

## Erratum on the paper notes on the commutativity of prime near-rings

Abdelkarim Boua, [karimoun2006@yahoo.fr](mailto:karimoun2006@yahoo.fr)

**Abstract.** In this paper, we correct some results of the article entitled “Notes on the commutativity of prime near-rings” published in the journal Miskolc Mathematical Notes, Vol. 12 (2011), no. 2.

**Keywords:** near-rings,  $(\theta, \theta)$ -derivation, generalized  $(\theta, \theta)$ -derivation.

### 1 Definitions and terminology

A right near-ring is a set  $N$  with two operation  $+$  and  $\cdot$  such that  $(N, +)$  is a group (not necessarily abelian) and  $(N, \cdot)$  is a semigroup satisfying the right distributive law  $(x + y) \cdot z = x \cdot z + y \cdot z$  for all  $x, y, z \in N$ . Recalling that a near-ring  $N$  is called prime if for any  $x, y \in N$ ,  $xNy = \{0\}$  implies that  $x = 0$  or  $y = 0$ . For  $x, y \in N$  the symbol  $[x, y]$  (resp.  $x \circ y$ ) will denote  $xy - yx$  (resp.  $xy + yx$ ).  $Z(N)$  is the multiplicative center of  $N$ . An additive mapping  $d : N \rightarrow N$  is said to be a derivation if  $d(xy) = xd(y) + d(x)y$  for all  $x, y \in N$ , or equivalently, as noted in [12], that  $d(xy) = d(x)y + xd(y)$  for all  $x, y \in N$ . Recently, in [7], Bresar defined the following concept. An additive mapping  $F : N \rightarrow N$  is called a generalized derivation if there exists a derivation  $d : N \rightarrow N$  such that  $F(xy) = F(x)y + xd(y)$  for all  $x, y \in N$ . Basic examples are derivations and generalized inner derivations (i.e., maps of type  $x \rightarrow ax + xb$  for some  $a, b \in N$ ). One may observe that the concept of generalized derivations includes the concept of derivations and of left multipliers (i.e.,  $F(xy) = F(x)y$  for all  $x, y \in N$ ). Inspired by the definition of derivation (resp. generalized derivation), we define the notion of  $(\theta, \phi)$ -derivation (resp. generalized  $(\theta, \phi)$ -derivation) as follows: Let  $\theta, \phi$  be two near-ring

automorphisms of  $N$ . An additive mapping  $d : N \rightarrow N$  is called a  $(\theta, \phi)$ -derivation if  $d(xy) = \phi(x)d(y) + d(x)\theta(y)$  for all  $x, y \in N$ . An additive mapping  $F : N \rightarrow N$  is called a generalized  $(\theta, \phi)$ -derivation if there is a  $(\theta, \phi)$ -derivation  $d$  such that  $F(xy) = F(x)\theta(y) + \phi(x)d(y)$ . It is noted that  $d(xy) = d(x)\theta(y) + \phi(x)d(y)$  for all  $x, y \in N$  in [9, Lemma 1].

## 2 The Main Results

In [9] the theorems 3, 4, 5 and 6 are not correct in general. Moreover the following theorems show the non existence of generalized  $(\theta, \theta)$ -derivation of  $N$  satisfying the theorems.

**Theorem 1.** Let  $N$  be a 2-torsion free 3-prime near-ring, then there is no generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that  $F(x \circ y) = 0$  for all  $x, y \in N$ .

**Proof.** If there exists a generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that

$$F(x \circ y) = 0 \quad \text{for all } x, y \in N. \quad (1)$$

From the proof of [9, Theorem 3], we conclude that  $N$  is a commutative ring and using equation (1), we obtain

$$F(xy) = 0 \quad \text{for all } x, y \in N. \quad (2)$$

It follows

$$F(x)\theta(y) + \theta(x)d(y) = 0 \quad \text{for all } x, y \in N. \quad (3)$$

Replacing  $x$  by  $xz$  in (3) and using (2), we get

$$\theta(x)\theta(z)\theta(y) = 0 \quad \text{for all } x, y, z \in N.$$

Since  $\theta$  is an automorphism of  $N$ , we have

$$\theta(x)N\theta(y) = \{0\} \quad \text{for all } x, y, z \in N. \quad (4)$$

By the primeness of  $N$ , we obtain that  $d = 0$ ; a contradiction. This completes the proof of our theorem.

**Theorem 2.** Let  $N$  be a 2-torsion free 3-prime near-ring, then there is no generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that  $F(x \circ y) = \pm\theta(x \circ y)$  for all  $x, y \in N$ .

**Proof.** If there exists a generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that

$$F(x \circ y) = \pm \theta(x \circ y) \quad \text{for all } x, y \in N. \quad (5)$$

Using the proof of [9, Theorem 4], we conclude that  $N$  is a commutative ring and by (5), we arrive at

$$F(xy) = \pm \theta(xy) \quad \text{for all } x, y \in N \quad (6)$$

which implies that

$$F(x)\theta(y) + \theta(x)d(y) = \pm \theta(x)\theta(y) \quad \text{for all } x, y \in N. \quad (7)$$

Taking  $xz$  instead of  $x$  in (7) and using (6), we get

$$\theta(x)\theta(z)\theta(y) = 0 \quad \text{for all } x, y, z \in N.$$

Since  $\theta$  is an automorphism of  $N$ , we have

$$\theta(x)N\theta(y) = \{0\} \quad \text{for all } x, y, z \in N. \quad (8)$$

By the primeness of  $N$ , we conclude that  $d = 0$ ; a contradiction.

**Theorem 3.** Let  $N$  be a 2-torsion free 3-prime near-ring, then there is no generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that  $F([x, y]) = \pm \theta(x \circ y)$  for all  $x, y \in N$ .

**Proof.** Suppose that there exists a generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that

$$F([x, y]) = \pm \theta(x \circ y) \quad \text{for all } x, y \in N. \quad (9)$$

According to the proof of [9, Theorem 5],  $N$  is a commutative ring and returning to (9), we get

$$\pm \theta(xy) = 0 \quad \text{for all } x, y \in N$$

it means that,

$$\pm \theta(x)\theta(y) = 0 \quad \text{for all } x, y \in N. \quad (10)$$

By (10) and the primeness of  $N$ , it is easy to verify that  $x = 0$  for all  $x \in N$ ; a contradiction.

**Theorem 4.** Let  $N$  be a 2-torsion free 3-prime near-ring, then there is no generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that  $F(x \circ y) = \pm \theta([x, y])$  for all  $x, y \in N$ .

**Proof.** Let  $(F, d)$  be a generalized  $(\theta, \theta)$ -derivation  $(F, d)$  of  $N$  and  $d \neq 0$  such that

$$F(xoy) = \pm \theta([x, y]) \quad \text{for all } x, y \in N. \quad (11)$$

Using the same proof of [9, Theorem 6], we find that  $N$  is a commutative ring and by (11), we arrive at

$$F(xy) = 0 \quad \text{for all } x, y \in N. \quad (12)$$

Since equation (12) is the same as (2), arguing as in the proof of Theorem 1 we conclude that  $d = 0$ ; a contradiction.
