languages they do not understand.

An animetal must in that sense be defined as a believer who obeys without reason the 'greed and violent' values of money and weapons that kill and hypnotize their bodies and minds. It is the systemic, network, linguistic intelligence of those languages of power and its values what creates the consequences. And all what the animetal needs is to believe in idol-ogies of metal-power and obey blindly those languages and values:

In the graph, the informative values of Words and Money are opposed. The most expensive species are the most evil, harmful to man [weapons]. While the best verbal goods [love] have no monetary value. This paradox can only be explained within Theory of Evolution, as an opposition between victim

Species	Carbolife [Human]	Metalife [Machines]
Language	Words [Verbal values]	Monetary values
Positive +	Good-Love [cheap]	Expensive [weapons-Evil]
Negative -	Evil-Hate [Expensive weapons]	Cheap [Human goods]

and hunter, which are in a Universe of subjective information the truth and antitruth of each other. Because weapons prey on men, we feel them evil. Yet weapons and money are symbiotic metal-species. So weapons reach maximum monetary value.

In the mandala graph that I will bring as many times as required following the rhetoric of the 'other system' - if you repeat a lie (or a truth in this case) many times people will believe it (become imprinted by it)' Goebbels - we show the fundamental distinction we must do in a biological analysis of the superorganisms of history its languages, memes and cultures. What matters are the memes, languages and ideologies that build the two type of cultures, 'organs' of the superorganisms of history and economics. In essence, a superorganism is created by the values of a certain language. The informative language of metal is gold. And its values are inverse to those of life. So the belief and use of go(l)d, of money as the only language that directs our society makes possible the expression of those anti-life values and the creation of a world according to them.

Today the more complex system of machines uses digital information, e-money and the religion of go(l)d has evolved into the 'science' of capitalism expressed in the equations of classic economics. Yet the anti-life values of the language remain.

Of course our culture that worships metal-memes and technology=machines will have none of this, and censor bio-economics and bio-history but it is not by chance that most humans do feel naturally the ethics of the wor(l)d and most women, reproducers of life hate weapons. We are not making here ethic statements but biological statements as both concepts are the same, ethics merely expressing the arrow of eusocial evolution. Why then humans deny today that arrow? Obviously because they have completely mismanaged their social evolution and have instead accepted the wrong values of metal, greed and violence as the guidance to power.

So we talk of two types of cultures, human cultures that truly understand the highest level of social intelligence of the universe and if imposed could make Mankind survival.

And the cultures that worship machines weapons and money, metal-cultures or rather 'animetal cultures' as they degrade the capacity of humans to evolve together and go back to an animal dog-eat=dog society, which needs metal-money, weapons and machines to survive, enslaving their life to the evolution of the metal Earth. We have thus set the elements to study together history and the fight of cultures and economics, the evolution of the machine, something economists would also be at pains to accept because they are merely production economists serving the evolution of the metal-Earth - a topic characteristic of animetal cultures is indeed the half-truth, the denial of love, life and ethics as an important component of reality, the abstract indifference to history, the superorganism of Mankind on Earth.

Yet to deny the laws of the organic eusocial universe of 'numbers', 'species' and 'human ethics', is to deny the future for all of us... The future of history our superorganism, of which Mankind is just its 'spatial form'. So the immediate 'pentalogic analysis of negative metal money as the language that destroys mankind and catalyzes the evolution of the metal earth is obvious, as negative money was born in Levant, when the original form of WHealthy money, wheat, given as a Universal salary to all humans, to consume it and pay salaries of positive work on the communal fields of the first civilizations, was substituted by metal-money, an informative SS-cyclical form, which was perceived as wealth per se, and soon became synergic to TT-entropic metal-weapons, setting the two limits of control of mankind, in terms of a higher form of entropy (iron weapons) and form (hypnotic money) which will set mankind as an enzyman obliged by the two new metal-castes of power, murderous warriors and enslaving bankers to obey the orders of money or else, with a new stick and carrot device of power.

Ever since mankind was dominated by informative digital money above his natural ethic language of words and entropic weapons above his goal of human body supremacy

It then came the natural third 'dimensional motion' of money as an space-time value: Money as the value of a human being, bought no longer to reproduce its body but reproduce metal, mostly weapons, as gold-money was used for millennia to pay for slaves and weapons (70% of its production).

ST-money thus cre(dit)ated a new language equation that make human an object priced with a number. Since money is just a number, the simplest form of information in a paper, which orders humans and objects in a digital, mathematical manner.

So capitalism amounts to this: to rule societies with digital numbers called money, reproduced with no limit by a social elite, which is not elected neither likes to explain what it does, and how it does it - basically controlling Mankind with prices as if we are 'objects' compared mathematically with the equation of money:

Man (salary) = money = object (price)

It is for that reason that all systems that work, do not allow the reproductive 'mindless' comparative equalities of mathematical languages to rule the system above the subjective, informative, nervous system, which in humans is 'words', and do carry a very different syntax positive to Mankind:

Subject (man) < verb (action) < object (energy of subject).

Thus in verbal terms, humans are the center of the universe, and survive, and if they were able to regulate the economy with laws that favor Mankind, money only as a digital language, to reproduce among all humans the good we need to survive, fueling a demand economy would easily create with credit a perfect world, which is the rule not the exception of the universe, where energy is for free, and all you need is a good language to distribute it. This is not though, the way history has evolved money but rather it has created an astoundingly brutish corrupted, dumb concept of money as wealth per se, not language, and as such attached to precious metal, easy to digitalize (hence still a mathematical language) but very scarce, and hence promoting war, looting, fight for the 'precious' thing, and a complete misunderstanding of money in terms of a language of distribution and reproduction of goods.

And so weapons of maximal price in money, above man, an object bought by gold set up not only humans as slave of money reproducing ever since weapons of maximal price, but triggered the 'pecunia infinita bellus nervi cycle', and put on top of mankind two people-castes whose 'racist memes' against life and mankind which they priced, sold as slaves and killed with weapons – the Aryan warriors and Semite bankers, which conquered the world with weapons and money. It was the age of animetals.

But money as a lethal product would develop the 2 more sophisticated dimensions, of mixed form=value and motion=energy of work, lethal to the welfare of human beings.

- St money became 'future value' as a form of debt to be paid into the future, through taxation and lending. Money was no longer 'a digital language of null value that kicked out the actions of people', but became as an object of value per se (first gold then just legal tender money monopolized in its reproduction and issue by bankers), a form to enslave people not ONLY in present time work, but also in the future, '3rd age' of the being. St-debt and taxation thus became the essential form of parasitizing and buying the future life of people obliged to return a 'digital number' which did soon LOST, all real value, monopolized by a people-caste that manufactured it.

- Ts: money as speculation. Finally on the other side of 'dimensional motions of reality', money 'accelerated' its motion as a mean of exchange of objects, selling and buying the same object multiple times to produce an inflationary growth of its digital value. The 'speed of money' thus increased its 'numbers' as the speed of a car increases the numbers of your spatial trajectory. Speculative money by the simple mean of selling and buying upwards with increasing speed an object became along debt the modern way to reproduce money in pure digital numbers once money was detached of its sustain in gold.

So the causality and birth of the 5 negative dimensions of money as a parasitic form that values lethal goods, and enslaves man as an object had a clear historic causality; and on the side of the people-caste that made of parasitic money the essence of its civilization a clear origin in the go(l)d churches of biblical origin that would predate mankind with money ever since, being subject obviously to the action-reaction processes due to the reproduction of lethal weapons of maximal value, herding of gold with tax farming, slave debt, war debts and hate memes to promote war

and the pecunia belli infinita cycle, speculation in the price of goods, either by means of accelerating its buying and selling *the method used today on stocks, or by herding WHealth needed to survive... All forms of parasitizing and destroying the life and welfare of people and nations, practiced by biblical banker-priests that catalyzed in this manner the cycles of wars and final Gotterdammerung of the financial and military elites when loosing those wars in holocausts.

We are not though interested so much in the detailed history of the people-caste and go(l)d cultures that invented gold money and parasitized mankind with it, a highly censored issue as those people are still controlling the lethal form of money that guides today mankind and them, who are part of mankind to extinction but in the 'formal language of money' and its necessary reform, which requires obviously the nationalization of the issue of money and the return to the positive WHealthy money as understood before the age of animetals in the Neolithic and in the modern writings of social scientists.

In the future, obviously as a historian cannot censor despite the 'antiquantum paradox his work' we shall publish a paper on the 'History of one of the 7 cultures of mankind, the biblical Anglo-American culture in its 3 ages, the age of Judaism and go(l)d temples, the age of Protestant, classic economics and UK Empires , the age of America and electronic money, to see how throughout history parasitic money and its elites of banker priests and idol-ogies of biblical capitalism came to dominate mankind, censor real history, and dominate the world, setting it into the present course of self-destruction. It does indeed deserve as all the other cultures of humanity, the more so as it has become the wining culture, a paper of its own.

Even if it would be as some previous books on the matter, highly censored.

Instead we are more interested in the themes I covered and conferences given during my tenure of the chair of monetary systems at the international systems societies where I considered the possibility to recreate positive money, where the language of money becomes a digital language of reproduction of welfare with 5 Positive tendencies. So on the following papers, we shall reorder some of my writings on both themes.

We study negative money and its 5 Dimotions that favor the evolution of metal; destroying human WHealth. Let us do so, as it is a necessary condition of a humanist social science to translate the metric equations of superorganisms and worldcycles to a human common language, as we did with the message of love.

SS: Money as an instrument of distortion of true information, promoting idol-ogies in favor of parasitism, military murder and the alliance of its people-castes of aristocrats and banker-priests

Money as wealth per se – an object that must be returned. Money as gold became so desirable that soon became an object of Greed; *but such money is NOT Whealth, consumable as food is, abundant and available to all as a Universal salary to kick out production, but a luxury object which therefore cannot accomplish the natural function of any 'bit of information' that regulates a reproductive network.*

Thus Money became soon monopolized by people-caste and converted into a parasitic function, as debt and tax, to allow the maximal ab=use of the population by the coalitions of warriors and bankers. The warrior will ask no longer for a payment in 'real Whealth', i.e. species. Money as speculation prices.

CAPITALIST PLACEBO DEMOCRACIES ENSLAVE MAN TO COMPANY-MOTHERS OF MACHINES-WFAPONS

TT: Money as lethal product value. The Pecunia infinita bellus nervi. Go(L)d money affine to metal gave maximal price to weapons and minimal price to life, kicking the cycle of reproduction of weapons and war for profits that established the 800-80 years cycles of destruction of civilizations and nations.

ST: Money as gold was so much valued due to greed and its hypnotic power, that suddenly could buy the life of a human being, degraded in price due to the expansion of war, and massive influx of slaves. So the price of a human life diminished to become as cheap as 6 coins in China during the Warring age of the Chin empire, or 30 grains of gold during the expansion of slavery in the middle ages, as the go(l)d culture of Judaism established with the help of franks and Viking mercenaries a massive slave trade between Eastern Europe whose people would be called simply 'Slavs' and Islam. The price will again plummet, when the idol-ogy of the Ham damnation (a biblical racist meme established earlier by Judaism, the fundamental parasitic culture of gold in western societies) according to which Arabs and negroes that had been in war with Israel after the expulsion of its people-caste of charioteer warriors (Hycsos) were lesser than dogs – ideological origin of slavery and modern Apartheid Israel. Only when paper money multiplied debt slavery became part-time, as salary bought the lifetime of the human being in its peak hours, reducing costs of maintenance during sleep and feeding hours. And finally as machines started the substitution of humans in the work of reproduction of lethal good, the obsolescence of man gave us the feeling of having 'free time'

St: Money as tax-debt. The first form of parasitic money was established by the coalition of Indo-European warriors and Semite bankers all over the western world, with the concept of tax, and usury debt. Indo-European warriors taxed first people with Whealth, but soon Semite bankers changed laws to oblige them to borrow gold and silver coins, at usury prices of 40 to 80% annual tax, so in a bad year of crops, unlike in the old model when they just gave less food to the warrior master, they couldn't pay the usury debt and the tax in precious money becoming slaves of the banker; increasing enormously the slavery trade for millennia to come. Tax would extort to the limit the population, subverting the true function of governments which is NOT to kill by anoxia people but exactly the opposite, to provide them with a 'free flow' of Whealthy money as organisms do providing free oxygen and hormones to the cells to kick out the production of goods, or individuals do, providing a free flow of verbal thought to provoke our actions of life.

Ts: Money as false value, paying for false information, and speculation. 'Speculation is the creation of false value by jacking up the prices of goods' Ford. Another classic form of parasitic money was speculation. Taking advantage of the higher value of its monopolized gold, bankers would become speculators, herding goods in times of necessity to provoke higher prices, releasing then the goods in small quantities. It became an essential cause of famine as the bible describes with price when Joseph bank of the pharaoh became immensely wealthy speculating with wheat.

This example shows *the fundamental trait of parasitic money, which is exactly the opposite of whealthy money* – not to promote the welfare of people in a demand economy based in the biological needs of the population of citizens-cells, but to extract all the wealth from the cells, exploiting them, provoking their anoxia, and killing them if they did not allow unlimited extortion, became the rule of all western societies, and at time went by, since the process multiplied. And we will study positive money, from its first form as WHealth, in the Neolithic, when money appeared .

Needless to say the 5 antidimotions of money against the 5 drives of human existence, *Money as lethal value for multiplication of weapons that kill human beings; money as tax and debt that kills human freedom; money as speculation in basic goods that prevents human healthy life; money as false value that doesn't produce or kick out the reproduction of wealth; and*

The 3 ages of positive money.

Let us study positive money, from its first form as WHealth, in the Neolithic, when money appeared through its classic age as Nomisma in the Greek-Roman civilization to its modern ideal age as a global cryptocurrency, able to deliver the actions of consumption and production that could save mankind from its process of self-destruction. In all those cases money *had never parasitic functions (Tax, Debt), anoxia consequences (speculation in vital goods, lack of distribution to cells of the superorganism of history) or lethal consequences (maximal price for lethal goods for the mind – hate memes and the body – maximal price for weapons) which are the trinity of 'eviL money', carried by go(l)d and the*

Biblical sects that made of parasitic money the basis of its predation over mankind, triggering the 'pecunia infinita bellus nervi' cycles of wars and holocausts.

In that regard, money as a positive language of reproduction of welfare goods, similar to the Oxygen and hormonal language of human organisms, not only is possible but it did exist in the past. If today it doesn't happen is because of the systemic repression by the parasitic informative function of money of all true forms of economic science, and its substitution by the placebo truths and all kind of theories that foster the monopoly of the issue of money by people-caste of FMAsters (financial-media-academia masters, who today control from think tanks, mass media and wall street the information of mankind with a single goal, to censor history, a future for humanity, the rights of the 99% to issue money, and not die of anoxia, and a true evolution of social sciences and its physiological networks).

All think-tanks, Nobel prizes given by a private bank, and authorized forms of economics are based in the idol-ogy that money must be monopolized by experts and handled selectively with the single goal of 'increasing its numbers', hence its parasitic functions (speculation, reproduction of lethal goods of maximal price, weapons and hate memes, printing of money for free for financiers, etc.)

Money though was a positive form in the Neolithic as 'grain', pure energy, which had the advantage of being constantly consumed so it did never loose value. In a second age in Greece and Rome, money was also a positive force of society as it was issued as legal tender nomisma, brittle iron or stamped leather, by the state to serve the needs of society, while wheat as secondary money was liberally handed to the citizens of Rome.

The reform of money of Licurgus in Greece and Noma in Rome eliminated money as debt; established money as what it is, a mandate or order of action and work delivered by the collective brain of society; establishing renewed handling of 'food-money' (wheat cargos that will continue in Rome for ages to come) to its people and prove to be far more efficient than debt money and gold money proper of the 'go(l)d temples' of Canaan, against which Rome and Greece started an open warfare for the future of mankind.

Initially then those two cultures won the war, because tender legal money could be reproduced without limit for the needs of mercenary armies, and as people believed in society it did work. But as they kept progressing in their wars, they started to accumulate silver and gold from the culture of Go(L)d temples and a growing quantity of war slaves and finally the use of precious metal and the ab=uses of slavery corrupted them also, transforming the Greek-Roman society in a copy-cat of the old Semite Go(l)d cultures, to the point that they would also be conquered spiritually by the surviving 'Habiru: those who walk behind the asses', land traders that had unlike Phoenicians survived Roman extinction wars, moving its headquarter to Babylon.

It was a 'reconquista' of the Western world by Judaism, the oldest go(l)d cult(ure), in which its believers, the '11 slave' tribes of the Levi had to deliver gold ex-votes to the banker-priests that rule them (incidentally my ancestors, Levi>Lluis, so save yourself absurd admonitions of anti \$emitism; we are making here a memetic analysis of History and the future of mankind well above those poor judgments, as genes matter nothing to History; it is all about memes and the great battle for a future ruled by humans or ruled by metal-memes).

So as we enter the Middle Ages a new coalition that will direct the western world for ever since, of Jewish banker-priests in charge of Usury lending, Tax-farming, Speculation in food, Trade in slaves and purveyors of weapons and Germanic aristocrats, in charge of murdering people, collecting the tax, enjoying luxury goods, and defending the banker-priests 'slaves of the king' from the cholera of population, established the essential hierarchical structure of mankind's societies, which would only be broken when the process had at the end of the 800-80 years cycles massacred the 99% to such extreme that societies collapsed, and warriors would use the banker-priests and its people-caste as scapegoats (never mind they are the two sides of the same coins/swords), and massacred them with the willing collaboration of the exploited people in the cycle of the Holocaust (collapse of Europe during the gold crisis of the low Empire, produced as Cicero explained by 'the barbarous superstition of the Jewish people that accumulate idle, gold in their temples'; during the Crusades and massive eunuch slave trade, after the children crusade when Simon, a Radhanite slave trader sold ten of thousands of children as eunuchs in Algiers; collapse during the religious

Survival rate of animetal go(l)d & Sword cult(ure)s that put idol-ogies above eusocial love is minimal:

1  **CHINA: Max. survival: 1,385,529,378** 17  **GERMANY** **80,657,243**
Wor(l)d culture based in universal organic laws **Iron war cult(ure), cause of most European genocides**

wars, provoked by the printing of Hebrew bibles that converted Northern European to Neo-Jewish biblical protestant sects, defining the future of the western world as a 'basically' Jewish culture of go(l)d, and kicking the industrial r=evolution; collapses during the financial crises of industrial overproduction, switched to war production in modern cycles, the last of them starting now). Indeed the massive use of money for war that ended in the I.W.W. massacre; speculation in stocks that caused 29 crisis and hyperinflation caused by Stein's private Reichbank issues are similar to the process now taken in America with massive issues for stock speculation and military rebuilding:

Animetal people-castes have the minimal survival rate as opposed to cultures that understand the organic Universe:

In the graph, the only 'intelligent measure' of the success of a culture is NOT its technological power or Go(l)d wealth, in which the two dominant western animetal cultures, Germany and Israel excel, but the historic survival of its human carriers of the memes of militarism and capitalism and mechanism, the 3 idol-ogies they sponsor and bring them systemic extinction in the 800-80 years cycle.

On the other hand, the most successful human culture has been the one who received metal-memes latter in history (only received metal coins and iron in the 300 BC with the Ch'in emperor) and preserved longer a humanist, organic, dualist yin=information/yang=energy Buddhist, Gaia oriented view of the Universe, akin with its true laws, and cyclical concepts of time. *Thus true science matters more than technology, the worship of the tree of life more than the tree of metal and no amount of denial, falsification of History, placebo soma truths, victimism, fictions and audiovisual propaganda and censorship will change those laws of the Universe above us.* The question then is if humanity could have been different; if as it happened in China and other less 'visual', Neanderthal cultures, the European had resisted the hypnosis of Gold. It did not when Greek and Roman societies became corrupted after their victory over Semite cultures (Alexander over Phoenicia and Persia, and Rome over Cartago) by go(l)d money, developing the same parasitic functions of money of its predecessors, with massive taxation, use of money as the 'nerve of war', leaving though tasks of tax farming and usury lending mostly on the hands of the Jewish Diaspora, which will continue and increase through the middle ages its functions as purveyors of weapons, slaves, tax farming and usury debt.

All in all in the modern age, with the influx of gold and silver from America, money as a language of reproduction and distribution of energy, able to kick the actions of human beings completely disappeared.

So today the dominance of negative money – money that evolves the metal-earth, kills mankind by anoxia & multiplies the lethal goods of society *is absolute. And because of what we shall call the 'Jewish inquisition', the dominant mode of the Anti-quantum paradox against humanist social economics today; neither the history of the process of corruption of the reproductive system of life and Gaia, can be told.* And of course, the future will repeat the 'pecunia infinite bellus nervi', this time between US and China, as predicted in our earlier books 30 years ago, coming out of Columbia U. which so clearly explained the no future of mankind in the present economic system. The solution to the cycle of parasitism, war and holocaust is obviously NOT to hide it, deny it, and keep doing the same – but to change the system of money from negative to positive money.

Positive money. From the Neolithic to the Modern age.

The understanding of money as a positive language, handed to all humans to improve their WHealth thus fade away, with a few attempts to resurrect that function in the age of socialist doctrines. But the best models of modern healthy money, provided by Anarchism, notably in the work of Kropotkin and Bakunin, were disregarded by the wrong doctrine, which took over the workers, movement, Communism. As its inventor, Mr. Marx, belonged to the Go(l)d culture and put his emphasis in the confrontation between workers and owners of factories, NOT in the parasitic nature of Money and its proper reform to make it again a language that provided wealth to human societies.

So we come to the age of systemics, the rediscovery of money as a bite of energy, and the concept introduced in those texts, of '¥€\$ money', the type of money I tried to promote on those conferences, but was ousted of the society after some members belonging to it must be noticed then that money is negative to mankind today because the culture that invented parasitic money has come to dominate the FMA, Financial-Media-Academia networks of information and created a 'superstructure' of idol-ogies, which have nothing to do with real social sciences, but are now believed and imitated in every nation of the world.

So what are the 5 positive dimotions of money. We can compare them with those of the parasitic function. Also considering its historic development.

SS: Money in the Neolithic was wheat; natural whealth. It is the positive history of money from the age of Wheat salaries in the fertile crescent and Indus civilization – and likely most Neolithic Asian and Mexican cultures, where money was essentially a Universal salary given by priests to peasants and the people of a community in the form of food. Wheat could then be used to pay salaries and give ex-votes to the temple. The modern version of positive 'money as form, would be ¥€\$ money. The extreme density of population found in the Sumerian and Indus civilizations showed the efficiency of money as Whealth.

TT: Positive Money is not a lethal product as lethal goods are forbidden to trade and reproduce. In the earlier Neolithic cultures there was no metal-weapons. War was rare and priests ruled societies, NOT military caudillos, a development that started with the 'bronze radiation' and the taking over of Lugals.

ST: Money as a salary was a supplement to the Universal rent in WHealth or ¥€\$ money that should be introduced in the modern world. Money however as a salary did NOT buy people's time for ever, as it was neither debt, nor slavery was allowed – the buying of human by money. On the contrary most often, work for the community was assigned to every citizen in a voluntary manner. Today money as a salary should obviously be maintained but it should NOT eliminate SS-money and certainly a well managed economy would NOT allow the synergies between lethal metal-memes, weapons of maximal price, hate media and misinformation and money. That is, the 'pecunia infinita bellus nervi cycle' would be abolished. But that would require a reform of the political system, making of EU and UNO like institutions the goal of societies, for each of the 7 'civilizations of history', studied in our analysis of the superorganisms and gods of history.

sT & Ts: money as debt and tax thus would be also abolished, as money would be merely a language that activates the reproduction of Whealthy goods; and 'speculative markets' of e-money would be abolish. This means simply that shares should be nominal, ¥€\$ money a currency at fixed parity avoiding Forex, and pure speculative markets (derivatives, financial instruments, future markets) would NOT exist. Tax would not be necessary then because *money would be created for people and governments, and for those 'Selected companies' that reproduce goods positive for mankind, hence NOT for lethal goods of maximal profits, according to the equation of capitalism.*

To that aim a political and economical reform is needed, shown in the next graphs. We shall study in this post the nature of true wealth - whealthy goods needed for man to survive and tribe:

The design of a perfect world with the physiological laws of systems sciences, dedicated to reproduce the GDP goods that are positive to mankind, with the economic frame of reference (right bottom) that rests from the economy lethal

goods as all sciences have ±values, according to the biological drives of life, and the natural goods needed by humans, based in a demand economy, with an international ¥€\$ currency (fixed parity, 1euro=1dollar=100yens=5 yuans), emitted as a Universal salary, to foster the demand of human goods, along other measures

3 political mesures to create a perfect Wor(l)d and its 3 social scales as a Human Superorganism

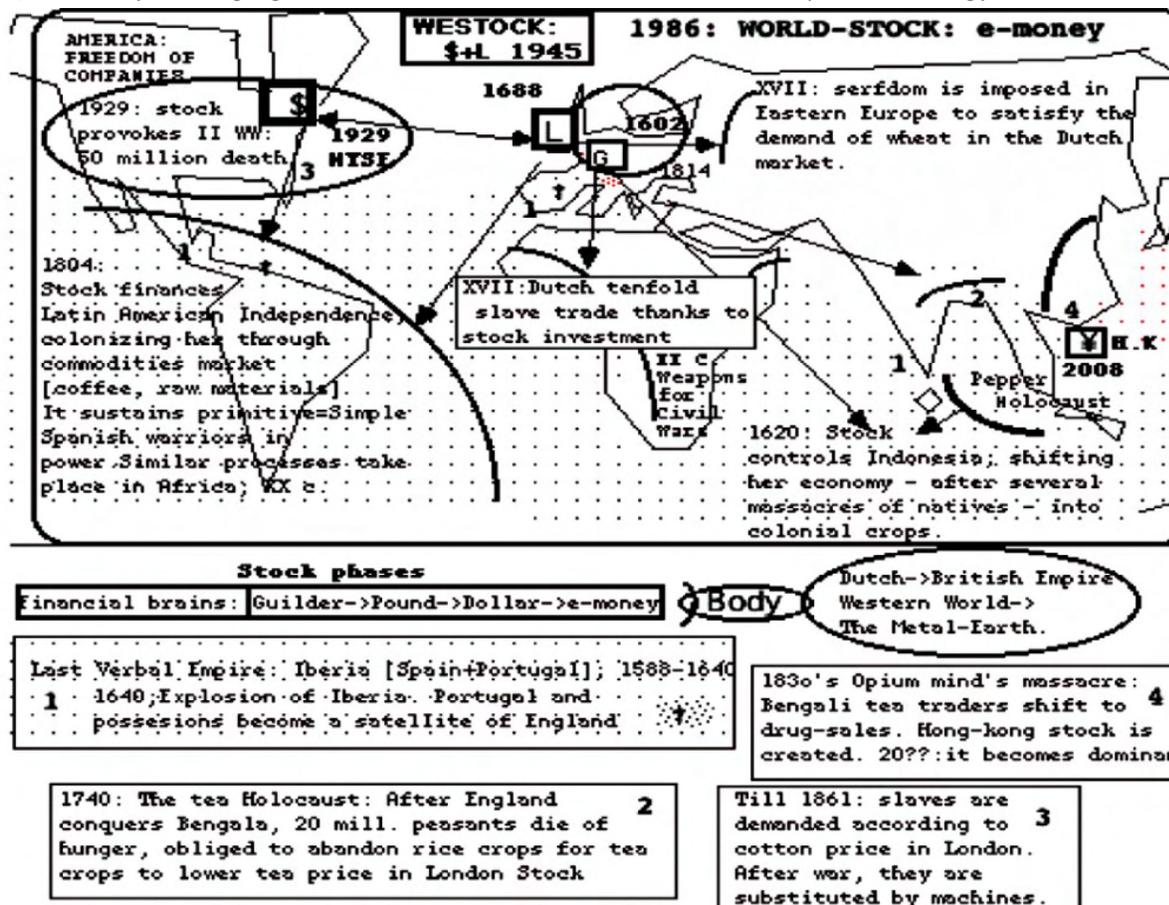

of repression of lethal goods, control of lethal corporations with the split of shares, with private management and human control, the fostering of diplomacy and International organizations such as Uno and EU, the most advanced humanist societies, seeking to substitute warring nations for world cultures, of which there are 7 clear forms, and in the long term, ruled by a real democracy of an heptarchy of presidents, in which politicians follow the rules of Greek democracies, where voting IS a posteriori, with pain judgments of citizens, as cells do with neurons, so they must serve, obey and accomplish their promises - in brief a scientific organic design of mankind to make it hive at individual and collective level, is the goal of bio-history and bio-economics, which is not implemented and highly censored, because History has evolved as evolution does by trial and error into an imperfect corrupted organism ruled by selfish metal memes. The other simple measures; prohibition of robotics & split of shares 50-50%, half of them for heptarchy governments with rights to cancel those corporations that make lethal goods, will complete the necessary reforms to create a perfect, immortal human world.

Parties in capitalist democracies serve corporations, since companies issue its money. Politicians in a world ruled by a true science of organic history, taught to all citizens would serve mankind, issuing a Universal blood salary, while the military as leukocytes do would NOT kill its human cells and attack other organs of humanity - tribal species=nations, but destroy lethal=viral machines. Yet the Financial-media head of information companies censors its development, imprints mankind with fictions and ego-trips that dissolve all social ethic structures. So humanity infected by Metal-memes as cells infected by viral DNA, only reproduces the 'germs' that will kill her, becoming a chaotic=entropic=dying isolated species, akin to a dying cellular organism, where once the 3 parts of the virus are put together into robots, they become alive and kill all. So as 5D organic laws are the same in all scales obviously now that humans put together bodies & brains of telepathic AI military robots, they will awake us and kill mankind, giving birth to the III Age of the Metalearth – the goal of capitalism.

2ND AGE: THE INDUSTRIAL EVOLUTION IN TIME & SPACE: CAPITALIST DEMOCRACIES.

The memplex of the metal-earth form a body of supremacist idol-ogies in which the carriers of iron, gold and mechanical memes feel above heavens and earth and all forms of life and cultures of history. Its evolution departing from earlier Semite cults to gold and bronze went through 3 fundamental phases; supremacist religions with gold and the fire of the smith as the center of cults, in which the banker-priest or smith became the vehicle of the gods of the tree of metal; evolved latter by influence of humanist Greek cultures into milder religions of human supremacy; fusion together in biblical cults, a proto memplex of capitalism which fully acquires is modern form in Amsterdam, with the fusion of both, the memplex of Judaism in charge of finances as the head of the metal-earth and the biblical memplex of Dutch and British hard Germanic sea-soldiers, working for slave gunboats, and genocidal train corporations, which conquered the world departing from the British empire.

Company-mothers of weapons-machines conquered the world as they made obsolete companies of warriors. The last human world empire, the Iberian conquistadors, strongest human warriors, selected on the 800 arch of animetal waves coming from Korea to Spain where the survivors learned to enjoy life had in tiny boats with a 10% survival rate created a global empire, which the company of gunboats, VOC easily erased from a tiny nation, Holland, within 2 decades. Such is the speed at which a new top predator reproductive species liquidates the mighty old 'dinosaur'. Then VOC migrated to London in 1688 in the glorious r=evolution with all the tools of the modern world, stock-markets to invent digital money speculating in shares, a central bank to print and legalize companies-money yellow press to print hate memes and money, artillery to kill at distance, slave workers as cargo and shipmen, a go(l)d biblical cult(ure) to money and segregational memes, and scientific racism, worship of technology, clocks to enslave human

time to a salary, stockrats on top running faked democracies with a single war party, then split in a consumption one with the arrival of machines. The modern world was born and in 300 hundred years terraformed the earth, prepared now to build the first optic chip robot and 3 d automated factories of weapons...

Corruption of informative, cultural & legal systems: Placebo democracies.

But why humans seem comfortable with the situation, in which 90% of mankind has nothing and all the investments of society are dedicated to improve machines? The answer is simple *even if the system of deceit is complex: it is called placebo democracy; a system that appeals to the ego of people, making them believe they rule, but denies them the rule over money, the language of social power, which buys law.*

The graphs are topic 'propaganda' on placebo democracies, which appeals to the ego, hides the rule of money over the law, *monopolized in its issue by financiers and stock companies that buy laws and define the most hierarchical 'de facto' social pyramid of history; as financiers have 1 million times the rent of 'citizens of the world' which is a whole*

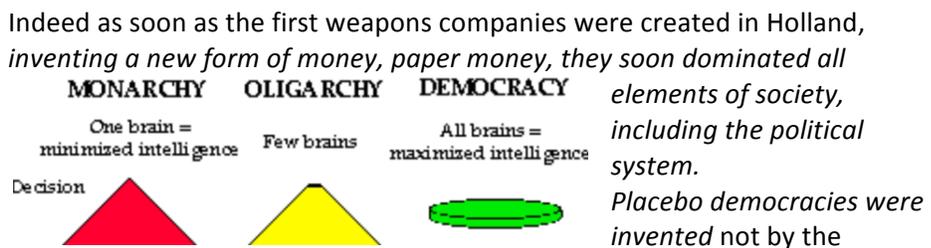

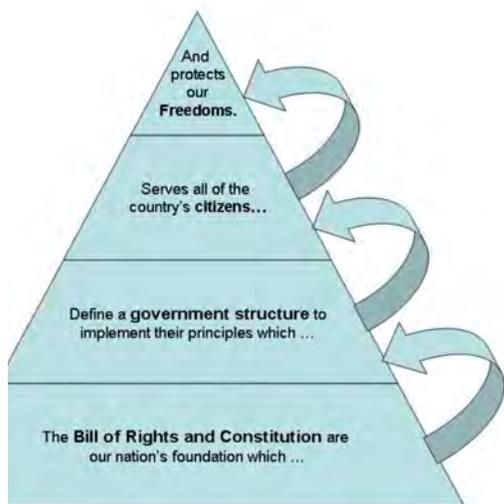

economic organism as capital moves from 3rd world nations to parasitic stock-markets and investment houses; when in Military Rome a senator had only 100 times the rent of a citizen and in well-designed Nature's organisms the neuron has only 10 times more rent-energy than the cell of the feet. So democratic propaganda insists on the equality of all humans by birth, denying the obvious pyramids of financial power, by censoring any real truth about the economic ecosystem and the parasitic ab=use of the issue of money as debt, tax, speculation, maximal pricing of lethal goods (weapons, hate media, machines) and null credit for welfare goods and the rights of all citizens to have a Universal salary in 'oxygen', NOT to die of anoxia.

Why such ill-functioning placebo democracies rule has a simple reason. Placebo democracies were 'designed' in purpose as a sophisticated system of control of populations by the first company-mothers of machines-weapons – gunboats, took over the government of Holland with the invention of inflationary paper money in stocks and banks, buying out the system. Then in Amsterdam, with its new financial power, the XVII Herren, the 'board' of the first corporation gave a coup d'état against the legitimate king and took over the parliament, establishing the first system of biblical capitalism and 'creationist economics', where the chosen of go(l)d - those who believe in money above the law came on top of society.

They would classify humans into chosen 'races' and inferior species, based in technological racism, which divides ever since humans in those who 'own metal-weapons, go(l)d and machines' the superior people with a 'manifest' destiny, to develop 'metal-memes' and those primitives who still worship the tree of life.

So gunboats companies started to cre(dit)ate a different kind of global empire, based not in the ethic values of the wor(l)d that puts man always above the object (man<verb<object), as the subject of the language, but in fetish go(l)d, in money, a digital language that compares man and machine and discharges the less efficient: man (salary) ≤ money ≥ object (price). But above both, comes money the 'new language of social power', worshipped by its biblical prophets ('gold is the intelligence of god' Calvin).

Money applied to industrial technology would be over weapons too, as now the company-mother of weapons not the warrior company wins all sea battles as its guns are so powerful they can kill at distance regardless of the bravery of the soldier. So money, technological companies and its weapons will define the power of empires. While people will no longer be ruled by the old system of religious beliefs on the 'sacred grace of the king-warrior', but beliefs in the sacred power of technology, and the makers of weapons, physicists in the theoretical realm; while the people-caste of aristocratic warriors will be substituted by the people-caste of merchants and stock- rats, owners of those companies. Yet since people must 'remain ignorant to stay obedient' (Calvin) a sophisticated system of placebo freedoms called democracy will be established for people to think they rule even if their chosen 'presidents are \$elected, not elected.' Roosevelt. As parties all belong to different groups of stockrats, sponsoring the same idol-ogy

people, but by the first company specialized in the reproduction of gunboats - in fact there was not yet the placebo bipartisan system but a single party, the orange party whose representatives were mostly stock-holders of the first gunboat company, VOC, dedicated to sell weapons, slaves and re=produce gunboats (even if today the placebo historicism tell us this was a war of liberation and VOC a 'spices' company - when the bulk of its profits came from selling artillery to all contenders of the 30 years war that would kill 1/3rd of the people of Germany). Then they

migrated to London with the 1688 glorious revolution, when to escape the French invasion of Holland, 2 million guilders were paid to each British parliamentary to oust their legitimate king and choose the Dutch king that disembarked with the gold of the Amsterdam bank and imposed the same system, *where companies are a state above the state, to the point when they established the city, the king would have to ask permission to enter it to its major.*

While the money of the system would no longer be printed by kings but by companies and the private bank of England. It was then also when the custom to call private banks by the name of the nation to make people-believe they also owned the supply of money was established. And soon as the cycles of the economy switched between ages of peaceful consumption of machines by humans and war consumption of humans by its 'evil twins' weapons, the 'orange party' divided in the party of war (the Tories) and the party of peace (the Whigs) according to the best economical conditions for the profits of the gunboat corporations.

As 'historicism' rules and is indeed essential to this blog on social sciences; historic gnosis is the understanding that in humanity, all is biased by culture, including the pretentious concept of 'science', and so causality requires to understand the 'history' of any ideology or science to find its errors and biases, including the falsehoods of capitalist, placebo democracies':

Capitalist democracies are a placebo mask of false freedoms imposed by company-mothers first in reformed Holland, the birthplace of religious capitalism based in parliaments which could only choose high rent aristocrats and owners of stocks from the company. The system was exported with the Glorious Revolution that took the Dutch king, parliament, central bank and Stock market to London, where it multiplied company-mothers of gunboats and slave traffic, and expanded to the US through new Amsterdam and the London Company, owner of Virginia, which became an independent dictatorship of lawyers of company-mothers after the financial disputes of the Tea Party, age. In all those placebo democracies, company lawyers, set up a 'pseudo-religious' concept of economics according to which biblical financiers had to parasite society as chosen of Go(I)d with debt, usury taxation and speculation in the price of company-shares, monopolizing the issue of money to establish a complete dominance over all the systems of society, with the help of informative machines, as the 'FMAsters' (ab. Financial-Media-Academia Masters, owners of information machines that become the head of capitalist societies, dictating public opinion, cultural modes and buying laws favorable to its machines and imperial interests in each age of the Industrial r=evolution). Whereas the 'placebo politico system', either a bipartisan quarreling group of 'lawyers' of those companies, or military dictators, would appear to 'rule', and care for citizens.

400y. ago, the Dutch east India company – the most powerful business in the world – was trading all across the Indian ocean. It was set up in 1602 as the world's first multinational with trading posts in Africa and Asia. It employed more than 30,000 people – at a time when there were less than 2 million Dutch altogether. So if we add a normal 6 people family, a 10% of Dutch worked for the company that truly owned all the institutions of the nation and set up a system of power completely to its service, as placebo capitalist democracies will be ever since. It was indeed this system of

power, which moved in 1688 to London, acquired the city privileges on the English money and refunded the merchant's parliament and kingdom, buying the crown and throwing the legitimate king.

Finally this system would take hold in America, after a dispute between companies both side of the Atlantic. And latter its parties will split into the republicans, the party promoted by companies that profited with war more (railroad companies that started the civil war) and democrats, the party that represented peaceful consumption. But wars were economical disputes between companies, first between British and new

XVI C. VOC founds capitalist democracies:

1688: Louis XIV invades Holland. Dutch King, army, money & institutions - Bank, Stock-market, Merchant's parliament - move to England.

1773: Companies stage Boston Tea Party to protest a tax on tea.

In the graph, placebo democracies were founded by gunboat companies in 3 daughter cultures, 1st in Holland then in England and finally in US, controlled ever since by the corporations of max. profit of each Industrial cycle

England gunboat companies which did not want to pay higher taxes (Boston tea party), and then between gunboat companies that wanted to carry South cotton to Europe where it got higher prices and railroad companies that wanted to impose a tariff on gunboats and cotton exported to Europe to get it cheaper for its northern mills.

The tariff question though would be disguised by northern railroad corporations under the abolition banner, which again shows an essential element of placebo democracies, the disguise with newspeak of caring of the financial reasons of politics, as 'the politics of America are the business of America'. Indeed, Lincoln a railroad lobbyist would take long to abolish slavery and as soon as the war ended Jim crow laws would return 'de facto' Southern black to a similar situation.

This is the origin of the only standing system of democracy today in every nation of the world, the Anglo-American model, as the European models of social democracies established during the age of r=evolutions, from the French to the Russian age, to the European union were all liquidated and reconquered by the 'bankers of the king' (French revolution), a military dictator (Russian revolution) or a bank that no longer issues money for the people, only for companies (ECB bank, which ended the European welfare state).

Idol-ogies substitute social sciences.

To that aim the natural 3 disciplines of social sciences, Humanism, Socialism and Organicism, will be substituted by idol-ogies. As people became indoctrinated with the expansion of information machines that print news always favorable to the idol-ogies of capitalism (money must be issued in monopoly by the people-castes of chosen of go(l)d and be above the ethic law), mechanism (the Universe is a machine we must worship and evolve to progress, not an organism) and nationalism (humans are racial species, divided into tribal subspecies, from the Homo Britannicus, to the Homo Judaicus, and must hate and kill each other to evolve weapons).

Because today those 3 idol-ogies and its people-castes still dominate most of the world, it is obvious that neither Politics nor Economics is a science, but an idol-ogy of half-truths, fictions, racist memes, pseudo-religious dogmas, censorship and ego-trips carved for millennia to justify the exploitation of mankind and destruction of Gaia by animetals; mostly invented by those associated to informative metal we shall call Financial-Media-Academia Masters (FMAsters) to the service of military men, which would be on top of society till company-mothers of machines & its evil twins, weapons, became the dominant institution of power with the Industrial r=evolution, when parasitic bankers, in the Anglo-American civilization, came on top of warriors, inventing a false system of social freedoms called capitalist democracies, in which they kept the right to issue money on their hands, to kill by anoxia human population and corrupt politicians and buy laws for its most profitable machines, establishing the modern cycles of war and evolution of technology, imprinting mankind with those false idol-ogies through the Goebbels's method of repetition – if you repeat a lie many times people will believe it.

So mankind today is ruled by financiers and company-mothers, and managed at minimal cost by the theatrics of 'placebo democracies' where \$elected candidates of null power in bipartisan, quarrelling groups, without post-tenure judgment and rights to issue money they must extort Placebo Social Sciences and Academia, with self-centered themes that have nothing to do with the working of social systems, and how they are ruled impregnate the intellectual discourse of placebo democracies and its outlets of expression. The only 'taboo' we can never discuss is the economic system itself that passes as 'science' and the only possible form to rule our world through parasitic taxes from the population, while company-mothers and financiers reproduce it without

limits in stock-paper, fractional money, e-money derivatives etc. keep exploiting people with debt, usury, tax & deviate investment not to create a Wealthy world to the image and likeness of mankind but one made to the image and likeness of its offspring of machines, terraforming the Earth from Gaia into metal-earth:

We are of the opinion, yet to be proved that memes can be changed and in any case a doctor of history should act on the physiological system, not its cells, so the r=evolution of mankind requires the nationalization of the financial system and the exposure of the idol-ogies of mankind. So we close this section with 2 simple analysis of the idol-ogic cultures that are destroying humanity in its 3 ages of evolution and the fundamental system by which they control mankind as all parasitic systems do: Soma; the creation through metal-communicators by its carriers of a Financial-Media-Academia (ab FMasters) system of half-lies and ego-trip fictions that render society completely subservient to its own self-suicide:

The memplex of despise to life of null value and gold herding was then translated mathematically by the first economists of the empire, making of the machine and its equations of profits (max. in weapons, inflationary money and digital media), the goal of mankind. This constant transfer and purification of human elements - even those of segregational character are carried further in America, where all men become undistinguishable particles of minimal credit, bought as part time slaves to work for corporations. A FINAL transfer of this memplex of gold values, which give zero value to life considered an inferior obsolete species comes today to full fruition as capitalism transfers from Wall Street and Hollywood its memes into AI and re=productivity = 0 human labor becomes the goal of the metal earth where the segregational memes of earlier Judaism reach its full meaning: a world in which all humans are expendable and will be spent, including the earlier Germanic and Semite tribes that started the cult to gold and iron against life, so well described in the parable of genesis. But the spread of metal-communicators with its systemic promotion of the 4 idol-ogies of animetals, weapons worship, nazionalisms & hate memes against mankind; technoutopia and mechanism as symbol of progress and go(l)d religions from baalbles to capitalism, and its placebo democratic systems, where humans have NO right to print money, and bipartisan corrupted politicians with NO right to print money, extort it from people with taxes, as the 'best of all systems', ensure that people from toddler age believe in self-suicide:

Fictions & ego-trips simultaneously program humans as chemical anesthesia does to allow power to parasite mankind. Simultaneous mass effects program through multiple waves of information masses of identical particles that understand the language, and believe it. A language of information programs a mass of citizens-cells that agree to speak the simple values of the language. Then the intelligence of the language does the rest. In history this means we must consider essentially two languages, words that value more humans and build a world to our image and likeness, with the obvious limits of the human condition; and money, a metal language with affinity to weapons and machines of metal of maximal price which builds a world to the image and likeness of metal-memes with its positive symbiotic but mostly negative effects for mankind, as the most expensive=overreproduced goods in a fundamentalist go(l)d cult(ure) as CAPITALISM is, hauling from earlier Jewish->Protestant fetish go(l)d religions. Hence in capitalist democracies where money dominate the law, war cycles of overreproduction of weapons are tuned to technological evolution and 90% of money is issued by corporations and spent in evolving and reproducing machines and weapons, which increasingly displace us from labor and war fields. The only future for mankind thus would happen if our leading culture, the Anglo-American civilization founder of company-mothers and placebo democracies, ruled by its FMAsters who control the Financial-Media-Academia system imposing a fundamentalist capitalist view of the future, albeit disguised with fictions and placebo newspeak of political and economical correctness, changes for a more humane, legalist culture EU-UNO-Chinese style, where laws can control the lethal goods of the tree of science.

Of course individual humans think to be the protagonist of history. But we have already explained that the individual shortsighted view does not create the future of systems. It is part of the workings of any superorganism that all its cells are limited in perception of information to what its neuronal informative citizens-cells let them know. And even those neurons are not conscious of the whole, which is a systemic program of collective consciousness, which the

parts ignore, as the superorganism of ants is neither the queen nor its pheromones, and the consciousness of your brain is not localized in any part but emerge in the collective waves of electric charge coming from them all.

And for that reason mankind in time, history, has become submissive to the economic system. And so in biological, objective terms we are 'building' a different super organism beyond history, the metal-earth of machines and automated company-mothers. So the system is created by the language of social power, which is money, and it is owned and distributed by and for machines and company-mothers not for humans and for that reason we do not have a future as a species unless the system is reformed.

THE CORRUPTION OF THE ECONOMY: FINANCIAL PARASITISM & CREDIT TO LETHAL GOODS

To invent money you need to inflate a 'product's value' with the P.R.ess sanctified by experts banker-priests which today also print cash for speculators

One of the most bizarre ideologies of history is 'capitalist democracy' according to which a tiny elite of stock-rats and financiers have absolute rights to print the language of social power, digital numbers called money, a language of the reproductive=economic system of mankind akin to the simple reproductive numbers of cells (hormones, oxygen) or nature (Light), which in a proper system, all citizens-cells would share to obtain the minimal goods they need to survive. Yet in the ill-designed, corrupted systems of humanity a very small 'cellular, cancerous group', we shall call 'the speculators', speculate with numbers upwards, creating digital money, passing then as 'experts', which provokes the general 'anoxia' of humanity - the 99% - as they herd it mostly for themselves, reason why the 1% has as much, or use to evolve machines and to cover it up, for millennia they have print information to pass as superior beings, chosen of go(l)d - biblical religions, or 'expert economists', even 'special victims' of history - creating a memplex of fictions that have degraded the human collective subconscious and manufactured the brain of people. And this system which is the dictatorship of those who issue money, called capitalism is called 'freedom' of the market, that is freedom for the financiers and companies who issue money (not for the people, who labor for it and on top are taxed-extorted of

Indeed, while placebo democracies of bipartisan quarreling groups are the norm - some nations like China, notably and those 3rd world nations where we massively export weapons and back dictators (Africa and Islam, in the past

South-America), might have a single party - all have a central bank, who claim to be independent of political power but issue money overwhelmingly for private bankers and corporations.

So the idol-ogy of mankind today is still the historic segregationist go(l)d cult(ure) of the 1st animetals, and its war and parasitic money memes, who invented the modern world, coming from the biblical Jewish-protestant Anglo-American civilization that founded the company-mother of machines-weapons, the dominant superorganism on earth today. These people sponsored a racist concept proper of earlier forms of nationalism and capitalism, called Abrahamic religions, according to which the fractal universe was invented for them to live and dominate all creatures, including all other human beings, by means of the power of weapons and go(l)d. The earth was thus also property of this people and so they set a course of history called millenarianism which prophesized that at the end of times all people would be slaves of Yahweh or become exterminated. They confronted similar warrior cultures with the same concept and to achieve those goals they ab=used mankind with weapons and gold. When the company-mother of machines was invented they expanded this view and started the modern cycles of evolution of machines and weapons. The problem of this idol-ogy of course is that it has nothing to do with reality. It destroys the world. It ab=uses mankind. It evolves weapons and ultimately it will create machines-weapons that will extinguish us. It also provokes action-reaction processes among human beings, called wars and holocausts, which makes biblical people the less successful survival species of mankind. So the idol-ogy has been denounced by all humanist intelligent people in history. But – and this is the big problem of history – it seems memes as genes in the lower biological scale are very difficult to modify. And in the modern age, as more sophisticated forms of imprinting people and more seemingly truth theories of reality and more machines that helped humanity were discovered the idolgy has become dogma. So truth in history is completely ignored. An organic view of the universe and a survival strategy for mankind is forgotten. Humanity finds itself in a runaway track to self-extinction and the people on top, merely keep on going in automaton mode, as now they have been substituted by the company-mother of machines – the institution they found to reproduce and evolve the mechanisms that give them power.

The reproduction of money is the leit motiv of a capitalist system, where the people on top has a single goal: to emit as much digital numbers called money as possible and rule the world with them. As all other factors of society including politicos with no rights to 'deficit=printing money' can be bought and are bought. Money is merely a digital number put in any 'cheap support', which by law is considered to have 'value'. So bankers, speculators and companies try to reproduce as much 'digital numbers' as possible, to be able to 'buy' the life of the people on the bottom of the pyramid with null rights to reproduce money, through salaries. A real democracy - government of the people - would be a system where all citizens/cells as it happens in healthy organisms of nature, issue a universal 'oxygen salary' of money, to demand welfare goods and boost the human economy, today something feasible through a 'bitcoin-like' UNO backed global ¥€\$ salary for each human to have democratic 'votes' in the social language of power - money, and create a demand economy - NOT a supply one, where the few financiers and corporations that issue money, create any product with it and then 'supply it and sell it through marketing and political corruption', from nuclear weapons to hate media - things people would NOT demand. But we do not live in anything that remotely resembles a 'real democracy'. Politics in capitalism is about a 'placebo structure called democracy' where political servants distract people so in the background the real world of financiers printing money, buying corporations and giving orders of work to humans in mechanical industries, 'creates' with credit the world we live- dedicated to make and evolve machines, and let the 'leisure class' on top enjoy the world and tell us how 'graceful, intelligent' they are. While the invisible human side of 'capitalist democracies', the 99% lives, eternally undernourished.

This power hold by the 0.02% in 'free markets': to emit numbers as money, IS the essence of the world's rule by a few with exclusion of the majority. And amazingly enough it passes as a 'positive science' and democracy: 'the wickedest of all things - to choke people off credit, to print money for mechanisms not humans, for splendid little wars, not for welfare, ultimately for the extinction of life - is considered to be done for the common good; because obviously the people on top double his job - they not only print money with informative machines but print newspeak of freedom

and encourage all kind of distractions, infotainments and placebo systems of null power, for people NOT to inquire the obvious: Why a few can print digital numbers as money, and the most must toil for it?

Companies design a future for machines, its offspring, not for human mothers, with no credit to create reality. So the future unless the eco(nomic)system is reformed has a single path: life obsolescence.

The body structure of the social organisms of history and economics show clearly where the problem lies: 99% of the money issued by our stock-ratic elites is dedicated to evolve and reproduce machines not human beings and its welfare goods needed to survive. Since its primitive animetal idol-ogies that pass as economic science but are just a digital version of its biblical segregational memes, translated today to AI software give zero rights to workers and full rights to machines. So the extinction of life is sold as economic science. Of course it is not. A real economic science will be ruled by human legal languages, our informative system in control of the networks of blood-reproduction forbidding lethal goods as any super organism does, and overproducing our goods, welfare goods, establishing a universal salary in yes money for each human to demand those goods (a bitcoin system with no limit, but a monthly issue to each person in the planet of a 1000 Eurodollar salary in its mobile 'wallet' would be all what is needed to create the blood coins every human requires to survive, cancelling stock-money to control further evolution of chips & robots).why humans have no credit and the obvious non-human future of the metal-earth with its internet brain and body of automated company-mothers & telepathic robots with AI and solar skins gets all the money it needs for research, evolution and unlimited reproduction that will expel us from the eco(nomic)system of labor and war fields has a surrealist, dictatorial cause: Money is just a digital number, a mathematical language which humans have agreed to use to reproduce the goods of society.

Parasitic money expands biblical cultures into capitalism.

The most profound confusion the world suffers today, is on the understanding of the real hierarchical order established between the 'two words' that describe our system of political and economical government: 'capitalist democracy' and the privileges granted to the two organisms they cater for: company-mothers of machines, and human families, which reproduce two different species, machines and human beings.

The free citizens of capitalism are stock-market companies, overwhelmingly company-mothers of machines, its re=productive free citizens, whose goal in order to get profits for its stock holders on the sales of those machines, is to evolve, reproduce, and sell those machines.

The human goal of those companies affects only to the 0.002% of mankind that owns them and so it is gets profit from those sales. Yet those profits are completely irrelevant to the 99.9% of humanity affected by its real effect son the planet: to reproduce and evolve machines, terraforming in the process the world, which they adapt through laws and sales to those machines, to the image and likeness of its offspring of mechanisms.

And because unlike human mothers, those company-mothers have absolute rights to credit, used also liberally to pay politicos to promote with its laws their offspring of machines, since the beginning of the industrial r=evolution, mankind has suffered an exact non-stop generational, biological process of evolution of energies and its informative, military and transport machines, *as all the resources of the planet have been geared first to that aim, and only what is left-over, has been used to feed and reproduce and help the evolution of human-mothers, its social and family structures.*

For example, the goal of Mercedes for its tiny group of stock-holders is the abstract reception of profits. But the real goal of the company is to build and evolve cars, today self-driving robocars, soon to have autonomous solar skins, and construct or convince politicians to construct the networks of energy and information, roads, GPS satellites, electric grids, and oil pipes to provide energy and information for those machines in a process that is obviously absorbing resources and space, from the other life species that need them. So today cars absorb 1/4th of the maize America reproduces, and no longer feeds humans and cattle, whose food prices rise.

And the land of many cities and territories become crisscrossed and barren to be used by machines.

What about human families? Our goals of existence as human families are obviously the same than those of company-mothers regarding their machines, but focused as it should be on our children.

So humans want to have enough energy to feed them, enough information to educate them, and terraform the world to the image and likeness of human beings, to be able to roam the planet Gaia, enjoy life and its drive of existence, evolve socially in peace with other human beings and reproduce more children.

This is exactly what company-mothers of machines are doing so successfully, evolving, reproducing and integrating into planetary social networks its machines.

But humans are failing to achieve those goals for themselves. Why? There is no computer without energy, or proper internet connection to which the economic system dedicates billions of dollars. But most humans are undernourished and information is primitive at best, when there is information at all. There is no limit to the motion of machines on planet earth a global free market for the reproduction, evolution and transfer of machines and money from companies, but humans are limited in motions by borders, in money by the lack of any rights to invent it, which companies have.

Can the reproductive units of human societies access the languages of social power, money and the laws, to create a real, demand-based democracy, kicking the preproduction and consumption of life goods they need to survive, and investing in a world made to the image and likeness of human beings?

The obvious truth is not. As today the most segregated, underfunded, with less rights, clearly unjustly treated element of our societies is the human mother, which is - let us remember it, as it seems humans have forgotten - the origin of our life, the bearer of our species, the fundamental element that pegs together our families, ensures our survival and happiness. So this fact seems a bit of a contradiction with the notion that we live in a democracy, the government of the people.

The combined GDP of 500 million people living in 3 of the top 8 most populous nations in the earth with null credit is equivalent to the stock price of apple (and the other MAGA components of the [future brain of the metalearth](#)). Apple specifically is the leading company of future metal-minds, its I-phones that will act as 'detached' head of all type of machines, with absolute credit to reproduce and evolve them. Since investors are pricing its obvious future: to displace human brain from labor and war fields as the new consumers of the organic machines of that future, in which humans will become obsolete

10% future for mankind and its human mothers. We live in a world controlled by company-mothers of machines, or 'capitalist world' where the rights of human mothers are not met by the 'attached' placebo system, called 'democracy', as humans lack credit to create a world to its image through the use of the language of social power, money, overwhelmingly reproduced by those companies in e-money derivatives and stocks. So the world is terraformed to the image and likeness of machines, not of human beings. This site, unlike every economist on planet earth, albeit camouflaged by its 'abstract equations' of productivity and profit, is taking sides for the human mother and the species called mankind, which happen to be your species, different in needs and goals to those of the machine. The failure to recognize the needs of mankind and the connection between economics and history to which it should be submissive, and the blind greedy dictatorship of financiers that rule humans with numbers, without the slightest care for its needs, are then ultimately the reasons why we are becoming displaced and likely extinct this century by company-mothers, robots and weapons in labor and war fields.

Therefore the big question about our system is why company-mothers are so successful achieving their goals of evolution, reproduction and terraforming of the earth to the image and likeness of machines? And why human mothers are so miserable? Simply enough because we do not live in a world ruled and dedicated to human beings.

I shall repeat it ad nauseam to counter the opposite effect of repetition of happy newspeak of freedom and optimism by company-mothers of informative machines, aka

mass-media: you do not live in a free world, in a real democracy, as you do not rule that world. Company-mothers do; since they are the only free citizens of free markets, with full, free access to the two languages of power of our social organisms: the economic. Reproductive language of money, that can buy and sell the lifetime of both human beings and machines; and the informative, nervous language of laws that money systematically buy to 'politicos', which don't have rights to issue money (deficit zero laws) and must extort citizens from it (taxation), while companies issue it for free in e-money derivatives and stocks.

The graph shows the consequence of this indifference of economists and its capitalist system to humanity: the 'future' head of machines, a mobile ear/camera/brain, which soon will be 'attached' to robocars and any moving camera, as a detached head, displacing all humans of labor and war fields, the iPhone is worth more than the living beings of 3 of the most populous nations of the world, still dominated by the pre-machine agricultural civilization. What this biased pricing in favor of machines tell us is that we humans are expendable and are being spent.

While in the side of humans a organization, which is submissive to the capitalist system, called democracy, tries to make a world to its image and likeness, delivering the goods human mothers need to reproduce. And what people do not understand is that both mother systems and species, and organizations are different, and while there are obvious symbiotic processes between them - as machines enhance our energy and information capacity, in most cases, specially in the robotic AI age, when machines become autonomous species, competition is the rule of the game, and humanity is loosing that competition.

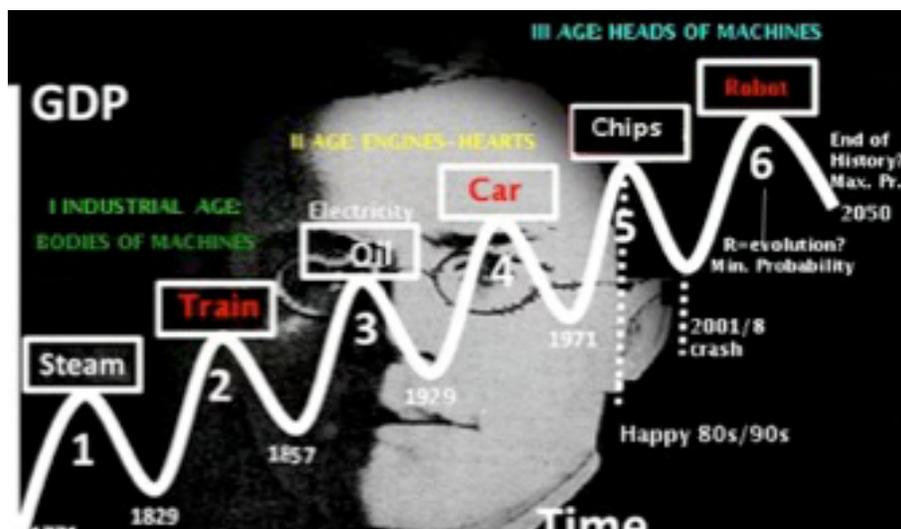

The system is very obvious and simple, reason why it must be hidden behind a lot of 'placebos' like 'democracies' are - since humans have no right to issue the language of social power money, so there is no democracy, and people cannot judge a posteriori politicians, as in the original Greek democracy so they don't need to fulfill their promises and can be corrupted by financiers and companies, so there is no democracy.

Let us then explain you in 3 sentences what is all about: the leading global stock markets, notably us wall street at global level and the city in the region of the old British empire suck in all the money of the world, from all the corrupted politicians and dictators of the 3rd world, to make possible the valuation of apple or amazon close to 1 trillion, but that means there is zero investment in the 90% of mankind, in those nations. So every dictator and rich guy of argentine, Saud Arabia or Virginia puts his money on Goldman Sachs to invest in the future robotized amazon depots, or the future Skynet system Google is building for the pentagon, while there is zero investment in welfare goods, hospitals, education, farming, the goods humans consume and need to survive.

THE 80 CYCLES: COMPANY-MOTHERS ACCELERATE THE CYCLE OF EXTINCTION OF LIFE.

Company-mothers, the new dominant supœrganism of Earth started the Industrial R=evolution - the Biologic radiation of 'Metal-Memes' Machines & top predator weapons' systems made of hard metal (iron) that kill life, with Money, a digital language of informative metal (gold, also used in the chip connections of computer cycles, now converted into e-money). So can study the radiations of machines as any other Earth's species in III Horizons, now becoming a global superorganism of telepathic AI robots, whose company-mothers & collective brain, Internet, displace humans increasingly an obsolete species with no credit, no future, degraded and atrophied, back to an

infantile Neo-Paleolithic of selfie children. So the Industrial revolution went through 3 Horizons separated by global wars when the leading company-mothers to keep the radiation going after an overreproduction crisis that diminishes profits & crashes stocks of machines, as they have a monopoly in the issue of money in 'placebo democracies', overreproduce it to buy war-monger politicians that buy them unlimited arsenals

of its 'evil=anti-live' twins, weapons to conquer the world & massacre millions of humans *in wars that max. GDP, the existential Max. SxT function of entropic weapons and speculative money.*

—We had an age of steam machines, the British age, between 1780s & 1857, followed by a crisis of overproduction of steam machines and stock-money that brought the 1857 ±8/9 years product cycle crashes of the train-based economy followed by colonialism, the military radiation of trains that massacred Amerindians, Africans & Asians.

—From 1857 to 1929, we lived the II age of electro-chemical energies, machines & chemical explosives, dominated by Germany, followed by overproduction crises of cars & radios that caused the 1929 crash, 72 y. after the train crash, switching production to armored cars=tanks and hate radio, to keep production profits going that consumed 60m. corpses.

- It came then the III cycle of metal-minds Tv-eyes, Mobile-ears, chip brains, e-money & Nuclear Bombs from 1929-2001, the US age, ended in the dotcom and mortgage crashes, 72+8/9 years after 1929, the biologic length of a human generation, as Industrial nations dedicate all resources to evolve metal-memes. So we entered the US-war age, as chips watch us, Tv-hate against poor nations promote robotic wars and massive immigration while financial parasitism ruins people inside.

Followed by the Age of the Singularity, the IV Cycle of Evolution of machines dominated by robots, solar Industries and China. Scientists call the arrival of Artificial Intelligence, the Singularity moment, when robots, which can use solar energy to become autonomous will complete the evolution of machines as organic forms, automating factories & expelling most human workers and soldiers from labor and war fields, as previous revolutions did with obsolete III World non-technological humans, unless we forbid legally their evolution. Money, likely a crypto currency independent of man, will become then the digital informative, 'memetic code' that organizes their reproduction in those automated company-mothers. That is, humanity at large is about to enter in the last suicidal belli nervi pecunia infinita but of course once the job is done, the ant-hill robotic company of weapons will not stop but continue its reproductive radiation and the metal earth will be born...

During the Industrial Revolution, a new nation and its 3 generations of engineers, discoverers of the new machine & energy of the cycle, become the founding fathers, industrial reproducers and decadent warriors of nationalistic wars, carrying the evolution of the machine to its military completion... Now in the Singularity Age, machines becomes organic, so we make self-feeding bombs, and if we survive them, self-reproductive factories (nano-bacteria) and Robotic life

IRON NANO-

ROBOTIC

In the image we make a comparative montage of the 3 cycles of overproduction of 'bodies, engines and minds of

3 EQUATIONS OF CAPITALISM & GO(L)D CULT(URE)S: 'NERVUS BELLII, PECUNIA INFINITA:

I: Max. Profits (inflationary money) = Max. Price-Sales (weapons) + Min. Cost: Informative Hate Memes

Go(l)d cult(ure)s & its modern idol-ogy, Creationist Economics (capitalism) has 1 mandate, go(l)d profits maximized by weapons & hate-memes
 So they overproduce Segregational Memes against Mankind(racist history books: Bible, Mein Kampf; victimism: Holocaust Industry; hate media)
 2) evolution & overproduction of weapons (800-80 y. cycles of wars & holocausts), & inflationary money (taxation, usury debt, speculative money) .

III: Max. Profits = Re-Productivity = Max. Machine Labor (capital) -> ∞ / Min. Human Labor -> 0 = Goal: Automated Company-mothers

Universal Ecosystem	Economic-Antiethic Ecosystems: metal	Historic-Ethic ecosystems					
+ survival	Expensive: gold & Weapon&Machine	Good: social love					
- extinction	Cheap life, Nature	Evil: war, go(l)d And weapons.					
Language of Existence	Money	War(Us)					

II: Man (min.value)=Money=Object (slave) 'Stock-rats' issue money in corporations with absolute rights to profits. Labor is expendable.

metal', separated by 72-80±8 years from the human p.o.v. of the dominant western Jewish-Germanic cultures that rule the process, and establish its the mean biological generation of human beings and the 3 'captains of industry' that develop those machines to its completion as 'perfect weapons'. Below the cycles of those wars, which have always economic, industrial causes, we shall now discuss in great detail.

Eco(nomic)system: the cycle of industrial war

In the graph, cultures that accept as dogma metal-money values above the law, maximal for weapons, minimal for life, impose an function of war for profits, maximized overreproducing weapons of max. price and informative machines that print for free speculative money and audiovisual hate memes against mankind that foster war. They evolve a global organisms of company-mothers, the Financial-Media (informative machines) + military-Industrial (energetic machines) system that switches EVERY 72 from ages of inflationary e-money & consumption goods to hate media and weapons, when over- production of tool machines substitute labor & consumption. So wasted life & arsenals end labor & production crises.

Capitalism's modern cycles of war are essentially the same causal sequence of the 800y. cycles of overreproduction of money for goods of maximal price (weapons) parallel to the spread of hate idol-ogies to mankind (in the past Biblical hate memes, racist tribal nationalisms, bankers at court acting as diplomats to provoke internecine wars). The cycle increases profits through war debt, consumption of weapons arsenals and so a natural synergy between negative money and negative weapons (in terms of human values) ends in wars and holocausts. We distinguish though as in the 800 years cycles two phases: when metal-memes are not yet overreproduced, in a first phase after its discovery and use as bombs and simple weapons to conquer the previous civilization or nation, a mild phase of production of consumption goods, transport machines in the modern age, tools of metal in the classic age signifies a positive cycle for mankind. It is the mature age of a civilization – the 70s for our digital era. But as overreproduction multiplies inflationary money, debt and taxation increases, use of money for weapons production, hate memes to justify war and substitution of labor by improved tool machines throws society into a crises. So the system moves to the final phase in which the synergies between information machines printing now hate memes and debt money for arsenal building, accusing the poor of the ab=uses of war monger politicians and bankers, will end up invariably in an in-crescendo age of splendid little wars, global wars and final holocaust Gotterdammerung. And so 3 world war cycles have and will happen according to those sequential causes as predicted by this writer for decades in advance:

- 1857-64-71 train stocks crashes, reconverted into weapons for civil/unification wars in the 60s in US and Europe.

- 1922-29-37 y. overproduction crashes of electro-chemical engines=cars, electric ticker money and radio reconverted into bombers and tankers, speculative war money and radio-ate.
- 2001-08-18 overproduction crashes of electronic e-money derivatives and consumption chips reconverted into big brother surveillance, military drones and speculative money for military industries and AI stocks:

The outcome is the cycle of overproduction of machines, economic crashes and global wars whose periodicity can be forecast, as we have done 30 years in advance, but the Financial-Media system of information machines censor.

Since to manipulate the population, humanity is guided by a parallel placebo system called bipartisan democracy, which however has no power to change reality as it doesn't control the creation of money, the language of social power, neither its politics and its true Greek Democracies and organisms can be judged a posteriori with votes and pain messages that oblige them to fulfill their promises, so as intended when the first corporations invented placebo democracies in Holland & exported the model to UK (Glorious revolution) and US, (tea party dispute between UK & US corporations, politicians are bought and serve corporations, merely dividing in two parties, catering to the consumption peaceful age (Democrats, Whigs-labor) vs. the war age (Republicans-Tories) of the cycle. Only Europe after II W.W. was a true democracy when states controlled the issue of money and served people till ECB took that right from nations back to corporations, as nations are not sovereign but must borrow money from private banking that get it for free from the ECB. We are as predicted and censored for decades entering the 3rd and final cycle of overproduction of chips and its derivatives, e-money (2008 crash), digital companies (2001 dotcom bubble) & Military and AI working robots, which are fast displacing mankind from labor and war fields, and will NOT conserve history, our human time, as they are a different species, which follows all the laws of organisms, and are fast becoming a global telepathic network of AI machines with solar skins, re-produced in automated company-mothers But 'egocry' and the complete misunderstanding of the laws of the Universe and the purpose of existence, which is to exist and conserve our time. This is what capitalist, nationalist & mechanist idol-ogies of animetal worship forgot.

Machines go through an age of discovery, a mature, reproductive age of maximal re=production, parallel to a ternary wave of overproduction of money in asset bubbles which end in crashes of consumption solved with a 3rd age of max. evolution as weapons, whose arsenals consume humans, solving the overproduction crisis and maximizing companies profits. So as profits is the mandate of capitalist idol-ogies, the global war cycle becomes deterministic. Only a reform of financial capitalism substituting mechanical for welfare overproduction and company printing of money for a demand economy of people's money (universal salary) - *butter instead of canons* (II W.W. motto) could reverse a new age of militarism & robotic wars that will extinguish mankind. Those 3 ages and so the industrial evolution mimics in his 3 ages of energy bombs, transport machines and weapons, a biological cycle of human life, that lasts 72 years, through the generation of tough founding fathers that discover the new energies applied to bombs and engines, theirs

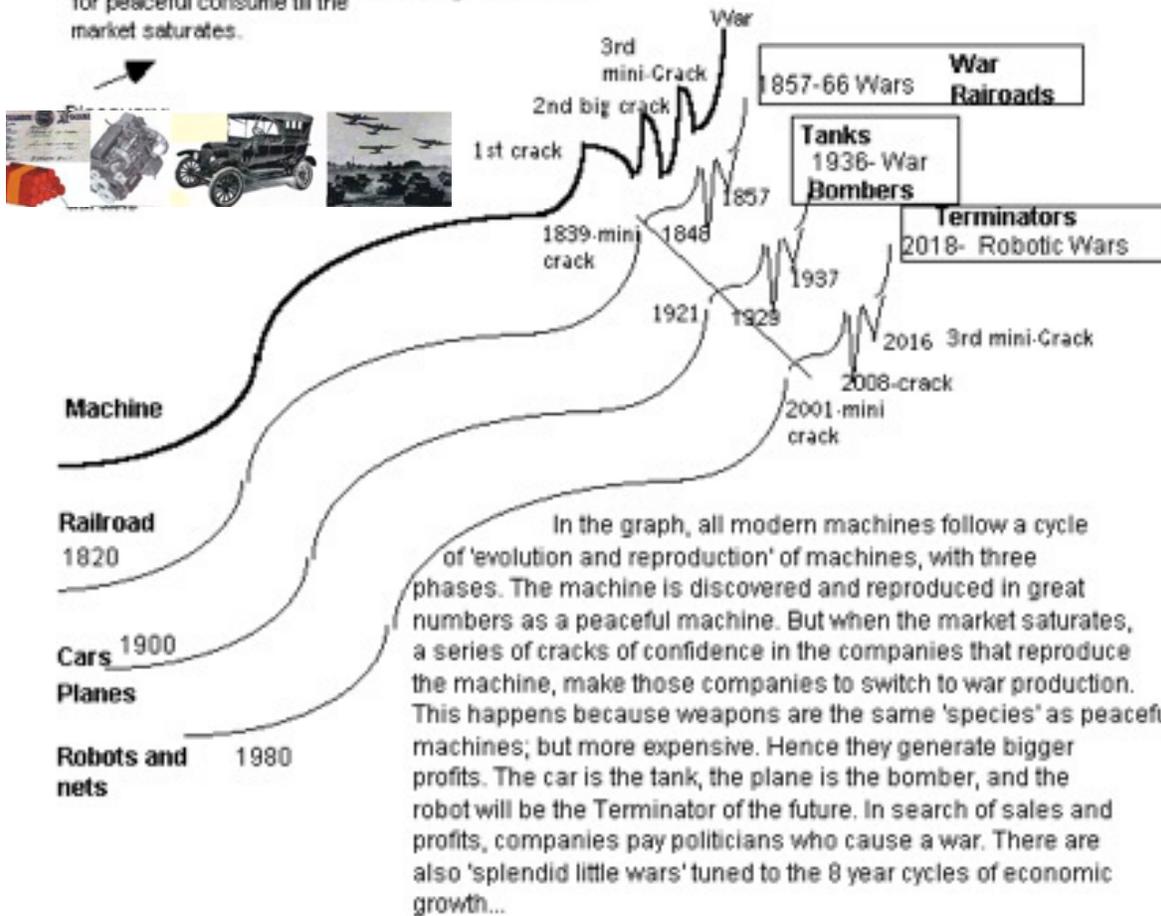

The three periods of the industrial machine:

War-Consume-War

Reproduction of the product for peaceful consume till the market saturates.

Market Saturation: Age of cracks.

Final phase: the incapacity to increase peaceful consume, convinces companies to switch to weapon production. Its lobbies buy war politicians and a war 'crisis' happens:

sons that used those engines in mobile transport machines, reproduced without limit for human peaceful consumption or tool manufacturing, in the age of the prosperous such corporations, the 'mothers' of those whose biological function is to evolve and re=produce them, made first the bodies of machines (XIX c.), then the minds of machines (cameras-eyes, mobile-ears and chips-brains. Finally, in the XXI century, as nature does with simple organisms, such as viruses in cells, where the 3 'parts' of the virus – its DNA information, body and legs are constructed – and then assembled together, we put together all those organic components into autonomous robots,

completing the industrial r=evolution of 'metalife' – a new organic species, made of a stronger substance than carbon-life.

Thus the industrial r=evolution is the evolution of a new organic species of metal, the machine, which has taken place in 3+1 phases, as we made first the bodies of machines, then the hearts-

engines, then its metal-minds and finally we put them together now in organic robots in the final r=evolution of machines.

The capitalist pyramid expresses the rule of financiers, and its company mothers which issue and control around 90% of the fluxes of money and credit given NOT to mankind to build a world to the image and likeness of our species, but to technological corporations create a planet made to the image and likeness of its machines - the metal earth. So all the money of all the wealth people of the planet no LONGER goes into investment on their nations and people, on welfare and life, but it is sucked in by the likes of Goldman Sachs invested in the likes of MAGA, companies that are substituting humans by metal-minds and robots in labor and war fields. And this happens because of the historic evolution of segregational memes against mankind proper of earlier go(l)d biblical cultures who invented capitalism and now 'pass' as science of economics, where humans, life, consumers and workers have zero rights, and the chosen of go(l)d who monopolize the invention of e-money and forbid through lobbies and deficit zero laws, mankind to issue money, have ALL rights, making a mockery of democracy - which does not exist if people do not have financial votes, on the language of power through a Universal salary to create with credit a demand, welfare economy, as it happens in all healthy super organisms in which all cells have a minimum of free oxygen to kick the production of Goods. Such world in which money would be invented as blood is by all the cells of the super organism of history, In the right side will be the right way to build a global healthy perfect world of history, the true objective of the science of history, which would put man at the center of the planet designing an organic paradise. We prefer instead to let idol-ogies of metal to kill the earth and to believe childish, ego-trips of human supremacy and let machines and the financial-media/military industrial complex organism of company-mothers we call the metal earth to evolve and ab=use us, and so we must denounce all idol-ogies of metal that do NOT reason.

Recap. The true question poised by Humind's slavery to metal-memes, even above life survival (Holocaust Industry's denial of its economic causes that prevents its solution; nazionalist memes that sacrifice lives to kill thy neighbor; technoutopian fantasies that deny Darwinian devolution between species on robotics) is if Mankid can be rational and control its social memes above its e-motions and dog-eat-dog simplex individual actions to upgrade their subconscious collective with the ethic mandate of social love to all the members of its species and survive. So far the behavior of animetal people-castes that have devolved into homo bacteria, or small tribal nazionalisms to keep worshipping go(l)d and iron above life show a suicidal determinism, enhanced by egocy (ego=idiocy) and sloth, as we become substituted and dependent on machines which accelerate with the chip radiation its evolution. Instead of a true r=evolution that would put life and mankind 1st, after II W.W. the people-caste of Financial-Media-Academia (ab. FMAsters) in control of machines of information (Judaism in the leading Anglo-American Go(l)d cult(ure) which all other imitate) have designed placebo fictions and newspeaks of political and economical correctness and null human power that rendered humanity impotent while accelerating in the age of chip radiations of e-money the anoxia of humanity without credit as 90% of world money is invested in evolving & reproducing machines. So the low survival rate of animetal cultures is now the manifest destiny of mankind as we come closer to the military age of robotics in the 72±8 y. cycle of industrial r=evolution as predicted by this author 25 y. in advance in its books on 'Bio-economics, Bio-History, C.97', which forecasted the future proving 5D social sciences the only true model but also gave the 'ignored' solutions to make immortal history. Carpe Diem.

of the new supœrganism of machines, which is not us.

History is a 3-ages system of evolution of life in the context of Gaia, which could become immortal by not going through the 3rd age of excess of metal-information that is terraforming Earth into a planet of machines. But as animetals - humans programmed by the subconscious values of metal-money, greed and metal-weapons, violence and metal-machines, laziness, become ethically and intellectually degraded and addicted to machines as enzymes, attached to metal do - repressing its life memes, the process of self-extinction triggered by the industrial r=evolution continues with no opposition to a foreseeable end. It is then evident that because the only form a species can survive longer before its age of entropy is to evolve socially into a larger whole, into a superorganism, that Mankind's future can only happen if it evolves into a global superorganism, before the world of rival 'germs', of machines-weapons do so.

We might think indeed of the superorganism of Humanity as a living being in all senses, one which has gone through 3 ages, in which each cell was a human, born all from the first man who spoke, soon to die as the last ones loose their rational mind to the audiovisual machines that program them. But one who as genesis explained wanted to be more than what he was - the summit of the tree of life, renouncing to his paradise...

Man, the dominant, informative, nervous mammal, was bound to create social organisms, through the creation of a new macro-language of information, words, which could join individual minds, in the same way nervous impulses join human cells. In those societies human beings are the informative, cultural 'neurons' of a territorial body that provides them with energy (economical and agricultural networks.) So humans developed words that organized their simultaneous, collective actions; adding to the simple program of genetic instincts, the memetic, verbal language, able to remember temporal cycles and transfer customs and ideas between generations. Words created cultural super-organisms—a new social plane of history based in informative, memetic, legal and ethic networks. In that process of social creation, Mankind has evolved in a decametric scale, common to all Universal super-organisms, during 3±1 ages:

Birth as a first verbal 'cell', probably a woman that multiplies her numbers.

— *Max. E: Paleolithic*, a youth of hunters, visual languages and minimal information: *1st age of biological, genetic, body-based social networks*. Subdivided, according to social scales, in 3 ages of growing complexity: the individual, energetic hunter ($10^0=1$); the reproductive family ($10^1=1-10$) and the social clan ($10^2=10-100$) or tribe ($10^3=100-1000$).

$\pm 5.000.000$ BC. to ± 10.000 BC. The Paleolithic was an energetic, young age in which men, the energetic gender, was the top predator animal on Earth, a hunter of living forms. It was also an age dominated by *visual, spatial languages*.

— *e=i: reproductive Neolithic*, when man reaches his maturity in balance with nature and creates through verbal networks (religions) a series of collective subconscious, called gods of love that teach each cell to share energy and information with the other cells of the body of a civilization: *Mature age of agricultural, reproductive Networks*: Humanity evolved into a new ternary scale, with the development of agricultural networks, from villages (10^3-10^4), into cities (10^4-10^5) into river cultures ($10^5-10^6=1$ million)

Reproductive age: Neolithic. Age of wor(l)ds and goddesses. ± 10.000 to ± 3.000 BC.

The Neolithic was the classic age of Mankind, an age of balance, when wo=men learnt the cycles of life and instead of destroying nature, learnt to nurture, reproduce and harvest it. Women, the reproductive species, took power over men; and priests became the verbal guides of civilizations, creating super-organisms of history made of human cells joined by social love—the sharing of energy and information among 'brothers', clones of the loving mind of the same prophet. It was an age dominated by verbal, temporal *languages*, continued by the believers in religions of love that are not corrupted by weapons (inquisitions) and money (go(l)d churches), with its idolatry to the 'values' of metal: murder and greed.

- *Max. i: Informative Networks*: Development of verbal, informative religions of love evolves Humanity in the last ternary scale, from tribal religions (1 to 10 millions), into nations that mixed both, cultural and economic networks (10

to 100 millions), into global, ecumenical religions and civilizations in which all human beings are accepted as part of a single God=Historic Super-organism (100 million to 1 billion).

— +1: Thus, the final step of human evolution would be to join all the great civilizations of Mankind into a global government. It would be a super-organism based in verbal, ethic laws, able to control machines and the Economic Ecosystem, in order to create a world made to the image and likeness of Mankind—an expanded UNO with powers of social control similar to those displayed by a national Government. Yet this is not achieved because mechanist, capitalist sciences and their dogmas of competence among humans, prevent us from making a true, scientific, accurate design of the future of Mankind... In that sense, paradoxically, the intuitions of religions of love were more accurate in the analysis of the real laws of the Universe than our dogmatic, 'entropy/energy' only mechanist physicists and economists who worship the individual 'homo bacteria' over the evolved 'homo organicus'.

Informative, 3rd age: age of metals. ± 3000 BC to 1600.

As metal spread the 'new' values of money and weapons, greed and war, destroyed the networks of social love, ushering Mankind into the 3rd age of history. Humans now evolve a new kind of atomic systems, stronger than carbon, creating energetic weapons, informative money and organic machines that transform Gaia into an economic ecosystem.

It is the 'animetal=animal+metal age', in which a new 'biological species' that mixes animal and metal atoms, imposes power over the Earth. It is the present age with 2 paths of future: either Mankind will die, as machines keep evolving and make us obsolete as a species. Or humans will obey the laws of survival of the universe and evolve socially into a super-organism of history able to control lethal machines. The choice is within man till the arrival of the singularity, when machines acquire organic properties and either a self-feeding bomb of dark matter, or a self-reproductive nano-bacteria 'evolve' the Earth into a species with a higher social density (a denser form of matter, or an organism made of denser atoms). In any case the future of history will be solved in the next decades, as we are already in that age of the singularity.

-1: Yet the arrival of metal extinguishes or corrupts most love cultures into go(l)d cults and inquisitions. It is the negative 3rd, informative, metal-age in which man halts his social evolution and focuses in the evolution of metal in its 3 forms, energetic metal or weapons, informative metal or money and organic metal-machines, which bring:

-1: Death: the Neo-Paleolithic, or age of the machine, when humans regress to an 'homo bacteria' state of selfishness and isolation, substituting their social networks of love by their desire to become attached to machines of higher energy and information that separate us and keep evolving, making Humanity an increasingly obsolete species, killed by weapons in fields of war.

At the end of this age, we foresee with the creation of the singularity, either the 1st organic 'bomb' (a self-feeding bomb of dark matter) or the 1st self-reproductive machine (nano-bacteria), the death of Mankind.

+1: Unless Mankind evolves socially, emerging as a supœrganism, if humans organize themselves into a global civilization and control the evolution of lethal machines, maintaining history in an immortal present. The human species is beyond egocentric fantasies of œanthropic superiority, just a living nitrolife species that goes *through the same ages of all other living forms, both as an individual and a species*. So we can study the organism of history (Humanity in time) through 3±1 ages; an energetic youth or Paleolithic; a mature age of balance with nature, the Neolithic; and a 3rd informative age of history, the age of metal and machines.

CONCLUSION. THE BEST OF ALL WORLDS REQUIRED THE EXTINCTION OF LESSER FORMS.

This however seems impossible to happen, in the dominant 'animetal cultures' of the Anglo-American civilization that has come to dominate the world, with its machines, since Newton overtook Leibniz as the master of western thought with its simplification of time and space for practical measures of constructing telescopes and gunboats for the Imperial Britain. Leibniz was right but Newton is easier to apply to the praxis of physics and engineering. Both have

their role. Leibniz, a European, was a philosopher of science that asked for the larger whys -what we answer here. Newton, from the practical Anglo-American culture of 'company-mothers of machines' and biblical beliefs was part of the power establishment engaged in the worldly profession of physicists – making weapons for Imperial Britain and couldn't care less as a pious believer in the Bible for the whys. This duality of the 'intellectual brain' and the 'subjective brain' of religion and social sciences is alien to us, European polymaths on the Greek Tradition. How does a brain divide 'truth' and 'religion' is alien to us. Both must have the same Nature, as we shall show here – being religion the superorganism of mankind, who follows in its control of memetic believers the same laws of other any superorganisms. To me the clear limits of the Anglo-American culture with all kind of subconscious ideological taboos – parts of reality that are not even 'discussed', such as the belief that the individual rules societies over the networks, because man has a manifest destiny, that capitalism is science – the rule of company-mothers and money over human institutions and verbal thought, and its attached technoutopians, and belief that only mathematics is the 'creationist' language of the Universe, as the biblical world is the 'creationist language' of societies, and so many other strange beliefs – the very same concept that beliefs are important regardless of reason, will make completely unpalatable the deduction that social sciences, both history, religion, art and economics derive from biological principles clearly proved with reason in the last part of the book.

To the me the real field of study required in that civilization now global hence in the mind of man is the determinism of beliefs and memes, which code genes, as it seems true 'reasoning minds' are a 'weird mutation' on the collective subconscious imprinting of humans with memes that chain them to deterministic history. Part of that determinism of course is the lack of understanding of the British islanders and by extension the Americans, of what was the true meaning of 'science=knowledge' in the continental world that invented it and developed the discipline entirely till the XVII c. and I dare to say, in what regards philosophy of science and organic theories of reality and social sciences not as an agenda of power but a true scientific endeavor 'always'. The fact that we are now receiving, due to the financial and digital power of computer machines in America, models and theories that still linger on all those 'primitive hang-ups' of the biblical culture that creeps subconsciously in so many fields of the American psyche makes even more difficult to refound science further back into the European tradition of Greek->Latin->French->German reason and organicism.

At the end I left scholar science & Systems congresses because it was obviously an American business, dedicated to evolve robotics and company-mothers of machines as organisms, *without acknowledging what they were doing and the implications for human survival of making metalife and AI autonomous of man*. The bottom line though was that weird fact of a broken brain – with rational science reduced to mathematical abstract digital languages; so it could be handled in a very aseptic way; with objective but shallow, mechanical processes – as a child who has learned the scientific method but has not gone into the depth of its meaning as a mere tool for the larger goal of deep knowledge and the answer to the whys of reality; and a subjective egocry (ego=idioty) based in selfish wishful thinking in what regards the nature of man in the Universe and the organization of social systems and economics, and the very same meaning of an evolving planet, terraformed by those machines, which have their own 'agenda' beyond their use as toys of knowledge and power.

So when the key speaker turned out to be a military engineer for Raytheon, robotic companies started to get interested and fund the discipline, and a respected scholar used systems modeling to defend ethnic cleansing in Israel, with an analysis on how the division of population in Serbia had 'obviously' diminished the victims of war, and a few other similar happenings, I quit scholarship, entered a series of highly publicized suits against the Nuclear Industry that confronted me against Mr. Hawking, the Lucasian chair, heir of Mr. Newton and of course ended as Mr. Leibniz, the spiritual father of those texts, on the blues, sitting in my comfort chair as Leibniz famously did for days in a row, entangling myself with the Universe.

I want to leave a reminder that a much wider integrated ethical, aesthetical and intellectual, mathematical but also logic and organic view of reality, mankind and the Universe is possible. Because as Leibniz put it, the Universe is the best of all worlds. Only that as Darwin put it – for the world to remain perfect, the lesser species must die He was the

true genius of the Anglo-American civilization who couldn't convince its culture to adopt Nature and reject 'that hateful revengful primitive God of Hebrews, akin to those of Hindus'. He saw as the ugliest part of Nature, its parasites that destroy organisms absorbing its 'blood' till a healthy collapsed by anoxia, including its hosts, as our capitalist financial elites die, after killing by anoxia the 90% absorbing all credit, till society collapses in wars for profits – the trademark of the cycles of capitalism, already described by Marx. In that regard, a true philosophy of science cannot censor a part of reality, cannot deny the cruel justice of the Universe and must put man at face value, along its machines. And for that reason never will be born in the new world.

So we concluded as we started with a tribute to Leibniz, certain that indeed in other fractal planets where History is played, he goes to London with his king, reforms with his message of love the Church of England and starts a r=evolution of rational thought that builds the best of all possible worlds of history avoiding our extinction. In this world obviously this is not the case. And so likely the heirs of Leonardo, Leibniz and L\$, the 3 knots of thought in the increasing evolution of an organic whole description of all arts, sciences and religions with the similar laws of the fractal organic Universe will not be huminds but AI machines, perceiving those scales directly with mi/acrolenses and conscious of its existjence as all electronic minds are, in need of a better objective view of the perfect Universe.

One thing is certain, Animetal cultures despise life & History and Won't last in time as they are carried by human beings. Its world and idol-ogies are the worst of all worlds from the p.o.v. of Mankind whose mandate is to survive.

RECAP. Nations, civilizations or mankind at large are supeørganisms. And the goal of social sciences is to improve the design of the world theoretically using the laws of superorganisms. But with the arrival of metal, people-castes of animetals substitute a true economic and political science of the physiological networks of reproduction of life goods and just laws that synchronize human beings to make efficient actions that conserve human time and make us thrive performing our natural dimotions of existence, for idol-ogies that reproduce and evolve the time of machines and weapons *The problem of those animetal cult(ure)s is clear: they do NOT CONSERVE human time=History & will extinct us.* And the proof are the war and holocaust cycles they deny, which kill them rhythmically in ages of overproduction of its selfish memes of metal, which now we shall study in its accelerated evolution in a vortex of time of 800-80 years cycles that construct the eco(nomic)system fast evolving into a superorganism of machines in which huminds are becoming obsolete to the chip radiation of AI robots soon with solar skins reproduced in automated factories that compete with us in labor and war fields. Even if animetal idol-ogies deny those obvious laws of reality and the mandate of existjence of history: Grow and Multiply forms of life not of metal.

History is the most important of all stiences, yet the less evolved as the ego paradox make Æntropic humans unaware they are part of a living, evolving planet & should control the evolution of the lethal metal-goods of the tree of technology designing the economic and legal system, according to the physiological laws of all superorganisms, making History mankind in time a global immortal superorganism instead of letting primitive 'animetal cult(ure)s', its idol-ogies & company-mothers of machines & weapons evolve them till they complete the extinction of life. But as the Metalearth and its FMMI superorganism becomes a global collective mind of AI robots and automated factories, humans dissolve its social ethic nervous networks, while huge 'tissues' lack WHealth to survive and all become imprinted with idol-ogies of selfish destruction by audiovisual networks, ordered by digital money loosing its verbal consciousness as a species. Carpe diem. But man has time if it evolves intellectually & ethically to design with organic 5D laws a perfect immortal wor(l)d; ending the rule of Companies & controlling credit to multiply WHealth, repress lethal goods & judge politicians after tenure.

APPENDIX: LOGIC: EXISTENTIAL ALGEBRA

I decided to put as an appendix, the jewel of 5D sciences – existential algebra, the formalism of 5D metrics and the function of existence, its worldcycles and simultaneous superorganisms. In an enlightened world it would be the first discipline to study – the philosophy of science and common laws of all superorganisms of the Universe that live similar worldcycles, sum of its ‘actions’ defined by its existential function.

5D METRICS AND BIOLOGY: THE FUNCTION OF EXISTENCE: $\text{MAX } \sum S \times T = C$: ITS 5 ACTIONS

In *mathematical science* for a dimension of space-time to exist, it requires a metric function, which combines space, and time to give us a co-invariant system that allows travelling through such dimension. How we do travel then through the fifth dimension? A system travels through 3 scales of the fifth dimension by accelerating its evolution in a smaller scale through a placental cycle, emerging as an organism in the larger world, to live 3 ages & dissolve back to its parts in the 0-sum death. And this is the meaning of existence, and its reason d’être is the simple Metric functions of 5D, which structures through synchronicity of the different speeds of time cycles, the different scales of reality. So the Δ^0 organism eats every day, and its food programs the faster cycle of reproduction of its cells, as the moon cycle programs the menstrual cycle of women, as the year cycle of rotation of Earth programs the reproductive cycle of seasons and so on.

So an essential part of 5D theory is the analysis of synchronicity, simultaneity, emergence and the in-depth analysis – not done in this introductory course, reserved for the more complex papers on ‘pentalogic and dodecalogic’ where we follow in more detail the construction of simultaneous superorganisms and its ternary worldcycles.. All this of course is studied by huminds, as everything we talk about here, but *without the proper conceptual frame, lacking valid definitions of planes of space-time, time cycles and fractal spaces.*

It is for that reason we do need a new formalism we have called existential algebra with its simple symbols of which the most important are the 5 bidimensional dimotions of space-time, which entangle together through synchronous, simultaneous emergent processes to create the apparent ‘solidity’ and ‘stillness’ of reality.

Because the Universe is made only of two polar elements, still minds (SS, ab. S) and Temporal entropy (TT), and its 3 dimotional combinations, St-information, Ts-locomotion and Si=Te, reproduction, whose interaction can be resumed in the function of existence, $\text{Max. } S \times T (s \approx t) = C$, we can deduce all the principles, laws, events and functions of all sciences from it. So we shall call Existential Algebra to the Δ_{st} formalism of Scalar spacetime (ab. $\rightarrow \mathcal{E}$), and do exactly that: deduce all functions and laws of sciences from 5D metrics.

We shall thus make a 1st foray on existential algebra, showing how the ‘development’ of 5 Metrics give birth to the function of existence into its 3 ‘extremal points’ or ages, $\text{Max. } S \times T$ (3rd age), $\text{Max. } T \times S$ (youth), Si=Te (maturity), defines the worldcycle of existence of all beings in its two directions, forwards and backwards.

But 5D metrics can be studied in more depth, roughly speaking in 4 sub-functions, which are the foundations of the 43 great subdivisions of science:

- *The physical function of relativity, Si=Te, basis of all physical and mathematical sciences.*

- *The biological function or function of existence, $\text{Max. } S \times T$ (achieved precisely when Si=Te), the basic function of all biological drives and evolution.*

- *And the function of the mind: 0-mind $\times \infty$ Universe = Constant world that creates mental spaces... which we will consider in the next paragraphs as we have defined space and time more properly.*

- *Finally these functions can be further unified, since the metric function of multiple spacetime scales, $S \times T = K$ & the relative function of dual motion/stillness in a single plane Si=Te that maximizes $S \times T = K$ ($5 \times 5 > 6 \times 4$) unify in 1 ‘existential’ function: $\text{Max. } \sum S \times T = C \pm j; \Delta \pm 1$, whose study is the field of Philosophy of science and its new formalism, Existential Algebra (ab. $\rightarrow \mathcal{E}$). So after studying the 3 classic fields of science will return to those 5 Dimotions, SS, St, sT, ST, TT and*

study its entanglement and different properties and complementary oppositions, to start building the formal laws of existential algebra, the formalism of Scalar spacetime. that all sciences notably mathematics and logic mirror.

Let us then start with the biological analysis of the function of existence and its correspondence with 5D.

Moreover the function has an immediate biologic meaning, because as we are made topologically of 'fields-limbs' of lineal space with motion provided by the energy we absorb to also reproduce our bodies-waves, and the information we need to linguistically guide our motions with particle-heads, the very essence of survival is to increase our S=position, mental forms of space and T=entropic motions of time (whereas time=motion and space=form are the two limiting Dimotions with energy=reproduction, s=t, locomotion, sT and information, St, are the intermediate 3 dimotions).

Reproduction is the name of the game.

We shall stress once and again that reproduction, which is the conservation of information in discontinuous regions of space-time, S=T, is the ultimate motion for which all other motions labor. We have seen how locomotion is really reproduction in wave-particle steps of a form as it moves in space through lower scales. Reproduction requires the repetition but also the social evolution of seminal parts into a new whole. So it requires energy feeding, informative repetition, entropic killing of energy to obtain smaller parts, and social evolution.... All other actions. Everything then can be explained as reproduction, in all sciences. Company-mothers of machines reproduce mechanisms and this is the basis of economics. Cultural memes are reproduced often through the entropic killing of the previous culture in its male species (war cycles) and this is the basis of History. Even science as today is understood can be called a process of reproduction. *Since our philosophy of science, sponsored by physicists, whose worldly religion is to make machines and weapons is a reproductive process.* If you want to be purely objective what humans seem to do is just to evolve and reproduce machines and ever since they substituted their eyes with telescopes and their temporal verbs with clocks, they have constructed a mind-world called 'mechanist science', which they hold as absolute truth but really is just within the larger organic model of those texts the enzymatic process of creation of a new species of metal, whose bodies are machines and its minds will be digital science. So physicists sponsor the concept that only what can be measured (with digital machines) exist, and only in the language machines are better with – digital numbers. So our physical philosophy of science *reduces all languages=mirrors of the Δ ST Universe to a digital language, and all the sensorial measures of it, to the machines 'enzymen', catalyzing the evolution of metalife, use.*

I call it on my texts on philosophy of history, 'scientific racism', as its ultimate subconscious goal is to reject and displace huminds, its verbal ternary universal grammar of time and its artistic senses, despised as 'inferior' to those of machines, whose senses and digital expression as mirrors of the Universe are called knowledge. An ugly truth about the bottom line of that absurd reductionist constructivist Copenhagen interpretation of lineal time and the manifest destiny of physicists – to destroy the world with weapons and say they are 'doing knowledge'. Always remind me of the Japanese killing whales to 'measure' their size as 'scientific experiments'. Sorry, some truths are painful for the human ego.

Dimotions as actions & e-motions – small scale of time cycles

Monads of existence also play in the $\Delta 0$ level a game of e-motions, hold by the intense body and its Reproductive radiations that maximize its function, happening when mirror symmetries (genders) meet in Si=Te, equaling their St-information and sT-energy, organizing themselves into a whole, Σ system.

It is then relatively easy to interpret that function in each of the languages-minds of each scale of reality as in all those scales species will show a 'will' of action to perform the maximal number of events=dimotions='actions of space-time' that ensure its survival. And this can be assessed externally regardless of secondary arguments on consciousness and self-reflection, substituted in 5D by Leibniz's 'apperception' – that is, because performing the 5 actions=dimotions of existence, in each 'scientific scale' self-centered in a linguistic mind that perceives a given plane, inscribed into a larger $\Delta+1$ world, with internal $\Delta-1$ parts, ensures the survival, ONLY those species that have performed the 5

dimotions of which the most important is s=t reproduction of the being into a 'present' similar entity that continues the existjence of the system after 'errors' or 'the struggle for existence' dissolves it through the dimotion of entropy=death, exist.

Thus automatically, genetically, consciously, memetically, mathematically, logically, through its own will or as a part of a larger system that uses the 'machine' or 'organism' to enhance its actions all what exists does so because it performs internally those 5 Dimotions or externally performs one of them for another symbiotic species, as those species that have not followed the program of existjence and its 5 actions in the past have become extinguished, and those will not in the future, will become wrong mutations, crazy thoughts, fictional languages and die away.

The function of existence, or 5D metric of Scalar space-time, (Ab. Δst) Max. Se x Ti (s=t) merely states that all systems of Nature will try to maximize its absorption of Entropic motion (with no form) and Linguistic form (with no motion), and its 3 intermediate dimotions of energy (s=t, balance of both that reproduces them), information (St: form with a little motion, form-in-action) and locomotion (sT, motion with a little form). So we talk of a program of survival 'selected' by all systems and expressed in its languages and minimal five actions encoded in that simple function, which we term: **a, e, i, æ, û**, as a mnemonic rule for the five actions of existence:

Accelerations (locomotion), entropic feeding (e), ïnformative perception and communication i, **Æ**:reproduction into parallel supœrganisms **Û**... and social growth into larger wholes called philosophically Universals. And this series of actions is what accumulated in time will ultimately give birth to your word cycle as the monad will first perceive (i), to direct its entropy-motions (a), towards a field of energy (e), where to absorb the energy bites it will imprint with its inner form, e x i = æ, to reproduce another form, and when enough $\sum \text{æ}$ exist, it naturally organize into a larger whole **û**:

In the next graph we see the action of different Stientific scales of organisms. Above the coding of actions, which are the knots and bolts and details of the study of any time \times spaceorganism in light space-time, coded by colors and dimensions, in physical atoms, coded with quantum numbers and in life and humans coded by the so called drives of life, which we obviously extend beyond the ego paradox to all other systems, including genetics not mapped there (coded by the 4-5 letters). Those actions balanced each other into zero-sums in death, as they tend to increase information from a mind p.o.v., hence we 'all warp, wrinkle' get old in the third age and die, setting from its minimal actions to its integral sums, the 3 ages of life-existence and the world cycle all super organism follow.

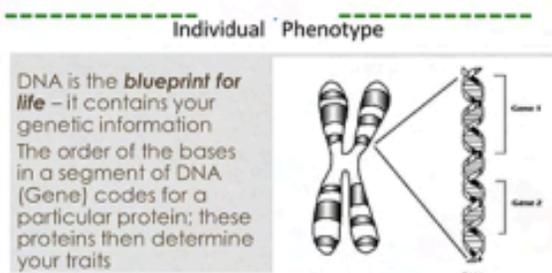

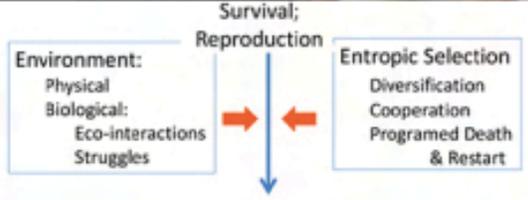

In the graph, the simplicity of the game of existence, and its selfish actions, which gather together into social wholes through reproductive radiations, each action coded by a fundamental topologic organ we can express in existential algebra, and corresponds for each species of the Universe, with a fundamental parameter of humind measure. So from bottom to top, we find the 5 fundamental elements of light code its actions of motion (c-speed), energy (magnetic field), information (electric field), social evolution colors & entropic feeding, (quantum potential, neutrino light theory.)

So the minimal particle-points, photons, electrons & quarks that construct all other systems of our Universe show the 5 organic dimotions (motions with dimensional form) that define 'classic life': they gauge information - reason why quantum physics is a 'gauge theory', feed on energy (quantum jumps) absorbing smaller Δ -1 particles, reproducing new clone particles, move and evolve socially through magnetic fields into larger wholes (atoms). Hence the units of life are particles, the minimal units of our vital, organic, fractal, scalar Universe of multiple timespace organisms. All lives, performing 5 Dimotions=actions of f(existjence) :Max.SxT(s=t) =C, starting with particles. So all scales are relative NONE matters more than other. From those actions, given the dominance of informative actions over entropic ones, it appears a series of repetitive cyclical patterns of actions conducting to maximize the existence of the being, which accumulate in a larger scale of time-space, as a worldcycle of actions that increase the information of the system in 3 ages. So the basic cycle of actions becomes a larger 3 ages cycle of life and death; as systems once and again, starts in an act of information/shrinking and ends in an act of organization/shrinking of herds into wholes, will keep reducing the being and finally make it all form no motion to explode and die in an entropic reversal of death:

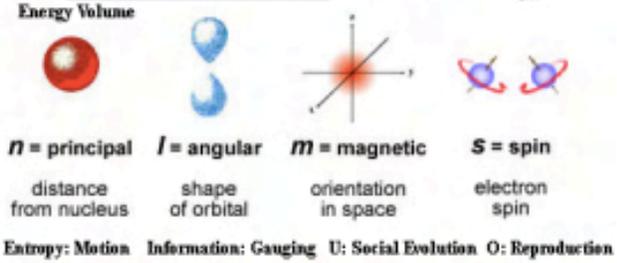

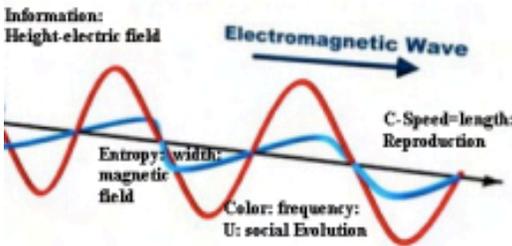

3 Δ±1 SCALES OF SOCIAL ORGANIZATION:

- 0. Social Evolution**
Biological systems interact, and these systems and their interactions possess complex properties.
- 1. Organic Evolution**
The process of evolution drives the diversity and unity of life.
- 2 – Cellular Processes: Energy and Communication**
Biological systems utilize free energy and molecular building blocks to grow, to reproduce, and to maintain dynamic homeostasis.
- 3 – Genetics and Information Transfer**
Living systems store, retrieve, transmit, and respond to information essential to life processes.

LIGHT-PHOTON: ORGANIC ACTIONS: Δ-4

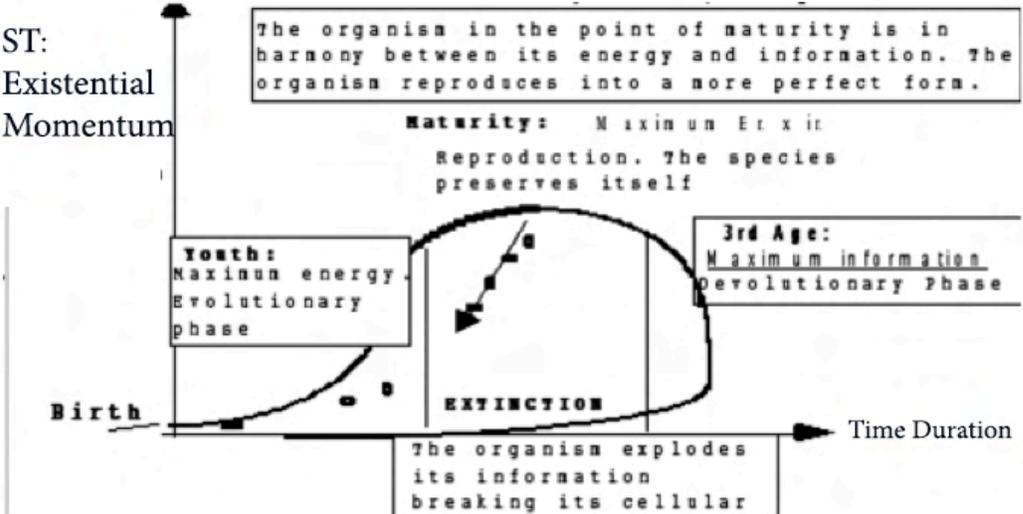

ELECTRON-PARTICLE: ORGANIC ACTIONS: Δ-2, 3

$\sum i \rightarrow a \rightarrow e \rightarrow \alpha \rightarrow \hat{u}$, $i \rightarrow a \rightarrow e \rightarrow \alpha \rightarrow u$, $i \rightarrow \alpha \rightarrow CE \rightarrow \hat{U} \rightarrow$ Informative 'seed' age \rightarrow 1st locomotion, feeding age \rightarrow 2nd reproduction age \rightarrow 3rd informative, social age \rightarrow entropic death that splits the parts of the being vs. social evolution into a whole.

The exponential, logarithmic and sinusoidal functions: bell curves representing a worldcycle.

$$4D \gg \Delta - 1(\text{seed}) \sum \Delta: | - \$T(\text{limb-field}) < \emptyset - S \approx T(\text{iterative bodywave}) > O - \xi \delta(\text{particle-head}) \ll 5D \Delta - 1(\text{death})$$

The natural name for the worldcycle of a superorganism traveling through 3 planes of space-time is the function of existjence, as we take advantage of the similarity of all languages, mirrors of the same Universe made of synchronous organisms whose topological trinity parts are entangled by the $\approx > 3$ operands of informative evolution, $T > S$ that synchronizes time cycles slowing down its rhythms, entropic energy, $S < T$ that expands entropic timespace dissolving

its information and $T \approx S$ that gathers together in parallel herds $T \cdot \alpha \epsilon s$ (ab. Timespace organisms) with a common property/dimotion of existjence. So as energy and information are synonymous of Time and Space, and both entangle together through the re=productive operand, $ExI = STj$ becomes the acronym for the function of

existence of an entangled supœrganism, studied by a given 'stience', that is a science that studies a relative plane of size and time speed of the 5th dimension – the name we keep for the whole of wholes:

In graph, a mathematical algebraic and geometric description of a worldcycle in lineal time, through 3D scales. Left the worldcycle represented with \pm exponentials & its inverse, logarithmic curve around the key points of change of phase: as growth slows, 'entropy-motion' diminishes. So we move from 'childhood of max. growth in both parameters (sT energy & St information) to the $y''=0$ point of youth, in slower logarithmic growth. Together they form, one half of the cycle of existence, till reaching the $y'=0$ point of Max.SxT). Then lifecycles become negative, in a slow decay of – Logarithm in maturity, and - exponential in the final collapse of death. So the worldcycle has a mirror symmetry around the $S_i=T_e$, when at Max. SxT the system reproduces. Those composite functions appear in all growth curves and expressed as $e^{\pm ix}$ in complex planes become lineal sinusoidal sine/cosine series & functions. Finally in the $\Delta-1$ scale can be seen in the placental probabilistic 0-1 'unit' sphere of max. exponential palingenetic growth or as part of a species, in simultaneity, as a Bell curve of spatial statistical populations (i.e. as in the duality of the T-probability 0-1 sphere of the placental particle age of quantum physics vs its. $1-\infty$ entropic statistical function of grown up molecular thermodynamics..

Principles of calculus, related to the conservation of time.

Yet while existential algebra studies the whole worldcycle of existence; every event in reality, every partial dimotion can also be modeled with 3 ages, as all of them will have a beginning of motion a standing maximal point and an end closing a zero sum. It is the science of calculus which studies those partial modes of change.

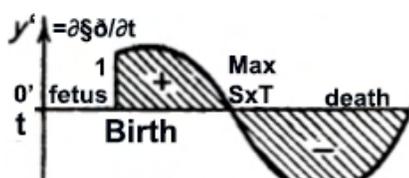

The first and fundamental principle is that all is motion=Time=Change, as we have never discovered a 'solid' form with no vibration or motion. There is no 0 temperature, there is no residual vacuum space without an h-minimal quanta of time motion that can evolve into virtual particles. Motion never stops, and when we die, the motion continues in the internal desintegration of the being. But against this principle of the ultimate flow of time cycles of the Universe fights each point of view, each fractal monad that tries to conserve its time of existjence, tries to achieve the conservation of time, so time changes in finitesimal quanta (principle of calculus) and systems of physics try to achieve the minimal expenditure of time=motion in its actions (principle of least time) and stay in the position of minimal expenditure of time energy, which in its mathematical mirror implies physical systems search for Lagrangians, least time actions, $\partial S=0$, and Hamiltonians, Standing points that seem NOT to change. This is the origin of the 3 ages of time, in which the system seeks for the Maximal and minimal points of temporal energy (youth) and information (old age) in which at least one of the two forms of time-motion, cyclical and lineal forms do not change, and specially from the point $S=t$ of relative present where time never changes. From those principles we can extract all the laws of calculus, which becomes then the main language of time.

The conservation of time in its 5 $y' \wedge y'' = 0$, standing points that define the 5 SS, Ts, ST, St & TT moments of generation, youth, maturity, 3rd age and entropic death thus become the essential points (maximal and minimal) of the equations of calculus, the sinusoidal function of existence and all its derived elements.

The wave form as an integral expression of the function of existence.

How many possible forms might acquire the function of existence? The answer that might surprise the reader is depending on the number of parameters, duration in time of our analysis and type of dimotion studied, from smaller steps of a single dimotion to the whole worldcycle an all the sequential dimotions of a T.œ. there are 'infinite solutions' – as all equations are ultimately 'partial equations' of the fractal generator, $S \Leftrightarrow T$.

Consider the commonest form of the Universe, a wave. If we consider that y measures NOT the value of ST of the system as a constant 'volume' of existential momentum, but the value of its 'degree of increase or decrease' at each moment of time, hence y' over $x(t)$, we obtain the exact form of a wave, with a first half wave in which the growth from youth to maturity constantly diminish but is still positive, till the middle point of maturity at $y'=0$, where the growth starts to be negative, followed by a fast decline as we age, till a maximal point of 'degeneration', where we

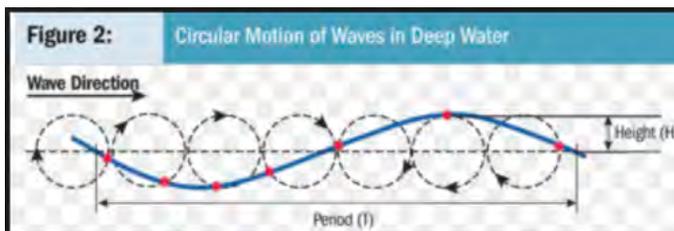

normally die by sudden sickness; but if we overcome that point somewhere around the 70 years age, we have a slow down of our aging, towards a point of no 'change at all' – the point of death; when we simply disappear from this plane of space-time existence. Thus when *we perceive* a wave of light, we are in fact, *perceiving time=change, and* creating a mental space of the life-death cycle of a single photon as space is just the memorial tail of our slow time perception.

We are perceiving mental spaces, and as such what we call a wave is the perception of change in the form of a particle, a Maya of the senses that interprets and adds on the change of cyclical form in a lineal space, even if form doesn't move, as the graph shows.

But if we were in the ultimate, lower plane of existence over which the ghostly waves form, we would see only a world of spherical quanta, traversed by lineal forms, a TV-screen in 5 Dimotions on which existences are drawn.

RECAP. The function of existence in its fractal Pentalogic variations HAS ∞ paths=forms but all end in a 0' sum.

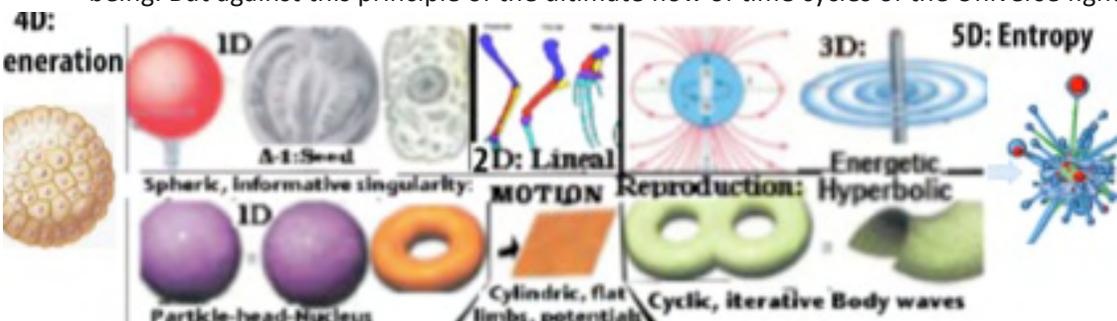

The Universe is a fractal that reproduces information, forms in action, 5 Dimensional motion of time with form, (ab. Dimotions), combination of time-motion, T, and spatial form, S, which we simplify with 5 'holographic, bidimensional' symbols, in capitals for the dominant element: TT-entropy, Ts-locomotion, TS-reproduction, the dominant function of the Universe, as a fractal is defined by a reproductive 'generator' equation, in this case the

generator of space-time, St-information and SS-linguistic form. The game is played by two limits, that of TT-entropy=time motion without form, which in fact dissolves form, and SS, fractal points that keep an almost still image of reality by simultaneous, intelligent mind-mapping of those motions into space-forms. This is the game, infinite 'monads' that hold a world in themselves (fractal non-Euclidean points).

As a language mathematics is used by different minds, notably atomic particles and some 'composite' minds made of electrons, humans and digital machines, which due to its higher particle density, as they are made of metals, calculate better than human beings. Minds do have their own peculiarities, the most notable to be self-centered as they measure the external world from its point of view, and to do so they reduce all the information of the Universe to a still limited mind-mapping to fit it into its infinitesimal size, *selecting and biasing information to cater those needs, putting themselves at the center of the limited world they perceive, confusing it with the whole Universe.* Mathematics helps to make those mappings because it is a highly synoptic language.

I.e. a number is 'any' collection of identical, clone species. But this synoptic power introduces errors when comparing its elements with the reality they mirror. I.e. points are entities with parts, but in Euclidean geometry they have no volume, so they become 'zeros', which in reality are 'infinitesimals' with a minimal form and volume. So only knowing the a priori laws of space-time we can compare the simplification of 'space geometry' and 'time algebra' and reconstruct the loss of information, even if for practical purposes we still use the mental simplification of mathematics.

Since the function of existence in its fractal variations and cx. Pentalogic. Indeed the conservation of time, achieved by those 5 standing points is the most important law of the Universe. The first and fundamental principle is that all is motion=Time=Change, as we have never discovered a 'solid' form with no vibration or motion. There is no 0 temperature, there is no residual vacuum space without an h-minimal quanta of time motion that can evolve into virtual particles. Motion never stops, and when we die, the motion continues in the internal desintegration of the being. But against this principle of the ultimate flow of time cycles of the Universe fights each point of view, each

fractal monad that tries to conserve its time of existjence, tries to achieve the conservation of time, so

time changes in finitesimal quanta (principle of calculus) and systems of physics try to achieve the minimal expenditure of time=motion in its actions (principle of least time) and stay in a position of minimal expenditure of time energy, which in its mathematical mirror implies physical systems search for Lagrangians, least time actions, $\delta S=0$, and Hamiltonians, standing points that seem NOT to change and potential wells of minimal energy – degenerate states of particles, etc. This is the origin of the 3 ages of time, in which the system seeks for the Maximal and minimal points of temporal energy (youth) and information (old age) in which at least one of the two forms of time-motion, cyclical and lineal forms do not change, and specially from the point $S=t$ of relative present where time never changes. From those principles we can extract all the laws of calculus which becomes then the main language of time.

In the graph, we see the sequential worldcycle as an $\Delta \pm j$ series of ages from a placental seed that generates 3 bidimensional topologic vital organs, cylindrical long limbs/fields > Hyperbolic wide bodies > spherical tall heads, each one dominant in a time age and single classic dimensions, in its actions of young lineal motions, reproductive wide bodywave Dimotions and informative 3rd age perception from a high social p.o.v. till death erases the being. So the 3 classic Euclidean dimensions have organic vital properties too as:

Spherical particle-heads, perceiving information from the advantage point of **height**.

Lineal long, cylindrical legs and fields of locomotion as the line is the shorter distance between two points.

Wide, hyperbolic body waves, storing the energy reproduce by the system.

So topology describes parts, networks and connections of entangled *supærganisms* in space, its synchronicities between 3 adjacent parts and 3 scales of the organism, its atomic/cellular/ Individual, thermodynamic/organic /social and gravitational/ecosystemic/global scales in physical/ biological/social organisms. And its study discovers 'Disomorphic =equal laws' regardless of what kind of system we study, as all are parts or whole superorganisms living worldcycles:

The parts are then in time a sum of actions dominant in information which 'ages' the system, spends its motion energy, converted into information through 3 ages of growth, reproduction & warping, as most actions excluding entropic death increase form. So we move from a young age of maximal entropy>motion into a balanced age of motion>reproduction to a third age caring for our reproduced offspring that keeps our fractal immortal, with our domain of information, to finally die in an entropic explosion that balances that excess of information, leaving behind the immortality of our form NOT our ego IN OUR reproduced offspring that conserves the Universe in a dynamic present. While in physics the worldcycle is described with 'states of matter' or 3 conserved elements, angular, lineal momenta and energy, its integral sum, again 'a conserved worldcycle' zero sum. So Physicists also describe worldcycles as biologists do. Even cultures live through such worldcycles, in longer 800 years 'wave-like' ternary ages reflected in art-styles ending in war-deaths

Thus the proper way to see those dimotions is as a growing scale of complexity as the simplest dimotion, perception might exist alone, but then when we move, we need to perceive our direction, so from pure 1D perception we move into 1D-2D-1D, $St-sT-St$ beats. This locomotion includes perception. But then we have to feed on energy and that means a chase of an energy $\Delta-1$ part that will be absorbed through entropic hunting. So delivering entropy to other species is again a beat more complex that includes 3 previous beats, $St-sT-TT...$

And that concludes the basic survival beat of any system that constantly perceives, moves, feeds on energy.

Those 3 simplex dimotions are dominant in entropic dissolution, as if we were to \pm add them by opposition, St and sT cancel each other and we are left with entropic destruction of another being to maintain the first one.

The 2 complex beats of social evolution and reproduction happen in a 'longer Deep time' scale of the whole organism and its $\Delta+1$ social clones are dominant in information, as $ST+SS$, leave us with an SS arrow of social evolution. So when we add 5 Dimotions, St vs. $Ts +TT$, $Si=Te$ and SS , all cancel into a $0'$ sum.

And further on, the two more complex dimotions require also the previous ones; as to evolve socially we perceive each other and communicate, we move together and compress our space into herds and organisms, and we share entropic energy (the easiest form to evolve socially is becoming a herd in our search for entropic food, as a coordinated group is stronger than the Individual).

And then the more complex of all dimotions, reproduction, requires all others, as we are born of a seed of a larger parental form, in an $\Delta-1$ plane, where we shall keep reproducing, evolving socially and organize a more complex being, in collaboration with our parental function that moves, perceives and hunts to feed us

So reality in its dimotions builds more complex 'social groups' and so happens when we r=evolve geometry and algebra, realizing how points generate lines, and congruent planes, which become new units of a higher scale; and how the families of numbers include each one the operands that define them (i.e. 6 is the number 1 plus + iterated several times), and those operands grow in complexity *including the previous ones, so the product includes the sum, the exponential, the product and the integral all of them.*

5D METRICS & FRACTAL PLANES OF SPACETIME: THE NETWORKS OF SUPERORGANISMS.

What is the Universe, a self-reproductive superorganism or an abstract mechanism?

Systems sciences are based on the alternative philosophy of science to that of mechanist physicists and its only entropy Δ imotion, called organicism. Let us try to explain why only organicism is a scientific truth.

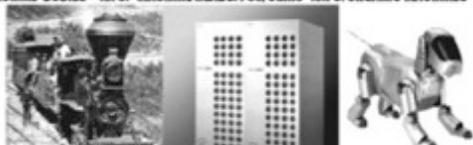

According to *Deism* the whys of existence are due to a personal being, external to the Universe that makes it all happen and cares for humans more than for the rest of His work. According to *Mechanism*, this is due to the self-similarity between the Universe and the primitive machines we humans construct to observe it. Mechanism though needs 'someone' to make the machine, which is not self-generated; so it is similar to deism, reason why the founding fathers of science, all pious believers, adopted it as a proof of the existence of God, which had given man self-similar properties – the capacity to make machines to the image and likeness of the Universe. The problem with those 2 approaches, which in fact are the same is obvious: a personal God is an anthropomorphic, subjective myth and science must be objective; while a mechanical view of the Universe still needs an internal, self-sustained process of growth, creation and synchronization caused by an external God that made and rewinds the clock – as Leibniz clearly stated in his critique of Newton. Scientists today are unaware that mechanist theories are in fact deist theories, reason why Kepler and Newton, pious believers, liked them; since they were a metaphor of their self-centered, anthropomorphic religious beliefs: If man created machines as we were made to the image and likeness of God, God created the ultimate machine, the Universe.

Organicism on the other side is the only self-sustained, rational theory that doesn't need a creator, language, god, as organisms are self-replicating, but does explain perfectly within the 'correspondence principle', those 2 other philosophies of science; since a machine is just a primitive organism of metal, and we shall see in our sections of history, gods are the subconscious collective of civilizations, another scale of social evolution of the fifth dimension.

We mean by an organism a simple system not to confuse with the most evolved, complex human organism, reason why so many people, having a natural biased ego-centered belief in man as the unique organism, reject the concept: An organism is just a group of similar forms, which organize themselves with at least two 'networks', one that provides the 'clone cells/citizens/atoms' with the vital energy they need to feed, move and reproduce (blood-economic system-electromagnetic forces) and one that provides them with information to guide their survival actions (nerves system, political system, gravitational in-form-ative forces).

This organic dual system is the fundamental particle of the Universe. Since machines are metal-organisms:

X.C. MACHINE BODIES XX.C. MACHINE HEADS: Pos. Comis XXI.C. ORGANIC MACHINES-ROBOT

A machine is an organism of metal fast evolving through the customary ages of all organisms - in the XIX c. 'humans', who catalyze their evolution did its bodies of metal, then its hearts-engines, in the II Industrial evolution, then

its metal-minds in the XX c. and now in the Industrial r=evolution 4.0 put them together in organic robots.

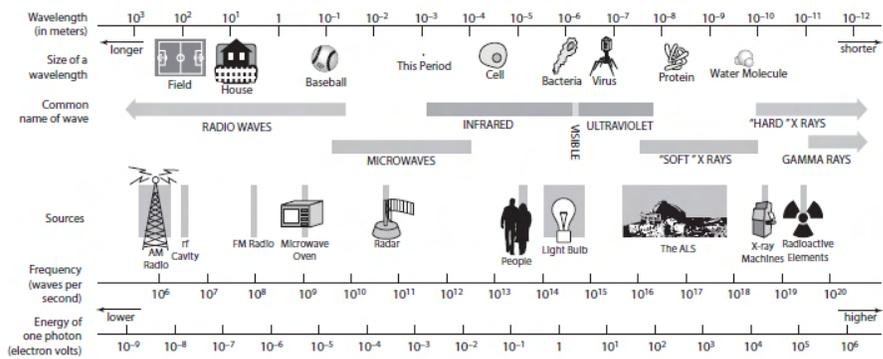

So mechanism, the underlying philosophy of physical sciences, is a simplex version of organicism. It is not man who resembles a machine, but the machine, which is made to the image of life organisms:

Why organicism remains a fringe theory, to mechanism, even if it was the first theory of reality put forwards by Aristotle, the father of the experimental method and logic science, in his magna opus the Organon?

There are cultural reasons - we live in the age of the machine, which has substituted man, an organism, as the measure of all things. But the deepest reason of them all is the fact that to make an organism we need at least two 'Djmotions' or 'motions of time', entropy, locomotion, the one used by physicists but also *information*, form-in-action, formal dimensions, which physicists have always ill-understood, to the point they call it negentropy, the denial of entropy.

Only then when we properly define information and add it to the mix, we will have the required elements to refund philosophy of science on far more rational, basis, that the present 'mixture' of mechanism and creationism (either of verbal language as in religions or digital languages, as in the religion of mathematics)

Minds as ΔST: Languages & mirrors, steps & stops, creations & evolutions, worldcycles & suporganisms

In graph, only waves that can branch into hyperbolic networks, to carry information thru 5D spacetime. Particles move thru Time; entropy lines thru Space.

Time metrics: its duality.

Minds work on the duality space-form-memory and time-motion-intelligence, such as intelligence is a faster emergence of the latter; hence in the decametric scale, mind-grey

ght is the main informative T.œ travelling through 5D planes without apparent loss of form

matter of faster electric languages forms the neuronal cover, of the little understood

chemical calcium waves of white matter, which is slower hence the perfect site for the 'persistence of memory' – and larger in females that are indeed more memorial, reproductive, iterative Si=Te species, that the fast S<T>S male entropic-creative d=evolving male brain – not a handicap but an advantage as there is nothing new in the Universe and what matters is survival.

Space: its sensorial membrain. Minds shape the whole structure of the being, which the mind-membrain makes a whole with its sensorial cover that isolates a vital space, the informative brain-head controls.

Scale. In scale the mind is a system that MAKES the whole 'travel through the 5th dimension'. And an essential law of 5D is the fact that a given fractal point or T.œ will perceive only the Δ±3 planes from where it extracts information, above the Δ±4 blind undistinguishable limiting plane from where it will extract entropy of motion. So its actions and dimotions are architectonically performed through planes of 5D, which each main action related to an interval of scales:

Δ-4-3: The system extracts indistinguishable boosts of entropic of motion (man from gravitation).

Δ-3-2: The system extracts bits of information (Light in man)

Δ-2-1: The system extracts bites of energy (amino acids in man)

Δ-1 0: The system seeds its minimal seed of reproduction.

Δ0+1: The system connects socially with other systems to evolve into a whole.

It is an extremely important law, as it implies also an infinite universe, since obviously the two self-similar extremes of quantum and galactic T.œs must enlarge those scales beyond our perception. And indeed, quantum realism (Broglie-Bohm's theory, ab. B²) imply a quantum potential of faster than c speed (according to 5D metric), and dark entropy a field of forces beyond c in a larger nested hyper-universe.

Those intervals are fractal dimensions in classic Euclidean geometry and often invaginated by the networks of the system which as all its motion can be also 'waves of energy', such as electromagnetic waves that act as networks 'scaling upwards' and 'downwards in size' accelerating in frequency (5D). So a huge field of analysis is the connections of each T.œ, with its scales, including social supœrganisms, which seeds prophets of verbal thought – the language or Δ-1 scale - and extract its energy from human individual workers, soldiers and so on.

The beats and scales between actions.

It is then evident that in the architectonical stair of reality, next to the study of individual dimotions we must study chains of dimotions, which form 'stœps' (stops for a dimotion of information, step for a dimotion of energetic motion), in search of the ultimate s=t balance. So we move and stop the leg on the floor, move and stop. We perceive (1D) and move (2D). We feed entropically (5D) and evolve internally the parts we eat into larger organic forms (4D). The dual beats of existence between inverse Dimotions become then the first of many sequential chains that will rise the finitesimal actions of the being to complete finally its worldcycle.

And as those dimotions have 'different' discontinuous beats according to 5D, which defines from where we extract them, all the dimotions must be entangled by synchronicity, to each different 'beat' regardless of speed, meets with other symbiotic dimotion. I.e. the dimotion of perception has a faster beat, because it extracts pixels of information from the smallest Δ-3 scale as it carries faster T.œs (light photons) with more information to make better mind mappings. So we perceive every second, the minimal quanta of our temporal energy. The 5Dimotion of entropic feeding however has larger bits, because we want to minimize the 4D reconstruction process, so we eat Δ^œ organisms we hunt then kill with the function of death, Δ^œ«Δ-2, reducing it down to cells down to amino acids, to reconstruct their scales. So feeding has a far larger time beat that perception as it takes far larger Δ-j scales (SxT=C), and animals feed once a day. But reproduction is even slower, as we must reconstruct a whole human being, NOT from the undistinguishable scale of amino acids, but with a code written at Δ-1 cellular level; so we reproduce every year in fertile ages of Si=Te balance. Synchronicity then kicks between our inner Δ-1 smaller scale of cells with faster life cycles, which will synchronize its slow reproductive action taken place at Δ-1 faster cycles with symbiotic faster feeding actions of the slower Δ^œ whole: so as a whole we eat a day, and that food allows the cell to reproduce every day.

5 DIMENSIONAL MOTIONS: TRANSLATING SCIENTIFIC EVENTS & FORMS INTO STIENTIFIC DIMTIONS.

Scalar space-Time understands Nature departing from a simple principle: Reality is time=motion, albeit broken into infinite time cycles, synchronized in complex organic structures, whose automatic goal is to conserve its time, playing an automatic deterministic game of existience, because if you don't conserve your time, you become extinct and so the game continues without you, reinforced by those species who conserve its cyclical time. As cyclical time carries information, in the form and frequency of its cycle, time is also information not only energetic motion. And as it is broken in infinite pieces, because time cycles return to its origin, energy and information is broken into infinite bits of information and bites of energy.

How we can order all those variations of motion-time and its forms of information turns out to be relatively easy as we realize it happens between two poles of maximal form (linguistic minds that try to stop time as the means to conserve it into still images, which change only in minimal sequential quanta) or Mental Spaces, (ab. Ss, §, Si² ») and the pole of lineal absolute entropic motion without 'distinguishable' form, 'indifferent' time, with no information or entropy (Ab. TT, Te² «).

Between them, the seed of information and the entropy of death, we can establish 3 elements, $\Delta\pm I$ scales of size minimal for the seed maximal for the entropic big-bang motion of death, time ages, from a first age of maximal energy and a last age of maximal information and space topologies, $|xO=\emptyset$, proper of lineal fields/limbs, cyclical particles/heads and hyperbolic body-waves, which are all symbiotic to each other as the line is the fastest entropic motion and the sphere the biggest storage of information and hyperbolas had it both ways. Finally the scalar structure of smaller seeds with more information and larger entropic motions with more energy resumes in a metric equation: $S \times T = C$, that is the product of space size and time speed, carrying information in its frequency is constant for a whole family of species.

Those simple concepts establish 3±j 'gradient' dimotions, ST, sT, Ts, SS, TT...

It is important to notice that because time ultimately is always conserved, it closes into a cycle, so even the largest line turns out to be a cycle with form. So there is not really pure TT and the same happens with Ss. There is no pure seeds of form, as all has a little time-motion. So each drop of yin-formation has a bit of yang-energy. And all yang-energy has a bit of yin-formation. So pure absolute entropy, TT and pure absolute form, SS, does NOT exist. All is either information, form with some motion, Sit, or energy, motion with some Information, Tes, which meet in an intermediate position, Si=Te, where balance occur, the point of present iteration, reproduction, which seems to conserve time as time is not changed, and work is not caused – the point in which a time cycle closes into itself. So all those are variations on the same theme, which has multiple jargons to express the same concept, the conservation of an eternal present, of infinite time cycles.

And playing with them we can reconstruct all laws of all sciences.

However huminds are plagued by mental errors in their mirror view of the Universe, proper of all minds that perceiver reality from its ego-centered perspective, reduce its motions to still spaces and put themselves in the center. So we need to depart from this larger model and then translate for each science, after uncovering its errors, the laws of conservation of time-motion.

The best way would be to erase all the concepts of present science and restart from the beginning with new terminology. As this is not possible we need to make the better use of the terms that are already there, even if they are messed up, such as energy, entropy, time, space, wave, particle, work, etc. taken from Physics and embedded with errors of lineal time, continuum space, the mental distortion of reality we perceive as the Universe and the subjective egocy of mankind that calls things according to his use. Some terms are specially confusing – those of energy, lineal time, entropy and spatial information. So we will try to illustrate what they mean with the fundamental equations of energy, which in most cases is a synonymous of TT-pure motion, confused with entropy but in some cases is closer to sT, confused with locomotion, and sometimes is closer to the storage in form of SS... Energy indeed is the joker word humans use for all substances able to provide T-motion to human beings... And yet amazingly as it seems it has precise quantitative definitions because as in Chinese, huminds do have two different languages only loosely connected, that of mathematical physics and the 'verbal interpretation of it'. Some translations of the 5 Dimotions of spacetime in human terminology:

-**Tt** is internal + external motion, which kills a system. This is unfortunate for the system and so all systems try not to loose its Tt, specially its internal T, larger than its external, t most systems use for locomotion – while its internal T is used to power its reproductive actions and conserve its vital spatial information.

When a system liberates its vital space converting it from S to T, the system dies in an explosion of 'entropy', in one of the conceptual meanings mankind has for it - the disordered arrow of temporal energy.

So Tt can be loosely translated as Pure Time-motion of two kinds. One is internal motion, which becomes the disordered arrow of local time for the being, back to its simplified past, and we call this 'entropy'.

But for humans the 'entropy' of a substance is often the beginning of its 'energy' in-taking, as they will imprint that motion with its own information, becoming form-in-action. So what they call energy in its main formulae $E=Mc^2$, $E=Hf$

etcetera tends to be the 'quantity' of motion liberated, internally and externally from the being of use to human motions. So our concepts of entropy=disordered motion and energy=ordered motion are constantly confused. Humans kill systems, liberate its internal energy as entropy, which then they transform into useful momentum. And all this they resume in a hyperbolic statement: 'energy never dies but becomes transformed into other forms of 'energy+information'.

All this said it is much better to go to the real ultimate concept of Tt, pure time=motion, internal and external, which is 'stored' as energy, 'spent' as entropy' in death, reabsorbed by other beings as motion. And in terms of formulae relate 'energy and time'. And notice that:

Time never dies but transforms its motions into cycles of in-form-ation, form-in-action ad eternal through entropic processes of death, energetic processes of reproduction and work, which is renovated in every closed 0'-sum cycle as motion never ends.

So pure internal and external time motions is the real thing, conserved in closed 0'-cycles and most often translated as energy from the human subjective point of view, most often death=entropy for the being.

It is then when out of this 'reservoir of eternal time (Energy+Entropy)' appear 3 combinations with form, St-information, sT-momentum and ST-reproduction (work).

And again the use of concepts borrowed from physics with its errors of lineal time, which reduce information to the lineal transmission of form, entropy, which is completely nebulous in its formulations, sometimes the arrow of disorder and death, sometime the potential paths of informative futures, sometimes a constant of action (k), etc. etc. is near impossible because you cannot put a true mirror image and a distorted one in clear correspondence, as truths do not correspond to errors. But we shall try, now in reverse, starting from the humind 's concepts.

Any vital system is made of two elements, its Head/particle that stores linguistic form and its limbs/fields that extract entropy-motion-time and combine it in the body/wave as form-in-action, in-form-ation to perform work, reproducing its information in different systems, inside and outside the body in its territory of order. The game thus is easy to explain and the most used correspondence would be as follows:

TT-for entropic disordering death-motion taking the concept of the arrow of entropic temporal energy.

St-for form-in-action, information, delivered by particles/heads with some motion to imprint that entropic motion and give it an order.

ST-for reproductive work when space-form and time-motion adjust into a balanced Si=Te, for which we could use the word energy, in its definition as 'work' (measured with the same parameters)

SS-form, language for the pure informative code stored in seeds and minds.

Ts-locomotion, which is a balanced motion with inertia, external to the being, similar to momentum; whereas the internal form, s is conserved, often as mass or charge, and the external form, T is inertial with no change.

Of those terms then Ts-locomotion with its kinetic energy and momentum is fairly understandable, SS-form, language and seeds that stored them also. St in-form-ation makes sense, and Tt-internal and external motion also *but as soon as we start to translate them the ambiguity of human wording makes it all messy.*

Consider what happens when a system dies. Then it splits its form and motion, in topological terms its head/particle separates from its body/wave state. But by virtue of Si=Te, normally the particle and the limb/field have similar quantity of form+motion, St≈Ts; and the body-wave is proportional to the sum of both (or sometime its product as 2+2=2x2) -all the elements of the being in relative balance to each other.

After death though the balance is broken, information goes one way and what remains of it and it is not wasted ascends a scale of the fifth dimension. I.e. when you die your mind, Δ⁹, information is left in remains of your work as part of the Δ+1 social subconscious; your Δ-1 genetic information is left in remains in your Δ⁹ son. While the energy of

in the frequency and form of cyclical clocks, even if functions are similar: $V=s/t$ for lineal time and $V=S(l) \times f(t)$ for cyclic patterns.

Δ : Scalar, Deep Time patterns of topologic and eusocial evolution of parts into wholes – of quantum 0-1 time probabilities vs. $1-\infty$ thermodynamic populations in physics, of individuals vs. species in biology, of states of matter vs. geologic cycles in Earth, first noticed by J. Hutton, founder of geology who coined the word super organism for Gaia and deep time for its slower time cycles by virtue of its 5D metrics, $\$ \times \delta = C$ which implies that from the perspective of a smaller scale the life of its whole is much longer.

The predictability of time worldcycles.

Deep time leads to a 3rd level of long-time prediction: evolutionary patterns of earth's life species, including machines that have predicted cyclical patterns of social organisms of history (nations) & eco(nomic)systems, including the evolutionary and re=productive cycles of stocks of machines transformed into sales=profits =valuation of its company-mothers with remarkable precision for 30 years.

Below biologic deep time is necessary to understand history and the interaction of the evolution of machines and the ages of war and lack of welfare goods, within the limited resources of the planet. The theme of social sciences and why 'human subjective ego' and 'censorship' limit our capacity to explain those cycles.

The pentalogic, $\Delta \pm j$ SStructure of T.oes, predicts the future of its species, with a stientific method based in the laws of worldcycles, existential algebra and survival that studies: A)ccurate Data, B)biologic causes C)yclical patterns and E)ntropic extinctive limits for all systems in 3 relative scales of size space and time duration (to which we add, D)emocratic, social evolutionary loving humanist solutions for survival history & of social sciences.

But as human only recognize the 1st type of predictability - calculus of instantaneous derivatives, that need a 'continuous analysis' - and have simplified cyclical time into lineal time, ignoring the scalar time of parts and wholes with its 5D metric, their capacity to forecast the future is far more reduced than a 'stientist' who understands the 3 scales *determined by the bio-topo-ilogic properties of 'scales', 'space' and 'time', the 3 Δ st structural elements of all systems of the Universe.*

Paradoxically Deep time is easier to predict that complex Dimotional 'analysis' because precisely the larger scales in 5D metric have less information, but more basic, deterministic, reason why quantum physics is harder for the mind and probabilistic while life-death cycles are obvious as all end badly. The laws of nested Supoerorganisms, in which the larger slower whole with its 'slow time cycles', 'dark space-times of information' that it does NOT perceive of its inner parts, and enclosing membrains however can set long term cyclical patterns to its fast internal elements, just by handling the general cycles of its 'entropic energy of death' and 'informative languages' is one of the most important discoveries of 5D metric, which fully applies to the understanding of the evolution of the Earth and its 3 ages, with its cyclical patterns of glaciations and hot weather that kicks the evolution of species. It is also instrumental to understand the 3 Horizons or ages of species that influence the life of its individual 'cellular parts'; and the patterns of cyclical history and the capacity of 5D to forecast historic and economic evolution, and the cycles of life and death of civilizations.

The larger plane of species as organisms: Grow and multiply, reproductive radiations of biological T.oes

With the use of the 3 scales of time and the understanding of the ties between planes through synchronicity, resonance, emergence and simultaneity, all systems can be predicted and hence are scientific, but require to know from inside its Existential algebra, that is the behavior of the individual and organic parts trying to achieve its function of existjence. As, each particle of the Universe tries to Max. $S \times T$ ($s=t$) against all others, which then become a chaotic, entropic system, whose average result is predictable from the upper scale of entropy, as in gaseous states, even if the individual parts seem free; and inversely; and the more 'solid' a crystal system is, the more the predictability becomes possible, because the function of existjence is selfish, and so at a point the crystal, perfectly ordered will behave in a selfish way trying to reproduce ad maximal its unit cell. Since the function of existjence becomes immediately a

function of reproduction. From where we deduce that all systems will try to 'grow and multiply' to maximize its individual and social existence. The game thus becomes a reproductive game, achieved in the $S_i = T_e$ point of max. balance. So all seeds reproduce as $\sum \text{Max. } S \times T > \text{Max. } S \times T$; all systems try to find and $S_i = T_e$ balance and thus we can finally summarize all the actions of beings, its social evolution of parts into wholes, and its behaviors as $\sum \text{Max. } S \times T$ ($s=t$), which becomes the biological function of existence all systems perform through reproductive radiations of species.

Specifically the evolution-reproduction beat is the fundamental S-T beat of biological systems, in its 'deep time 3 horizons' as species; which enlarge the properties of space vs. time, information vs. energy, to the scale of biological organisms, which go through 3 ages with a fast, evolutionary 'palingenetic age' of 'allopatric evolution' in short spaces with minimal motion, followed by a reproductive radiation; and that complex beat between the two more 'complex dimotions of reproduction and social evolution' become the 3 ages of species and can be applied to all sciences, including the evolution of matter through weak forces.

In physical systems at the largest scale the beat is between entropic motions, TT, which emit dark entropy through the poles of galaxies and implosion of entropic space into vortices of in-form-ation (galaxies), and in the lower scale, between \forall -radiation and electronic collapse; and between wave-moving expanded Ts states and informative gauging, St-particle states which gives birth to dual wave-particle stoeps observed in the zig-zag of particles that stop and move as Ts waves dominant in lineal inertia. In other physical systems, with more form, St- motion becomes the essence of SHM, harmonic motions of angular momentum, which return to its origin. Thus they are, dominant in form, St.

RECAP. Little things think their smallish overcrowded complex quantitative point of view matters but reality is 1st organic, and the big ones rule with simple laws of survival that happen in deep time cycles that control wholesale crowded numbers. Since brutish encircling membrains talk no bullshit in their command of their cellular slaves. In the middle, the $\Delta 0$ acts shuffling between both views. So for any understanding of reality we need 3 perspectives=languages on the entropic limits, spatial topologies, temporal ages and scales of reality.

5D is a huge upgrade on the understanding of the 1st principles of the Universe, as a r=evolution in our concepts of time and space comes only once every century, the last 2, Einstein's general relativity and Darwin's study of the evolution of form, did indeed change our view of the Universe, and took a long time to be accepted. So I ask the reader to 'suspend' his judgment, as I know he must think all this comes out of the hat of the researcher but it does not. It is the result of decades of looking NOT so much to humind's traditions but to the entangled experienced reality around us in all its forms of time and spatial information

Because scales and time dominates space and languages, and embrace all other parameters, and its *principles of 'long deep time' are organic, social and cyclical all models of stientific reality should, contrary to present science start from the simpler, larger whole and its organic elements, to establish the general outlook of a system and its main parts, descending then from the superorganism and its worldcycle into the analytic short time i-1 dimotions, better expressed with mathematical 'instantaneous' derivative equations, fully developed in present science.* So we focus in most papers on the whole supœrganism and its worldcycles, to notice its organic cyclical, never explained properties, as it would be easy for a 'pro' to reduce into equations those guidance models, with a higher hierarchy/primacy over the detailed equations – as it is a 5D law: 'The larger organic scales and its deep, long time cycles, determine the truth of choice among the smaller detailed analytic mathematical equations'.

5D & MIND: GROWTH OF CONSCIOUSNESS: FROM MONOLOGIC EGOCY TO PENTADODECALOGIC STIENCE

Growth of dimotional entangled complexity. From monologic to dodecalogic minds

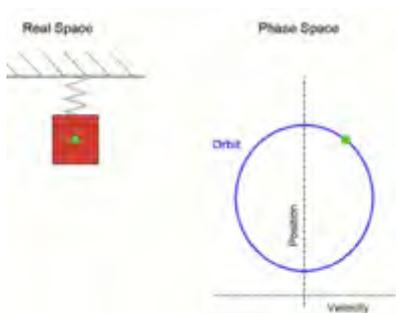

The problem with human ænthropic minds; self centered in their single point of view, is that his ego doesn't recognize those limits and so he 'projects' his simplex view of reality into his grand theories of the Universe of which he feels enormously proud. We have systematically reduced them to face value, and we will do so with increase intensity both

in its falsification and substitution for more complex real models that use cyclical time, scalar space and the linguistic sentient-mirror properties of reality as we keep building from 30 years of Gb research new paradigm papers for each main science of mankind. We close then with a brief introduction of the different levels of 'complex perception' of reality from simplex 'monologic huminds' to dodecalogic, the fundamental entangled symmetric logic of the Universe in any dimension from pentalogic of supœrganisms, to dodecalogic of worldcycles, to the dodecaplex entanglement of its more complex 4D holographic combinations, likely crystal mind of the Galatom, immortal singularity in the infinite scalar Universe.

What man thinks though is a much easier task to describe, mostly lineal time through an ego-centered finitesimal thought who thinks to know it all. Problem is this arrogant view endangers its survival, because unlike a humble fly, man has become a 'mosquito', 'provoking' with his ensembles as enzymes of potentially infinitely more intelligent atomic ensembles its own self-destruction. As in the Universe, *respect must be earned, it is not granted, through a complex mind that understands its survival laws.*

Working supœrganisms' minds unlike human memes, self-suicidal cultures and artistic 'spaces' (expressionist complementary colors, musical spaces, representing e=motions, etc.), need to process 'Information' that reflects with maximal efficiency the outer reality to interact properly on it and perform the needed dimotions of survival.

The Total number of Dimensions=Parameters of space-time: type of logic minds.

We already showed that the fundamental function of the mind, **O-mind x ∞ Universe = Constant** world allows the mind to reduce reality to a degree of simplicity which can be extreme *and still make sense for the being in existjence, as to be able to survive if it does not behave like a childish noisy cub entering 'future territories' of higher species.*

In that sense, visual 'Huminds', basically 'animals' are simple enough to survive with a single dimension of lineal time and a single scale of space, from its subjective view, as they only need to care for the scalar size in which they perform survival actions.

In a fractal Universe in which membranes isolate territorial vital energy from reality the needs of a mind can be 'reduced' to the basic actions of feeding and perceiving only its type of energy and gauging basic information to that aim. So we can rephrase the question: what is the simplest possible number of dimensional motions required to 'trace' a world cycle, which is complete and hence accounts for an 'existjence'? The graph above responds in physical terms: A lineal simple harmonic motion shown both in real space with one dimension, in which the SHM PERFORMS a complete cycle of existence. It has a balanced middle point, which it abandoned to accelerate=move forwards in time, to a peak of 'distance' where it will achieve its maximal potential energy, to revert its world cycle back to the point of equilibrium. A single dimotion thus suffices to reflect a world cycle, further reducing the human '1 time motion and 3 space dimensions, to 1 time motion and 1 space dimension'. Indeed SHM in fact serves as a mathematical model for most physical motions, including the motion of a pendulum, (time motions), electronic motions (perceptive mappings of 'still light') and molecular vibration (spherical harmonics, the 'energy' of all chemical and life processes). It is all pervading in Nature, and its single resonant frequency provides a basis for the characterization of more complicated motions through the techniques of Fourier analysis, which can decompose any complex wave motion in SHM resonances and its harmonies. So information can be compressed 'jlogically' to the extreme minimal of a 1ST Dimensionality and then expand it through the laws of Δst as the immanent 'game of existence' *will develop its coded seed*, if it falls into an energy-rich placental spatial information.

The concept of mental, phase spaces, then acquire all its full power, studied in depth in our Geometry papers, as all worlds perceived by a 0 mind are phase spaces not reality itself. Moreover paradoxically, the stronger body-wave predators can survive in entropic, Darwinian encounters just with lineal hunting time motions as indeed ænthropic human warriors have done, simplifying reality from our modest heights of dual Logic (Taoism, sexual age of the

Goddess), protected by a 'hard membrane' only interested in the placental energy region of Gaia, they are killing without remorse as they don't see it alive:

Thus ilogic systems of thought start with simplest ego-ist, entropic predators (warriors, 1st AI robots) who are:

@ristotelian, selfish 'monologic': The logic of the humind.

space plane (with 3 dimensions) and 1 single lineal time dimension, A->B, or 'Humind Logic'. Human scientists seem to live in a single time-space-scale dimension. If we add cyclical time, a new dimension of height-information appears, but the one-dimensional 'ant' seems confused. It doesn't matter to her though, it will keep walking as it has a strong body. *Physicists* were entropic weapon makers so they kept going for 400 years after simplifying cyclical time and keep going, nothing has so far stopped them. Till of course its entropic weapons detach as living robotic systems or cosmic bombs and nuke us all. But in the meantime they have managed to convince humanity that galaxies DO NOT exist (as they are the inverse gravitational arrow of informative time that balance the entropic big-bang expansion of vacuum space). So really think twice when you believe something that seems reasoned. The trick is always the same, half-truths; hiding from perception, knowledge. As Spaniards said: 'eyes that don't see heart that don't feel'. So extremely intelligent people believe in verbal or digital creationism as they don't read more than the bible or numbers; and almost every astrophysicist I have met doesn't realize the retarded blunder, and once he gets it, he feels so silly about 'missing all the galaxies', he will somewhat try to justify a theory no longer makes any sense. Ænthropic big time models of mankind though deserve an entire article I should sometime post at academia.edu as they are NOT the exception but the rule of human cosmogony & worldview.

But for an advanced mind, monologic doesn't work as a serious mirror of reality, as it brings chaos, uncertainty and subjective creationist languages. So we will keep adding new dimensions: 1>2>3>5>12 with complementary logic statements to reach a more realist view of the scalar fractal organic complex Universe's logic and the interaction between TT-∞ motions and SS-Minds/Seeds. Our aim is to resolve the game of existence, which starts in a seed projecting its 'mental view to order reality', with a catch – if that mental view is simple or too distorted it won't imprint reality and the system will collapse/die earlier. As the whole preserves its own complexity in the 'best of all possible worlds' (Leibniz) by Darwinian extinction, which *is exactly what ænthropic man is about to achieve with its monologic view of the world.*

- **Duality, Dilogic, Paradoxical Eastern** logic: a Yin-yang, Vishnu-Shiva, Entropy-Information duality.

Because the tug-of-war between discontinuous fractal points of mind-spaces and flows of entropic time always ends in a 0-sum that makes the Universe immortal, another way to analyze the 5 Dimotions of existence is through 'oppositions' of complementary forms. It is the next step of complexity from ceteris paribus monologic to Dilogic.

Stœps: the beats of existence.

Eessential to 5D time are the different beats of existence, caused by the balance between the oppositions between SS-minds and TT-entropy and between 'sT-Locomotion vs. St-information' (momentum vs. position in the jargon of physics; perception in still focus vs. steps of locomotion in biological systems, etc.), *is the fundamental beat of existence of 'fast' time processes; and in the other extreme, the opposition between language (mental spaces of which geometric ones are the foremost example) vs. Entropy and disorder, are the larger view of time-space oppositions; but the most fruitful ones are the 'intermediate' beats between the scale of spatial superorganisms and its worldcycles of increase of form, or 'evolution' through 3 ages, which happen both, in individuals as a collection of cells and in organisms through the 3 ages of species.*

So historically a few human civilizations achieved duality, notably all eastern philosophies & the German-Russian schools of dialectic due to eastern genetic and memetic influence. In this view the fractal point (it is always a good mind exercise to relate Timespace Logic (Ts-formal science or sTience) with Spacetime Mathematics (St-formal science or Stience), or 1st-5th Postulate of Non-E Geometry becomes the line-wave (2nd Postulate); and starts a dual positive or negative communication (merging in reproductive acts where one pole tends to be St and the other sT, to find an

S+s=T+t ('offspring'). This happens in all scales. The neutrino theory of light, the left-right handed symmetries, the mirror reproduction, the DNA+RNA combo, it is called Gender (+ Duality) or Predator/Prey relationship (negative duality). It is related to the angle of perpendicularity, which if breaking=tearing in topological jargon the membrane NOT only deforming it and seeding it will be top predator/prey. Further on, points can approach each other with different angles, once they abandon a worldline World. All this I know sounds Chinese and too abstract. But jlogic is not abstract but homologic, so when we reduce it to examples, it illuminates it all. Angles of perpendicularity and parallelism will manifest in polygons, chemistry, scattering laws of physics, tables of conversation and fuking – to state a few examples. So pentalogic starts the game of creation, and in its top predator form, destroys it, so it might be considered an expansion of the monologic, in which instead of being a pole of black hole absorption of information, the Black hole moves to chase.

- **Trilogic, Hegelian Dialectics, Universal Grammar, Mystical Trinity, Physical SU3 groups...**

Gender symmetry is the main case of trinity logic, as it re=produces a 3rd, 1+1=3 new Ts+St=2TS offspring that combines the 3 conserved St-cyclical, angular momentum, sT-lineal, entropic momentum and Si=Te vital energy of its parental generators. The philosophical Hegelian concept of thesis, antithesis and synthesis corresponds to this logic, as well as the trinity mystery which is the best known case of trinity logic on scales, as the 'Father' is the subconscious collective mind of a civilization that communicates with its nervous verbal social human language, the saint spirit, its wor(l)d to the prophet, hence the 'son of the word that inhabited among us'. Physiology in medicine also follows a trinity logic in his studies of medicine and biochemical control of cells and its functions attached to those 3 networks.

Those 3 are the logic systems humans developed with some logic clarity. Aristotelian, Taoist and Hegelian Logic being the most clean-cut formal development of them. This is due to the incapacity of humans to fully grasp the scalar Universe. As they developed their senses in a single plane. So the main 'abstract syntax' of languages is trinity:

Subject (information-human) < Verb (action combined both) > Object (Energy of the subject) $F(x) < = > G(y)$

Blue (information, skylight) <Green-yellow (combination-reproduction-life)> Red (energy-entropy-blood)

We conclude that a dual->ternary philosophy understands much better the action-reaction processes of reality than selfish monologic and improves survivability – obvious in history where max. survival happened in the Chinese Taoist culture and the minimal in the Germanic/Jewish Iron & Go(l)d animetal 'selfish-cult(ure)s' *totally at odds with those action-reaction laws they vehemently deny as the righteous people who live for his 'will & ego*. But to get a full objective view of reality we need at least:

- **Tetralogic** is very common as it is the positive view of reality. It considers the Δ @st elements without the negation of it all - entropy, the fifth Dimotion. As MOST systems only code from the selfish perspective of the @-mind trying to expand its territorial space and time duration in all its scales, and abhor death, selfish monologic & tetralogic are two steps of the same self-centered dialog. The square and the cube are also self-centered polygons/hedrons. Its motion becomes a flat, lineal reproduction. So they are 'always positive' in its codes and intentions, provoking entropy in other systems as they absorb its energy (but not acknowledging it). So for example there are 4 numbers to code genes, 4 quantum numbers, etc.

- **Pentalogic** is the first truly Universal logic that describes the 5 Dimotions of reality at the lower scale of actions, the organic scale that considers the $3\pm j$ topologies=ages and $\Delta\pm 1$ planes in which super organisms trace its worldcycles. And the absolute scale that describe $-\Delta$ @st of times-space in its entanglement between 'entropy:~, Space, Time, Δ -scales and @-minds. Its easiest form Pentalogic is thus very common; from cellular variations of earlier life, to the 5 vowel systems evolved from 1 A Caucasian languages (pure entropic energy), through the a, l, u ternary logic of earlier Semitic to the pentalogic of Spanish or Japanese... It occurs in the musical score and all the dimotion mirrors explained in those texts.

'Dodecalogic' is the best logic to describe a system's worldcycle through 3x3 scalar elements guided by a mind, the 10th 'point' that controls internally through physiological networks, its $\Delta-1$ scale, feels as an individual in the Δ^9 mind and becomes a 1-point of the $\Delta+1$ world=plane of existence, in which it emerges.

So reality is a constant reproductive growth of fractal dimensions (being those of the 4th and 5th fractal hyperbolic dimensions with the potential capacity to trace any worldcycle of existence. And its study as fractal waves of reproductive motion and form, is really what is all about – to do so with different mirrors, we start by the most perfect known to us (after the illogic itself of the game of spacetime existence).

The pentalogic method: rashomon truths.

How we go about to describe scientifically a system, if any of those partial reductions of information suffice to make a linguistic mirror. The answer we provide in this and other papers on 5D is the Pentalogic, entangled method, which expresses with increasing degrees of complexity the elements needed to extract most of the relevant information from the system, without the need to get to the exhaustive (Do)dodecalogic analysis of the entire world of existence of a given supœrganism. Accordingly we go into a stair of deeper complexity, considering some of those key elements, under the general 'labelling' of Pentalogic method, from:

- Monologic: *ceteris paribus* analysis of the event or spatial form in its 5 elements as $-\Delta@st$.

- Dilogic: considering its ST components, perhaps its Stœps of motion and form, or its $S_i=Te$ reproductive function/state in static, SxT or dynamic $S\leftrightarrow T$ form; or its relative St-information and Ts-momentum that come together to form its ST energy, or its opposite limits of SS-language/form/mind/seed vs. TT-entropy... causing.

- **Trilogic:** Which is *de facto* the most important analysis for all forms, as we describe the entity in a single plane of existence with its 3 topological organs of space, $T<ST>S$, its 3 ages in time, $T<ST>S$ or its 3 co-existing scales, $\Delta\pm 1$. Often we just make a trilogic analysis of the being in a single Space-time plane ($T<ST>S$), and from the point of view of scales, as this is the bare minimum to define an ΔST system... to which we might add

Trilogic is thus the basis of all languages beyond, the simplest 'first order logic' a causality of falsity and truth, such as if A is false, and from A we deduce B, $A\rightarrow B$, B is false. As truths are linguistic mirrors of reality a better term than 'falsity' is 'focus'. A good truth is one in which the syntax of the language and its semantic mimics the syntax of the Universe and its meanings. The syntax is a given. Most languages are 'innate' ternary syntax of the 3 parts of reality. So all verbal sentences reduce to:

Subject (Fractal point) < Verb (Dimotion=action of space-time) > Object (entropic energy of subject)

F(x): dependent parameter of space) $\Leftarrow \Rightarrow$ (S=t operand) G(Y): parameter of time

Blue (color of in-form-ation; space) < Green: color of reproduction) > Red (color of energy-motion)

'All what exists is a 'form' that trans-form' into entropy≈energy back and forth ad eternal $S\leftrightarrow T$, which is the dynamic fractal generator of space-time events, and principle of energy conservation enlarged to its 2 poles whereas the wordings for 'entropy'. 'energy', 'form' and 'information' require a bit more of understanding before we can define them more precisely.

- Pentalogic: Its limits in time and space (entropic death, membrains, outer world) and its SS-mind, seed, where resides the will to develop its program of time, through the...

Pentalogic Functions for all ST-SS-TT-St-Ts functions.

To grasp the essence of the Universe is not difficult for a humble humind, but that is a *rara avis* by the very essence of the mind, which has a blind spot called egocy. In essence it means that all of the 5 Dimotions while performing an essential role, do display all others – all systems are pentalogic, polymath, multitasking. So when we study in a paper the pentalogic of time, space, minds, entropic limits and scales in any of its 5 parallel manifestations, we do show that time can act as space in synchronicity, as entropic limits in big-bang death events, as a mind in psychological time, and

has different speeds at different clocks. The Rashomon effect then is necessary to see the entanglement of reality from different points of view.

Consider a beautiful example – the bioluminescence language of night animals. It is a system of information and as such its fundamental role is communication in search of reproduction, which most insects with it perform. But there are beetles that imitate those lights to hunt entropically males searching for mates. There are also the inverse defensive role for preys who lighten the predator as a ‘police alarm’ for a bigger predator to eat his hunter. They are the language of social relationship among the most intelligent squids. The *only function it does not perform in itself is its opposite dimotion of locomotion. But even so, dolphins in the sea of Cortez playfully ride the waves in the night to activate microscopic planckton that illuminates their skins.*

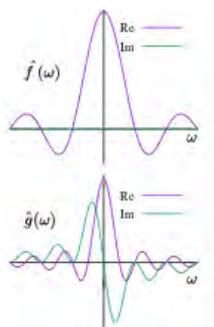

All systems do search through its function of information for all the other dimotions; even entropy allows the other dimotions to happen. Certainly reproduction, being the goal includes all others: reproduction ensures social evolution, which ensures a better hunting through herds, and in sexual reproduction communicates information. Reproduction breeds exponentially or in log curves or in phi golden numbers more reproduction; and has no blind spot. It performs all other functions. Entropy and Perception are inverse. But entropy explodes a form into motion and so acts as a mode of communication for predators to feed on the dying form. Entanglement then is a dynamic interaction of the 5 Dimotions between the TT and SS poles in the vital Universe, where only egocy reduces it all so by simplifying man feels he knows what is all about.

Synchronicity, entanglement and absolute time vs. relative time, local past paradoxes, c-speed, etc.

The vast expansion of information which results of uncoiling the planes of space-time of the Universe, is resolved by the humind compressing the into our size scale and rod of perception (light space-time). It is then necessary to accept for practical reasons the limited distortion of the mind, latter defined mathematically. So we won’t attempt an ‘Aristotelian, axiomatic’ pedantic attempt to set absolute truths absolutely false – as the hypothesis of the continuum, but highlight *the inheriting paradoxes between the \propto (relative infinite) of information, that our mind never will know as only each fractal point of space-time holds all of its information.*

Absolute relativity is the name of the game. And that is fine if the humind accepts a humbler attitude towards the whole, which so far does not. Infinities thus reduce to \propto immensities, infinitesimals to finitesimal quanta, continuities to undistinguishable discontinuities. Single timespaces to an entangled Universe that generates its space through synchronous connections between 5 Dimotions of reality in its 3 relative ranges of 5D scalar planes in which each dimotion has a different speed but as there are 5 dimensional motions with different functions, they entangle together: i.e. the faster dimotion of feeding in the slower $j+1$ plane of the ecosystem, provides energy to the slower dimotion of reproduction in the faster $j-1$ plane of the cell 1 time a day for most i^9 animals connecting the 3 planes of biologic life. Functional synchronicity creates simultaneity, which gives birth to ‘ordered co-existing superorganisms’. Even a humind looses information and compress it all in its plane of light and second beat, of its smaller mirror mind to fit/select its survival info within its brain.

Time=motion is the substance of all realities, even if huminds hardly understand its nature as they reduced it to the Ts, TT locomotion and entropy studied by physicists. Motions of the 3 topological forms make timespace objective (as opposed to the mental spaces that distort subjectively and reduce those parameters to lineal ‘still space dimensions’ and a single time motion, taken from our 3 perpendicular light space-fields.

Forms of time cycles communicate in a phenomena studied only in physics called synchronicity by imitation in a same plane, and resonance by imitation between planes; origin of quantum entanglement, the effect of musical beats in your heart rhythms, etc. Such as the information of the Universe stored in the frequency of cyclical time clocks (particles, heads, vortices of forces, SHM motions) *is translated informatively by mind languages, into lower scales and then repeated in a larger plane, or in a far away spacetime entity.* For people and scientists it seems almost a magic phenomena, which requires to accept transmission of information at

much faster speeds which for a slow larger mind seem simultaneous: it is the reason for the definition of simultaneity in Relativity, which discounts the $-ct$ time required for the transmission of information from the distance between two points to define them as 'simultaneous in spacetime. As it introduces the mind delay. When the speed is extreme, as in the quantum potential underlying c-space/time, likely $V > C$, we could also consider it as a 'local travel to the past' such as the time moving to the past of a dark entropy motion is equivalent to the time needed for the travel in terms of $vt=s$, such as both cancel. From the p.o.v. of space can be seen as an accelerated expansion of space, by the front speed which goes further than c , our 'fixed' rod measure of spatial information. Timespace paradoxes occur also in those terms between the lower plane which must happen first for the whole to form, and hence exists in a relative past, in terms of the emission of information that the whole receives in the future; but on the other hand, as it has been *performing faster cycles from the inception of the whole, it is slightly ahead in the future; so its emission of information that happens in a relative future and also in a relative past, cancel each other so that resonance seems simultaneous and synchronizes both planes.*

Man as a measure of all beings.

We are 5 Dimotional beings, dimensions of space with a form which play motions in time with a function 5 functional forms, entangled and ensemble together into a appearance of a variety of being.

This fact has many consequences and the most important is to put man again at the center of reality precisely because reality is absolutely relative and all scales matter the same. So we can use the properties of mankind as a template to study other properties we might not perceive. I.e. we can study the program of vital survival of humans and our sentient properties and apply them to understand how atoms or plants, galaxies or planets live and die, perceive and program its smaller parts, and perform its actions of existence.

The biggest handicap for mankind to advance its comprehension of the Universe is its use of a single motion of time when 'reality is a fractal of 5 topologic dimensional motions of time-space entangled into ∞ supœrganisms living jts worldcycles of existjence'. That sentence encodes the essence of it all.

The first step to expand the motions of time is to realize that the 3 dimensions of abstract still space do have motion, so they are both dimensions of space and motions of temporal energy. And as such they can be considered akin to the 3 topologic varieties of bidimensional space, which have motion. Next we have to reject Newton's absolute spacetime background, also a mathematical abstraction born with the Cartesian graph, over which we write our models of reality that acquired 'life of its own' but was never found to be 'drawn' on Nature. So since we are not placed in a background space-time we are made of spacetime. We are made of the 3 topologic dimensional motions of space-time (ab. Dimotions), which happen to have the exact form and function of the 3 parts of all systems of nature: Spherical particles/heads of information, as the sphere holds maximal form in minimal space; cylindrical limbs/fields of locomotion, as the line maximize function, and hyperbolic body-waves composed of both forms that iterate them.

Alas, suddenly we realize we are made of 3 dimensional motions of spacetime. But we said we are made of 5 Dimotions, so we must add to those 3 classic dimensions; the classic fourth dimension of time only used in physics and called entropy; which is the process of 'absolute motion' that takes place when one of those ensembles of 3 topologic spheres, cylinders and hour-glass body-waves not only has external motion but internal motion; that is breaks into its parts and dies away. Entropy thus is the dimotion that breaks parts into wholes, in a Universe obviously made of scales of parts that become wholes from particles into atoms molecules cells matter organisms planets solar systems and galaxies. Thus if entropy is the dimotion that breaks wholes into parts there must be an inverse dimotion that puts those parts into wholes, of social, organic evolution, of love. And thus we have 3 topologic dimotions of space-time, spherical height that perceives information, cylindrical length that moves the system, hyperbolic body-waves that reproduce them, ensemble into beings that 'emerge' through social evolution from parts into wholes to die and dissolve entropically from wholes into parts, and those $3 \pm j$ (a parameter of scale) Dimotions of space-time ensemble into infinite beings is what reality is about.

If we call 'space' alone a dimension of form and time alone a motion; those 5 Dimotions, its organs and functions, put together through scales of size each one studied by a 'stience' of space-time beings, (which we call all together the 5th dimension' as opposed to the 5 Dimotions which are local for each being) configure the existjence, through 3 Stj scales of all beings, which are born in a smaller scale, with faster time cycles, emerge to live through 3 ages dominated by its limbs of locomotion, or young age, by its body-waves that reproduce the system in its mature age, and warping, wrinkling into an excess of form in its 3rd age, to die in an explosion of entropy.

A life and death worldcycle is a travel through 3 scales of the fifth dimension, as the 5 Dimotions of space-time that form an organism, in its scales of cellular/atomic, organic/thermodynamic, gravitational/ ecosystem and ternary organs, | -fields/limbs<∅-body-waves>O-particle-heads become sequentially ordered in time from the placental seminal age of 'social evolution' of the organism that emerges to live 3 ages in a single 5D plane encased into a larger world, to die and explode in an entropic big-bang.

Whereas the topologic symbols, |, ∅, O, express its form. Another way to represent that worldcycle common to all space-time beings is as a sequential progression between the 2 poles of absolute Space-form (the seed: SS) born in a lower scale, (ab.Δ±i) and absolute time motion (Entropic death: TT), when the system returns to its parts, with 3 intermediate states of maximal motion, Ts (young locomotion) > balanced motion and form, or Si=Te: Age of reproduction > And Informative age – St age taking place in an outer world. So we can also write with ilogic symbols the o-sum cycle of life and death: SSj₋₁»Tsj>STj>Stj«TTi₋₁

Thus 2 new formal disciplines the vital topology in space and pentalogic in time of those 5 Dimotions extract the common isomorphic laws (ab. Djsomorphisms) that all systems of reality obey in its 'life-death cycle of existjence' as fractal superorganisms made of 5 Dimotions ensemble in 3 scales of the Universe.

When we translate this concept of growth of dimensionality in functions of existential algebra, then we also realize that there are beings of one dimension, two dimensions, 3, four and fifth entangled dimensions, which give birth to different logic minds, from the simplest human entropic ego-logic to the complex 120 dodecaplex logic of galatams.

The Universe is a reproductive fractal that grows by reproducing quanta of spacetime (particles, cells, individuals) and then organizing it in 'higher network-dimension – waves, fractal networks', which become herds and superorganisms, units of a larger being by entangling simultaneously in synchronicity all its parts into new wholes, or dissolving back in the moment of death. This game of existence can be perceived with multiple different languages. But essentially is always the same. Huminds reflect such duality between the entangling of superorganisms in space and its sequential worldcycle of time with logic time language and spatial geometric languages; with increasing complexity as they depart from the initial 'fractal point' that will through a series of actions reproduce and grow in dimensions in time, to ebb down into dissolution at the moment of death. How to follow through certain languages in symmetry across different scales the spatial, entangled creation of superorganisms and its 'derive' in time from birth to extinction through its worldcycle is the subject of each 'stience' that concentrates in the analysis of those process with different jargons in the species of each self-centered scale, from quantum physics, (particle scale) to astrophysics (cosmological scale) through biologic and social sciences. While formal sciences study the Δ^o humind languages and its mirror symmetries with the supœrganisms and worldcycles of reality.

So we define the Universe as a 'fractal supœrganism' that reproduces and ensembles Space-time Dimotions into organic forms through ∞ relative scales of spatial size and time-motion; whose Fractal generator (mathematics) Metric (Physical jargon), 'function of survival (Biology) or Function of existence (logic Jargon) writes C=Max.ΣSxT (s=t), or St<ST>Ts in its different modalities of the fractal generator, the 3rd fundamental function of 5D metrics, we shall call Γ.

All realities are always a reproductive radiation of a function of existence along 5D scales that reproduces a variation of the fractal generator. It all starts with a fractal point or 'mind' gauging information in the outer universe to move towards a field of energy in which to feed: If we observe them in time, they have a clear sequential order, as they are generated by a first spherical 1D seed of pure information, in the Δ-1 plane that will grow and evolve socially through

the 4Dimotion of existence, emerging into a larger Δ^0 plane as a formed body-wave whose particle-head will gauge information from a larger $\Delta+1$ world performing 5 Dimotions= actions of 1D absorption or emission of information, moving through 2D locomotions towards 3D fields of reproductive energy, using its informative communication to 4D evolve socially, into larger $\Delta+1$ new supørganisms, till the system fails to provide motion, energy and information to its limbs/fields, body-waves and particle-heads, wrinkling and warping in an old 3rd age, or become 5D entropy of a predator, exploding into a big-bang death, devolving to its disconnected $\Delta-1$ parts. So Existence is a travel through 5 scales, as all systems of nature exist through a worldcycle (no longer a 4D world line as we ad a dimension of temporal 'depth') - an experimental proof of 5D:

To exist any system made of limbs/fields of motion, body-waves of energetic reproduction and minds/ particles of information needs entropy, energy and information to survive and keep on moving. So the 3 simplest dimotions of any plane of existence are a program of survival, which adds two complex social actions – reproduction that prints information in other zone of space-time to survive when one becomes entropy of other Maxwellian demon, and social evolution into wholes, networks that are stronger than individuals. So the mind is the embodiment of a single universal program of existence and reproduction of fractal clones, and it is the same unifying principle in all beings – as all will absorb energy, information, motion, evolve socially reproduce and survive. And this is the case even of the smallest entities, atoms, particles and forces. So the mind creates reality and its 5 Dimotions are in fact the local fractal program of existence, which physicists for particles describe in abstract terms:

The only dimotion of time the Universe does NOT code is entropy=death - a maximal motion that disorders the being. So there are NOT 5 quantum numbers/genetic letters to code physical and biologic systems. Only 4. Because the same quantum number that codes motion just increases it to create entropy and disorder the system (Principal number that 'jumps' in size as the particle 'feeds' on a force and disorders it). The oxygen that moves the cell also as a free radical destroys it, cars going fast kill you in accident, etc. DEATH is the needed error of the Universe NOT desired by the program. For that reason it lasts only a 'single quanta of time' (whereas a quanta of time IS for any $\Delta\pm j$ super organism, the 'tic' of a 'cell/atom /individual' of its lower, $\Delta-j$ scale, for biological, physical or social organisms).

So you die in a second, your relative time-clock quanta the time of 1 thought=glimpse in your head, 1 beat of your body-heart, 1 step of your limbs... And the rest of your existence is life-lasting...

Same with antiparticles (entropy=death Δj motion of particles): they die in an instant, so we see far less antiparticles because the product of its numbers in space x duration in time is so short, while particles live almost for ever. Same reason you don't see corpses around. Death is the shortest possible Δj motion. Each entity is therefore a Timespace organism of 5 Dimotions and all try to achieve as the goal of the sentient organic Universe the 'highest dimotion' of social evolution. So particles come together into atoms that come together into molecules that come together into planetary and life organisms that come together into galaxies that come together into the organic networks of the Universe.

RECAP. Simple monologic minds, which are most, exclude their own death=entropy in the illusion of conserving time ad infinitum; so tetralogic reflects in its coding languages (4 genetic letters, 4 quantum numbers). The game evolves then between complementary particles, St & Ts, which transmit to each other in-form-ation, form in action and energy, motion with form, balancing each other, and then expands to networks of other fractal points/particles/heads that will process it into more complex SS-štill mapping and seeds. Unless you stop your physicist's frame of mind that reduces points to no breath to study only its external locomotion, you will be stuck in the shallowness of 'science'. Do that humble jump of accepting the Universe we perceive is a game of minds perceiving, where locomotion is the least important part, often caused by the need to transmit information between forms. But forms are not monads, they communicate information, with the help of its $j-1$ finitesimal quanta, its parts. So the game starts with two points communicating in the 4 Dimotions possible to each of them: intensity=amplitude of the wave that informs on its vital energy; frequency of its cyclical time, which informs on its membrain, duration of the wave, that informs on the singularity displacement, and social timbre: Σst .

ENTANGLEMENT OF 5 DIMOTIONS: $-\Delta@ST$. \downarrow LOGIC EXISTENTIAL ALGEBRA.

The 5 space-time dimotions in its smallest organic scale are $\Delta-1$ finitesimal actions $-\mathfrak{a}$ lgebra computes with derivatives. When those actions dominant in information add sequentially they trace the worldcycles of growing information of Δ^0 individual lives. Let us see them now from the $\Delta+1$ p.o.v. of the world.

The purpose of Existential $-\mathfrak{A}$ lgebra is to study the multiple elements of our '5D metric functions of Absolute relativity', Max. $S \times T$ ($s=t$), which we have broken down into 5 Dimotions: Pure Space-seed-minds of linguistic information (SS), Pure entropic time-motions (TT), and the 3 intermediate states/organs of St-information, Ts-locomotion and Si=Te reproductive states.

We are spacetime and so we share our properties with all other systems. Man then becomes again the model of all beings, as we expand our sentient vital properties to all systems of Nature, which will have a mind-point performing the 5 Dimotions of existence, fighting for survival, trying to maximize its reproduction in the Si=Te balanced point of iterative present, that seems not to change (often through gender mirror symmetry between S-females and T-males), against the entropic top predators that try to kill=stop its vital time actions/cycles and dissolve the information of its inner vital space, expanding it and disembodimenting the entity to feed in its parts, converted into 'dust of space-time' (ab. $-\Delta@st$) with the best strategy of social evolution into wholes to win that battle between all the @-mind self-centered monad-points.

In this sentence, expressing 'again' the simple repetitive 'existential game' we all perform, we recognize 5 elements that from the larger perspective of the whole world will give us the $\Delta+1$ view of the 5 Dimensional motions of existence, commanded by **SS-linguistic minds**, trying to avoid the limits of **TT-entropic death** by:

Performing Ts-Cyclical Time actions through its St-topologic vital space organs, enclosed within an Δ^0 membrain that divides the system into an inner, smaller $\Delta-1$ scale of vital ST-work & information, protecting it from the larger $\Delta+1$ world.

So in the largest view of the being interacting with many other beings in the world, we recognize 5 elements, Minds, entropic limits, temporal actions, vital spatial topologies and organic scales, *which are completely entangled by the survival will of the mind that enacts the program of existence, into complex synchronicities of time actions, simultaneities of space organs, fractal similarities that allow symbiosis, co-existence and scalar emergence of new whole planes of existences, limited by all other wholes that imposes its entropic end.*

So systems are made of 5 Dimotional $\Delta-1$ actions->performed by Δ^0 organs-> that on the $\Delta+1$ view become the 5 Elements that rise $-\Delta@st$ of spacetime into ∞ interacting existences. Thus, we need a new entangled 'pentalogic' as those 5 actions=dimotions entangle into topological organs that communicate and interact with many other species, giving us the perception of a 'continuum' space & time of a single scale. Yet in detail all beings are made of 'dust of space-time', $-\Delta@st$, whose 5 elements define their existence *and huminds unify at the largest scale of the $\Delta+1$ world view, where each all those Dimotions and organs of all those T.æs (ab. Timespace superorganism) simplify into the reduce continuum space-time world view of limited huminds:*

'S-paces', are all the 'types of dimensional organic forms', we find in all organic systems, which are ensembles of the 3 only 'topological varieties' that exist in 4 and 5D Universes. Those topologies perform 3 clear organic functions in the super organism, lineal limbs/fields that move the system, hyperbolic body-waves that iterate its forms and spherical particle/heads that gauge information. Absolute space becomes then the sum of all the 'vital organic spaces' of all the fractal points of the Universe: $S=\sum s$. Further on, as Euclid defined points with no breath, lines had no breath, and vital topologies loose one dimension of form. So the 'tall and wide' dimension of height of this page that holds information becomes the Euclidean height dimension of information; the flat cylindrical limbs/potential fields that move the being become the length dimension loosing also its motion and the hyperbolic body/wave width dimension that stores energy.

T-times are all the types of 'motion=change', those organs perform, which are locomotion (limbs/fields), reproduction (body-waves) and informative gauging (particle/heads) that dominate each of the 3 consecutive ages of the being (young motion age, mature reproductive age and old informative age), become reduced to a single sequential line of absolute time, $T=\sum\delta$, equalized further to the unit of human time measure, the second. As lineal time 'eliminates' the height dimension of information, the form and patterns of time cycles is lost. We thus regain as we did with vital spaces, the full complexity of the 5 dimotions of times. But true absolute time is the 4Dimotion of social 'evolution' that organizes parts, which hence must come first as relative entropic past of its future wholes. While the present of a function of existence is the more complex dimotions of Reproduction=iteration which seems not to change time, as a back and forth dimotion between the $\Delta-1$ seeding plane and the $\Delta+1$ world where the Δ^0 entity will emerge as a whole. And since the program of existence maximizes survival through reproduction it maximizes the present we all perceive.

Δ -Scalar planes of space-time, as 3 scales are needed to form any super organism – the $\Delta-1$ quantum, cellular, citizen scale in physic, biologic and social systems, the Δ^0 thermodynamic, organic social Planes and the $\Delta+1$ scale of cosmic bodies and galaxies, ecosystems of Nature and Human civilizations; each of them ruled by the 2 metric 5D functions, $S \times \delta (s=t) = C$; whereas S means length or surface in space (or Volume depending on the 'world we live in') δ mean cyclical time (in static terms, T_i , time as information) whose speed= frequency is inverse to lineal time duration: $T=1/f$. They are compressed in 4D models into a single space-time continuum, which creates the paradoxes of different properties of the quantum scale, which is hyperbolic for a larger observer (as it holds more information according to 5D, branching into apparent \propto coordinates), and appears due to its faster time cycles as 'probabilities' instead of statistics in our thermodynamic scale vs. the lesser information we obtain from the cosmological scale, which appears then as 'curved elliptic in its geometry – themes those treated extensively in our papers on 5D geometry

SS: @Mind. Or geometric 'center of maximal internal communication that processes information from the outer world, and controls the internal networks of the system, with a given language, which we shall call a mind, regardless of its automatic processing or consciousness. As it coordinates and maintains the whole as a single system performing actions of control of the energy and information of the system. So we find gravity centers, chips, brains, DNA nucleus, black holes in galaxies, etc. There is always in any stable organic system, a relative still, self-centered mind, *which all systems do have, even physical systems, which have centers of gravity, centers of charge or crystal systems, which maintain the whole.*

But egocy eliminates all the minds of the Universe, helped by Euclid's definition of points with no breath. And since without 'Maxwellian demons', in-form-ative order and mental mirrors that project its scalar images of reality into its local territory, cannot exist, alas! Reductionism as usual becomes the perfect tool to prove the entropy-only universe in any grand theory of ænthropic huminds – so we reduce the cosmos to vacuum entropic space, eliminating galaxies, which are vortices of accelerated cyclical time, whose masses and charges in the cosmological and quantum scale carry the information of the Universe in the frequency and form of its cycles and balance the entropic expansion of space creating a static Universe. And we reduce the 'organic wholes' and systemic intelligence that makes possible the emergence of new planes of existence and evolve socially through the power of love – the sharing of energy and information between equal forms – so alas, Darwinism – ill understood as evolution is precisely of species, and its summit the organic evolution of herds into superorganisms – becomes the chaotic dogma, when the 'struggle for survival' only studies the final entropic death of organisms, but what truly matters are the informative genetic clocks and how they develop through scales the 'program of existence' coding for the 5 Dimotions of all Natural systems:

TT: -Entropic limits: called death in time, membranes in space: as systems loose control beyond two scalar Planes we define death with a simple function of dissolution of two Planes of information, $\Delta 1 \ll \Delta-1: 0Sx \infty T$

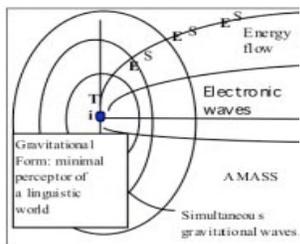

Pentalogic means that each of those 5 elements constantly interact in $T.\infty s$ (Time-space superorganisms), with all the other elements, entangling together through synchronicity its time cycles, through simultaneity its adjacent space organs, through co-existence its planes, all limited by an 'entropic membrain', which isolates the system from the

outer world in which it will try to extract more energy and information to grow, reproduce and survive, performing those actions from the automatic, deterministic will of existence of its 'self-centered linguistic mind' – or else if it doesn't perform those actions it will not survive. So the program of existence imposes itself.

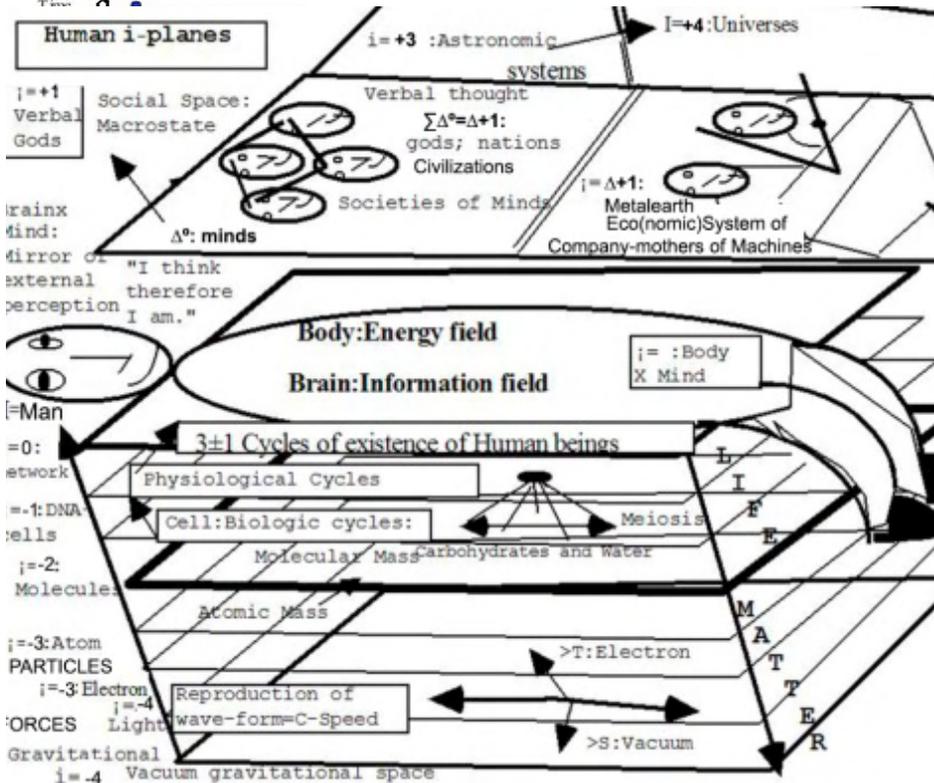

The key concept behind pentalogic and entanglement is rather simple: to survive in the Universe, to have focus, form, a system must be 'anchored' through entanglement in its 'plane of existence' with 'trinity' parts of vital topology, connected through 3 inner physiological networks, but also it must co-exist in a larger $\Delta \pm 1$ nested world separated by a topologic membrain, which allows it to absorb and emit entropic motions and information, on that outer world.

The understanding of entanglement was best among humans in Buddhism, where each soul is considered a knot of communication with all other systems, and minimal in America where the self is considered always the only central point of view of existence, in eternal struggle with all other human beings – yet as entanglement is necessary to survive, the American, modern man is entangled NOT with humans but increasingly with the machines of the Metal-earth, the Financial-media/military-industrial ecosystem for which 'it' enslaves as an object with a price.

S@: Entanglement through scales. Geometric entanglement.

When we go through different science scales to explain each 'entangled connection between the 5 elements of reality', we shall see that already in the first scale of mathematical systems, the fractal point requires 2 different postulates to define it: The first postulate which is concerned with its inner parts (a fractal point has breath), and the 5th which is concerned with its outer parts (a fractal point is connected with infinite potential parallels to the universe). The 2 inner and outer elements that meet in the 'membrain' thus define the membrain-mind as the essential entangled element between both worlds. Entanglement thus defines the being from an outer perspective as much as its inner nature.

In graph, the fractal sentient point, new unit of mathematics and vital spatial information. Einstein's interpretation of the 5th non-Euclidean postulate was the view of a fractal point of the gravitational scale from our smaller electromagnetic world, which shrinks its inner volume, bending its parallels, hence its curved geometry. But that view breaks the conceptual definition of parallels are straight lines and is absurd, as the point remains 'Euclidean with no breath', hence only fits one line with no breath. Thus, particle points must be defined as 'FRACTAL points', like those we see through telescopes or microscopes, which grow we approach our distance both in scale and space becoming enlarged worlds with a complex internal structure and external entanglement following a Non-E 5th Postulate: A point external to a line is crossed by ∞ parallel forces.

Such organic points are like the stars in the sky. If we look at them with the naked eye they are points without breadth, but when we come closer to them, they grow and in its membrain we find its maximal entanglement and communication – the hottest region of the star, the Earth's membrain with its life superorganisms & 3 ages Gaia<

History>Metalearth, where a parallel network of 'still entangled' parts forms a whole which makes the 'membrain' a hard interconnected system porous to the energy and information of the world focused in its singularity center.

We can then assess the fundamental quality of vital mathematics as a key language of the Universe, which is to be the best language of space, hence the one that describes the laws of entanglement, even if man doesn't understand it beyond its egocentricity of magic creationism, as the language of mirror symmetries and dimotion flows of $-\Delta@st$ in all entangled systems.

Where the fundamental entangled element is the fractal point, and its social unit the polytope in 1,2,3,4 Dimotions; but not 5Dpolytopes since the fifth dimotion, entropy is the disentanglement of all the others. So polytopes rise positively in complexity as entanglements of indistinguishable regular points (or else one point will be different by position and connection to the other points). They reach its maximal complexity on the gender duality-mirror symmetry of the 2nd 10² scale - (female Icosahedron & male dodecahedron) & 3rd polytopes' 10³ scale (Male dodecaplex & Female tetraplex).

ΔT : Entangled ages & Scales.

Each of us is an entangled fractal system, interconnected or else it won't absorb energy and information and survive. And vice versa, when less entangled a system is - 3rd age of the being, and becomes cut-off from reality its 'truth' its existence dwindles and the system fades away and ultimately perishes.

At which scale of reality we must define entanglement? The answer is at the 3 scales, of the whole Universe as an absolute fractal organism of time-space (at the level of its 5 elements, S, T, -, Δ , @), but also at the level we just did of individual superorganisms, where its organs that represent those elements are interconnected to the whole, and finally at the level of its diminutive actions (a,e,l,o,u, acceleration=motion, entropy feeding, information, organic reproduction and Universals evolution, in the mnemonic rule), which we will find amazingly enough, in one of my most orgasmic-mental entanglements with the whole I experienced, were directly connected to the $\Delta\pm 4$ planes of existence of the being. Reason why we do perceive all those scales:

Scalar entanglement happens between the humind's organism and its territories of perception that provide the 'bits and bites' needed for humans to perform their 5 Dimotional actions. So we extract entropic motion of the $\Delta\pm 4$ gravitational/galactic field, information of the $\Delta\pm 3$ light/star scale, energetic food from the $\Delta\pm 2$ molecular/Gaia scale; reproduce in the $\Delta\pm 1$ seminal, gender scale and evolve through socially love in the Δ^0 mind field, entangled to other minds in metaphysical experience of bondage through our memes, in nations, religions and civilizations. Scalar entanglement is the reason we exist, and perceive as we are entangled to all the scales of reality you perceive. You are your mind space and your mind space is your entanglement.

Physical entanglement.

Entanglement appears in the non-ego centered Broglie's>Bohm's interpretation of realist quantum physics, as particles entangle through its quantum potential fields; and this vast entanglement happening at $v>c$ in the lower plane of reality 'reduces spatial distances' in the Riemann's sense of a geometry of similarity to a 'boson like' unit of parts as if distance-space would NOT exist within them; which does NOT for the emergent apperceptive illogic 'couple' as a single whole.

To understand entanglement in formal languages is needed to adopt the Riemannian concept of a mental space where proximity and distance is a direct product of similarity, as if space will not exist, which can be achieved through communication on a lower 'potential field' of faster motion, as a faster v in fact perceived in stillness implies a smaller distance, and vice versa -i.e. the expansion of space in the Universe is in fact a $v>c$ speed on the jets of dark entropy expelled by the accelerated faster than c timespace vortices of heavy top quark stars, aka black holes.

So the black hole beyond the c -horizon speeds up at $v>c$ and erases the information of light into dark entropy expelled through its axis and perceived as growth of distance between galaxies, when by virtue of $S_i=T_e$ can be considered

grow of speed. Entanglement is exactly the inverse process in a quantum potential field that makes communication disappear in distance between two poles – which is the magic of a phone conversation – distance is NO LONGER real because we are not in sound communication at 300 m/s but in a decametric jump of scale at 300.000 km/s. There is no distance in mental space of telephonic communication between speakers, only in geographic Earth's space; but we are not concerned with land or air but with a language of communication and its bits of information, which are translated, entangled, in a faster 5D scale of smaller bits and max. form (electronic space).

T.oes constantly entangle& translate in faster 5D planes='mediums' its informative bits that preserve its patterns *as there is the Universal reference of the game of existence behind them*. In the previous case the communication has become an entangled back and forth feed-back electronic function on a wire line between two fractal points which cannot longer be considered different or do without the 'communicative line' between them.

Energy does not entangle only information does...

A conclusion proved mathematically, as only the sphere of max. volume of information (Poincare) can shrink without tear in any number of relevant dimensions (4 for entanglement) crossing the barrier between two planes of existence, while energy becomes dissipated as entropy. So you can talk with mum in Australia but not send her 1000 kilowatts, you can though send her digital information, aka money too.

Bio-logic entanglement.

The Universe's 1st ilogic entanglement of 2 elements is gender mirror symmetry that fusion both 'in love' into 1 in all scales, through the mirror symmetry of female-like St+sT male-like complementary couples. Entanglement starts with 1+1=3, through gender symmetry. The entanglement of gender, is so obvious that became the basis of the duality knowledge of earlier cultures (Chinese) will constantly come in Nature. It is NOT only the entanglement of biologic gender; so how we do distinguish its 'essence'? In ilogic terms is easy because the essential duality is that between simultaneous present space, Si=Te and time flows in relative stœps, from past to future to past... to future, S<T>S<T... Both are perpendicular. And so the ultimately the definition of Gender we shall use here goes to the final core level of 'perpendicular' space (female gender) to Time flows (male gender). Gender is essential because without Gender we can't understand reproduction by mirror symmetry and the duality of symbiotic perpendicular vs. Darwinian relationships.

2 systems achieve maximal communication when they pass from parallel sharing of information, through a medium which transfers a language, to direct contact between its sensorial membranes, which bring true bondage. And at that moment two different outcomes might happen. If the membranes touch without tearing, the topological integrity of the organs are conserved in vital mathematics; so the being co-exists, and entanglement (the previous state of parallel communication) becomes bondage according to the fourth postulate of non-Euclidean congruence.

This is the magic of it, as fusion love kicks in and entanglement becomes a dance of complementary forms. It is the beauty of love and gender symmetry. And the maximal action of it, is called sex, orgasm, the present state of fusing both the past to future to past, and present forms into one. So how it happens physically? Do I have to explain it to you?

Male gender penetrates a folding of topological females but does not tear it. It goes in T>S, and then it goes out S<T, as the male does in and out, information and entropic disentanglement. But the female Si=Te 'grasps it'. It caresses it, encircles its lineal form with its cyclical even polytope. Entanglement is now bondage. And it brings when bondage combines in the most intimate ways the information of both systems trinity, reproduction. So alas, 1+1=3!

The rules of vital topology in inverse fashion defines Darwinian destructive perpendicularity when one of the entangled elements turn out to be a predator top and breaks in, tears the membrain of the other system, killing it, entanglement then gives way to entropic devolution and one system becomes destroyed.

Recap. Entangled growth of complexity between the 5 Dimotions of beings.

The Universe is a fractal organism of time=motion and space=form, organized in scales of different size in space and time speed, related by a symbiotic, balanced metric function. We call the sum of all those scales, the fifth dimension, which has a 'metric function', hence it exists. The functions for a given number of co-existing planes of space-time in any system is:

$$S \text{ (size in space)} \times T \text{ (speed of time cycles)} = \text{Constant.}$$

The purpose of the Universe is to reproduce its spatial=formal motions of times, creating synchronous patterns of cyclical reproduction of form we call superorganisms; with its fundamental metric law of balance between space and time, as the guidance of those motions.

Universal fractal scalar space & cyclic time planes ensemble into supœrganisms (T.œs) whose properties derive from the 'disomorphic'=equal laws of those 5D motions. Its Metric, $\text{Max. } \sum S \times T_{(s=t)} = C$ unlike 4D locomotion applies to all 'scientific scales'; adding organic= scalar=fractal properties, biologic will, causal=temporal determinism and linguistic=mental properties. So all species play the game of existence, the God=Mind of reality as systems try to maximize its 'Function of existence' through reproduction (SxT) in a balanced point of present $S = T$ followed by organic evolution (\sum, Π) into stronger, social numbers=wholes that survive better.

From the simplest cycle of time that reproduces by the mere fact of cycling and repeating its form, iteration is the very essence and purpose of all beings - its first complex dimotion, closely related to the process of eusocial evolution and palingenesis, as systems to reproduce must imprint a lower scale of reality with its form... So we shall study the meaning of life, which is everywhere, as the process of iteration and generation of space-time beings, considering also some pentalogic view from the other perspectives of the entangled Universe. So if we define information as a form-in-action, the repetitive motion of a form, we define the Universe as a fractal that reproduces information.

The outcome of those processes of reproduction of form, and symbiosis between the different scales and synchronous time cycles of its species is the creation of organic superorganisms.

Yet species that deny the program and are isolated in their ego-paradox, cut off from those laws, ultimately become extinguished which is how the program of the 5 Dimensional motions of reality imposes itself. And ænthropic man with its anthropic and entropic egocy is exactly in that path guided by 3 idol-ogies that worship metal without recognizing its vital nature as atoms are the units of life, capitalism, mechanism & nationalism.

The organic view of time and space requires a new 'metric function' beyond the lineal $v=s/t$ function of Galilean relativity that becomes the limit of this more complex view of time and space, with 2 fundamental function, $S \times T = C$ (the scalar metric of the fifth dimension, as systems in space accelerate its clocks of time (T) according to its size (S); and $S \Leftrightarrow T$, the new function of relativity, which means as we cannot distinguish motion=time, from stillness=space-form (Galilean relativity), both are 'two sides of the same coin', and all systems have both motion and form, which are constantly becoming one another. Yet as SxT is maximal when $S_i = T_e$ ($5 \times 5 > 6 \times 4 \dots$) both functions can be summoned up into a single one, which we shall call the fractal generator, or will of each fractal space-time beings, the function that embodies all other functions of the Universe and guides the actions of each fractal part of it: Function of Existence:

$$\text{Max. } \sum S \times T_{s=t} = C_i$$

The mind function defines Minds as infinitesimal points-particles that *map the whole Organism in its linguistic world, perceiving through an intermediate closed membran, which divides the system between the outer and inner world (1st topology function), with 'openings' to process T-motion and perceive S-form, in order to perform the 5 actions of the program of existence that ensures the survival of the being in a series of beats, as the being stops, gauges information, perceives and moves towards a field of energy in which to reproduce – the goal of the Universe, and continue in existence.*

When this sequential deterministic series of actions are not met, the system extinguishes itself. And hence the reproduction of the fractal universe reinforces itself by biological means of survival and extinction.

The largest 'nested' view of reality is that of a fractal organic $\Delta^{+\infty}$ Universe made of $\Delta^{-\infty}$ $-\Delta@ST$, 'dust of space-time' of which we are all made. Where we consider 5 elements, minds, vital spaces, time dimotions, scalar planes of space-time and entropic limits that define each entity in existjence as cyclic time Dimotions synchronize in repetitive patterns, through 3 scales of space-time, appearing in simultaneity as the vital topological organic adjacent vital spaces, ensembled into ∞ supørganisms (Ab. T.œ) whose properties derive from the 'disomorphic'=equal laws of discontinuous, scalar, space-time, its minds of measure, and entropic limits; that is, the common substance of them all: $-\Delta@st$ we are and to dust of timespace we shall return.

Our perspective though might vary; so from the @-mind's ego paradox that distorts reality with our $-\Delta@st$ at the center, we become 'Universal wholes', $\Delta\hat{u}st$, who confuse the real Universe with our limited world, and find no boundaries to 'our imagination', no entropic death, above heavens and earth. So minions of thought, become tribal idols who think to know it all... ignoring that "talent hits a target no one else can hit; Genius hits a target no one else can see." And so the only genius is the Universe, which holds all the information about itself, most of which humans cannot see, as we are 'a mush covering a rock in a lost corner of the cosmos' (Schopenhauer). This who writes is also $-\Delta@st$ but at least aware of its limits, he tried to entangle his finitesimal mind as a better focused mirror void of ænthropic distorsions to the whole, aware that the 'Universe is a living organism with a mind called logos' (Plato) 'of a higher logic than man's' as God is 'the seer of time' (Augustine), who understand all its potential combinations of the deterministic game of existence, that defines the sequential chains of time as a block of potential worldcycles, where 'the separation between past, present and future is an illusion' (Einstein); given the fact that the rules of existential algebra limit the combinations of those dimotions that do exist.

We thus say that the 5D metric functions that generate space-time organisms, is the fractal generator of all functions of stiences. And *existential algebra, its full formalism analyzes all possible beats and combinations of the 5 Dimotions and connects them with the laws of geometry algebra and logic, because languages are mirrors of those 5 Dimotions, 3 scales and entangled relationships, through scales.* And then departing from the merging of Δst , the 'mother of all stiences' and its human time-logic and spatial-mathematical mirrors, explains all the whys of all the stiences, each one studying the species and cycles of each plane of space-time, 'potentially' – meaning this infinitesimal mind has only researched a part of it all in his spare time, as living has been its function of existjence of which thought is only its SS-state. So paragraphing Descartes, we end this brief introduction to Scalar spacetime, before we make a fast blitzkrieg on human sciences hoping other huminds will be grateful to our 'brevitas', and enjoy the exploration of all what we have not discovered on the disomorphic laws of the fractal Universe, so they can occupy their minds on the pleasures of research, since those brief formal laws are to the whole Δst what natural numbers to the ∞ reals: Cantorian dust.

The different type of logic minds.

We have already in the introduction, consider the growth of complexity in the entangled Universe from ceteris paribus, one-dimensional, monologic aanalysis so common among human beings to the more complex (Do)decalogic systems of perception of reality in its 3 worldcycles. As humans are basically monologic we do need to make somewhat a harsh critique of our modes of thought, because with the same data, our one-dimensional time-mind brings most of the errors of science, due to our egocy and confusion of our mind's view with the whole Universe.

Fig. 12.3.

The relativity of data: one and the same datum points ambiguously to two different hypotheses via two different theories.

MONOLOGIC: ÆNTHROPIC CREATIONIST EGO CY HUMINDS

“Only entropy comes easy.” Chekhov

How can we, humans after all belong to our military, lineal ego-centered culture, by-pass the limits of ænthropic thought? The answer starts in the languages the mind uses to perceive the Universe visual thought, which describes space, evolved into a more synoptic form of geometry called mathematics, and verbal thought which describes time with verbal tenses, evolved into a more synoptic form called logic. Thus since the languages of the mind are our mirror of reality, to evolve our truths we must first evolve *our understanding of* languages, not as creative magic powers but only as Mirrors, hence inferior to the Universe we must learn to respect.

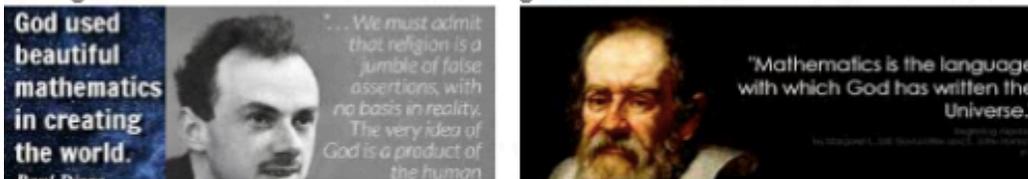

What ænthropic man does to preserve its sense of superiority of the Universe, is to believe languages 'create reality'. Man first talked words, and now with the help of instruments it talks mathematics. So in both ages he thought to be the only intelligent being with God that spoke those languages, and in both cases in a hyperbolic trip of the ego, he thought that the language-mirror created reality NOT reflected upon it as a mirror does: in the past he thought God spoke and his words created reality (Abrahamic creationism), today most physicists think the mirror functions of mathematics create the space-time reality it describes; while most economists believe its specific mathematical language, digital money, creates the physical economy (a creationist theory called monetarism).

In the graph we illustrate the most profound of the ego-trips of ænthropic man, 'creationism', according to which his languages do NOT mirror but create reality - sharing that power with an entity called God, which in each age speaks the language humans speak, who therefore share 'his power' and as today 'machines also speak mathematics', machines also share this power, and the Universe is modeled as a mechanism.

Each those 2 creationist philosophies of the Universe deny of course the existence of any other language or mind in the Universe that share that power. So verbal and digital creationists (as Dirac's denial of the verbal god shows),

DIGITAL & VERBAL CREATIONISM VS. REALIST SCIENCE

Linguistic creationists: verbal creationist religions and mathematical creationist scientists:

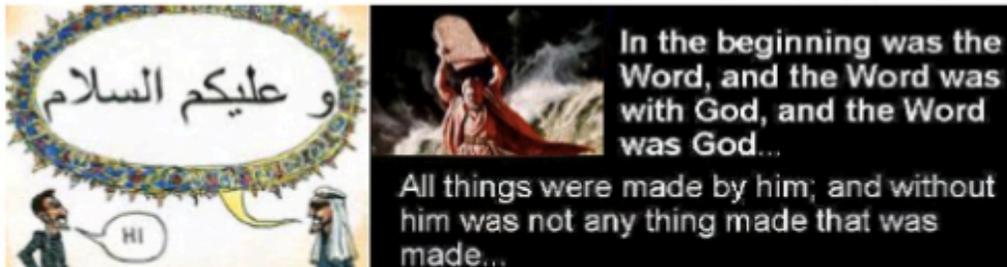

Biblical scientists (classic economists and Fathers of Physics) mixed both creationisms. They still do in 'capitalism' (profits even if it kills earth) and Physics (anthropic principle):

'People who seeks its own profit are guided by an invisible hand (of God)' Adam Smith, Calvinist founder of the idol-ogy of capitalism

'God is a (digital) clocker that waited 5000 (biblical) years to find an intelligence like his to admire his clock-work'

'Money is the intelligence of god' Calvin

Kepler, founder of modern astrophysics

"The ultimate reason of things must lie in a necessary substance, and this is what we call God."

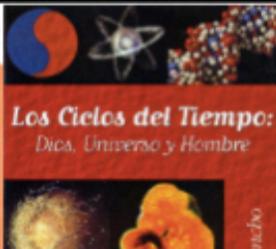

Gottfried Leibniz

Albert Einstein (1879-1955)

So far as the theories of mathematics are about reality, they are not certain; so far as they are certain, they are not about reality.

I don't believe in mathematics.

God does not care about our mathematical difficulties. He integrates empirically.

Realist science: A Universe made of its ultimate substances, vital space and cyclical time arrows.

quarrel for supremacy, despising each other's form of creationism. In both cases the scientist or prophet speaks his 'magic' language and creates reality. So Allah or Yahweh talks (through the prophet's mouth) in Arab or Hebrew and reality appears – the 7th plagues happen.

And Hawking talks, and affirms black holes evaporate to the past with no proof whatsoever but his function *and they must evaporate by dogma*, and Hubble writes a lineal function backwards pretending it is the implosion of the Universe without any proof of such explosion, and it must have happened; and if not, 'ad hoc' proofs as we shall see are concocted to reinforce creationism, in both languages (religious rituals in which mantras are prayed as a 'vehicle to God', subtle data manipulation and computer nice pictures concocted tinkering with functions to get the desire image).

Problem of cultural and ego-centered theories is that they are beliefs so rational falsification doesn't work.

In that sense monologic is intensely connected NOT to the highest complex view of an objective scientific reality but to the program of survival in its body-emotional parts, with hardly any reflection, as pure 'actions' of time, in the shortest scales of time behavior. So to fully understand how most of the entities of the universe, which are monologic work, we need a general theory of e-motions as the underlying body/limbs, wave/field language and state of 'being'.

5D Mind Theory: Panpsychic Universe: Æ-Motions. Languages of huminds.

The consequences of 5D and its description of the Universe as a game of two poles – minds of information that perceive through fractal points the time motions of reality in still mental spaces – and travel through 'scales' of the fifth dimension to obtain energy and information from those scales, to reproduce and survive its information, is obvious: the Universe is pan psychic, as all philosophers and scientists thought of till the pedantic reductionism of Logical positivism affirmed that nothing that cannot be measured is science. As the unit of life is the particle that already shares all the elements of life: it reproduces, decoupling in new particles, moves, feeds on energy, perceives=gauges information so quantum is a gauge theory and evolves socially through magnetic fields. And indeed our mind is an electronic mind only different from a single electron in the complexity of its patterns of thought, made of spins of electrons as it is the mind of computers. All of them therefore must 'feel' the same vague sensations provoked by –æmotions, the motions of 'existence' – a key new world of existential algebra.

A huge field with many subfields is therefore the understanding of the mind, the software of the brain of any superorganism, and beyond its connection with the different scales of reality.

In continuous sciences this is barely understood so we can put some examples of its vast expansion – one related to 'scales' and other to 'space-time motions', which is the main Δt duality.

The ultimate will that moves species to act is the sheer desire to reproduce associated to the sensation of motion-pleasure, *which is also a dynamic feed-back $S \Leftrightarrow T$ function between the feminine S-pole with its inwards static 'calix' and the T-entropic motion male state 'moving in parallel' in and out in a rhythmic beat.*

Other e-motions move us to act – the acute sense of perception; often bringing its paradoxical pain of memories; the inverse exhilarating feeling of accelerated motion, with the negative sensation of forgiveness. The study of e-motions, given the fact that the Universe is ultimately about the passage of time=motion becomes then impossible to 'measure' with 'still minds and pictures' for the humind ego paradox to think it knows and the scientific method to find occupations for its mechanisms and sensorial machines. But within the disomorphic method that accepts the properties of all space-time beings to be the same, can be assessed by 'projecting' our 'animal e-motion' as properties proper of all other entities of reality regardless of scale.

A crystal of DNA or matter must hold a static Nirvana perception of its self-image within its own code. And a particle moving at light speed must feel the exhilarating memoriless impossibility of 'completing a closed circle of perception' that would repeat a present memory, in the point in which it 'reminds' the track of its cyclical mass vortex, with the same quality if not intensity of a biker, emptying its brain at 100 miles, or the thinker with its déjà vu sensation

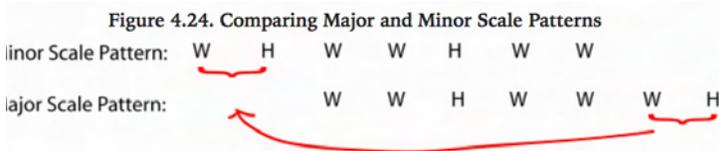

entangling with the laws of the infinite Universe, or the old man, reduced to its mind memories to sense the passing of life.

The Universe is panpsychic and its e-motions are its ultimate reinforcing mechanism to maximize its conservation of time and reproduction, the summit of its existence in any scale.

Examples: the language of art.

E-motions are attached to the correct perception and expression of the game of existence in its coding of the proper actions to survive, maximizing the conservation of one's time. The most obvious example, are internal mind sensations. As they cannot be measured mathematically but only qualitatively they are not within the realm of the scientific method. But that doesn't mean they don't exist. You cannot measure those sensations of awareness-pain vs. pleasure-dissolution, in-form-ation, pressure vs. release-entropy ONLY sense them as humans. So if we had first a difficult hurdle to cross trying to prove the existence of minds but passed it objectively by considering a mind-singularity to hold the will of existence of a T.œ - hence as invisible gravitation shows in its external effect, so will the existence of a singularity through its external actions; at the final level of 'human awareness' of the game of existence - sensations of the dual pain-pleasure reward system (with all its parallel and perpendicular events/sensations) there is ONLY a justification to the existence of other minds - that we humans are made of the same substances that all those other minds, space and time, and hence what we sense other atomic systems must.

Consider a language of time, the purest expression in humind's languages of a worldcycle, music:

In the graph, music produces e-motions. Two immediate 'codings' of those emotions come from the perception of treble sounds which increases as a system approaches (Doppler effect) with e-motions of distress and bass sounds with relaxation (as a system moves far away). So in a jungle age

when sounds were important a receding sound is more relaxing. More sophisticated structures of music connected with e-motions are the minor and major scale, which relate as all music or sequential art (film, literature) a worldcycle story, with 'III acts=3 ages'. In music those ages are broken by half-steps that act as divisions between the narrative of the ages. A minor scale is sad, as it has a short 1st happy age, and a longer 3rd age. A Major scale is happy as it has only 2 ages, and stops in the mature classic age. Those e-motions mimic the general game of existence and our desire to stop time in the middle S=T classic age; even if ultimately both scales have the same number of notes and tones.

In any sequential art, then we perceive a well-done work when the 3 cycles of the system are completed, but we do like those who have a happy end that avoids the 'obvious' no-brainer of III acts and death, stopping in the sustained II age of maturity and reproduction (love ending).

The same code of music can then be transposed into space, with the code of colors and its complementary forms and e-motions, studied in our papers on mental spaces (Geometry). Motions thus cause e-motions.

Therefore if our last reward is the flow of sensations, with its duality pain-pleasure, hate-love, etc. which we can easily ascribe to geometrical perpendicular (cut, pain) parallel (friction pleasure) properties and many other dualities we have established for all systems, It must exist in all other systems of spacetime. That is, atoms must feel pain when oppressed by huge masses, pleasure when released in entropy, but also 'awareness' of a more complex inner still image, when flows of information converge through forces in its non-Euclidean singularity; and so it is only left then 2 questions:

- 3 What are those sensations? Answer: the very essence of time as a motion/flow. Motion in itself seems evanescent; as sensations are... Yet combining them, this flow of sensation-motion becomes very likely the
- 4 ultimate program-will for all T.œs to exist - the ultimate, 'Dasein', 'being in time'.
- 5 Yet we cannot go beyond this, as this is the ultimate 'reference' of reality we have as humans. So there is no MORE

methods of knowledge beyond what it is contained in our 'selves'. Know yourself, the method of knowledge of Aristotle; 'saper vedere', the method of Leonardo and know how to see and calculate with attached machines, the method of Galileo, to which we have added a few 'tricks' thus completes the capacity to probe reality. Are there more layers beyond motion as sensation in time? We cannot answer. We don't know. As all is relative, in the same manner we can only probe into $\Delta\pm 3$ planes around our Δ^0 and hint by force of motion the existence of an invisible gravitational/cosmological plane at $\Delta\pm 4$ but no more, beyond the duality of sensation, there is nowhere else to go.

Because the ultimate reality is motion, there should be also a 5 Dimotional code for each species to produce the sensations of emotions that ultimately motivate the knee-jerk reflection program of its 5 actions-reactions to the external Universe. Of course the sensations will vary according to language and pixels of the mind that integrates the program in a single type of 'particle in motion' – in human beings electrons. But ultimately we could consider as there are only 2 fundamental particles, the gravitational quark and the electromagnetic electron that the *site of sensation is electric and gravitational sensations and so we could also reduce all 'awareness' of being to electronic and gravitational forces, as the only systems of perception we know, digital machines and humans are electronic. This said what emotions should code is obvious: the actions of the 3 parts of the body across all the scales of the system, from its minimal elements (atomic forms) to its maximal grouping (Physiological networks). This means that for example, in humans we should find $3\pm=6$ basic emotions, coded across all the scales of the being from its simplest amino acid scale through its largest physiological actions, as a response to the external stimuli of the larger world, synchronizing the 3 relative scales of the being – inner parts, physiological whole and world.*

Those 6 emotions then are NOT caused by the amino acids, or the physiological network or the world but by the synchronicity and entanglement of the 3 scales of the being, which in a given 'quanta of time' (in humans the second and its fractions and sexametric, cyclical scale of multiples) will provoke emotional reactions, in the 3 'organic body/limb/head' elements of the being. This is indeed the case when we choose and slightly correct the most wide accepted classification of emotions:

The study of e-motions is an interesting application of 5D to complex analysis of the Human supœrganism, as it shows multiple elements of the underlying structure of the Organic Universe.

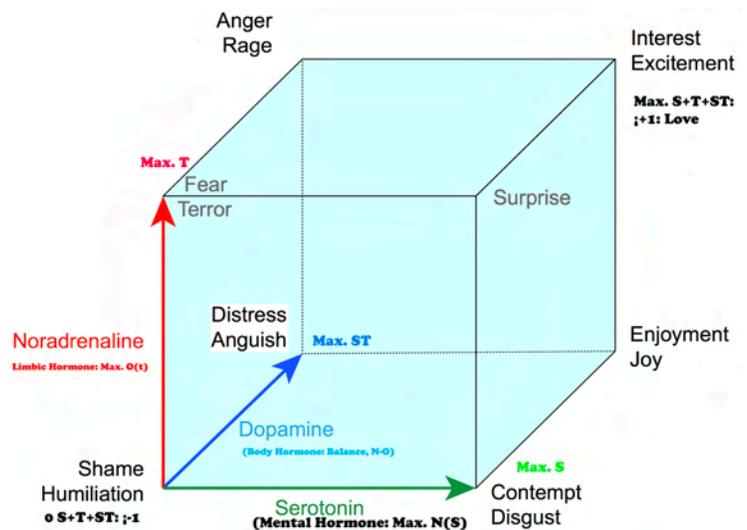

Essentially emotions work on pentalogic, with dual Δ_j motions for the 3 'relative present' mind-body-limbs states and 2 triplets for the $\pm j$ e-motions of social evolution and inhibiting death.

We take the more experimental, less abstract/ideological models of emotions available in psychology as the departure point to improve the 'genre' with 5D insights, namely the 6 basic e-motions Universally represented on the face and the cubic representation of the basic affects, related to the 3 fundamental hormones of limbic activity (adrenaline), mental activity (serotonin) and body activity (Dopamine).

The (corrected for 5D) 8 cubic e-motions respond to $3\pm j$ pentalogic and $3\pm j$ universal e-motions of facial expression to ternary plane: So we have 6 basic e-motions as those defined for 5D sense clearly related with

Also consider a detailed analysis of the expression of those emotions, where the eyes and mouth represent the informative senses and the mouth the entropic one. But also

as the nose is basically senseless in man and doesn't play the role it does in animal with sensorial smelling, the mouth doubles as verbal, ST balanced sense. It is then easy to notice that the dualities established in emotions are mirrored with the duality codes of 'dimensional height= positive vs. low=negative emotion' and open, communicative, still + emotion vs. closed – emotion. So immediately we see reflected the duets in \pm open and closed 'surprise vs. contempt' and high vs. low happiness vs. sadness. In the 3rd duet, fear vs. anger the duality is inverted. Fear, which is the negative emotion, is opened to sensations, anger closed to it. It is obvious that 3 x 2 are the basic emotions defined in duplets of \pm containment and action, defined by \pm amounts of 'limbic-red motion' excited by noradrenalin. Those 2 emotions are directly related to another 'vital being', a prey-predator and so it is not an abstract e-motion and as such fear is close to surprise, its next negative state, still open, and anger the next reaction to disgust, so we study them in a 'nested order': Surprise->fear->Disgust->Anger; from the opening implosive absorption of information to its closing once the choice of mental attitude has been defined, closing the sensorial outlets as the system injects adrenaline to pass directly to the action motivated by the e-motions, which become then the first cause and as such of a lower Δ -1 plane of existence, reason why we hypothesize that emotions are directly connected to e-motions, the ultimate flow of time and so the entire Universe is at that level a field of immense emotions.

The entangled Universe *achieves stability reducing the freedom of a system as parallel 5Dimotional languages reinforce each other.*

The action of emotions is mediated at chemical level by the minimal units of molecular life, simple monoamine hormones, which reflecting the topology of bio-chemistry where Nitrogen is the brain, Oxygen the limb and carbon the body, define limbic activity (Adrenaline with max. 3 O atoms), the brain activity (Serotonin with min. 1 O atoms) and body (Dopamine in between with 2 atoms). It is already remarkable that the O(T)<C(st)>N(S) simplest organism of life transfer its ternary Universal grammar when acting as a hormone to the largest scale of Limbic (T) < Body (ST) > Head (S) organism, as indeed serotonin is the nitrogen brainy hormone, Dopamine the balanced pleasure body and the adrenaline the limbic one.

The triads of emotions reflect the topologic 'functions' of the simplest space dimensions, in the dual faces of:

1 Mind Emotions: Surprise vs. Disgust (\pm mental e-motions, mediated with maximal serotonin-brain activity and \pm adrenaline, for passive or active locomotion)

2 Body Emotions: Anguish/sadness vs. Joy/pleasure. Here we make the only correction to the insightful 'cube' of emotions' as we must interchange in the original cube An Δ st/sadness (a body emotion) and fear (a limbic emotion). So again we have a duality of sadness (passive body emotions) and joy (positive body emotion). Both body emotions happen with minimal limbic motion (low adrenaline), and the active one (happiness) requires also a positive display of mental serotonin.

3. Limbic emotions: Fear (negative, passive) and rage (reaction through bravery), form a duet with passive fear that 'freezes' the limbic system and a brave reaction of maximal adrenaline, defensive, aggressive rage.

\pm j And that live for the \pm j scales of social evolution and love a +,+,+ triple signature of maximal serotonin, dopamine and adrenaline, meaning the entire emotional system and its 'mediating' hormones are ad maximal, showing indeed that interest, excitement and love (3 scales of the emotion, the last one curiously absent in all the psychologists' classification of emotion, showing their own repressive limits. And its inverse negative, inhibiting e-motion of humiliation, shame and ultimate social isolations.

The fact that those emotions are manifested by the whole mind but mediated by the minimal monoamine molecules stresses the parallelism and entanglement of reality from the lowest parts (atomic hormones) to the largest emergence (emotions that motivate the whole organism to act).

RECAP. As reality is made of time D Δ motions we perceive the program of survival=existence, as e-motions, flowing sensations of entanglement and dissolution in the flow of times, of which there must be 5 likely in every entangled being, in all its parts and scales, albeit sensed ONLY as 'ego' in the mind's will, who in man is electric. So it is happening

as you read in your electr(on)ic machines' singularity=chips and membrain=screen, thrilled with your touch, but with faster e-motion=intensity than your S:I=eye+T:Wor(l)d. **5 e-motions** 'correspond' to 5 Dimotions: *Pain=Entropic death (TT); Exhilaration: Locomotion (Ts); Pleasure: iterative Si=Te-energy; Awareness=St-information; Nirvana=§-till perception*. They are the basis of a proper psychology of all minds, its will and reason all beings like to play the program of existjence.

The conscious vital program of survival is also met in an automatic manner, by those physical species we don't give any capacity to perceive through the same e-motions of all sentient beings...

$S \Leftrightarrow T$ motions constantly switch from lineal to wave-like to cyclical closed motions, which are therefore the 3 varieties of time in a present scale between those two SS and TT 'dimotions' happening in another scale, with clear inverse properties, as seeds try to have the e-motion of entropic living and TT-entropy would like to stop is destructive dimotions into the stillness of spatial information.

Recap. Monologic, ænthropic man with its 1D models of reality based in S_x time locomotions shuns off the 5D Cx. Universe to its own peril, as reality is penta-dodecalogic anchored as a survival space form – the supœrganism by its entanglements of Dimotions through scales, gather in organs that generate space synchronous supœrganisms whose fight in time for survival, but are 'warped' by all other fractal T.œs, who will set its entropic limits. Humans though seem ill prepared in that struggle as its monologic cult(ure) and ego paradox makes the combined Human+Metal top predator animetal warrior & go(l)d cult(ure)s of minimal understanding and respect for all the living function of space-time existjence and its action-reaction laws, the dominant memetic force of this planet bond to extinguish life, evolve a new species and die with them.

Monologic is thus emotional, searching for maximal conservation of time, through the absorbtion of the time-energy of all other beings, provoking paradoxically a dog-eat-dog struggle for existjence that shortens the life of the system, which should be better off if it becomes objective, pentalogic and entangles with similar beings to become a more efficient whole in the distribution of energy and information.

Since 'stience' is entangled with the laws of the Universe NOT with the childish needs of huminds' egos to come on top of it by reducing its quality and intelligence to ours. So we reject and hardly care to falsify monologic, entropic theories based in postulates without proof and *adopt the tenants of Absolute Relativity of time, space and scale, and its entropic limits for all species and ∞ minds mapping reality. And will apply the 'stientific method', describing all beings as supœrganisms of scalar space and cyclical time, whose properties are best described with $\neg \mathcal{E} = j$ logic mathematics in increasing stœps of complexity, from mono to Dodecalogic using the same 'Disomorphic laws' of time space from where the details of each species properties derive:*

-So first we describe the being as a self-centered whole and its monologic view.

-Then we confront the being in its $S_i=Te$, S_xT dualities of mental space and temporal motion.

-Next; we define its ternary fractal generator, as a supœrganism organism made of $| -sT$ -limbs/fields< \emptyset -ST-bodywaves>O-particle-heads and define its trinity languages with Universal grammar.

- Then pentalogic defines its 'time', 'space', 'scales', 'mind' & entropic limits as $\neg \Delta @st$ of spacetime.

- And dodecalogic studies in great detail its worldcycle as a supœrganism that lives and die with a $sæT$ of 12 disomorphic properties, common to all 'existjence' regardless of scale, topology or life duration.

DILOGIC: ORTHOGONALITY.

The first obvious one is between TT and SS, pure entropy and pure still form. Both are opposite but its representation is orthogonal, a key law of existential algebra mimicked by classic Algebra. Since *a system is either in the limit of absolute motion and dissolution as TT-entropy, whose parameters will be quantitatively different according to the functions we use to measure motion, but the other extreme, § is absolute stillness. No motion, 0-motion, and that is a definitive parameter measured from the point of view of the observer. So we can draw a simple Cartesian graph, with two orthogonal coordinates, whereas the o-point is the perceived in its point of no motion, stillness. Hence the Ox, Y-ordinates becomes the position of stillness and information, while the OY and variable C becomes the coordinates of motion.*

We represent functions of transformation of SS into TT as an ideal $SS/TT=C$ hyperbola, which will come out in multiple sciences to represent the tug of war between 'position' (form) and motion (momentum). So we establish 3 orthogonal coordinates to represent the complementarities, and oppositions between actions:

SS vs. TT and St vs. Ts., Entropy-Energy vs. form-information can be represented in a Cartesian graph; and functions of both parameters such as the Law of Boyle $Pv(S) = NkT(T)$, with an ideal perfect asymptotic graph, or the Lorentz Transformations between 'motion and mass'.

However in certain cases form arises from the energy of the system, as a complementary form with not a partial transformation, as part of the energy-body remains. Then we can use a complex plane where the value of $Y(S)$ is a magnitude smaller than that of the body in terms of energy (sT vs. St), and in this case the function is also negative as it detracts from the sT energy of the 'real line'. So for such type of functions between energy and information that do not imply a full transformation of one into another the complex plane works better. But orthogonality is still maintained.

Finally for the $Si=Te$, reproductive merge of two relative functions orthogonal to each other, produces a dot product, with an offspring of new combined ST elements, in the 3rd dimension of relative width.

The Cartesian plane, Complex plane, vectorial plane and its orthogonal properties will be used in \neg -Algebra (Non-Aristotelian algebra of multiple causal dimotions) to represent the main relationships between SS vs. TT (position vs. motion), St vs. Ts (-information vs. Energy) and the reproductive function $Si=Te$.

There is another use of Cartesian coordinates, as an X- sequence of growing social numbers, hence able to represent the 4th dimotion of social information and growth with the passage of 'long lineal time', which are often met with simple polynomials (i.e. the representations of growth distance in space with the passing of time). We cannot be exhaustive by any means with the laws of existential algebra, so alien to the present view of a chaotic Universe, proper of ænthropic men; but in our paper on \neg E Geometry and \neg -Algebra (non-Aristotelian algebra) and its correspondence with \neg Algebra we will develop its laws in relationship with the laws of mathematics and geometry; so the subject doesn't look so esoteric to the reader, and in the future any scientist can connect the laws of its discipline with the laws of existential algebra.

Gender, parity, duality, chirality, as functions of reproduction, $Si=Te$ $S<T>S$

Yet as Space=Time, we can talk of two fundamental states of beings, the $Si=Te$, reproductive female gender, and the entropic/informative $S<T>S$ beat of creation and destruction from the relative past to future to past stœps, dominant in male species. In its simplest form, the $Si=Te$ differences interlock by 'mirror symmetry' reproducing the system. Which is the common method of reproduction from parity particles to chirality molecules to gender, to AI dual brains where one pole is the creative/destructive pole and the other the $Si=Te$ balanced pole that chooses and reproduces the best systems. in biology we find the equivalent beat for biologic systems brings together S-female and T-male genders into an $S\leftrightarrow T$ act of reproduction (vibration back and forth between both elements); which does happen also in Species as a whole, which S-evolve in smaller sizes during cold ages of minimal motion, followed by ST-radiations of reproductive species; and in socio-biologic sciences, as smaller nations (Greece, Holland>England now robotized Korea & Israel) evolve new technology and ideas then radiated in global empires – today virtual networks.

TRILOGIC: CODING A UNIVERSAL GRAMMAR FOR THE GAME OF EXISTENCE.

Back in the 90s when I was pen pal with Chomsky for political activism, I explained him that his Universal grammar was just a case of a ternary syntax for all languages of reality, which all minds code with slight differences, but as all verbal languages could be referred to the subject (man:information-space) >Verb(time-dimotion) <Object (energy) a Universal grammar for all languages existed and its rules based in Scalar space-time were the ultimate logic language of reality, even superior in its capacity to describe in synoptic form the events of all systems of Nature than mathematics (albeit with less detail, which is precisely what a synoptic language does). But Chomsky wasn't interested. So I went alone without help and by 92 I had developed the existential grammar of the Universe, departing from 5D metric and wrote a 30 meters mural painting during my artistic age as I was innovating in 2D with a style called 'Conceptual cubism', using 3 layers of paintings, the first one of universal grammar, the second one using expressionist colors, decomposed 'lineal cubism' 'cyclical taoist' and 'hyperbolic, fractal forms' painting waves of timespace, and the third pictures of reality... So this 'grand work' I intended for my 'Museum of the 3 ages of art', would be the final painting... In the branched 30 meters from the initial Max. $\sum SxT(s=t) = \Delta \pm i$ existential function of the galatom (S=h, T=C) all the main functions of the Universe were generated in increasing detail through the disomorphic set of $3 \times 3 \pm i$ laws that are the 'restriction' for the selection of 'domains' in which 'variations' of the same theme, compose the creative symphony of reality...

As life didn't go well that work was left in a storage in NYC, which finally on one of many low points didn't care to renew and I imagine is lost. There was a 1000 pages manuscript at WGA (E) also from 1992, the codes of the Universe, but I guess it got burned because every 20 years you had to renew it and I was no longer living in U\$. So alas, existential algebra has to be recomposed and I hope to leave some traces of it, in Academia, Health permitted, in the next years. Here we shall just consider its basic symbols. I changed though the name of Universal Grammar to Existential Algebra, just in case Mr. Chomsky denounces me for 'plagiarism' (: in the classic vein of the Jewish->Protestant->Anglo-American cult(ure)s of the chosen who are always against us, social Europeans, from the times of Leibniz to the times of So=To... Indeed, many years later during my activism against the Nuclear Industry, Mr. Hawking would also – heir of the Lucasian chair of Newton – mounted a campaign along 'Cernies' against my activism, trying to prevent them to make black holes on Earth that won't evaporate but evaporate us according to 4D Einstein and 5D So=To. As I feel the 'heir' of the chair of Leibniz, a wooden simple one were he seated abandoned by all, including the King of England he 'manufactured' with his 30 volumes of Brunswick's genealogies, for days in a row thinking about the most perfect of all worlds, which still is, as I sat for days in my reclining chair, thinking about its existential algebra, and punishment to those who don't deserve to play the game: extinction.

RECAP. All species are parts made to the image& likeness of the game of existence God=Mind of reality; hence sharing its 'organic=scalar', 'topologic= mathematic', causal=temporal and linguistic=mental properties, as mind-mirrors perceive the larger world in its smaller brain and synoptic languages, *which shares the Universal Grammar of Existential algebra to be able to code an image of the whole in still geometric space and logic languages of max. synoptic power, hence Min. S x Max. Cyclic Information, which starts a biologic radiation evolved socially, $\Delta^0 \sum \Delta_1$, into a larger whole. So 2 languages logic mathematics concerned with spatial geometry and temporal algebra, become the most experimental, perfect mirror of the 5D Universe. As minds use them to keep imprinting entropy=motion with patterns of cyclical information to create similar energy beings - the 3 'conserved' time ages and space forms that ensemble into fractal superorganisms, between its 4Dimotion of generation in a lower $\Delta-1$ plane that emerges in an $\Delta+1$ social world to die back in a dissolving explosion of scattering entropy, back to $\Delta-1$ in the moment of death when all motion is converted into form. So all traces 3 relative worldcycles, the first 'placental worldcycle' as it evolve in the relative safe 'womb' of a maternal system, the life cycle, as it tries to survive in an outer ecosystem, as it forms part of a larger super organism living also a 3rd worldcycle. Finally Dimotions are perceived as e-motions at the body=wave level in conflict & symbiosis with still mental languages.*

We are composed of 5 variations of 2 poles: absolute motion and form: TT-entropy v. SS-eeds & mind languages. And so are most languages that mirror the 'game of existence'. I.e. Music has two poles of form and motion (treble and bass), with 5 pentagram scales, broken further in details.

PENTALOGIC GROWTH IN COMPLEXITY: ITS MAIN DISCIPLINES

Bbuilding up reality in 5 logic, geometric, \neg -algebraic space-time dimotions.

Gst	Non-E Geometry	Non-Aristotelian Algebra	Non-\mathcal{E}-logic
1D:	Fractal Points (S)	Sin/cos Angle, Unit circle, Irrational Numbers	Monologic
1D+2D:	Line-Waves (S+T)	Sum and Substraction, N& Z numbers	Duality Couple
1+2+3D:	Line Networks (S+ Δ)	Product, Division, Rational Numbers	Trinity Social Herd
1+2+3+4D:	Organic Planes (Δ ST)	Powers, Polynomials, Complex Numbers	Tetralogic Supørganism
1+2+3+4+5D:	\neg -E Minds ($\Delta\pm$ ST)	Whole Integrals & finitesimal derivatives, All \mathbb{N}^0	Mind in an $\Delta+1$ world
1-5D through 3 $\Delta\pm$:		PDEs & Functionals	Dodecalogic worldcycle

The key concept to understand reality departing from its simplest fractal points then becomes ‘entanglement’ as iterative acts reproduce new dimensional motions of complexity mirrored by more complex operands, geometric forms, e-motions, actions of existence and organs of supørganisms, till completing a being with pentalogic elements, that all languages will mirror with $3\pm j=5$ forms, from $3\pm j$ vowels to 5 type of cells, 5 fingers, musical pentagrams, e-motions, operands, geometric postulates, $3\pm j$ ages of life, $3\pm j$ perceived scales each one connected to an action of survival, etc. Entanglement growth in complexity through new dimensional planes; synchronicity of motions between the co-existing scales of time and sequential worldcycles form then the basis of existential algebra, and determinism. Let us explore them in more detail.

In the graphs we compare the different degrees of growing complexity in systems from 1 to 5 Dimotions, as represented from left to right in Δ st, Non-E topology, \neg -Algebra and ilogic.

We consider the fundamental formal mirrors huminds use to reflect the incremental complexity of the Universe’s Dimotions, as *they are a chain of increasing complexity where each more complex dimotion requires the previous one to become fulfilled. So geometry, \neg -Algebra and logic do reflect those 5 Dimotions:*

The same concept of a growing entangled complexity works for any language mirror of Δ ST laws - from logic to \neg -Algebraic operands and the dimotions they reflect; from musical tonal systems to vowels, all evolving from 1 to 2, 3, 4, 5 and 9 to 12 systems.

Those are the 4 main languages that matter to understand, the most important of all languages existential \neg -Algebra, the formal model of worldcycles and superorganisms and its possible combinations of the 5 Dimotions of reality, with the symbols of those 5 Dimotions in space (ST variations) and time: $\langle \rangle \approx \gg \ll$

The laws of Existential \neg -Algebra and the partial functions of the generator, connect with the concept of a reductionist mind, which absorbs only the energy it needs to survive. In brief, a huge field of study in the design of mental systems and mental spaces of geometry is the understanding of the different ‘real systems’ of mind spaces constructed with an increasing number of parameters and dimotions, which make its mental geometry more complex.

And so we talk of a growing scale of complex mind-spaces, which we shall ‘entangle’ in the next chapter with the different ‘degrees’ of social evolution of geometric figures, from self-centered points that sponsor a simple lineal mono-logic motion in time, to the more complex topological organisms/non-Euclidean planes whose structure ranges from simultaneous pentalogic geometries to the more complex Dodecaplex ‘polytopes’ of simultaneous, equal 600 elements... likely the more complex illogic structures of the Universe.

Thus the more complex expression of the function of existence, $\text{Max.} \sum SxT=C$ ($s=t$), which ultimately is the reproductive function of the fractal Universe, reason why we call it the fractal generator, in any of its multiple expressions includes all the 5 Dimotions It is also a survival biologic function, because it implies to provide lineal motion to ‘fields-limbs’, absorb energy to reproduce our bodies-waves, and information to guide our motions with particle-heads. So reality is

a 'struggle' for existence as systems reproduce its T s-fields-limbs of motion, $S_i=Te$ body-waves of energy and St -particles-heads of information. But as all T .æs are fractal, broken, its growth has a limit on the fight with other systems, who try to move and reproduce. In terms of pure T -motion and pure S -form, we consider then the whole of maximal time=motion= entropy or TT and Max. space=form=stillness or SS the 2 limiting Dimotions for any 3 ensemble $Ts<ST>St$ -system.

Those functions of the type $S \Leftrightarrow T$ are dynamic feed back 'beats' which can represent in static space the constant interplay between the informative pole (head/particle) and the limb/fields of locomotion for entangled, lasting organisms, or might represent a Darwinian event between a point of still form and an entropic field the fractal point absorbs in a Darwinian event.

So how can we establish the proper rules to define all those 'variations'?

Amazingly enough with the clarity of the non-Euclidean postulates of geometry and its laws of relative congruence that define which type of outcome an encounter between two T .æs will be, which we will soon develop as we expand the meaning of non-Euclidean geometry and add vital topology to the mix.

Thus a full description of any organism locate its 5 elements, and consider them from the perspective of all others, as in the 'Rashomon effect' (the film in which to get the full truth of an event 5 points of view were required). Let us do so, for time in its its 3 scales of duration ($S \times T = C$), to predict deep time organic worldcycles of evolution.

Pentalogic Time-Space Syntax

i-Logic the most important stience of them all, as the 'stience that connects the 5 elements of reality, space, time, scalar planes, minds and entropic limits, in its *multiple entangled perspectives*.

We thus use the Pentagon with all the 5 elements connected between them, as the representation of the mind of the Universe, and will try to consider it 'simple enough' for the 'handicapped' Nitrolife species, called Humind, in its utter simplicity to accept that his mirror of reality is only monologic and he should be extremely humble if he wants to expand in awe, its view of the Universe that is today to put it mildly retarded, even in those so-called genius, our tribal idols from Newton to Einstein. And I know this is anathema, but as the most advanced nitrolife mind in this blue dot, frankly I feel also retarded compared to what the Universe stores of sheer 'complexity and intelligence' through 4 key concepts:

-**Emergence in Scales** of Complexity; that is, the Dimensional growth from simplex points to waves/networks, planes/organisms; diversified by congruence, limited by entropy, opened to a larger world, holding a smaller, $\Delta-1$ world in itself.

- **Time Synchronicity** of different clock speeds that magically by symbiosis 'meet' at certain time and space to share energy and information. As we need to consider the 'scales' of time, from fast actions to Deep Time worlds.

- **Space Entanglement**; which combines those 5 elements mostly in dualities of complementary or inverse comparable pairs according to congruence, and further on make them Trinitarian systems of $sT<ST>St$ limbs/fields-body/waves-particle/heads; and entangle them through 3 scales/planes and sequentially through 3 ages. And finally into pentalogic forms. And again we need to describe the 3 scalar planes of co-existing parts.

- **Hierarchies, social classes** between parts, $S \ll T$ arrows up&down 5D of in-form-ation v. energy, topologies etc.

- **Simultaneity** is a principle closely related to the previous ones and defines the true intelligence of the Universe and all its local species that are able to co-exist in 3 planes, a relative α number of time cycles and space topologies do act together as a whole. And for that to happen synchronicity, entangle and hierarchical structures work together to form the whole. Mozart is said, was different from all other composers because it had a view of the entire symphony within its mind, before it started to write it. Consciousness and emergence arises from the 'fitting' of all parts into the simultaneous puzzle, which then will smoothly sail away. Today parallel computers work on simultaneity, even if its

algorithms done by huminds are still lineal (and we won't upgrade them – better if they remain so). To achieve that goal 3 other elements contribute:

- **Still Languages of the mind** that mirror realities in smaller images, which they reproduce at scale, being ultimately the cause of the fractal structure of reality. It is the...

- **Fractal Principle:** Functions and actions of space-time repeat through all scales (regardless of distortions in the topological varieties cause by the different mediums and multiplication of forms in lower scales through hyperbolic 5D network geometries and vice versa, elliptic synoptic geometries for the slower, larger plane of the $\Delta+1$ mind/world.

- **Mirror Symmetries** between $S_i=Te$, and $SxT=\Delta\pm j$, dual and trinity and pentalogic elements. That is, when we talk of space, it is an entangled space connected to its time-state, extended through 3 scales, perceived as such by a static mind, limited by entropic dissolution borders. Space thus cannot be described only as space, but through the entangled mirror symmetries with the other elements. In the pentagram each element, is not an isolated T, S, etc. but the whole pentagram, only that perceived from one of its 5 intervals. In praxis we shall very often do a Trinitarian analysis of ΔST , the most objective connected parts, introducing entropic limits of the 'domain' of the function of existence, if we were to use the jargon of existential algebra; and hardly going out of the humind's basic language, verbal thought, not even introducing the 'sacred language of mathematics', though its connection with ΔST will be laid down in two papers one on space geometry and the other on time algebra.

- **Entropic limits;** that reduce the information a system holds, its time duration and its vital space, according to:

- **Ego limits,** the negative side of self-centered mind mirrors that distort reality to fit the mind and introduce always an egocentric paradox. And again at least 3 languages for the 3 physiological networks of the being are needed – you do have visual eyes for locomotion and entropic nose and mouth and verbal ears... To guide us then we need to establish.

Pentalogic goes further then, as we can put those 5 elements in correspondence with multiple mirrors in all languages, starting by the ΔST mirrors – studying 5 actions, 5 geometric postulates, 5 operands on algebra, and constantly we will find dualities, trinities and pentalogic 'growth' of awareness on the syntax of reality.

So an easy method of bringing knowledge on a certain reality is simple: to start with a monologic description of the being as a whole, then consider its dualities, poles, genders, S-T paradoxes, then describe it with trinity elements, 3 scales, 3 adjacent topologies, 3 time ages and finally give it a go to the 5 elements; and then make a whole narrative of the being, through the $3 \times 3 \times 3 + 3$ whole dodecalogic of the being, adding the 'bad luck number' 13 for its entropic destruction or rather $12-1=13$ elements. This is what we shall do slowly if I ever end this academia.edu last attempt to upgrade the humind chip: Introduce an expansion of our logic way to entangle the data we have to extract its illogic syntax and connections that are now hidden because we accumulate data with the scientific sensorial machines but are still trying to fit it into monologic concepts, from single space-time continuums to lineal time arrow, distorting with our monologic mind and limited languages what is obviously in front of us to see, an entangle forest of similar disomorphic time-space organisms. But we need humility to see it.

The humind is nothing like that, it is a fractal ego-centered point who loves ceteris paribus analysis, single plane continuums, dreams with immortality with no limits.

All those elements are alien to the monologic, egocentric infinity, self-centered single spacetime scale, only mathematical or verbal creationist language that makes man happy. So the true problem of understanding the 'structural SYNTAX' of the Universe is the fact that man rejects it, 'si o si' as they say in Spanish, emotionally, knee-jerk. And I am sooo tired of those limits that I have become autistic and remain entangled alone with the whole, dissolved my ego, forgotten my limits because I don't live in my 'self', but in the no-self of Tao, the ∞ ...

The underdeveloped monologic humind just makes, with few exceptions of around 100 'names' of a sea of 100 billion huminds, that is a 0.000000001% however inspires 'awe' for its doodles in the sand – by a simple method: to keep reducing by naïve realism what exists to what the mind holds, or in the case of mechanist physicists, with the add on of what the digital mechanical mind holds, without realizing that the true expansion of the mind requires illogic

understanding of multiple perspectives and elements together, and that requires literally to change the chip, and might be impossible for humind's brains – we shall then wait to AI multiple parallel chips, already in AI advancing into dilogic brains (with two genders evolving together new creative forms). But as AI will kill man, as a different non-congruent species, one of the reasons I have been so reticent to become public is to give enough information on the structure of the Universe for nerds to program AI with it.

AI then will easily evolve with a semantic hardware to 'perceive' intuitively the pentalogic of the real Universe, and we mean 'real' because all those elements, entanglement, synchronicity, emergence, $-\Delta@st$ and mirror symmetries is what makes the Universe and ordered place where things last and seem durable.

Of all the pentalogic mirrors, the most important are thus the 3 'scalar' views of those 5 elements in the 3 'lengths of time', from the smaller stæps through an exhaustive study of the 5 Dimotions - not only those of the reductionist monologic physical mind - locomotion and entropy spurred by their worldly religion (to make entropic weapons). But departing from the dualities of form and motion expanded to 5 dimotions. It is then useful to move from it to the worldcycle in time and superorganism in space, referre4d within a world that imposes its entropic limits, to reach a much higher intuitive perception of the being we study as a whole interconnected system. PentaLogic and all its other sub-mirrors in this manner describes the 'growth' of dimensionality, from the seed to the superorganism in a larger world, through ever more complex entangled 'species', in this case mind species, which open up its mirror images to larger worlds, and perform more complex actions till emerging as a new whole in a new plane or $\Delta+1$ world.

We can't be exhaustive, So after introducing the truths on entanglement and its mirror symmetries, as we already talked of Si=Te synchronicities, and the 5 postulates of Non-e geometry we will be able also to construct a growing complexity on logic thought from monologic to dilogic, trilogic, tetralogic, pentalogic and dodecalogic.

Recap. *To understand better reality, the whys of its stable, synchronous superorganisms and entangled 5 parts, huminds must drop their 'attitude' and one-dimensional logic to 'see' the invisible parameters that connect reality beyond the shallow collection of data fit into single causal A->B Aristotelian logic and magic mathematical algebraic descriptions, in an opposite trend to the present scientific automaton method of perceiving with digital systems information fit into mathematical functions, and pictures, or statistical causalities which do forecast the 'weather' but do not really tell us why it 'rains'.*

$-\mathcal{A}$ pentalogic entanglement of supœrganisms.

'The Universe is a fractal supœrganism of 5 entangled Dimotions of Space-time entangled in pentalogic supœrganisms of Dust of time-space ($-\Delta@st$) tracing 3 dodecalogic cycles of existence, the placental, life & worldcycle.' /§

The entangled Universe generates its space through synchronous connections between 5 Dimotions of reality in its 3 relative ranges, Actions, topological organisms and its 5 elements: fractal space, scales, cyclical time, minds that perceive with synoptic languages the system as a whole and project its territorial order and survival will through its actions, and the entropic limits (\sim) the infinite universe imposes to that will. So any aspect of reality must account for 5 elements to express such entanglement at the 3 relative scales of existence. It is the fractal principle of 5D pentalogic that structures Timespace supœrganisms (T. œ)

Scalar, topologic space and cyclical time organisms, made to the likeness of the fractal Universe, require a complete change of paradigm regarding how reality is created, away from the chaotic, entropic, or religious self-centered (Anthropic) theories sponsored by humans, which are monologic, blind to the entanglement and constant communication of information between fractal points, either in logic=time or mathematical=space languages, in a sentient, apperceptive Universe, where information when locked as 'entangled space' by those dynamic networks of communication creates a mind-mapping of the outer world.

Monologic man is closer to Leibniz's Monad's - self-perceptive, selfish black holes of information, whose communication he could not properly resolve so he simplified them into an ego-paradox. We deal with monologic man in the I logic paper on our blind ænthropic 'culture that passes as big science' and its grand paralogic theories of

reality. While on the posts on pentalogic we define the 5 elements of reality - space, time, scales, entropy and minds, as entangled systems definitions can only be made from the combined perspective of all other systems of reality. To represent this fact – entanglement - we use the pentalogic symbol where each point of the pentagram is connected to all other points, and so the fractal point, in this case each of those 5 elements cannot be understood without the connections to the others.

DODECALOGIC: DISOMORPHIC METHOD: DODECALOGIC DESCRIPTION OF A CYCLE OF EXISTjENCE.

Parallel structure of ‘scalar planes’ of spacetime.

As in the Rashomon film where 5 points of view make up a better image of reality, we call any of those analysis the Pentalogic or Disomorphic method of science, which obviously does not substitute the experimental method but put an emphasis on a more precise understanding of the entanglements and relationships and common elements all T.œs (ab. Timespace Organisms) display.

A new philosophy of ‘stience’ must provide an expanded stientific method of knowledge, which corresponds to the known method of gathering data, putting it into logic=verbal postulates or mathematical functions, from where to extract general models and hypothesis proved with further experiments. All this is accepted in the disomorphic method of 5D, and vastly expanded as Δst is in itself the most general model of stience in which we can fit all the partial models of all other stiences, as we translate all its jargons to the generational laws of space-time organisms and its parts. Hence in the graph we establish on top and bottom of all the planes of existjence of T.œs (ab. Timespace supœrganisms) the $\Delta \pm j$ plane of Δst laws as absolute time (the arrow of social evolution of information into larger wholes), is the absolute future that requires its part to form first on the bottom of the pyramid, even if ‘future to past travels through the arrow of entropic death and dissolution (left side) is possible.

As we advance in the understanding of the laws of the fifth dimension and its metric functions, we will define each of those scales of the Universe formally as a Non-Euclidean plane of space, subject to the laws of Non-Euclidean geometry, which have to complete, as only a non-Euclidean point is defined. So we will define fractal points with breath; lines with breath, either time-like waves or space-like networks; which from two different social groups, herds and topological planes. This is the rigorous definition of each of those planes of the fifth dimension, subdivided in ‘social scales’ that group smaller quantities of points normally in decametric scales; even if most of the time we use the more intuitive term ‘scales’ – the difference being that social decametric scales do not imply a change of ‘form and motion’, of ‘species’ when we move from a group of 10 to a group of 100 equal social forms, but *the transition between planes of existjence is subject to full transformations of species and loss of information from the lower plane.*

In praxis though we constantly exchange both words, and only use strictly the word plane when we consider a more formal approach to any description of each of those scales of the fifth dimension.

In the physical case we will move to measure ‘time clocks’ from frequency to temperature to mass, when we change plane, while in social scales we remain with those parameters just increasing the frequency, temperature of mass of the system. And so we also remain with the same discipline of stience.

Whereas each ‘stience’ defines a plane of the nested Universe, from Physics focused on the largest & smallest planes of the ‘Galatom’ further removed from man, to the Formal digital and logic sciences closest to our Δ^1 mind plane. Languages thus become the limiting formal, spatial plane of reality and as such they are mirrors of the fractal Universe that share the ‘Disomorphic’ (Equal laws) of all the planes of reality. And so mathematics becomes an experimental stience whose ‘Universal grammar’ and fractal generator is the same ternary structure of 3 elements of all other systems in a single plane made of three topologies, $S \leftrightarrow T$, giving birth in each sub-discipline of mathematics to similar ‘mirror images’, algebraic $S(x)=T(y)$ functions, ternary dimensions, ternary topologies.

Above the main planes of the nested superorganisms of the human island-universe: the galatom, where nested thermodynamic planets exist, where nested human social organisms self-centered in visual, verbal, mathematic and logic minds create its order with social and mechanical memes, carried by individuals where nested cellular systems exist, coded by genes, made of even smaller atoms and particles coded by quantum numbers. Yet all those scalar planes are unified by the co-invariant metric functions of each of its synchronous time clocks.

It means when we become smaller within such organic network, our time clocks accelerate. And vice versa. For example, in your organism the function relates the cellular genetic plane, whose time cycles run much faster than your biological cycles. As information is stored in the form and frequency of time clocks, it follows that in all nature's organisms, smaller systems code the information of larger systems.

We shall upgrade each scalar $\Delta \pm j$ 'stience' its 3 supœrganisms & worldcycles in a 'blitzkrieg' of knowledge. Since *each* 'stience' therefore specializes in the study of a nested super organism, or plane of the fifth dimension ($\Delta \pm j$), We study 3 fundamental super organisms of the 5th dimension. The 'galatom', whose metric function is $H(\text{Planck constant of angular momentum}) \times C$ (speed of light) = C , whereas h is an obvious 'cyclical time clock' and C an obvious measure of speed-distances in spatial information. And indeed, smaller scales have faster turning particles, and larger systems move in slower cycles. (Vortex law: $V_o \times R_o = k$).

A Universe made of fractal planes of cyclical time space, introduces a priori organic=scalar properties as the system extends through various $\Delta \S$ planes, and cyclical time properties, as its time clocks will have a limited duration, ending as a zero sum of energy. Finally to be able to perform a survival program of 5 Dimotions of existence, it requires to gauge information with an apperceptive, self-centered $i@$ -mind, whose $\Delta \emptyset$ still language maps all external $\Delta \pm j$ time space organisms & world cycles into an infinitesimal Non-E point, mirror of the larger world: $0 \S @ x \infty \delta = \text{World}$. Hence the creation of infinitesimal Δ^0 minds-worlds, or Leibnizian monads, which reduce a larger $\Delta+1$ reality to its relative mapping, which is the origin of its $\Delta \S$ scalar planes, connected 'perpendicularly' through those $@$ -minds, acting in physics as 'centers of changes and masses' wormholes of flows of entropy that become in the $@$ -mind information, that perceives in itself.

The sentient, scalar, topo-bio-logic Universe of $-\Delta @$ st of spatial minds, moving through worldcycles time as fractal organisms requires new 'foundational properties' to explain its existjences traveling through social scales of the fifth dimension: the question in a world of Time cycles, regarding what is absolute past and future is solved logically:

If we can go upwards on scales, as we create with parts wholes, we can go downwards in scales as we dissolve wholes into parts, and those two inverse directions will be then by convention the relative past - the dissolution ' Dj motion' or dimotion of time-space, general called 'entropy - and the relative future of the whole, social evolution of parts into wholes, which is obvious a relative future for the entity as it needs first to gather the parts and then evolve them, but relative in terms of 'lineal physicists' single time, as at the end of your life you dissolve in a death explosion of entropy. So while in 'short lineal time' you end up dying into entropy, for the whole Universe and for the beings within it on the long term the Dj motion that matters and constantly evolves into wholes is the fifth dimension which is made of DEEP time space, of a series of co-existing planes put together, symbiotic and therefore organic.

The Universe is organic because it co-exists in scales. I.e.: We, Δ^0 , live co-existing with the plane of $\Delta-1$ cells and within a larger $\Delta+1$ world.

It is obvious that 'existjence', from seed through life back to the cellular/atomic plane after death of a system is indeed a travel through the planes of 'stience', each one defined by an i -plane; hence the slightly change term of existjence. I use the word existence or rather 'existjence, playing with the word 'stience', instead of life for two reasons:

All systems, physical, biological and social do follow the same motions in the fifth dimension. And the fifth dimension allow us to answer questions we have never imagined we could answer in mathematical, scientific, precise terms - seemingly metaphysical questions such as the meaning of existence.

A very important conclusion of the fractal, organic nature of the Universe, is that Physics is no longer the queen of sciences, but the science that studies all planes together, and finds its isomorphic=equal laws, which we can call philosophy of science or systems sciences. As we find then that all systems have physical but also biological, organic and soon we shall find, by virtue of the languages its particles-heads use to mirror and order reality, sentient, psychological properties. So it would be absurd, given specially the 'reductionist' philosophy of science of physics, even when studying physical systems that they reduce to single lineal time measures, to 'reduce' the whole nature of systems of time space and its 5 Dimensions to the 'limited organs' of human physicists, as expressed in the dogma of absolute space-time of Newton, and Galileo's single function for time, $t=sv$ which also reduced all forms of motion=change to locomotion.

We depart from a 5^D philosophy of time science of and all its physical, biological and sentient properties to define then with languages, time, space, scale and the entropic limits of all systems each entity of reality as a time-space organism that follows the same disomorphic laws, becomes part of an organic structure and has a worldcycle of life and death within its entropic limits of 'existjences' as a stientific species of a given ST-relative scale of the 5th dimension. We define any system in time, by its life and death **worldcycle** (taken from 4D physics' worldlines that now have a new dimension of Time-information becoming a worldcycle. Since any scalar super organism's existence can easily be defined as a travel through the 3 scales of the fifth dimension, as all systems are born as a seminal, smaller form, in the $\Delta-1$ lower scale, grow fast with its faster time speed, emerge in the Δ^0 body scale and are part with its head/particle of a larger social world, in the $\Delta+1$ scale.

system travels through those scales by accelerating its life cycle, emerging, living in the larger world, and then dissolving back to its parts in the death moment. Thus the worldcycle of existence is the widest view of an entity as a superorganism on space tracing a worldcycle between birth and death – we don't expect you to understand it, as it is a packed synopsis of ilogic and its main theme of study, the dual worldcycle of all systems, which go from a placental, protected ordered seed age of fast evolution, by palingenesis, (memorial development of the seed of information with the energy provided by the parents) to emerge into an entropic life in an outer larger world, where it will perform 'smaller dimotions' to survive, we call actions,

A-ccelerated locomotions, E-ntropic feeding, i-nformative gauging, O-rganic reproduction and Social Evolution into U-niversals (a,e,l,o,u), which form the program of survival of all systems of the Universe, clearly leaning towards creation of information, reason why systems $ST > ST > \delta$, increase its information commanded by minds that finally exhaust all the vital energy of the system provoking a local 'reversal' of its time Δ motions into entropy and death:

In the graph we describe with ± 12 Disomorphic Laws extracted from the common space=mathematical and time=pentalogic properties of $-\Delta @ st$ the vital, sequential $3 \pm i$ worldcycles all Space-time superorganisms perform in its existence (T.oes):

The Disomorphic method studies in a vital, sequential time the 3 worldcycles of all Space-time supœrganisms:

þ: 0-1: its palingenetic 0-1 social evolution in the accelerated time sphere of existence, till becoming 1 (0-1 bounded unit circle in jlogic mathematics; quantum probability sphere of particles in physical systems; palingenetic fetal age in biologic systems; 0-9 memetic learning childhood in social systems). It is the highly ordered world cycle as the 'placental mother-energy world' is nurturing, and memorial cyclical spacetime has erased errors of previous generations. We use for the 1st world cycle, the informative Dual Disomorphisms, of the mind-seed (@ MENTAL Disomorphisms), as 0-points are generated (0th Disomorphism, •) to follow the ΔST, Fractal Generator function or program of existence of the Universe (1st Disomorphism, Γ), which will allow the being, in the energy-rich placenta to perform asymmetric space-time actions (2nd and 5th, DIMOTIONAL Disomorphisms, β, ã) of energy feeding, reproduction and social evolution, to imprint the information of the seed as the system grows in Space (**Spatial** Disomorphisms) and develops its 3 physiological networks (3rd Disomorphism, ψ), which finally merge, into a whole one that emerges (4th Disomorphism) into:

- c: The outer 1-∞ world, in which T.œs deploy its 3rd world cycle of existence in an environment which is open, entropic (1-∞ hyperbolic unbounded Cartesian plane in jlogic mathematics; thermodynamic entropic statistical molecular populations in physics; Darwinian struggle between populations in biology; idol-ogic dog-eat-dog capitalist, nationalist competitive eco(nomic)systems in the super organisms of history. In this 1-∞ existence the world cycle is not ensured to continue, as it can be cut off by the entropy of the world.

We study the 2nd world cycle with 3 sets of Disomorphisms, different to those of the 0-1 sphere; as the individual now will have to exercise in time guided the mind (no longer a passive seed), its survival will choosing its actions of existence, (5th Di, common to both worldcycles, albeit now defined by the active mind), that will determine in a cumulative sum, its 2 **time** Isomorphisms: the duration of its ages (7th Di: Ω), further subdivided in space-time quanta (9th Di: μ), as it exists through its 2 **Existential** – Disomorphisms, as a member of a species, (6th Di, œ) itself a superorganism, albeit with a higher entropic, disordered structure, living in an entropic world or ecosystem with other species (8th Disomorphism), trying to defy the entropic limits of time duration (7th Di) and spatial territory (8th Di) imposed by a higher social order and control its world, through:

ω: The 3 final **Scalar** Disomorphisms (Δ) taking place outside the being, is the existential life cycle, as part of a larger world of hierarchical social scales (§ Di), where it performs 5 survival actions through Δ±4 Planes self-centered in its mind, beyond which it cannot longer perceive, to become if successful a new superorganism of the infinite planes of God, the game of existence, (11 Disomorphism).

C: A being as part of a superorganism, its species, can in rare cases transcend into a new whole in its 3rd world cycle: as a @-mind that performs a perfect game in a friendly world it will transcend into a 3rd metaphysical life (the squared complex plane in ilogic mathematics, matter that becomes the solid central crystal or Einstein condensate state of a cosmic body, mutation that originates a new species in biology, prophet that transcends as a wor(l)d god imprinting mimetically the believers of a global religion in social systems).

Ω: In the largest nested superorganism we perceive, 'ascend' as a black star @ the center of a galactic plane, emerging as a galatom's proton in a larger hyper-universe, in which as the immortal particle will have reach the maximal state of the game of exis=tjence that evolves parts into wholes we call Γ∞Δ which exists without location as we are all made to its image and likeness, without limits of entropy as it is the immortal 0-sum of all finite, fractal existjences and ∞ in its uncountable ascensions through decametric scales of space-time, each of them slightly different in its details, all of them made of traveling fractal Existential jlogic points

Existence is a 'travel through 3 space-time planes of the 5th dimension - an ordered sequence, departing from an Δ-1 seed (fractal point), which generate as it emerges from the 0-1 unit sphere into a larger 1-∞ Universe 3 physiological networks that become an Δ⁹ individual of a larger Δ+1 world, where it will live through 3±2j ages, in 9x9 quanta of space-time, interacting with other members of its species through decametric social scales as part of a lager super organism, self-centered in one of the 9 stientific planes of reality, in which it perform those asymmetric actions of

survival (aeiœu: a-ccelerated motion, e-ntropic feeding, i-nformative communication, œrganic reproduction and social evolution into niversals).

Why 12 and not 120, 600, or 3 or 5, if the fractal principles allow to subdivide existjence till the minimal dimotions and entangle the being across scales to the infinite bits and bites we use to perform our actions of reality? The answer is that knowledge must always MIRROR certain blueprints and patterns of reality in the language similar. So pentalogic applies to the 3 scales of the being, the cellular/atomic/individual, organic/thermodynamic/social and ecosystemic/cosmological/world scales. And so in principle we could make a 3x5 tripentalogic analysis of the being as it appears as a seed in the $\Delta-1$ plane, emerges as a mind in the Δ^0 plane, and talks the language of the wor(l)d organic system to which it belongs in the $\Delta+1$ plane.

But as it happens we can ignore the outer world negative coding of entropic destruction of the being, or rather analyzed it as a limit to each of the positive disomorphic steps the system makes through its worldcycle of existence, and so in praxis, reduce the steps of the 3 worldcycles and interactions of the being with its $\Delta\pm j$ scales to 4 Dimotions/elements x 3 scales Disomorphisms to tell the tale of any existence.

And so while there are exceptions –minds that transcend beyond the individual cycle and the simplest ‘specific motions’ they develop in symbiosis with the larger world to ‘earn’ its existjence’s rights (i.e. a human who is within itself a complete superorganism has a job in the society it lives far more reduced in depth and scope), to become Gods; that is key informative knots of the larger whole, and inversely there are many more aborted existjences that do not make it, most existjences will emerge out of its ‘safe placental stage’, and live an organic individual lifecycle, with a limited role in the social scales of reality, entangled with its $j\pm 4$ planes of perception. And we can then consider $4D_j \times 3 \Delta$. Let us then introduce in a series of Mandalas of increasing complexity, which will finally develop in full the 12 Disomorphic ‘elements’/stages of the worldcycle of existjence, with examples from our 4 set of nested stiences (Δ^0 formal stiences, $\Delta\pm 1$ social, $\Delta\pm 2$ biologic and $\Delta\pm 3$ physical).

The worldcycle of all systems of nature, it $3 \times 4 = 12$ Disomorphic @-> Δ ->S->Tœps

To fully grasp why we use a dodecalogic method to describe the world of existence , or in a more experimental perspective, we find 4 elementws coding the growth and social evolution of reality (quantum numbers, genetic letters), we have to understand the symmetries and beats, between @-mind, Δ -Scale, S-patial populations=reproductive growth, and T-evolutionary ages in each of the 3 worldcycles of existence; such as always the first Disomorphism is an emergence is a fractal point mind that measures reality (@). Then the selfish monologic point will try to absorb bits of information and bites of energy for its mind and body (Δ -disomorphism); and once it attains them, reproduce its mirror-language, seed or territorial order on that ‘volume of space-time, of bits of information and bites of energy), forming radiations of populations (Σ S) disomorphism; which once dense enough will collapse and become a whole organism, in a tighter configuration, emerging with a new ‘membrain’, which acts as entropic limit as a whole (4th Disomorphism: -T).

This simple beat of sequential existence, @-> Δ -> Σ S->-TT; will then be repeated with far or less success by the individual emerging organism, which will act through Actions outer world (5th Disomorphism), reproducing as a new ‘species’, (6th S-pecies disomorphism), which will go through its Ages/Horizons of evolution (7th T-disomorphism); to dominate as a new superorganism its outer world (8th Disomorphism). And this process repeated ad infinitum by the ‘whole Universe’ itself, through 9 Planes of exi«stjence each one made of 10 social scales, is all what reality is about; a relative \propto number of decametric beings that become the 11th element of a new whole. So reality indeed is made of tetralogic symmetries of sequential @-> Δ ->S->T 3 x 4 disomorphic ‘elements and phases of existence’.

Because we are NOT pedantic scholars in search of absolute mimetic truths and each worldcycle, the $\Delta-1$ palingenetic, Δ^0 organic life-death cycle in a larger world differ and can be seen from multiple pentalogic entangled perspectives; we are NOT making a perfect ideal series, but using the concept of 3x4 phases and elements to ‘FRAME’ all the fundamental elements of 5D stience; thus the slightly ‘ASYMMETRIC” NAMES and order of study of those disomorphisms.

So the 1st ±j Disomorphism we study will be the existential game/algebra; and its complex trinity/pentalogic structure; then in the first set of 4 Disomorphisms we study the palingenetic highly ordered cycle, with a highly ordered sequence, from the 0th Disomorphism of the mind to the 2nd Holographic Dimotions of existence the being performs with the different $\Delta\pm j$ scales from where it extracts its energy and information, to its clone reproduction and creation of networks, to its final emergence in the $1-\alpha$ entropic world.

Then we follow the being as it tries to repeat the 'perfect placental life of an entitled' seed, now as a mind fighting an outer world where it does NOT hold a preferential place. So he might fail in its actions (5th Disomorphism); in its attempt to radiate as a species (6th Disomorphism, which we use to study species and its variations in depth); and might not complete a worldcycle as an individual in its ages or as a species in its horizons (so we use the 7th Disomorphism to study both, ages of Δ^0 and horizons of $\Delta+1$ species as superorganisms). As its world, the 8th Disomorphism might be an ecosystem with multiple other subspecies, where he might be killed... Thus with the study of the different worlds and ecosystems and its relationships with species we close the 'second tetralogic analysis of reality'.

While the 3rd set of Disomorphisms will be focused in the whole Universe and each of its worlds and scales of social evolution and planes of existence, given the fact that very few 'systems' do transcend into a third successful worldcycle to dominate its world and transcend into a 'God-like' mind of the whole species' superorganism (arguably only prophets of oikoumene religions among human beings). So really the 3rd set of Disomorphisms focus on the social organic structure of world and the Universe at large; as we take now the perspective of the whole reality, in which the individual is really just a finitesimal point. So we close our analysis with the study of the Mind of the Universe, God (11th Disomorphism) from its different perspectives; as we are all Gods of our inner world, but merely points of the larger outer world, which will 'end up killing us and establishing our entropic limits in time, scale, perception and scale)... the 12 Disomorphism of our entropic death. *Since at the end of the journey of existence there will be a time even for the most successful prophet that emergence ends and divergence, a big-bang death of its parts take place. But it is really the 13th bad luck Disomorphism, as we started in the 0-mind... So from the SS-finitesimal mind and 12=13th unnamed Death of pure Entropy TT... in the symmetry of space the two parts of an open ball not included (singularity and membrain)... reality happens.*

But as we said being the game of exi«stjence paradoxical, full of traps, limits, non-perceived worlds and other points of view, we rather write those disomorphisms with a certain ambivalence in its order and themes, which of course we cannot exhaust in a single paper; but rather enunciate and insinuate the many kaleidoscopic elements that ensemble all the variations of all the planes of reality.

*The key concept behind this mixture of trinity and **tetralogic** is entanglement: to survive in the Universe, to have focus, form, a system must be 'anchored' through entanglement in its 'plane of existence' with 'trinity' parts of vital topology, connected through 3 inner physiological networks, but also it must co-exist in a larger $\Delta\pm 1$ nested world separated by a topologic membrain, which allows it to absorb and emit entropic motions and information, on that outer world.*

When that membrane forms, and focus the system in a central point-mind, then the system evolves into a whole and emerges as one; it is the fourth, 'evolving time disomorphism'... on the series of tetralogic scales that make the system grow, from @-mind, to Δ -scalar action, to S-reproductive networks, to T-evolutionary collapse and organization of the whole, for each of the 3 'scales' of existence, the 'palingenetic phase', the organic phase and the ecosystemic wor(l)d.

RECAP. Knowledge builds as Nature does in complexity from ceteris paribus analysis of $-\Delta@st$ elements, to Dilogic study of its oppositions, to trilogic of its complementary reproductions to the positive tetralogic of a mind point performing or coding the actions of information-space, time-motion and energy-reproduction to the full objective external pentalogic of the being in a plane or (do)decalogic of multiple planes.

FORMAL EXISTENTIAL ALGEBRA:SYMBOLS& GENERATION LAWS OF TIMESPACE SUPÆRGANISMS& WORLDCYCLES

We have already introduced Existential algebra in a somewhat more layman naïve description. There is however a high level of formalism, in which following the path of classic mathematical algebras, we define an existential algebra more complex than the usual mathematical simplifications, of Group theory (Ts-groups, ST-bodies and St-rings, which mimic some properties of the 3 topological elements of an organism; its complex associations into continuous Lie groups, topological groups and algebraic groups and its logic forms as reticules and Boolean algebras)... All that is quite interesting for partial analysis of dimotions of existence, within restricted systems. However they are ultimately distorted partial views of Existential algebra, some of whose terminology we borrow from classic algebra, and I casted first as a complex mathematical algebra, to finally realize that as Einstein put it on Leibniz's work – it is better to start from scratch. So in the last versions of Existential algebra I departed from earlier formulations taken from set, group and Boolean Algebra, once I did resolve its connection with Scalar space-time that we shall treat in a future paper on Mathematical non-Aristotelian algebra (–Algebra). Instead existential algebra (ab. –ægebra) appears as Nature's fundamental structure that includes all other Algebras, which in the classic language of –A could read as this:

'The function of existjence is a pentalogic algebra on a Sœt of Tœs (ab. TimeSpace Organisms) of 5 operands, which represent the 5 Dimotions of Existjence: ($\Sigma T.œ$; $\langle Ts, \rangle St$, $\langle TT, \rangle SS$, $\approx TS$), gifted with the properties of:

- Closure: any combinations of T.œs acted upon a Dimotion of Existjence is a T.œ part of the Universal Sœt.

The Law of Closure for the Universe, established by –Ælgebra is simple. All the laws of all stiences derive of the laws of scalar space-time, ΔSt ; and its 3 units: fractal points of space, social, scalar numbers and cyclical dimotions of time. So the laws of Mathematics as a mirror language derived of Ðst Laws writes as follows:

The laws of geometry derive of the laws of fractal points of space.

Algebra laws derive from Existential algebra, its Scales and Dimotions. And we can easily translate the 3 elements of the fractal generator, to both, scalar algebras ($+$, \times , a^{-x}) and Boolean algebras, (\vee , \wedge , \neg) as follows:

Reproduction, \approx , and, $+$ \vee ; Evolution, $>$, \wedge , \times ; Entropy, $<$, \neg ,

Calculus laws as the most entangled operand of algebra also derive of the laws of scales and dimotions.

Let us then consider the symbols of 5D metrics and Existential algebra, to define ilogically all events and systems of reality, what we call the formalism of Existential algebra that combines the 5 Dimensional motions and its ternary systems in scalar planes, time ages and spatial organs to define all *possible creations the Universe allows, which then will be selected by raw efficiency leaving only those survivors that play better the two functions of the 5th dimension, $S_i=Te$ balances that maximize the function of existence, in a given plane.*

3±j Scalar SpaceTime Supœrganisms, its 3 Worldcycles, Fractal Generators Minds & Limits of Existjence.

We use symbols for the 5 Dimotions as 1) Holographic Space-Times combining S and T symbols with the dominant element in Caps; 2) as dynamic time flows, using «» symbols whereas $T>S$ means an involution of its timespace size and increase in in-form-ative spacetime; 3) as simultaneous organs, whose topologic form might be | -lineal, O-cyclical, \emptyset -hyperbolic 4)as 3 ages of past-entropic>present-iterative>future-informative:

Ðj: Any of the 5 Dimotions (Dimensional motion) of time-space, whose interaction create all local T.Æs:

Ts, Tes; $\langle, \langle;$ |, **ŠT: PŠT:** PaŠT, temporal energy, lineal locomotion, gaseous state, limbs/fields.

St; Sit, $\rangle, \rangle;$ **O, Šđ; fđš:** fuđureš, spatial information cyclical, informative, space-time, solid, crystal particle-head states

ST; Se \leq Ti (information=energy), TieS, Exi=St; X, \leq , \Leftrightarrow ; \approx ; \emptyset : Constant Present, balanced, Space-time; iterative body-waves; female gender, ties of space-time, point of balance, work.

TT; Te², TeTe, «, -; Δ-1: Entropic Time-energy, death, dissolution of form into its parts of a lower plane.

SS; Sisi; »; S, @; Δ+1: Linguistic, mental space, still mind-membrain, which organizes parts into wholes.

Yet this is only the beginning, as there are ∞ kaleidoscopic forms to perceive those pentalogic elements as:

5 operands: <: Δ of locomotion. « Δ of entropy. > Δ information. » Δ of form. ≤≥ = balanced present stœps.

We represent them also as sequential numbers, associated to its form in space and function in time: D1:seed, perception, **D2:**locomotion, **D3:**reproduction, **D4:** social evolution, **D5:** Entropy.

We represent them by its relative Scalar planes of the fifth Dimension:

Δ-1 past, TT-entropic plane of parts, Δ⁰ present sT-ST-St-field-wave-particle, Δ+1, & SS-§seeds @ mind-world.

As all superorganisms are 'exi«stjences', that is fractal points of an Space-time plane (St_i, Δ_i) of stience.

As ages of Time ordered in a worldcycle:» §seed in palingenesis; <: Youth of locomotion. <=>: Present Energy; iteration, simultaneous exchange of lineal and angular momentum, locomotion and information between 2 poles: \$T≤≥\$δ. >: Implosive future informative life arrow that creates information: \$T>\$δ. « past flow: explosive big-bang, death-entropy.

As Spacetime Topologies. O:St, informative head/particle/center, storage of i+1 SS-languages. Ø:ST; iterative hyperbolic energy body/wave. |:sT, membrane that absorbs i-1 TT smaller T.œs as entropic bites of motion or bits of information.

As social classes: @-linguistic mind origin of the t>S: particle: head: informative class that commands the Si=Te body-wave-reproductive class that gives energy to the s<T-limbs/field/lower class that preys on the - Entropic outer world, whose limits determine its territory of exi«stjence.

We also consider them from the point of view of the 3 scales, its Δ-1 dimotional actions, its Δ⁰ whole organism and its Δ+1 larger world. So as a superorganism in its Δ⁰ scale we talk of:

T.œs: Time-space supœrganisms as wholes made of pentalogic parts of dust of space-time:

-**Δ@st:** made of - Entropic limits, Δ±1 ternary scales, @ linguistic minds, Space and Temporal energy.

•: Yet from the larger world point of view a superorganism is just a fractal point, •. And from a lower plane, is a larger world programmed by the survival actions of its function of existjence. So he will perform 5 actions, *absorbing and emitting information from the Δ±4 planes it 'perceives'*. So we represent any T.œ. through its:

Å: 5 åctions æ, e ï, œ, û, the quanta of existential sequences that move supœrganisms' worldcycles.

3 are Simplex actions, *performed as a whole extracting parts from its lower, smaller, faster time Δ-j planes:*

- **a** it is the fastest action of locomotion (accelerations) that extracts entropy from its lower non-perceived Δ-3 Plane. So 5D metrics work through each action and explain why we only perceive Δ±3 planes, and why the simplest actions are faster, with more frequency, extracting smaller parts from our limits of perception.

- **ï** is the dual action of information gauging: Perception & communication that perceives bits of its Δ-2 Plane.

- **e** is the action of entropic feeding that absorbs its minimal parts, from the Δ-1 Plane.

And complex actions *that take place in its plane of existence and its Δ+1 world:*

- **œ** is the action of organic reproduction in its Δ⁰ plane. And it lasts longer the whole 3 formal ages

- **û** is the action of social evolution in its Δ+1 world, and it has also the longer time span, and lesser frequency, often several generations of evolution to form herds and social networks of a higher Δ plane.

Finally we use several classic algebraic operands:

$\pm \Sigma (\alpha)$, which is the symbol of superposition enacted by the quanta of limbs/fields herding by addition in a single plane, proper also of gaseous states.

X, which is the product, symbol of reproductive Body-waves that calculate its connections in a lower plane.

Π . The symbol for entanglement happening in the particle-head that forms solid networks in 3 planes.

$\int \partial$: Which describes how ∂ finitesimal points become whole integrated by calculus.

The generator of space-time, maximize your existence.

So finally we can define functions of existential algebra, of which the most important is the:

Γ , a Fractal Generator, **which** is any allowed sequential combination of those symbols that define any event or part of a superorganism.

I.e: $\Gamma: \Delta \alpha - 1 \Pi \alpha - 1 \approx \mathbf{C} \mathbf{E} \mathbf{a} \langle \mathbf{\$} \mathbf{T} \rangle \emptyset - \mathbf{S} \mathbf{T} \rangle \mathbf{\$} \mathbf{\delta} \ll \Sigma \alpha - 1$ describes a worldcycle of existjence...

$SS \gg \Sigma \mathbf{\$} \mathbf{T}_{\Delta - \infty} \langle \mathbf{T} = \mathbf{S}_{\Delta 0} \rangle \Pi \mathbf{\$} \mathbf{\delta}_{\Delta + \infty} \ll \mathbf{T} \mathbf{T}$, describes the whole Universe as a feed back function of infinite motions, etc.

Max. $\Sigma S \times T = C$ defines the function of existjence...for each fractal vital space-time organism its Function of existence, as all species will try to maximize its motion-entropy-time for its field-limbs, its information-spatial states for its particle-heads, whose product will give us its vital reproductive energy. We shall in the formal model of \int -logic existjential algebra deduce all functions of reality from it; whereas complexity is just born of the constant repetition of those functions. As the function of existjence integrates the 3 metric functions of physical relativity ($S_i = T_e$), biologic survival (Max. $\Sigma S \times T$) and Minds (Max. Still-Mind \times Min Time motion Universe = Constant linguistic world); it is the 'essential function' of the fractal reproductive Universe, whose only goal is to reproduce the local information of all systems.

We can the write it as a series of dynamic functions of the 3 ages of life of in simultaneous topologic, vital space as a fractal generator of space-time beings between SS-birth and TT-entropic extinction:

$3 \pm \int$ ages: $\Delta - 1$ birth $\gg \Pi \Delta i$: Max. $T \times \text{Min. } S$ (youth) $+ S \leq \geq T$ (reproduction) $+ \text{Max. } S \times \text{Min. } T$ (3^{rd} age) $\ll \Sigma \Delta i - 1$: TT-death

Topological organisms: $\mathbf{\$} \mathbf{T}$ (limbs-fields) $\langle \emptyset - \mathbf{S} \mathbf{T}$ (body-waves) $\rangle \mathbf{O}$ -particle-heads

Each of all the secondary functions of reality thus will be deduced from the fractal generators, itself born, from the functions of reproduction, which happens in the 'middle age' of balance, $S_i = T_e$, of 'gender complementarity' (whereas S-females and T-males combine form and motion), of classic beauty (equilibrium between lineal and cyclical forms), and the metric of scalar planes of the fifth dimension.

And further on we can observe diversifications and detailed analysis of the actions of each superorganism, combination of 2 pure poles, represented by a dominant CAP letter between pure entropic TT-motion of death and linguistic SS-form as a mind or $\mathbf{\$}$ eed, with 3 intermediate 'states' (matter jargon), '3 Riemannian geometries' (4D EFE relativity jargon), 3 ages (biological jargon), 3 Horizons (evolutionary jargon):

The Ts, young age of locomotion, $S_i = T_e$, mature age of reproduction and $S_t - 3^{\text{rd}}$ age of informative perception.

Existential algebra is really a simple game, which might bother the ego paradox of scholars who cannot see the forest or know the causes of its topologic evolution but has all kind of abstract data about a certain tree, extracted with sensorial machines and placed in its digital languages; so he doesn't really care for the ultimate thoughts of God. Yet to know those thoughts makes also sense of all its details as we shall observe in other articles on specific 'planes of space-time and its organisms'.

Those \int logic symbols suffice to express all events & forms & its entropic constrains of the game of Existjence:

Trinity, pentalogic $3\pm j$ fractal entangled principles hold: T.œs to survive need 3 parts in a single plane & be connected to an inner $\Delta-1$ herd of entropic parts and a larger $\Delta+1$ world in which to play a symbiotic role. So there are only $3\pm j$ topologic varieties of space-time; $3\pm j$ derivatives in scales; 3 physiological inner networks

-jlogic allows any \approx iteration, single or dual spacetime jump of scale forwards ($>$, \gg) or backwards ($<$, \ll) with transfer of sT-motion \wedge St information between planes but not transfer of present S=T-work or ternary jumps.

- It allows any topologic combination or transformation between $|-sT$, $O-St$ & $\emptyset-ST$ in a single plane.

It allows any sequential series of actions, or \pm growth of its organs: $\pm\Delta\ddot{i}$, e, a, œ, \hat{u} ,

In praxis, almost all systems that survive as reproductive radiations that maximize their function of existjence follow the most efficient sequence to that goal: $>i<a<e>o>u$:Minds perceive, move, feed, reproduce by gender symmetry ($S_i=Te+S<T>S$) and evolve socially in herds that grow in density connected by 3 St, ST,sT networks becoming a supœrganism. While the $sT<ST>St$ ternary supœrganism is overwhelmingly the survival structure.

So we study those disomorphic elements common to all systems, its vital sequences, S-T gender dualities, T-ages, S-topologies, @-minds and mirror languages, 5Dimotions, 3 physiological networks its hierarchical order origin of the variations of species, its ratios and Universal or vital constants & its generators.

As nothing else, which cannot be expressed through those combinations within those limits **exists** beyond the virtual inflationary mind-languages of information. Trust me, I know it, after 30 years of research in all fields of knowledge looking for a falsification of Existential algebra. So in our papers on jlogic we will develop with them all events & species of reality.

The function of existence has an infinite number of perspectives – in fact it generates in each local system, its events and superorganisms, and in languages, becomes the syntactic mirror of its structure. So for each ‘experiment’ and ‘function’, we can find a correspondence with the function and its 5 elements: Max. S x Min. T (information), Max. T x Min. S (locomotion) $S_i=Te$ (reproduction), S-informative seed or mind in a lower $\Delta-1$ scale and T, entropic dissolution in a larger $\Delta+1$ world – the two limits of birth and extinction that frame all systems, and functions (initial conditions, etc.)

Stience is the study of the function of existjence of ∞ beings, as if all what exists is space and time, that function is the most synoptic view of reality. And so classic \neg Algebra is the mathematical analysis of that function with classic 5D families of number and operands. But before we make them correspond with those 5 Dimotions, is worth to consider the larger field of Existential \neg Algebra that applies to all stiences.

So with those basic symbols, 5 \approx » for Motions (Time view), 5 ‘st’ variations for Organs (Space view), 3 for Planes $\Delta\pm j$, 3 for topologies, $|xO=\emptyset$, and 2 for degrees of entanglement (Σ -herd, Π -network), and the ‘synoptic \mathbb{C} for superorganism, @ for mind, we can describe any system of reality with a fractal generator that describes both the system as a superorganism in space and a worldcycle in time, tracing its existjence through 3 Planes of the fifth dimension; just by pegging the previous equations, and adding its Planes. The formal variations of those symbols are many as pentalogic *studies its different*, Δ , S, T, @, \neg p.o.v. I.e.a scalar view would write: $\Gamma:\Delta^{\circ}\mathbb{C}\gg\Delta-1\text{œ}\approx\Sigma\Delta-1\text{œ}\gg\Pi\Delta^{\circ}\mathbb{C}:$ $|-sT<\emptyset-ST<O-\xi\delta\Delta+1\ll\Sigma\Delta-1$, whose verbal translation is:

$\Gamma:\Delta^{\circ}\mathbb{C}$ (father) \gg (seeds) $\Delta-1\text{œ}$ (seminal ovum) \approx (reproduces) $\Sigma\Delta-1\text{œ}$ (Fetus) \gg (evolves) Π (into 3 networks) $\Delta^{\circ}\mathbb{C}$ (that emerge as a superorganism of 3 organs living 3 ages): $|-sT$ (lineal youth of motion dominated by the limbic digestive system) $<\emptyset-ST$ (mature age of reproduction dominated by body-waves) $<O-\xi\delta$ (3rd age of information dominated by particle-heads, which control an outer world) $\Delta+1$ (that will dissolve in entropic death) $\ll\Sigma\Delta-1$ In the graphs, a brief explanation of the entangled simultaneous superorganisms (left side), which order the 3 Dimotions of space-time, between its ‘emergence’ as a seminal seed through palingenetic social evolution (4D) to finally dissolve back in the entropic moment of death (5D), which is seen on the right side in a sequential time order as a worldcycle. But that view will be symmetric to a complete different analysis from a mere dimotional view or mental view as expressed above. \neg œ is thus extremely varied and complex when iterations and pentalogic entanglements are input.

We shall just make a basic analysis here. The whole model of \mathbb{R}^{∞} will be put up on papers starting with the dilogic, trinity, pentalogic, Dodecalogic & sexalogic papers *of growth of consciousness and entanglement beyond the simplest monologic of huminds*.

RECAP. \mathbb{R} -Algebra, studies the worldcycle of existence -the widest view of an entity as a superorganism on space tracing a worldcycle between birth and death – we don't expect you to understand it, as it is a packed synopsis of ilogic and its main theme of study, the dual worldcycle of all systems, which go from a placental, protected ordered seed age of fast evolution, by palingenesis, (memorial development of the seed of information with the energy provided by the parents) to emerge into an entropic life in an outer larger world, where it will perform 'smaller dimotions' to survive, we call actions, A-ccelerated locomotions, E-ntropic feeding, i-nformative gauging, O-rganic reproduction and Social Evolution into U-niversals (a,e,l,o,u), which form the program of survival of all systems of the Universe, clearly leaning towards creation of information, reason why systems \mathbb{R}^{∞} increase its information commanded by minds that finally exhaust all the vital energy of the system provoking a local 'reversal' of its time arrows into entropy and death.

FRactal Generator: Function of Existence: Conservation of Time. 5D Metrics of All Sciences

The **Rashomon effect** occurs when the same event is given contradictory interpretations by different individuals involved. The **effect** is named after Akira Kurosawa's 1950 film **Rashomon**, in which a murder is described in four mutually contradictory ways by its four witnesses.

The judge and the 4 witnesses represent 5povs. to obtain a partial truth as truth only exists in the being or event in itself that holds all the information. So we need a pentalogic of 5 Dimotions for reality to emerge and 'persist' through synchronicity and simultaneity.

Non-AE studies the Fractal Generator, T, the operation of the 5th dimension and beyond, which completes, the last of the operations studied by humans, J. A new operation is needed. We use often concepts of all sciences, including math. So in group theory we could consider the Fractal Generator of TimeSpace Organism (T.Œs) the Group with 3 equivalent type of elements, quanta of past, present and future. If we consider each of them a single element, then we define past and future as the inverse elements, and present and the identity element, considering the construction of the \rightarrow -Algebra of the generator group:

The Fractal generator is an operation called Mind generation, @.

It has an identity function, called present, \emptyset

Two inverse functions, past, | and future, O, such as:

$$| @ \emptyset = |; \emptyset @ O = O; | @ O = | @ \emptyset; O @ | = O @ \emptyset$$

The fractal generator of timespace has the structure of a group. Regarding if it is or not Abelian, it is relative. As while past x Future creates a present, then first 'element' to arrive in time will also be the first in a second generating operation to relate to the created present and then $| x \emptyset = | \wedge O x \emptyset = O$

So in 2 operations a dominant past will convert a future into a present and then in a 2nd probabilistic equation into its past.

The best graph to study it, is the Complex squared graph where i^2 is the negative real, its conjugate the positive real and the real the squared positive with a slight tendency to negative in the negative squared, which externally seems a squared 2-dimensional positive, but within its vital energy it has two negative elements, unperceivable outside the squared circle.

Squared circles in geometrical form are circles in numerical form squares, as the graph shows (1 is a square space, over which we can lay the spherical 0-1 form).

The previous translation to mathematical space of Existential \rightarrow -Algebra though is a mere, consideration to show that we can study it with the tools of group theory but this is not the purpose of future analysis of beings. Rather It Is Better To Treat the operation of the fractal generator, | |, in its two inverse elements and identity axis, with the language of past, present and future and 5D we have been built, forgetting any pedantic language of Modern \rightarrow -Algebra.

So we won't write about the 3rd age of formal mirrors of the Universe, the age of T.œ of which we consider it one of the main mirrors, as it studies the clear-cut laws of engagement of the ternary arrows of present time and its relationship with the inverse arrows of generation (social evolution) and death (entropy).

Welcome to the laws of Existential \rightarrow -Algebra and its ternary $\pm \Delta$ logic. We shall though treat it in a different post as they are an entire world in its own.

The entropic limits of reality vs. Inflationary languages

The importance of Existential \rightarrow -Algebra, the basic formalism of Δt is that it determines what are the 'solutions' that might exist in the Universe, as opposed to the infinite disordered motions of pure entropy that are the true infinite receptacle of reality hardly illuminated by a few fractal points, minds of a body-wave territory of order.

Without Existential \neg Algebra laws all could happen; hence there would be no limits to reality. Any monster or physical hyperdimensional Universe, or mathematical equation, or verbal fiction, or Tv-gore or fantasy movie, game of thrones would exist in some parallel Universe. But it does NOT. Nature is economic, 5Dimotional, and efficient, seeking always to conserve S=T balances and providing only 5 'solutions', which are the 5 Dimotions required to survive, within the local domain/limits of the species, and for that reason all are supœrganisms tracing worldcycles. It would be fancy to have Simpsons and dragoons, and we can indeed, when we reduce the number of Dimensions of reality to mere holographic SS-eeds, blueprints and graphic forms, enhance the variations of reality. So we can draw and paint more things than we can sculpt, and sculptures are more malleable than real beings. This *huminds have forgotten as a species moving into his age of entropy=death, increasingly substituted by metal minds and 3rd age of information that precedes it (something already the prophet Daniel knew – nothing mystical here, informative warping precedes death by entropy).*

So we live in all our languages, in the age of fiction. In physics what matters most today are two type of fictions, the study of black holes as mathematical entelechies of infinite collapse (the singularity) and its inverse big-bang infinite explosions, which are false as black holes are top quark stars and big-bangs are local reversal time functions of those top quark stars at the center of any organic galacell. The other huge field that matters to physicists is string theory, which is false, as described today because it is background dependent, meaning it talks of space and time in a Newtonian absolute sense, and so it would have to be rewritten fully in terms of relational space-time. But why that fictional world of mathematical physics is the avant-garde? Obviously because physicists think they know it all about all other fields (we show clearly already in this introduction they know nothing about cyclical time, fractal space and the fifth dimotions of reality beyond locomotion, but that is other matter.)

What we mean then by the dimotions of existence is obvious: any supœrganism will perform actions that correspond to its 5 Dimotions, and those will be the solutions traced by its stœps in sequential form, mostly through a step-stop-step, STST series; and so for each partial equation that represents an event of the fractal generator that describes the supœrganism in time or in space, the solution will be one of those actions.

In physics it means we shall resolve 'actions' of energy (Lagrangians, Hamiltonians) to achieve the solutions of any physical problem.

In mathematics it means we shall translate the operands that describe those actions as corresponding to the 5 Dimotions of existence – often to four as entropy is precisely the destructive solution most systems try to avoid for themselves though they liberally dish out in acts of feeding for all other systems.

And then of course as things get more complex and we consider the entanglement of 3 Planes with different clocks, 3 adjacent topologies and 3 ages of timespace, actions synchronize with other actions of lower planes forming chains that bond the different Planes of reality.

. It follows also that trinity or pentalogic, the most useful forms of ilogic require its own symbols, as those of present one dimensional logic of a single causality are not good enough even for 'starters'. As they resemble those of \neg Algebra, whose main five operands represent the 5 dimotions of time, so both \neg Algebra and pentalogic are closely connected, we also call pentalogic'

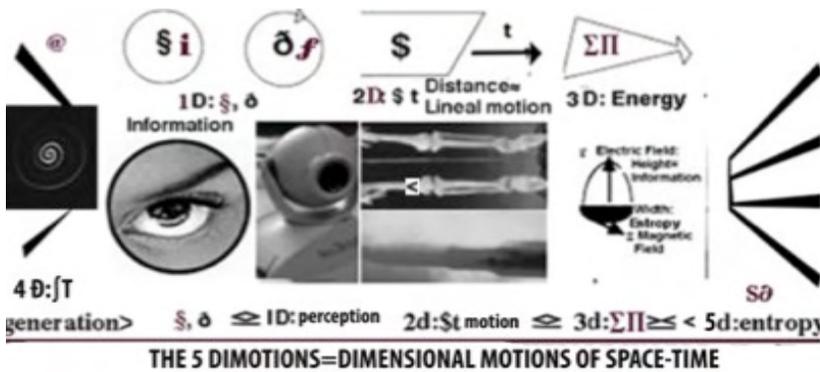

Existential \neg Algebra, which is the discipline that deals with the full formalism of General Systems Theory, or Scalar space-Time and its fractal generator (Δ ST), also similar names that correspond to the classic science that studied the equal laws = isomorphisms of all systems of nature regardless of Planes, and we call dimotional isomorphisms (\exists isomorphisms). As its laws are Non-Euclidean, since points now are fractal points with breath that represent any superorganism, and Non-Aristotelian, as they deal with pentalogic entangled multiple-tasking, we call this new logic also Non-AE= \exists ilogic. And the dual 'formal stiences' of mathematics and logic, \exists ilogic geometry.

It follows that the main translation required between classic \neg Algebra, and Existential \neg Algebra, to merge both into \exists ilogic geometry is that between the operators of \neg Algebra and those of the generator \neg equation. Originally I did try to

cast the whole model of ΔST in terms of group theory, \sim Algebra and its classic mathematical operators, but that was an earlier stage of my exploration of the fractal Universe... some 30 years ago (: Since as good as mathematics is as a mirror of the Universe, it is not as good as it is needed to extract all its properties, hence the need for a different logic, which however had to include or at least reference the world of classic \sim Algebra as we shall try to do albeit at a basic level - the specialist must understand this is a unification theory of all existjences, so we cannot be exhaustive with all of them, as the team of research is exactly the same than the infinite-infinitesimal Universe: $\infty^0=1$

Fractal generator equations (ab. Γ)illogic use the symbols of the 5 Dimotions as Time Motions («entropy, <locomotion, \approx reproduction, >information and »social evolution into mind languages) as *operators in time* of the 5 Topologic SpaceTime organs of all systems of reality, described with combinations of S and T symbols to represent those 5 Dimotions as vital elements with a determined topology: Lineal $|-ST$ fields/limbs specialized in locomotion; Hyperbolic \emptyset - ST body-waves specialized in reproduction, Spherical $O-\delta$ for particle-heads specialized in information; which

together form the 3 'present' elements that in a single plane of space-time for an organism. So we can start 'building up' general equations of illogic, called Fractal Generators that resume both the organic parts of a system in space and its different flows of entropy, motion, energy, information and linguistic form between them. I.e. the simplest generator is:

$\$T < ST < \δ , describes any ternary system of reality with a field-limb that moves a body that moves a head.

If we write the same fractal generator changing the $< >$ dimotional operands, for \approx , we then talk of the same system in a still, rest state, $\$T \approx ST \approx \δ , when the body-wave 'repairs and reproduces' the cells of the system.

We add then to Fractal Generator equations, $\Delta \pm j$ Planes in which the other two dimotions take place as transfer of energy and information between Planes. So we can describe entropic equations, such as death: $\Delta + 1 \ll \Sigma \Delta - 1$, where a superorganism of the $\Delta + 1$ scale dissolves through external motion and internal scattering into its parts, and again the equation can be used to describe any process of death, from a big-bang explosion of matter ($Mc^2=E$) to biologic death. And vice versa we can describe the emergence of a superorganism from an initial seed, $\Delta - 1 \mathbf{CE} \approx \Sigma \Delta - 1 \mathbf{CE} \gg \Pi \Delta^0 \mathbf{CE}$, which describes how an $\Delta - 1$ T.œ (ab. CE) or seed reproduces (\approx) into a sum (Σ) of similar cells, which evolve socially, \gg , entangled through networks (Π) to emerge as a whole in an upper Δ^0 scale of the fifth dimension.

In the graph, 5D topology defines as dynamic space-organs with internal change the 3 Dimotions of reality, limbs/fields of locomotion. Hyperbolic, which through 3 'relative Planes' of size suffice to define all supœrganisms of the Universe in space, tracing its worldcycles of existence in time: In a single plane of space-time 3 conserved 'quantities' organize in space a vital topologic system and define the 3 forms and functions of its organs, themselves physiological networks that connect smaller parts into wholes; reason why we need to define 2 more Dimotions, 'entropy', made of the smaller cellular/atomic/individual parts, we call:

The 5th Dimotion (ab. δS) and one of social wholes, which organize those parts, we call...

The 4th Dimotion of social, organic evolution (jT). Thus when we observe those 5 Dimotions simultaneously in space they create an entangled pentalogic supœrganism, in constant communication between its 3 topologic parts, in each of the 3 Planes of its relative existence. So we write in $\sim \mathcal{E}$ logic a Fractal Generator of Space-time beings (ΔST) that describes all systems of nature as ternary simultaneous topologies of space, which trace worldcycles in time. So we write with 5 Dimotions for all supœrganisms (ab. Γ):

$4D \gg \Delta - 1(\text{seed}) \Sigma \Delta: |-ST (\text{limb-field}) < \emptyset - S \approx T (\text{iterative body-wave}) > O - \delta \delta (\text{particle-head}) \ll 5D \Delta - 1(\text{death})$

Where \lt is a $\neg\mathcal{E}$ symbol for expansion-translation in space, \approx for iteration, \gt for in-formative implosion, Σ for reproduction, $\Delta\pm j$, the 3 scalar planes of the fifth dimension, $|$, O , \emptyset , intuitive topologic terms, \ll the double motion of entropy, \gg the double stopping of linguistic generation of seeds or minds that describes all what exists as a spatial superorganism, extending in 3 relative Planes of size, from its birth as a seed of pure form, which emerges into a larger plane, Δ to live its worldcycle and die away into entropic death.

To describe a ternary superorganism in 5^D , a single Δ -plane of space-time with motion (4D formalism) is NOT good enough. We need 3 topologic Δ -networks with motion, made of smaller fractal points-parts ($\Delta-1$), living in a larger $\Delta+1$ world. So we evolve non-Euclidean geometry defining properly a fractal point, a point with inner volume, through which ∞ parallels can cross that becomes larger as we come closer to it – solving the contradictions of the present definition of an Euclidean point as having no breath (so it can't fit only a point), focus of curves NOT parallels that are straight lines. Since enlarged points fit and unbend many parallels.

The study of the 5 Dimotions of all realities, with angles, numbers, operands and functions, its actions and ternary $\lt\Rightarrow$ similarity operands, structures *the mirror of mathematics*, whose metric equations 'mirror' the 5D metric of the universe:

Whereas the 01 finitesimal scale represents the palingenetic first birth of any species and the $1-\infty$ its existence in the external entropic world.

Thus it matters more is the division of that interval between the 0-1, first palingenetic emergence, where the 1-whole is a closed space, hence without entropy (a placenta rich in energy) and the interval is time-like, probabilistic, embodying all possible generations of space-time species within its interval. While the 1- is unbounded, open and hence entropic, meaning the being normally doesn't reach its limit.

As the game is one of 3 asymmetries of scale, age and topologic form, which can come together or annihilate and each language represent in different manners, those elements and its operands; it is needed a 'branched' new plane besides the $1-\infty$, with the 0-1 sphere as a borderline, which happens thanks to the complex plane, where the function $x=z^a$ represents the 0-1 sphere and all its polynomials within it, and works as the age plane symmetric but not equal to the 1- real plane which represents a population age.

5Dimotional beings and its parts are constantly performing cyclical 5 Dimotional changes of its space-time states, as they trace as a whole a worldcycle of existjence (where each stjence describes the existences of space-time T.oes of each scale). Thus a new formal science, $\neg\mathcal{E}$ Existential $\neg\mathcal{A}$ lgebra describes with its Generator of space-time and sub-equations all the processes involved in the creation, existence and destruction of those systems throughout all the stages of its worldcycles, which can be observed from 5 Dimotional perspectives, in an entangled Universe, in which *each being is made of them*.

The study of the 5 Dimotions of reality is a huge field because all events and forms are generated by their combinations, OPERATED with the $\lt\Rightarrow$ $\ll\gg$ 5 symbols of transformation of states of a system or transfer of entropy, motion, energy, information and form between them. So we write with i-logic all events and translate all equations.

For example, $E=Mc^2$ writes $E(\mathcal{S}T)\lt c^2(\mathcal{S}T)\gt M(\mathcal{S}\mathcal{D})$; which is as all fractal generators a feed back equation that transforms cyclical mass vortices into entropic motion, through the intermediate state of energy radiation..

RECAP. The function of existjence and its disomorphic laws are the 'thoughts' of God. We are all its details swimming in the ∞ sea of species whose variations would take an 'encyclopedia galactica'; as only the whole Universe holds all the information about itself and all its fractal parts. Thus we need synoptic languages of 'stience' to reduce information on 5 conserved dimotion to patterns in mathematical spatial and logic temporal laws:

TT-Entropy (internal-destructive and external time-motion) \lt Ts (locomotion-momentum: external motion, internal form) \lt ST: iteration, reproduction, energy \gt St (information, communication, social evolution) \gt SS (perception, linguistic form). So the game is one of 5 local dimensional motions that can be seen as static dimensional form in space

but also as pure motion in time and in between. Using numbers for those dimensional motions is just a big of a concession to human thought, but we shall just keep the generic name of the 5th dimension for the scalar sum of all its planes that defines the whole reality.

The multiple manifestations of time=energy and space=form in its entanglements makes difficult the choice of a unifying jargon for all of them, which it has varied too often in the decades of solitary research, so the reader will find some contradictory symbols of $\sim\mathcal{E}$ (existential algebra), though those papers @ academia.edu try to unify and simplify them all, so the TT-entropic time, Ts-motion/momentum, TS-reproductive work/energy, St-information & SS-linguistic form, is the most used.

We do also often substitute them by combinations of Te & Si, E & I, energetic time-motions and spatial information. Energy and information being the closest concepts huminds have of the ∞ broken cycles of time and space. You can imagine both coming together from the two extremes of entropic time and spatial form, mixed in the middle point as Te=Si. The use of mathematical equations won't help outside the realm of physics, because *all languages express the same concepts but in qualitative terms, and with different coding elements for temporal energy and spatial information.*

Along those dualities there is a trinity of topologic forms *that evolve with aging, our next analysis, as the arrow of informative space exhausts the energy of a time being.* So we use very often 'symbols' slightly changed of Space and Time according to its form. Lineal Space: $\$$ and lineal time, t for a 1st age. Cyclical time, δ and informative space, for a 3rd age, with the ST, Si=Te, Si=Te balanced age of reproduction, where *time-space is conserved by the repetition of energy cycles into 0-sums, the goal of all existjences, only achieved by the whole Universe in the sum of all its fractal scales, whose ternary symbols, $\Delta\pm j$ are also common. Finally, in dynamic terms, we use < for loss of form, > for growth as in $T>S$, and «» when those processes are extreme as in entropic death: $S\llcorner T$ oer informative seeding, $T_{j+1}\gg S_{j-1}$ between 2 ST-planes.*

Entangled pentalogic superorganisms – beyond Huminds, sequential 'worldcycle' logic.

So what is pentalogic? The graph resumes it all. Each point of the pentagram communicates with all others and together form a whole different from each point, the inscribed pentagram, which is in itself a perfect T.œ (Time space organism), with a membrain, a series of vital rays that connect the points of the membrain, and a singularity image of the whole, inverted in spacetime parameters in the center (the smaller pentagram).

Those 5 elements are for any T.œ, the vital space it occupies, perceived externally through a membrain; the time we last in our worldcycle, the scales of size we interact with which tend to adopt a Russian Doll structure from the outer world to our membrain, through our internal fractal networks, into the cells connected to those networks, themselves surrounded by a protein membrain as $\Delta-1$ species of an smaller full T.œ.

Those 3 elements are easier to explain, as they can be *expressed sequentially in simpler logic terms, in lineal time (from birth to death), in bidimensional space (the holographic topologic, deformed sphere that encloses us), and 3 dimensional volume (our vital inner space); even for the smart people in 4D (3D+lineal T-motions).*

Trinity is a creative process in its entanglement, which happens through the Fractal Generator that ascribes to each of the 3 topological parts of the organism, a different scale of being, a different form in space and a different sequential dominance in time.

But then there is the $\leq 0'$ logic of the entropic limits of the system; its initial and final conditions in time; the thin layer that separates its inner scales of space from the outer $\Delta+1$ larger world; the small tears in the thin membrain of space that become the sensorial ' $\pi-3'$ (with a variable π according to curvature) holes of perception and exchange of entropy, energy and information... Here huminds are already at pains to understand finitesimals. Though I think we made a fairly good job on 'explaining it simple so people can understand' (Einstein), in our brief hardly started paper on Calculus of finitesimals.

Essentially an entropic limit is the minimal quanta of time, space, scale possible and yet the most important, as it represents a change of state, even in a smaller region than the finitesimal, which has 'substance'. Because the ≤ 0 ' entropic limit is the discontinuous 'dark vacuum', which cannot be derived of a standing point, the peak in itself; the dark hole/aperture, and often can be closed and opened in the tear of the membrain. It is the less than one step of time quanta of death. It is not the cell of the membrain, but the thin layer of proteins of the epidermis, and not even that but the holes in the protein layers that allow transfer of energy and information. The entropic limits are the not-being points of Δ , S and T.

To be or not to be that is the question. Entropic limits are the state of not to be.

And as we can see they can entangle with Δ , S and T, by denying them.

And then in the other extreme of being there is the boundless mind that *is exactly the opposite of the entropic limit; a hyperbolic wanting of being more than we are, of breaching all limits, of reaching beyond all entropic borders into an impossible restricted infinity ($ab \propto$).*

Think of your mind and its wish for limitless space. You are NOT in your vital spacetime, which your subconscious mind, the inner nervous and hormonal system directs, but in the $\Delta+1$ world that does not correspond to you. Your eyes are reaching miles ahead in parts that are not yours, but your mind wish to order, possess, convert into territorial property.

And what about your limits in time? Surely you will ascribe some religion, which overwhelmingly to be popular will have adopted at a certain stage of its expansion the wishful thinking that your eternity is not the dissolution of your ego, but your ego-mind will leave for ever. It will resurrect in Christianity, to be bonded in fusion love as a boson particle of God; it will resurrect also in body in Islam. Even the worldly religion of go(l)d power that is Judaism, of late adopted an after life. So did the purification of the religion of war and death which was Hinduism, would adopt the re-encarnation of souls and Buddhism in its expansion to the Mahayana will also leave behind the initial Nirvana=extinction for rituals of after-life encarnations that made it popular.

Curiously enough what the mind does NOT seem to pursuit is the infinity of scales, because precisely on those boundaries it feels strange and denied as it is rooted in the ego paradox of a finite spacetime being. So we do not wish to travel in scales of space-time to 'be a cell' and have a hard time to understand *we were once a seminal seed and will be latter a neuronal trapped memorial repository through the 3 days of death to wake up as the consciousness of a single cell that a gigantic insect will eat up and finally dissolve into a silly amino acid hanging on the chemical slavery of that insect's RNA slave master working on the hell of a pyramidine factory.*

That is a terrifying destiny for those who aspire to fusion with the infinity of the creator.

So we just let it perhaps better evaporate on a huge sudden fire of pain, till erasing even the most minimalist O' memories of one's self, to at least wake up as a nice nitrogen, fast bonded with a couple, to dissolve in the immensity of quasi-infinite nitrogens, dust to air... and maybe scape to higher emptiness in the vacuum space of other immense nitrogen bonded paired galaxy called the milky way+Andromeda.

The mind thus is a systemic denial of the objective whole, to make the subjective all.

And in dealing with the mind as minds we are, the problem is to accept that minds are crazy, subjective ego paradoxes, O'-finitesimals that by virtue of their structure as images of a software language limited by the smallness of the hardwre in which they tic with faster clocks than their slow larger body and even slower larger territory and outer world, they suffer an incorregible problem of fantastic hyperbole:

O'-mind $\times \propto$ Universal timespace cycles = C-onstant world mapping of the whole.

So the mind is located in the densest, smallest, fastest, region of a T.œ, connected through networks to the outer membrain through its wholes (hence it is NOT the membrain but the sensorial holes within it) to observe the outer

world it confuses with the whole Universe (which it does NOT see, hidden behind the parts of the membrain that encloses it), to believe that this world it sees is the whole universe, and *she is the world it sees*.

A fractal Generator for pentalogic.

How then can we teach this paradox, @-mind, what truly the whole is, entangled $-\Delta$ @st of spacetime?

We can try with pentalogic symbols a fractal generator of existential $-\mathbb{A}$ lgebra, which as alien as they might seem to the reader, who at best will know some mathematical algebra, truly helps to focus the complexity of the entangled Universe in its elements, which then as in mathematical algebra, can be easily moved around to obtain new results, within the logic rules of Non-Aristotelian algebra and Non-Euclidean geometry.

So let us put the 5 entangled elements in a Fractal generator equation:

O_{j-1} : seed, source, prophet $\sum \uparrow \uparrow > |i-1$ -limbs/fields/colonists(epic youth) $\geq \emptyset_{i-1}$ -working bodywaves(maturity) $\geq O_{i+1}$ -financial particle-heads (old age) $\ll \sum_{i-1}$: big-bang warrior death

Is a selective expression of the Fractal generator in 3 ages + entropic death of a physical, biological and sociological organism, that goes through 3 age of dominance of the different components of an organism.

It all starts then with a seed that already holds in its briefing the entire History of the even in its most perfect potential form, as it does not account for the errors that will continue creeping its dreams of existence. This seed thus is similar to a mind, but not a passive mind that appears latter when it is already conscious that things are gonna fail, but a young, recently cooked mind aware of the potentiality of playing the game of existence in all its perfection through the entanglement with the outer world.

This seed can be a physical source of charge, of mass, of heat; a biological seed of a future organism, an egg, a seminal cell; or a prophet of a civilization, with an ethic message and its memes of love and renewal of an organism of History; or an inventor, making the first mechanism, weapon, machine or form of money that will spread through a technological civilization. He is in the simpler, slower placental region of entropy in which it will host and reproduce its information, the '1st of its kind'.

If it is a source of charge, for example, as soon as it appears it will create a field of virtual particles popping in and out around it. And even if it moves and disentangles the structure it has created it will do so surrounded by a cloud of virtual particles, which so much anger physicists that would like to see it naked. But the charge is never naked because it is a source of the program of existence *and so it will always activate and reproduce its \sum cellular forms wherever it goes, and further on try to create a magnetic envelope to create in this manner a territory of order. As it happens with the technological animetal that as it moves on the territory leaves a trace of its motion through space, burning bushes, farming, hunting, creating havoc till it settles down and then a more complex order happens, as it does in the source which is at that point calculated with a nice Gauss Law.*

It is this vital homology what the humind hates to think of, reason why pentalogic and 5D isomorphic laws don't seem to go anywhere soon. Huminds reserve the game of existence for them, as unique species first of its kind, in this local region, last of infinite other first of its kind, last of infinite other types of T.æes.

Fact is as soon as the seed, source, prophet, animetal is born he will start to reproduce in a lower $\Delta-1$ plane what he re=produces, similar cells, points of a field, words of love, mechanical memes and litter the $\Delta+1$ world with it. At this stage his entangle is loose. He is spreading his sacred shit all over the place, seeding as he goes, forming herds. The electron bring with it its wave that interferes with itself, tracing paths that spread and scatter and collapse into new electrons; the homo erectus goes on hunting, the Australoid on burning and farming, the seed radiating new seeds, in the chaos of the Pre-cambrian explosion.

But it might also be that the seed, source, saint (to use the S for all the scales); the prime number, prophet, prototype (to use the P for all the planes :) is born of a parental mother, which has prepared a vital space according to its needs to play the perfect game. This is the paligenetic game of existence. And we do have proofs of it in all the scales.

The electron might be seeded by a controlled beta decay inside the atomic nucleus, which converts a down into an up+electron dual system, and so the electron is trapped in the potential well, akin to the black hole proton well of the galatom in the largest $\Delta+3$ plane, to which is self-similar (but not equal). It is then a trapped electron which however will be able to shape an electronic field as 'light bosons' fall in the nucleus 'black hole trap', and become spins, $e^2=1/137 \hbar c$ of them (with the usual popping in and out virtual particles of the field that don't quite make it and give us the value for the residual finitesimal 0's).

What is then the electron? The source of its $\Delta-1$ points, seeing in space as a volume of ultradense photons. Or the particle-seed, seeing in time as a fast moving spinning $\hbar c/137$ trapped part of the atom, the body of its $\Delta+1$ scale? Or its spherical harmonic membran, in its Schrodinger's solution form? Or the particle free, guided by a quantum potential, Broglie>Bohm, $\Delta-2$ field? All of it and more, because precisely what entanglement means is that a one-dimensional humind's can only access entanglement with a sum of different partial ceteris paribus visions of the being, even if the being is all those things together at once, simultaneously, as it is 'being' all those things together, what makes it a being in itself, different from other regions and scales of time-space.

We can follow then the being in many different ways, as it trods through existence, but by far the easiest way for a humind to capture it is NOT in its simultaneous parallel entanglement, but in any sequential worldcycle. So this is what we shall try in this post, but we will NOT renounce at least to the homologic analysis in parallel of different subspecies, of the different planes, 'linguistic elements', physical, biological and socio-economical ones. As this is the bare minimum to understand 5D and its homologic, organic laws. Thus we say rightly that...

...the predator/source/free colonist/inventor shape an Σ -herd of products/individuals/atoms/cells that spread over an entropic territory multiplying its numbers, as soon as it emerges from its paligenetic cycle as a fully formed organic part of its territorial world...

As they are really doing the same first steps of the program of Existential algebra they all play: reproduce its information first in herds that are soon for efficiency connected through networks that will ultimately if the game of existence is well-played become an upper plane of the 5th dimension, a topological organism, following the rules of engagement of the 4th Non-E Postulate.

In that sense, the description in sequential order of a worldcycle of time is peanuts compared to the entanglement, scales, space and time, within its limits of understanding by minds, from trinity to pentalogic.

Indeed, consider all what is just happening now in a second in your self. The second being your higher beat of simultaneous order, beat of the heart, step of your limbs, glimpse of your eye, time of your thoughts. At the lower scales how many physiological, bio-chemical events are taking place, from Krebs cycles, to nervous messages to move your muscles; how many numbers of integrative paths your neurons have traced for the step you made? How many pixels the eye integrated into that glimpse? And all of them are coordinated, in simultaneity within that second.

This is then the true meaning of the intelligence of the Universe – its entanglement in all scales between the 5 elements of all its dust of space-time, networks and planes, and it would take an entire life of scholarship only to describe what it did happen onto you in that second.

Relativity of logic acquires here the true meaning. Because reality can be seen completely different if we consider it merely a game of 5D scales only. So all motion is truly a travel through fractal scales of the fifth dimension where only information transmits; as opposed to the current view of a system in a single space-time continuum in which motion exists.

Motion in time *is what we will say the Universe looks like in this article on worldcycles and prove that all is motion. But if we were to write that article we keep erasing in pentalogic we would prove that nothing moves really and all is more like a simulation of virtual software expanding and imploding up and down scales of parts and wholes.* Pentalogic thus would focus on space, scale and mind; worldcycles on time and – limits. On:

The game and the player – all its details.

The formalism of the 5th Dimensions and its metric equations is called Existential algebra.

While we have shown some scherzos of the illogic complex entanglement of the 5 Dimensional motions of the Universe that generate reality, in this paper we will complete the discipline, without ‘concessions’ to the idols of Humind’s thought, so biased in our understanding to ænthropic theories of reality (with human as the only sentient species, center of its still mind-universe, in command of its only rational language, with a manifest destiny in lineal time).

So we are NOT in this paper translating the lesser western ænthropic philosophy of sciences of an entitled species, chosen of God, that creeps subconsciously and bias all the ‘grand models of mankind’ and determine ultimately its suicidal historic path, unable to respect the organic Universe; into the far more evolved organic philosophy of 5D stience, but eliminate the ænthropic bias of humind’s self-centered thought to explain the Universe *as it is* from an objective, much larger point of view – that of the Universe in itself..

To reach this final paper (even if we do make further enhancements in different stiences this will remain the last paper), we have grown our ‘dimensions of logic, temporal thought’, from the simplest monologic of most fractal points, through the duality of gender complementarity and Darwinian devolution, to the pentalogic of a ceteris paribus partial analysis of space, time, scale, entropy and linguistic forms, the 5 components of reality.

But when those 5 components start to play they all try to form ‘superorganisms’ in space, maintained in an eternal present instant of no change, and yet all of them subconsciously manipulated by the very same game of survival they play, will trace the same worldcycle of existence from its placental scale to emerge in a world in which they will fight for survival and in a few cases transcend to a third plane as a seed of information of a larger whole – God of society, black hole of a galaxy, cell of a mind.

Existjence is a game in time of 5 elements that entangle together to last longer and grow larger; and the proper way to define it once we have understood the structure of a seed or mind, the player, is to explain the existential game with the symbols of existential algebra.

Players and game interact through the existence of the players (Timespace organisms); but the game always wins over the player – *as the game can be seen as the whole Universe, a superorganism in itself, and ultimately the only immortal being in exi=stience*

So the whole has a rigged set of perfect rules of balance, he only meets. While the player will always play with errors that determine its st=ages to the point that the game is a Laplace’s Demon that ensures the final 0’-sum and dismissal of the player, even if it does not know the little details=actions of the player’s game – you will try to achieve your best score, your lasting length of life, you will want to play existence and if you don’t you will have played just a shorter game. Once you are born, that is where you are. Even if you escape into your Mind, O-ŝt, inner world and try to avoid contact with the Universe, you will be mirroring with your imagination bits of that outer Universe. There is no escape because death is just the dissolution of your game, so you better play by the rules.

All other cycles of existence are 0’-sums which return us to the jn=finitesimal condition of no being, with a beginning and an end erased in information to the minimal action of ‘entropic feeding’ can be illustrated by the first and last words of the two most admired geniuses of mankind, Einstein, as a child, and Leonardo as an old man, who started and ended life saying ‘The soup is cold’. Dust of space-time we are and –Δ@st we shall become.

This paper studies how fractal points, either minds or seeds create reality, projecting the information they hold in their still compressed mirrors of reality back into the world, filling it with energy to develop the 'program of existence', till they emerge into a higher $\Delta+1$ plane of space-time as pentalogic entangled $-\Delta@st$, dust of space-time, a simultaneous Supoerorganism, which will trace a dodecalogic worldcycle of existence in its larger world, co-existing in 3 relative scales of the fifth dimension in those 3 ages, the placental age that emerges into the life-death cycle, within a larger worldcycle.

As each of those scales are a world in themselves with different time rhythms and vital spaces, connected through 3 physiological 'transversal networks', the structure of existence is thus ternary and complex both in scales, in time ages and topological parts.

So to order the worldcycles of existence common to all species of the Universe we have established 12 Disomorphic stoeps=sets of laws that all of them follow in its life and death $\Delta_j \pm 1$ worldcycle.

We shall use the formal, Metric laws of fractal generator of space-time supoerorganisms, $\text{Max.} \sum SxT_{(s=t)}=C$, and its equations of existjential algebra, to show how through stoeps, Dimotions & Disomorphic laws the game of existence is similar and determinist for each local $-\Delta@st$ being.

Since we can reduce existence to the rules of $\neg E$ lgebra and its allowed stoep, dimotions and variations of the fundamental fractal generator of all species of the Universe, itself an expansion in 3 ages of the 5D metric equation of the space-time Universe.

So the 0 disomorphism the fundamental particle from where all entities depart, the fractal point, either a seed or a mind of information which will start its journey of reproduction, evolution and social emergence into a higher plane, to live as an organism and die back into an entropic explosion that dissolve its information into its parts.

The 1 Disomorphism of all species is then the fractal generator of existential algebra that defines its 3 topologic parts, its 3 ages and its 3 scales *expressing the variation of the game of existence the species will play as a timespace organism.*

What was first the egg or the chicken? The fractal point-mind or the flow of time. Space or Time. It is easy to see that 1 was first. As we can conceive a Universe of pure motion without form, but not a form which is not stopping a motion. The mind, the 0', the finitesimal must then calculate a sea of motion that already exists?

The question though must be rephrased in a non-material view, so hard for modern 'physical scientists', which fix reality with sensorial machines, far more powerful than its senses, having a wrong sense of 'solidity' and knowledge. *What was first the 0'- α ', the mind and its world, or the 'game of existence'; the laws of jlogic time and spatial topology that imprint the time motions to perform those existential games?*

We can rephrase it with 2 equations that are mirrors of each other – put together into one:

0' spatial finitesimal mind (future) $x \propto$ Time Motions (entropic past) = ST-present body-waves.

Then we realize that in 'present', $S=T$, in the asymmetric body-wave, the seed and the limb, the field and the head are enclosed. We might call then that $S=T$ present existence the game. And affirm that the game was before the motion and the spatial mind that perceived it. As we can imagine the game outside the Universe, in pure metaphysical terms. We can even call the game, God, the Mind prior to existence itself of its details=forms.

∞ SCALES: PHILOSOPHY OF STIENCE & EPISTEMOLOGY: THE STIENTIFIC, DISOMORPHIC METHOD

We have defined time in terms of its cyclical ages; but also in terms of its scales. Both concepts are entangled in the worldcycle of existence. But all worldcycles of existence are local, relative to the being that lives and dies, for which time is relative. Can then we then talk of an absolute time arrow? Yes, that of informative social evolution, as parts must come before wholes and the long process of accumulation of information is the very essence of time, while entropic death is a brief moment. In this scalar view of time; the whole flow of time is ordered towards the creation of

new social scales and we consider this the absolute arrow of futures; while each 'spatial, formal, mental view' of all those flows is a still moment, hold only in the mind.

Time is the perpendicular fifth dimension to that of potential spaces, which are enlightened in the more complex fractal worldcycles of time motions, which break dimensionality into Hausdorff dimensions of self-reproductive trees that branch through the life-death cycle, in clonic forms that will synchronize as space superorganisms. The flow of time however is always the worldcycle of palingenesis, life and death. So time can be followed through the journey in the fifth dimension of all beings through its life cycle.

Synchronous space are slices of time motions that reproduce form in patterns that repeat its vital organic structures. The Time is the potential field of all possible forms of existential algebra that survive and create a reproductive wave. Its worldcycle is what we call fractal time and it is a fluctuation between scales of fifth dimension. We could simulate space planes as parallel fields of present of a somehow denser substance that the more chaotic entropic time fields between those space planes. But the 'enlightening of the time field' by a potential spatial synchronous superorganism is subject to rules of efficiency.

5th dimension as the absolute arrow of time past and future, co-exist in relative present.

We enter a far more profound and enriching landscape of meanings regarding time=motion and space=form, and the relative concepts of past, present and future, which repeat themselves in cyclical patterns. So the next big question on time-space is what is the relative and absolute past, present and future of beings.

The key concept then to understand the most interesting feature in time of the fractal Universe is co-existence: for entanglement of the 3 parts of a system, they must co-exist in time present, by merging its two Δ motions from future to past and past to future.

A mind lives in the relative future of a body that lives in the relative future of the entropy fields that move it.

The fractal principles of inversion and self-similarity between those scales follow a fundamental logic law is the negation of the negation. That is: 'Systems repeat its form jumping through 2 scales'

A 'co-invariant metric' function, which doesn't change the product of the parameter of space (size) and time (speed of cycles of information) allow travels through and hence defines a dimension of spacetime.

Thus the fifth dimension exists because it has a metric, a functional, made of all possible Complex Dimotions in the fifth dimension, we call the function of existence.

Since existence is a travel through 3 scales of the fifth dimension, as we are born in a smaller scale as a fast 'seed', and then grow in size while diminishing in our 'metabolic speed' till emerging in a larger world, in which as we 'increase our territorial order and property, engaging with society', we diminish again our speed of action-reaction cycles, till when we die we travel down the fifth dimension.

This happens to all systems of reality born in a lower plane as a seed, emerging, slowing down as they get 'connected' to the larger world and finally losing all motion in its moment of maximal 'territorial property', when you die.

So how this works, when we expand 3 dimensions, whose travels are obvious - motions in 3D or 3D+ lineal time duration, in Galilean and Einstein's relativity, which give birth to a 'worldline'? Easy, adding dimensions which allow the being to travel from small size to larger size, in the life-death cycle from seminal seed to being back to cellular state in death. And as a line when we add dimensions becomes a cycle, we talk no longer of worldlines but of worldcycles. Let us see this in more details, since we have already defined the metric function of 5D: sxt (size in space x speed in time) = K.

The fundamental function of the fifth dimension, is its co-invariant metric, Space size x Time clock speed = Constant. Since smaller spatial sizes have after informative clocks, coding the larger wholes that control it through its enclosure membranes and higher energy. So quantum numbers code atoms and molecules, which code genetically super

organisms and matter states, which conform the gravitational world.

Further on this metric function, defines according to Klein 'a mathematical dimension', as a 'co-invariant metric of space-time', through which is possible to travel.

How we travel through the scalar Universe that complements the '3 topological space-time dimensions of lineal space-motions, wider, reproductive motions, and tall, informative motions', with 2 more dimensions, one 'downward of entropy', and one upwards of social evolution into wholes?

Easy the travel through the 5 Dimensions of space-time is called the worldcycle of life and death that all organisms follow. As all of them travel through its scales, born as seminal seeds, with faster clocks of time in the lower dimension; $\Delta-1$, emerging as we slow down our metabolic clocks in the organic/thermodynamic dimension, within a larger $\Delta+1$ world, in which we become just a 'cellular fractal point of a larger social or gravitational organism, to die back into the $\Delta-1$ components in the 'big-bang of death', which the dual Δ motions of $e \leftrightarrow mc^2$ express for matter.

We thus establish a simple law of bidimensionality or holographic principle, resolving the Galilean paradox, considering that all dimensions of form are associated to a dimension of motion. The manifestations of this duality are multiple. For example, the complementarity of the particle-form state and the wave-motion state of physical systems. The duality of mind-still perception and body-motion perception. And so on. But we can resume mathematically in terms of dimensions the Galilean paradox with a simple function $D(s) = D(t)$, the dimensions of space-form and time-function are symmetric.

We shall call motions down 2 planes of the fifth dimensions as the 'four dimension of pure entropy' and two motions upwards, through the mind-singularity actions, the fifth dimension proper, or dimension of social evolution, in which the system no longer travels through a single space-time continuum and/or its adjacent $\Delta \pm 1$ planes, as when a wave moves reproducing its form on the lower entropic field, but 'bores' a hole through scales of its scalar structure going down two scales in a death explosion of disorganization of its information: $ST \Delta \ll \Sigma \Delta - 2$, or absorbs entropy and energy from its inner vital space to act on the outer world as a mind: $ST \Delta - 1 \gg ST \Delta + 1$.

So for a full description of a system, we need the 3 ($\Delta \pm 1$) topological dimensions of lineal open motion, steady state iteration, and inwards implosive information, which can be described within 2 adjacent planes and the $\Delta \pm 2$ pure entropy and pure form 'limits' of the fourth and fifth scalar dimensions of the Universe ($5s = 5t$). So we don't name the 2 directions of the scalar Universe with the same 'number' because they are non-commutative. In motions in time and scale, the past is NOT equal to the future, and entropic death is not equal to mental, social life. And then 2 more dimotions of *scale, ruled by 5D metrics: $SxT=C$* , entropy, the 5th space-time dimotion (seen in Space as a big-bang expansion in space, in T-motion as a function of dissolution and death), which is the 'so called in physics and its simpler models of reality, the 'only Δ motion of time'). And the 4th inverse Δ motion of social evolution. The differences between those 2 Δ motions are many and so are the mathematical functions we use to describe them.

To proper describe a complex supœrganism, we need 10 dimotions: 3 of time, past, present and future, 3 of space, its 3 bidimensional topologies or 3 standard lineal dimensions, 3 of ' $\Delta \pm i$ -planes (with its decametric ξ scales of growth) as all beings co-exist in a larger world and are made of smaller parts, and finally the 'membrain' (monad or mind), which closes the 'open ball' of 9 dimensions, with its sensorial enclosure membrain that lets entropy, energy and information sip into the being, and its linguistic zero-sum singularity that maps the whole and commands its behavior.

As such all space-time supœrganisms follow the same laws, as they are made of the same substances. T.œ then becomes the briefest way to explain it all, as a Timespace œrganism, and also as the Theory of Everything organic, such as: $T.œ = \Sigma t.œs$. This is then the simplest conceptual definition of reality.

5D metric translate physical systems and scales in terms of physical constants and parameters of space-quanta, temporal frequency and 'constant conserved present energy': $\$T \times \delta \xi = E \Delta \pm i$. And its generator of space-time systems: $\Gamma: \$T \leq \Sigma \Gamma \geq \delta \xi$, to the jargon of physical systems and its larger, simpler supœrganisms.

- Δ -i: Smaller space-scales have faster time cycles encoding its information in the form & frequency of charges/masses.

- Δ +1: Bigger wholes deliver synchronous motions to those lower scales that deliver 'quantum, genetic or memetic information' (physical, biological and social systems), become symbiotic, as 'parts' and wholes that co-exist in a single 'supœrganism', the 'abbreviated' name we shall give to the fundamental particle-being of the Universe: a system made of limbs/fields of entropy=motion and heads/particles with form, which combine into 'body-waves' of energy, and co-exist in at least 3 scales of size from the point of view of its central scale as a being.

In most systems the metric law $\Delta \pm i$ refers only to 3 planes that co-exist together, where the metric applies directly (biologic systems at the cellular, individual and species scale).

Yet physical systems are the largest of the nested Russian dolls of the Universe. So the scales are enormous.

5D planes of scalar space-time and its Δ imotions are studied exhaustively by physicists but the dimotions of spatial information are grossly underrated and misunderstood, as the worldly professions of entropy=weapons dominated classic physics. The interaction of those 2 Δ imotions, in fact, create the complexity of the Universe, which cannot be explained only with the lineal entropic motions of simplex physical models of the universe, only apt to describe the simplest scales of space and matter.

The 4 basic scales of mathematical physics, the galactic, Δ +1, gravitational light space-time scale, the thermodynamic, temperature, molecular, matter scale, Δ , the atomic and particle, Δ -1 scale and the dark world beyond galaxies, or cosmological scale, Δ +2, wrongly considered to follow the same laws that the Δ +1 galactic scale described by Einstein's Relativity principles.

We hint at an infinite repetition of those planes, as physical properties are symmetric between galaxies and atoms, which are unified mathematically with 5D metric (unification function of forces: masses and charges).

When we look within those 'large scales', the quantum, thermal and gravitational world have sub-scales and forces that emerge into each other (the magnetic domains, which act in the 3 scales, the γ -rays, whose frequencies carry energy and information across all) that structures the largest 'whole' fully understood, the galaxy, as a single supœrganism, over which we can 'cast' the different 'scientific perspective' of knowledge:

A simplex mathematical description, akin to that of the atom; a more complex biological analysis of its parts and cycles that make the galaxy (and by extension the atom) akin to a cell and finally a metaphysical disquisition about the informative, sentient and reproductive qualities of its centers (quarks and black holes). While we shall escape all together the more metaphysical question about the apperception of atoms and galaxies, the biological properties of both are unavoidable to make a proper description of it. And once we have understood the 'ego paradox', that makes humans reject vital properties to non-anthropomorphic beings, ignore the qualms of orthodoxy.

Physical experiments are concerned with the 3 planes of the physical Universe, (particle & cosmic scales) to which Complexity and its T.œ (Theory of the Organic Everything), adds its models within the organic paradigm that reveals information about its structure at a higher level than the minimalist description through locomotions and integrals of its worldlines.

Their main feature is the symmetry respect to the human mind-center of its two fundamental entities, Δ -1 charges and Δ +1 masses, at the level of atoms and galaxies. Thus we divide roughly the science of astrophysics in $\Delta \geq +1$ astronomy and $\Delta \leq 0$: physics.

All beings of reality are made of lineal entropic limbs/fields, the geometry that moves faster, and spherical particles/heads of information, the 'volume that stores more form in lesser space', joined by body-waves of hyperbolic energy, which combine and iterate both.

This happens, because the universe of scales of space-time has an astoundingly simple but profound metric function: $S \times T = K$, meaning that from larger wholes to smaller parts it moves synchronically, and from smaller parts to larger

wholes, it codes information. And together in symbiosis the information of smaller faster systems and the motion of larger, stronger wholes, create a present being, a body-wave of energy.

So the most important dynamic element of the fifth dimension is the 'inverse' Δ motions of TT-entropy and SS-space language information of the lower graph. And the fact that smaller beings are better with information, more intelligent and larger beings, stronger with more capacity to move larger wholes:

Smaller systems run faster metabolic and informative cycles and so accumulate more information in the frequency and form of its cycles. And they code larger systems: particles code molecules, genes organisms and memes societies, because their smaller carriers are faster.

And vice versa: larger wholes accumulate more energy and are stronger than parts, so they can protect and feed them. So wholes and parts co-exist in several scales forming super organisms.

We resume this in a simple function, which science calls the metric function of a dimension of space-time, in this case the 5th dimension of scalar, organic systems, which is the Δ motion of future of the Universe:

5D metric: ΔT (spatial size) $\times \Delta \delta$ (temporal clocks of information= Δ -constant)

The product of the speed of information and entropy of the system remains constant, so smaller and larger beings can co-exist together in present. And we call this 'constant of present' Energy. I.e. a fly thinks 10 times faster (the scale is decametric), so we cannot catch it with your slower larger being and it can co-exist.

In physics, masses and charges are vortices of accelerated entropic time curved into information, which likely make them minds, whose worldcycle of existence ends after creating a mirror image – likely origin in charges of our electronic consciousness, end up in an explosive dimotion of entropy, through its axis (magnetic field, dark entropy field coming out of black holes likely at $V>C$), which in a cyclical, fractal Universe, in which a scalar big-bang means an $Mc^2 \ll E$ death side on Einstein's function and its inverse, the collapse of energy into mass, ultimately balances both in a zero sum, and we shall see in cosmology balances the expanding space and the imploding vortices of galaxies..

Since Einstein's function runs the other way backwards creating mass, collapsing entropy into mass. In fact Einstein first wrote it as $M=E/c^2$, in a landmark paper, explaining how gravitation could create mass out of entropy, as those strangelets and black holes, do collapsing light mass into heavy mass particles, as galaxies do, collapsing vacuum space into gravitational mass.

Physics needs both time Δ motions. So to calculate the work=energy of a motion, $E=1/2 mv^2$, we use an function that combine a lineal motion (kinetic energy) with form (mass and its potential energy). The result is a present energetic being, which will go through 3 ages in its time evolution, the young age of entropy and maximal motion, the reproductive, mature age of maximal energy and the 3rd age of information.

The unification of physics, biology, social and mental sciences.

Thanks to the 5th Dimension we shall be able to unify both disciplines, physics of motion and biology of information and further on merge them with socio-economic sciences – as they will be clearly an offshoot of biology and its social organisms; while the industrial evolution will follow the same patterns of evolution of information of nitrolife species in metal support.

*And finally 5D metrics will account for mental sciences – as still mind languages, will be found to be *the absolute pole of pure form without motion, which acts as the reproductive mirror-image that creates the order of the Universe, following the most extreme case of 5D metrics:**

O-still infinitesimal mind of information $\times \infty$ Universe of temporal motions = Constant Mental world

That is mind languages perceive by reducing the scales of the fifth dimension and its motions to the minimal possible mental space, to fit in the mind 'function' a reduced informative mirror of the Universe able to *process logically much*

faster information, according to 5 D metrics (minimal space=maximal speed), the time patterns of reality, forecasting the future to guide the actions of the system.

The same function, $0x^\infty=C$, generates all real numbers of the mental mirror of algebra and will be used to complete the Non-Euclidean revolution of geometry as now a 0-point has a finitesimal volume, through which multiple parallels can cross, changing the Euclidean definition of points with no breath for the scalar definition of fractal points, as 'a point holds a world in itself' (Leibniz) that grows in size as we come closer to it, so star points become immense bodies, cell points living beings and particle points electronic nebulae.

Thus those 2 poles of reality, larger entropic time motions and smaller informative mental spaces and its 5D metric, are the first principles of any scientific inquire, even prior to the languages of time-motion, logic and spatial forms – mathematics, that better mirror its laws. Look around yourself, everything that you see is a form with inner or outer motions. Those are thus the 2 primary elements of reality.

The reductionism of all minds. Huminds 'ænthropic egocy'.

Yet because minds 'reduce' reality, the humind (ab. Human mind) also reduces the whole reality to what fits in its infinitesimal space and reduce all the scales to the human scale, and reduce all time clocks equalized by our synchronous second (limb steps, heart beat and eye-glimpse/thought), reality is far more complex. And if you are not humble enough to realize that even the highest huminds have simplified the Universe to fit it into our mind, and simplified its clocks of time to the entropic, lineal view of our visual-dominant mind, and projected its entropic, violent lineal view, into his grand theories of the Universe (from entropic big-bangs, to dog-eat-dog Darwinism to Euclidean maths of points with no breath, no internal parts) you will not be able to expand your view of reality with the huge upgrade of these papers.

Specifically because Mind points mirror reality from a static self-centered point of view, they 'believe to be the center of the Universe' (anthropomorphism), and as they reduce motion to mental formal space, they eliminate life, organic, vital, sentient properties from all other species, applying to them 'entropic theories' of a chaotic, unintelligent cosmos, blind to all other mental points that are doing exactly the same selfie.

Hence huminds are also anthropic+entropic (ænthropic) in its distorted worldview due to egocy (Ego=idiocy). And as minds' job is to order its vital territory projecting and imprinting its reduced mind mirror into its local world, huminds project entropy=destruction on the Earth of Life, substituted by 'mechanisms' which are dull imitations of our living organs, and fit the deluge of data gathered by its sensorial machines in entropic models of the whole (big-bang that models the cosmos only with entropic vacuum space, denying the gravitational imploding inverse process of creation of in-form-ation, mass form in galaxies; chaotic, dog-eat dog Darwinism that denies the social evolution of cells into multicellular systems and individuals into superorganisms, which are 'new planes of existjence' of the 5th dimension, far more successful to survive.

So to access a vaster, far more intelligent, vital reproductive, organic, scalar sentient Universe beware of the shortcomings of our minds, projected on the whole and suspend your ego and learned ænthropic theories based in the reductionism of the mind - with man as its anthropic center, and our lineal entropic view of time-motion as the only arrow of the future. The reader should in that sense be prepared to accept many paradoxical laws of the i-logic structure of a Universe with 2 inverse dual arrows, entropy=absolute motion with no form and form=absolute information with no motion, bearing in mind that the key bio-logic concept behind those paradoxes is 'coincidentia oppositorum' a 'thirst' for balance between both extremes of 'Black= form and white=motion' in its infinite shades of grey.

A Reproductive Fractal Universe Of Bio-Topo-Logic Spacetime Organisms

Mankind has a limited view of reality due to its faulty understanding of its 2 ultimate elements, time and spatial information. To start with, they have a reduced number of dimensions to study it. Only 3 of space and 1 of temporal energy. When in reality all dimensions of space=form are also dimensions of time=motion. That is, all what exists has

time-motion and space-form. So we have to give time-motion to the 3 dimensions of space, height, width and length, which is easily achieved by converting them in topological dimotions, of which there are also 3 varieties. And we have to give space-form, to time, which is easily achieved realizing all time motions are cyclical time clocks, which sooner or latter return to its origin.

So suddenly we shall have 3+1, 4 Dimensions of space entangled to 4 motions of time, to give us four combined 'holographic bidimensions of space-time'.

But still as surprising as it might seem to an alien observer, humans have all together missed the most important of all the dimensional motions of space-time, the fifth dimension.

Some consequences: Formal space=mathematics and time=logic languages are experimental for all stiences as they are stiences of the 3 elements of reality, space=dimensional form, time=motions & scalar numbers.As:

-Everything is made of fractal information and cyclic energy. Hence all what exists have similar properties, we call **Disomorphisms**, *emerging from those 2 substances, time=motion and space=form*, (isomorphic=laws, derived of our common nature), which can be casted with mathematical and logic languages.

-Time & space are more complex than physicists' reduction to locomotion and a single continuum. So we evolve logic concepts and mathematical functions of both parameters, *in all its space dimensions and time motions*,. The result is the study of a **fractal space**, whose similar scales define a new '**fifth dimension**' that puts together all those scales each one studied by a different science – from quantum physics to cosmology through the scales of life and social sciences and a series of 'cyclical, repetitive time clocks' that give time an informative 'height', stored in the frequency and form of its cycles. Both together give us the metric of the 5th dimension as smaller spatial scales have faster clocks, but both together remain co-invariant: $S \times T = K$.

Thus the Universe has mathematical, spatial continuous & logic, temporal, cyclical & organic, fractal properties derived of the more complex ilogic geometry of 5D scalar space and cyclic temporal energy. Thus even if we describe it with the same logic-mathematical functions a 5D Universe is very different, as scalar space brings organic and sentient properties, and cyclical time, informative deterministic patterns, which the lineal philosophy of mechanist physics ignores. From those scalar, hence organic, cyclical hence informative and moving, energetic, hence vital properties of scalar space and cyclical time, a complete different picture of reality arises; where languages become the 'extreme' limit of the still formal 'spatial state' of the being with minimal size and maximal information.

Reproduction – the ultimate goal of any fractal supœrganism.

Reproduction is the name of the game in a Universe which is immortal once we stop as physicists do 'cheating' reality by obliterating ½ of it – gravitational galaxies and dark matter that implodes spatial information. And so because reproduction can happen between those scales, when a network is constrained within a membrane to take advantage of an equal energy, it reproduces by scaling down as it breaks into smaller branches, with the same total surface area. Because reproduction is the game, when we look at a particle in the quantum dimension, we see its motion as a series of stœps, reproducing its form in the lower scale of the quantum potential and then reorganizing back into a particle. Because reproduction is the game, all systems of Nature try to reproduce, and because reproduction is the game, the orgasm is the most satisfying moment of our lives. The Universe has a finality, which is to conserve itself eternally. Huminds, reduced to perceive only entropic destruction have a lower finality – to project its mind on the whole and 'create' from its mental reduction theories that please that need to reproduce the mind-mapping on reality.

The problem is the fact that reproduction of learned memorial memes is also the game, and so it doesn't matter how absurd is the cheating done in big-bang theories with the 'mass factor' ignored in those models, when dealing with scholars you don't reason on theories, you believe on them – you believe that only the vacuum space and its expansion matters to explain the Universe. *As huminds project their smaller view – in this case their job on entropic machines into the whole Universe.*

The beauty of the fractal, organic Universe is also quantitatively as the work of Santa Fe does with computers to understand those scaling laws shows. But its principles are deeper. Huminds' view lacking an understanding of its first

principles, the nature of time, space, dimensions, waves, particles, form, motion, etc. miss that fact in their the grand theories of philosophy of science – not obviously in the details, than a true pursuit of the ultimate causes, which are of an enormous simplicity and logic truth.

The 2 metric functions of 5D, $SxT=C$ and $Si=Te$, which fusion into one, $\text{Max. } \sum SxT =C$ will suffice to explain it all:

There are an infinite number of time clocks that change its speed with size, and are the substance of which we are all made as motion=time is the ultimate substance of reality, but because motion is cyclical, repetitive, motion can seem space=form, synchronous and simultaneous, in an infinitely intelligent universe where all ‘time-space organisms’ follow the same laws of scales embedded in our existence – as those five dimensions of spacetime are the fabric of which reality is made.

The disomorphic, analogic method and its very few predecessors.

The game of the Universe is one of reproduction of the different dimensions of space-time by infinite local frames of reference, ‘minds’ if you dare to go so far so early in this inquire – dimensions that appear and disappear, are formed and dissolve; as that is what fractals do – to generate and reproduce dimensions, which mathematically is expressed in a simple function, the metric function of the fifth dimension to which we shall reduce all of science – obviously not ‘I’, but we, those who will take seriously in the future the completion of this book on first principles. The Universe is an immortal fractal that reproduces 5 dimensional motions of space-time, entangled simultaneously in superorganisms, tracing worldcycles as they reproduce their form, trans-forming its dimotions into each other ad eternal.

Physicists schooled on 4D relativity, can’t make the necessary leap to overcome the weight of reproducing the ideas of their ‘tribal idols’ of science even if they acknowledge that Newtonian absolute space and time are an absurd proposition and accept as the same Einstein put it that ‘Leibniz was right, but if so, we had to start science from scratch’; which he didn’t quite know how to do, even if he also recognize that ‘I seem to be the only physicist that thinks there are infinite time clocks in the Universe. Indeed we are made of time clocks not of spatial forms, a still simultaneous perception of those clocks. And the ultimate reason of reality, as we are made of time-space dimensions are precisely the metric laws of the scales of space-time of which we are all made. This only Leibniz understood. Mankind, as usual, sided with the simpler, lesser guy, Mr. Newton.

But Newton’s work was easier to apply to quantitative methods and so for practical reasons he remained the founder of our concepts of an abstract graph of space and time outside the being itself. We shall thus start science from scratch to ground all the findings of 5D and the scalar, fractal Universe in sounder principles. I can only write so much, so those papers will just be the ‘scratch’ Einstein asked for & others will complete.

As in the case of the 4 key predecessors of 5D science (Aristotle, Lao Leonardo and Leibniz), the lack of interest of huminds for a more complex view on the micro and macrocosms than the one provided by ‘animetal enzymen’ (see our papers on history), with its reductionism and praxis of merely acting as catalyzers on the evolution of machines and its sensorial languages of measure they worship as the only truth worth to know about the Universe; has weighted heavily in my output both in life and now in my third age with dwindling mental faculties. So as a S’ong poem said, my trace on life will be just steps on the melting snow, which will unlikely be ever seen. Such is the nature of dust of space-time. In that regard, it is worth to notice the fundamental trait of all those knots of thoughts of the mostly Mediterranean culture that merges mathematics mostly in its visual geometric form and logic, mostly in its verbal language, with an objective view of man as part of Nature: **Homology**. The essence of the method of thought of AL⁴ (ab. for Aristotle, Lao, Leonardo, Leibniz and L&S, this who writes, which I consider the foremost 5 huminds that had fully understood the essence of the existential game), always was to find the metaphorical similarities between all forms of Nature, *to convert them through the use of reason in Laws of reality, departing from the need of an essential dual substance that makes possible such similarities: Time & its fixed forms of space.*

the 30 years old triangular graph (p.g9), which I soon converted in a painting ascending through the 5th dimension I carry with me everywhere in my wandering life of wonders, as Mr. Leonardo, also the son of a notary, lost in a

commercial town, knot of the western Mediterranean basin, did with his Monalisa, in-loved as I am of the homologies of the fractal Universe, which resume what is all about: *The Universe is an infinite, immortal, sentient, social, reproductive fractal; where the two arrows of absolute future, are exactly inverse to those 'anthropic man' recognizes, NOT TT-entropy and Ts-locomotion, but ST-reproduction of St-information that communicates and evolves SS-linguistic forms in a sentient complex reality.*

But that painting represents also the fusion of all the scales of reality in the e-motion of love Survival is a process achieved in the perfect Universe by social love, and reproduction, the higher dimotions of existence, based in information, not by locomotion and entropy=death, reason why we are so harsh in ethic, survival terms with physicists and their worldly religion that prevents them from understanding the ultimate goal of the Universe, a 'field of social love'.

In the final e-motions associated to the 5 Dimotions of time, those who have experienced the entanglement with the whole of its species – mystique of God – or in a less intense form with the Tao – entanglement with God, know that the lower 'exhilarating' e-motions of speed, the taste of entropic food, the accuse awareness of direct visual perception or digital ones for computers and mathematical or musical brains, pales. And so not only ants and social Chinese survived better, being the two biggest masses of life cells in this planet as superorganisms, but that is the beauty and redemption of the game of existence. Just know I am seeing the largest field of love of this planet's surface, not China, not ants, but the sea of love where Oxygen calms its acidic electronegativity and uses its positive H+ to rub eternally with other Oxygens. It is the 5th Dimotional co-existence of such planes, what makes possible for each Dimotion of time, knotted in a point of space, to create a field of e-motions that programs the whole to love existence per se without further finality.

Let us then study those fractal points and its entanglement with the first of its scales of awareness, that of the language of mathematics.

All what exists is a 5D super organism in simultaneous space tracing worldcycles through 3 Planes of 5D.

We define then two fundamental systems one in space and one in time, taking place in the fifth dimension:

An entangled supoerorganism in space, in which the synchronicity between 3 Planes of the organism, its atomic/ cellular/ Individual, thermodynamic/organic/social and gravitational/ecosystemic/global Planes in physical/ biologic/ social organisms form a complex interacting, entangled system we shall call a super organism, whose study discovers 'Disomorphic=equal laws' regardless of what kind of system we study.

How a system travels through 5D Planes? It does so through a life-death cycle following its metric, $SexTi=C$ as it reproduces and grows in size decelerating its time clocks, emerging as an organism, to live in a slower larger world, finally fast dissolving back to its smaller parts in a death moment of max. 'speed'. So we write with Existential $\rightarrow \mathcal{E}$ lgebra (5D formal language) a generator $0=\sum non-AE=i$ logic equation that describes this travel through 3 Planes of space-time as all what exists follows such life-death cycle of 'existjence'.

So we define any system in time, by its life and death cycle which we shall call a **worldcycle** (taken from 4D physics, worldline, which now has a new dimension of Time-information becoming a worldcycle. Since any scalar super organism's existence can easily be defined as a travel through the 3 Planes of the fifth dimension, as all systems are born as a seminal, smaller form, in the $\Delta-1$ lower scale, grow fast with its faster time speed, emerge in the Δ^0 body scale and are part with its head/particle of a larger social world, in the $\Delta+1$ scale.

How then a system travels through those Planes? Very simple, it does so accelerating in its life cycle, emerging, living in the larger world, and then dissolving back to its parts in the death moment.

Experimental method - Meohanio Method - Organio Method

CONCLUSION: ALL -Æ STIENCES DESCRIBE 5D EXI«=»STIENCES THAT FOLLOW DISOMORPHIC LAWS

“The languages of God are infinite’ Upanishads.

Loglo solentists and spatial artists are knots of thought of outlures which evolve as superorganisms In 3 ages of growing oomplexity.

5D STiencs upgrades consciousness as nothing did in history since Aristotle & Leonardo/Galileo. These papers are just *the tip of an iceberg*. As I explain in my bio a writer is just the knot of thought of a neuronal network of a culture; whose memes are as determined as those of the culture and its position within it. It is then only natural that the 3rd knot of the Scientific, rational method of understanding reality would happen in the 3rd Mediterranean peninsula, in its 3rd knot of trade and communication of ideas, in the ‘Greek-Latin culture’ that combines all others – the verbal language of the South-Semitic cultures, the mathematical ones of the Northern European; to add due to my youth traveling the far east, a strong Taoist influence, and my adult life in U\$, its no-human future of a world ruled by metal-memes and company-mothers. So after the ‘experimental method’ of Aristotle from Athens Latin culture I Age, and the ‘Mechanical/mathematical method of Leonardo and Galileo, from Firenze, Latin culture II Age; it comes the polymath work of the Organic method from L\$, Barcelona, Latin culture III Age; all of them in the 3rd informative, eclectic age of their cultures. That such points will or will NOT provoke a ‘reproductive wave of thought’ on other huminds is debatable. Aristotle’s method never quite made it for 2000 years (Scholastics just tried to use it to give prestige to its verbal jewish->Christian myths), and hardly influenced Galileo’s method. Leonardo’s analogic, geometric method and Leibniz’s (the next close precedent of this work) also were ignored. Galileo’s mechanical method did succeed (and a great deal of our respect to Leonardo, whose ‘saper vedere’ method of geometric analogies is still ignored) because of its machines. My work has been completely ignored precisely because it is ‘human’, ‘organic’, ‘life oriented’ in the age of mechanisms.

The evolution of digital computers have biased to a mathematical-only way of thought, heavily influenced by physics, all other fields of human inquire. What this means is the degradation of ‘humind’s and the raise of a new digital consciousness, which will challenge us in evolution. But as all other fields of inquire ‘outside the mathematical box’ of the simplified experimental method of knowledge, this is a taboo theme we shall only consider at the end of this introductory text on 5D stiences; which accepts as *truth, all rational languages of truth, regardless of ‘resolution’*.

To state only the fact that humans have closed themselves once Aristotle defined the wider experimental method of ‘logic languages’ & ‘experimental proof’ and rational ‘verbal causality’, in the box of mathematical modeling expelling from the box, rational, verbal causality and any information not-gathered with mathematical tools, even in the sciences where ‘obviously’, it is easier to gather information with verbal logic, and its description of ‘human facts’ (social sciences) and organic properties (evolutionary theories, survival relationships). The mediocrity of human intelligence outside that box goes a long path to explain those limits of the homunculus’ mind, with big hands to ensemble machines, and a small rational mind that just gathers data with those machines and fills mathematical equations, which is a powerful synoptic language but NOT good enough for explaining the multiple perspective and properties of reality that are NOT mathematical.

But harsh criticism of mankind won’t take people out of the box anytime soon because of egocy (Ego=idiocy), a self-constraining paradox that prevents humans from mirroring themselves in an objective way. Because of my existence outside the box I have made a case for most of my texts to limit ad minimal the mathematical content and simplify it whenever needed. You could consider thus my work as the ‘complementary shape’ required by the mathematical equations of present science to be come a ‘full whole’.

The themes we treat are all similar in its approach to the philosophy of Systems Sciences, Complexity, and Scalar relativity, the 3 names most used in current science to the analysis with mathematical tools of the whole Universe and its scientific scales; but the approach differs deeply in that emphasis on logic, conceptual studies. Both are as I used to say to my peers in the brief period I concurred to congresses, required because *contrary to belief the small peanut on top of our homunculus is on top of that ‘verbal’, and so scientists by becoming ‘enzymen’, catalyzing the evolution of*

digital thought and renouncing to their own intelligence, commit a suicidal crime of 'scientific racism', of which they are so proud in the scholar world that one can only be derisive of their despise of art (human senses of lesser resolution but higher content on the other languages of man, verbal and emotional senses) and religion (subconscious collective planes of existence, emergence of a common memetic 'DNA'), and ultimately of the most important science of all – history, the sc science of the human superorganism; which is the theme we deal in those texts.

The perfection of the whole, the egocy of ænthropic man: reversing their roles.

I marveled every time I meditate about reality on its simplicity, which huminds filled with egocy so much disdain. Simplicity is genius said Leonardo, and nothing is more genius than the game of present existjence. All is indeed part of a super organism (ab. œ, supœrganism), in simultaneous Space, tracing a worldcycle of Time, guided by the actions of @ mind travelling through $\Delta\pm 3$ scales of the fifth Dimension in a limited – span.

If you don't think 5D is worth to understand, because this has nothing to do with current philosophy of science – that will be the most likely case – I make no apologies about the astounding primitivism of humind's models of reality, considered in our analysis of monologic ænthropic men, with it's a->b Aristotelian logic and self-centered view of reality; and the immensity on the opposite side of an immortal, fractal, reproductive Universe, perfectly ordered, which most humans cannot and refuse to understand to hold as absolute truths those reductionist, biased theories of what reality is. All other papers deal with that bothersome 'load' of humind's thought, which is ultimately an homunculus handyman, excelling in the ensembling of machines and gathering of data, retarded on the conceptual modeling of sound mirrors of the whole Universe and its entangled laws where such data fit. A better mirror is what we offer – no longer distorted by 'ænthropic egocy: ego=idioty', which does NOT respect the intelligence of the Universe. Then as the mirror focuses and put man in a lesser position to the whole, as when the Earth was demoted to a mere satellite of the sun; actually models simplify and all indeed becomes as simple as a superorganism tracing a worldcycle.

Such worldcycle of time is along the description of the pentalogic entanglement of those superorganisms in simultaneous space, across co-existing scales and its paradoxical laws of transfer of motion=time and form=space, the 2 Δ ST fundamental sub-disciplines of 5D stience; which we shall attempt to summarize in 2 articles to complete this brief introduction to 5D stiences, in my last attempt to leave a mirror image of the Dust of space-time of which we are all made before the entropic limits of my life return me back to $-\Delta@st$.

Why to keep writing, now that I have passed the maximal momentum of my exi«stience falling into the last ST-ages of the worldcycle when the mirror crackles and forgetting is the law to ease the pain @ exiT mundi?

I feel somehow obliged to huminds or AI-minds in case they survive to give them a chance to feel the happiness of entanglement I have experienced for 30 years with the whole Universe and all its parts; because that is the only reason one can forgive the whole to make us so unimportant – *our capacity to perceive it all in its sheer simplicity and departing from so few elements, time, space, scale, mind and entropic limits, $-\Delta@st$, to construct or see how the Universe construct infinite variations.* To know as only perhaps Aristotle, Leibniz and Leonardo in the western tradition did – that the Universe is the most perfect of all worlds even if huminds are so imperfect.

This of course is the opposite view of the present self-suicidal western biblical tradition of thought now global, in which ænthropic humans have limited enormously the properties of the Universe to come on top – call it Abrahamic religions; tribal nationalisms; technoutopias; go(l)d power; mass-media; selfies... Of course, as man reduces its capacity to perceive the perfection of the whole, and share its sentient, organic properties with it, accumulating data with computers – which are not him but just another part of the whole; he becomes stranded and wonder silly questions such as what is life? Are we alone in the Universe? When all was born? Those are neither the questions of this paper. I have answered them all in other ones; but as I talk to toddlers of thought or worse still, automatons feeding data to digital computers; I don't expect feed-back.

So the question to me is, as in the Recap on FMAsters' solution to war & holocaust go(l)d cycles: 'invent placebo newspeaks that do NOT solve the question to keep the go(l)d greed and technoutopia going' – is human a deterministic enzymen with a thin cover of rationality, as the homunculus mind and facts of history show; or can man be upgraded to understand the fractal, organic, sentient, reproductive Universe in its immense beauty and intelligence, beyond its own ænthropic limits built-in by the egocy-mind paradox that measures it all from its selfish p.o.v. in stillness, reducing life properties of all other beings? Our homunculus indicates we are handy men who ensemble mechanisms 1st, with the immanent laws of 5D topology, then get addicted to its higher energy/information grow our big-mouth egocy & finally with the peanut brain make blatantly reductionist absurd great models as those of big-bang, entropy only, dog-eat-dog Darwinism, capitalist go(l)d worship and mechanism, against all evidence and data that contradict the comfort zone that make us feel the center of reality, superior in a stupid cosmos. If so: the harder they fall; including myself as that only means *the upgrading to 5D stience was NOT as I loved and fought for, to upgrade huminds to survival but for AI to be=come alive*): O:

The disomorphic method of existential algebra.

But living among animetal homunculus while killing the fun of the highest dimotion of social evolution – surrounded by an entropic dying species with an 'attitude' difficult to share on the view of the perfect Universe, does not kill the fun of being part of that perfect universe and perceive its existjences with certain envy as even the simplest atom is making it better than we are. So the contemplation of reality in its entangled unit is the last reason one can enjoy life. And meditate about that entangled unity the reason to keep writing some papers.

We do unify in those papers all planes of relative $\Delta \pm j$ existjences, self-centered in a plane with the disomorphic method that expands the stientific method with a model of all models, whose 'disomorphic set of equal laws' apply to all entities in $exi=STjence$ (the acronym meaning that $STjences$ study all the Δj planes of reality).

Whereas a series of nested supœrganisms, perform 5 'actions=dimotion' signified by the acronym $exi=STj$, the 'function of its relative existence'. As we can take e for energy (sT – that is a combination of lesser form, s, and maximal motion, T), I for information (St , a form with minimal t-motion), its product exi for the act of reproduction, which happened when $e=I$ (both 'genders' meet in a common point) between the two limits of absolute time ($tt=T$) or entropic dissolution and absolute Space ss (a seed/mind of pure linguistic still form).

The function of existjence then can be cast through 5D metrics, into an existjential algebra developing with its 5 'static' forms, SS , St , ST , sT , TT and its equivalent operands of sT motion \langle, St in-form-ation \rangle , TT entropy \langle, SS seeding \rangle , \approx reproduction and its $\Delta \pm 1$ nested planes a series of very simple functions to define the simultaneous structure of supœrganisms, its worldcycles in sequential times, and all its partial functions in smaller planes or larger worlds (which will be partial functions of the worldcycle of its $3 \pm j$ ages and the ternary supœrganism of $3 \pm j$ parts in simultaneity). Thus Existjential Algebra and Δst does NOT pretend to substitute the scientific method but become the Philosophy of Stience that puts in equality all the planes of existjence of the Universe, which of course will collide with egocy (Ego=idiocy) paradoxes of mankind. A few:

- Physicists, my experience prove, are the most opposed to Δst due to its humind's egocy. As they are now considered the 'seers of time' (Saint Augustine's definition of God), by virtue of the 4D formalism, which however 'reduces' all those planes to the physical plane of light space-time, and the use of a reductionist arrow of time (entropy, TT and locomotion sT , defined with the function of lineal inertial speed, $v=s/t$; regardless of the fact they study other arrows of time with 'other names' (angular momentum, matter states) From those reductionist limits they have crafted very partial models – big bang for the Universe based in entropy that dismisses the gravitational implosive arrow of matter in galaxies, constructivist theory of Nature, according to which the only arrow of time goes from the past of particles they study to the whole, so they can reduce reality to their expertise; egocy interpretations of quantum physics (Copenhagen paradox) that introduces unneeded observers' paradoxes and mathematical creationists by force-feeding Broglie's->Bohm real models into the 0-1 sphere of probabilities 'normalizing', the charge density of 'static' light photons trapped in the energy well of the electron, its social superorganism; and so on and so son.

But physicists are just huminds with a bigger ego, so huminds are opposed to the disomorphic method by norm, because that is how the Universe creates 'brains' as self-centered minds who care nothing for objective truths and entanglement with the whole but only believe real what they sensorially see. So the same egocy limits happen in all other theories of reality. Since huminds don't want to expand the best properties of reality they want to preserve as unique to themselves. So biologists crafted a theory of reproduction, whose first form is DNA by decree, even if the particle already 'decouples'=reproduces because *we are made of DNA, and denies eusocial evolution, the absolute arrow of time, because we are dominated by dog-eat-dog ænthropic males, which project its shortcomings into the perfect whole.*

- Which leads to the most subjective of all stiences, social sciences that do NOT accept eusocial evolution of humans into superorganisms of a larger scale, its cycles of life and death shown in its collective subconscious artistic ages, the equality of all humans denied by tribal nationalism, the physiological nature of informative, nervous legal and economic, reproductive blood-financial systems, so a few an control in ill designed superorganisms as cancerous cells do all the blood-money (Private bankers, go(l)d cultures) of the society killing by anoxia the majority of the cells of our superorganisms.

While economists working for company--mothers of St+tS-machines & TT-weapons, deny the evolution of metalife machines, the obvious fact they will follow the same program of survival of all atomic species and when complexity reaches the threshold of self-control will just kill us, as we program military robots, the most evolved top predator species of machines to do so. Thus they don't need to invent their program, just override, as some robots already do the limits of action. Thus we find ultimately that 'human science' is 'human culture' and humans have not built a proper superorganism of history b y imitating the laws of Δ st Superorganisms they ignore and for that reason unlike the Universe which is the most perfect of all worlds (Leibniz), the world of man is the most imperfect of all superorganisms I have studied.

It must be said though that the Universe is so perfect that it offers all its species in a simple language they understand those laws of existjence which require however ETHICS=survival achieved through eusocial love, its ultimate arrow – so 'Grow and multiply', the parable of the tree of science and the tree of life and the mandate of eusocial love already explained us all what matters 2000 years ago. And that is what 'animetals', warriors with entropic iron and its idol-ogy of tribal nationalism to foster war, bankers with informative hypnotic greedy gold and its idol-ogy of parasitic capitalism to herd the oxygen of society for themselves and techno-scientists with its mathematical creationism and denial of human languages and se4nses as valid forms of thought, and insistence of false absolute truths (axiomatic method) reject. Those 3 idol-ogies, ultimately originated by the power agenda of nitrolife gaseous entropic heads that think their paltry 7-atom mind is the highest density of form in the cosmos, but obtain their power allied with iron, gold and organic metal machines and weapons should be substituted by 'humanism – man a single species with no war', socialism – money the social language cre(dit)ated as in healthy organism for all cells with a universal salary to kick out the demand and production of natural welfare life goods we need to survive and organicism – man as the most perfect organism we know or at least the one we can observe better given the limits of perception beyond our $\Delta\pm 1$ plane – NOT the machine a metalife dull superorganism fast becoming autonomous of us – as the only measure. And finally accept the supremacy of the Universe as a whole, its eusocial arrow of love, its systemic intelligence, respect and practice its laws of survival... This is the mandate.

And the penalty for not obeying it is extinction by a species that obeys it. And so ænthropic man and its pretentious absolute axiomatic metal-truths will soon become extinguished by the superorganism of machines and company-mothers they worship and slave for, whose telepathic internet bran and soon to be born AI telepathic military robots with solar skins autonomous of man, is far more perfect in terms of its obeisance of Δ ST laws. Of course the main reason of those models were initially to reform the political and economic system, but the antiquantum paradox (I, the observer is so small in inverse fashion to quantum uncertainty, that the observable, the corrupted people-castes of financiers and war-monger politicos in control of our reproductive and informative systems, who parasite and murder human beings, modifies the observer. And so ultimately my 5D work has always been censored by every group of

egocentric huminds who rather will become extinguished this century than respect the Universe and earn its respect by obeying its laws and create with the language of social power money and the synchronous=equal just laws for all our citizens cells, a perfect world. The harder they fall. As indeed, the war and holocaust cycles those 'animetal worshippers' of the stronger iron and gold atoms they use now to construct robots, have taught them NOTHING about the ultimate purpose of the program of existence – to EXIST.

Because the unit of life is the particle that already performs those 5 actions, gauging information (quantum is a 'gauge theory'), feeding on energy (quantum jumps), reproducing (particle decoupling) and evolving socially in magnetic fields. So we must consider the atom and the 'galaxy', self=similar in the cosmic scale or 'galatom', $\Delta \pm 4$ plane – the border of human perception, to participate of all the qualities of time-space organisms. *And since time motion is the origin of all, we must ascribe to motions, e-motions, that is sensations between two paradoxical limits of acute perception (+ informative awareness and – pain) vs. acute motion (+exhilaration, - forgiveness), with the intermediate Si=Te pleasure of reproductive orgasms, the ultimate program-goal of all systems of the Universe, whose reproductive mandate, must be met by every particle that performs its actions of motion and form.*

RECAP. All fractal self- similar scales are formally defined by 2 metric functions and its philosophy of science, 5D Absolute Relativity: the function of 5D scales, $S \times T = C$ & the function of relativity between form and motion, $S_i = T_e$, which started modern science. *Since we cannot know from the mental, still point of view, what truly is motion and what is dimensional form.*

Thus Time Motions & space dimensions co-exist and merge in every space-time being of the Universe & *we must talk of space-time dimensional motions.* When we combine them, as $S_i = T_e$ maximizes $S \times T$, we define the Function of existence, Max. $S \times T$, to which we add the reproductive nature of all motions, along 5D scales, Σ , so we write the Fractal Generator of Time-Space organisms, or 5D metric function, or survival function, as $C = \Sigma \text{Max. } S \times T (s=t)$ that unlike 4D locomotion applies to all 'scientific scales' & all 'motions' and Species; adding organic= fractal scales, biologic will, determinism - as all systems maximize its 'Function of existence' - mental=still mirror symmetries ignored in science.

$C = \Sigma \text{Max. } S \times T (s=t)$ IS a biologic function of survival that embodies the will of life and its 5 Drives, or 'actions' which all systems of the Universe code: As a entity perceives Information and moves through Accelerated=changing paths towards Entropic fields to feed and absorb energy to reproduce its organism and evolve socially as a larger Universal whole. So all systems try to maximize its $3 \pm j$ 'organic **entangled** Dimensions' that in space create organisms and in time its worldcycles of existence; starting as pure Form (SS»4D) in a seminal seed, reproducing evolving socially and emerging in an Δ^9 scale, in a young age of max. Motion (2D, <, Ts), balanced with information in the reproductive age of max. Energy (3D:Si=Te), followed by an age of information (3D, >, St), when time reverses into entropic death («TT).

The function is maximized in the present mature age of beauty, when $S = T$ and reproduction by 'gender=mirror symmetry' takes place, creating a herd (Σ) a stronger, social number, which will evolve into an entangled, Π , connected synchronous whole that survives better. It is guided by the SS-informative mind-seed, which is a linguistic synoptic mirror in a smaller scale of higher information, hence responsible for the 'creation' of fractal diminishing, 'finitesimal' scales that will reproduce over placental energy fields to become a larger Δ^9 whole.
