## Millenium Prize Problems

1. P versus NP

Euclid Infinitude of the Prime Numbers

Suppose: Prime Numbers are finite
$\mathrm{p} 2 * \mathrm{p} 3 *, \ldots, \mathrm{px}=\mathrm{n}$

$$
\begin{aligned}
\mathrm{n}+1= & \text { New Prime Number or } \\
& \text { Composite Number }
\end{aligned}
$$

Conclusion: Prime Numbers are infinite

Simply Greek Tragedy: Catch-25
$\mathrm{p} 2 * \mathrm{p} 5 \quad \mathrm{n} \quad$ "0"
$\mathrm{n}+1=\quad$ " 1 "
( The Prime_Twin_Conjecture
$\mathrm{p} 2{ }^{*} \mathrm{p} 3 *, \ldots, \mathrm{px}=\mathrm{n} \quad$ " 0 "
$n-1=" 9 " \quad$ )

Consequences:

P versus NP Problem
(P (Prim) versus NP (No Prim))
; and it makes me wonder how "the eminence grise" decide...
