# THE ORIGIN OF THE FUNDAMENTAL PARTICLES IN PLANCK`S CONFINEMENT 

This article presents unification of quantized Space and the quantized Energy through the Geometrical Primary Dipole with the universal Principle of the Virtual Work .Collision of Dipole creates Breakages and re-collision with them transfers to them Thrust the velocity vector, that creates all Particles.

## 1.. Introduction .

## A.. The Flow Plan of the Space - Energy Universe .

1.. It was shown in [9-18] what is Primary Neutral Space as well as Infinity [15] and rotational energy $\Lambda$ [22] so [PNS] $\rightarrow\left[\mathrm{A}, \mathrm{B}-\mathrm{PA}^{-}, \mathrm{PB}^{-}\right] \equiv$ Work $\mathrm{W}=|\mathrm{ET}|=[|\Lambda| . \nabla+\Lambda \mathrm{x} \nabla] \rightarrow \mathrm{W}=\int \mathrm{P} . \mathrm{ds}=0 \rightarrow$ so Time $\mathbf{T}=\mathbf{0}$
Cause is, because Primary Point $\mathbf{A}$ is nothing and is Quantized as $\rightarrow$ Point $\mathbf{B}$ (where then is following Principle of Virtual Displacements $W=\{P . d s=0 \quad$ ) = Force x Displacement $=$ Energy x Space, and according to ancient Greek Philosopher Anaximander [ The non-existent (i.e Point A ), Exist when is Done, it occurs as (Point B) =

The relative Range is Displacement $\mathrm{AB} \rightarrow$ which is the Space and Anti-space, $\mathrm{AB}=\mathbf{0} \rightarrow \mathbf{k} \rightarrow$ Infinity .
 is the beyond gravity forced field . [25]. As in case (1) $\rightarrow$ there is No change of ds $\rightarrow$ so Time $\mathbf{T}=\mathbf{0}$.
Cause is the moment Lever of Primary Forces and is Quantised as $\rightarrow$ Spin < The Spin modelling of microscopic description > [19] . The relative Range of the Infinite Points is the Displacement AB to Infinity.
3.. [PNS] $\rightarrow[\lambda, \pm \Lambda \mathrm{x} \nabla]=\mathrm{zo}=\Lambda=\mathrm{nRT} / \mathrm{V}(\lambda=\mathrm{C}) \rightarrow$ Gas equation $\rightarrow$ No change of ds $\rightarrow$ so Time $\mathbf{T}=\mathbf{0}$ Cause is the Heat causing vibration on molecules and is Quantised as $\rightarrow$ Intensity (Pressure ) between them . The relative Range of the Infinite Points in Displacement $\mathrm{AB}=\lambda$ is wavelength $\lambda$.
4.a. $\rightarrow \mathbf{k 1} \quad \mathrm{z}=|\mathrm{zo}| . \mathrm{e}^{-\mathrm{i} .(9 . \pi / 2) \cdot 10}=$ Energy Under Planck length, The Tank Cavity of Gravity, where $\overline{\mathbf{v}} \mathrm{E}=\mathbf{0}$ and $\mathrm{ET}=\Lambda . \mathbf{v B}+\Lambda \mathrm{x} \mathbf{v B}$ and is the accelerating removing, rotating energy $\Lambda$ to $\mathbf{v B}, \mathrm{m}=\mathbf{0}$ and $\mathrm{ET}=\Lambda . \mathbf{v B} .+\Lambda \times \mathbf{v B}$ and it is the linearly removing, energy $\Lambda$ towards $\mathbf{v B}, \rightarrow$ No change of ds $\quad \rightarrow$ so Time $\mathbf{T}=\mathbf{0}$.
Cause is the High Heat Conservational Balanced Tank of gravity and is Quantised as $\rightarrow$ The Fundamental particles (Bosons and Fermions). [30] The relative Range is of the Infinite Points in Displacement AB to Infinity .
4.b. $\rightarrow \mathbf{k} \mathbf{2} \mathrm{z}=|\mathrm{zo}| . \mathrm{e}^{-\mathrm{i} .(5 . \pi / 2) .10}=$ Energy in Planck length $\rightarrow \infty$ changes of ds $\quad \rightarrow$ so Time $\mathbf{T}=\mathbf{t}$. Cause are the Infinite changes of Space and is Quantised as $\rightarrow$ Matter, Energy and Existent .
The relative Range is Planck`s length .
4.c. $\rightarrow \mathbf{k 3} \mathrm{z}=|\Lambda| . \mathrm{e}^{-\mathrm{i} .(\pi / 2) \cdot 10}=$ The Black Hole Temperature Balanced Tank Energy length, where PV = n.R.T and $\left(\mathrm{PA}=\mathrm{Wd}=\sigma . \mathrm{T}^{4}\right) \rightarrow$ No change of ds $\rightarrow$ so Time $\mathbf{T}=$ Constant.
Cause is the Very high Heat causing vibration on molecules and is Quantized as $\rightarrow$ Intensity $=($ Pressure $=\mathrm{Fd}=$ C. $\left.\overline{\mathrm{x}}= \pm \mathrm{Co} . \mathrm{w} .\left[\sqrt{ } \mathrm{A}^{2}-\mathrm{x}^{2}\right]\right)$ i.e. Cause $\rightarrow($ Constant Co $) \rightarrow$ Quantized as New monad and relative Range is Infinity .
i.e. The meter of Space-Energy changes (which is time $=\mathrm{T}$ ) exists in k 2 quantized region only.

## B.. Work and Energy .

Energy E is initially absorbed in [PNS] and in all quantized regions, either as momentum (mv) or as rotational momentum $(\boldsymbol{\Lambda}=\mathrm{r} . \mathrm{mv})$. Since velocity $\mathrm{v}=\mathrm{s} / \mathrm{t}=$ distance $/$ time then for constant $\mathrm{s}, \mathrm{t} \mathrm{v}$ is also constant and $\mathrm{t}=\mathrm{T}$, the period of vibration and for a constant momentum $\boldsymbol{\Lambda}=\lambda 2 \mathrm{~m} 2 \mathrm{v} 2 / 2=\lambda 2 \cdot \mathrm{~m} 2(\mathrm{w} \lambda 2 / 4)=\lambda 2^{2} \mathrm{~m} 2(\pi \mathrm{f} / 2)=\pi \mathrm{m} 2 . \lambda \mathbf{2}^{2} / 2(\mathbf{f})=$ Co.f 2, i.e. in all rotational systems time T is constant and equal to the period of rotation which is the meter of changes . For monads in k2 region ET $=[\Lambda \nabla+\Lambda \times \nabla]=[\Lambda . M+\Lambda x M]=\sqrt{ }\left[\mathrm{m} . \mathrm{vE} . .^{2}\right]^{2}+[\Lambda . \mathrm{vB}+\Lambda \mathrm{xvB}]^{2}=\sqrt{ }\left[\mathrm{m} . \mathrm{vE} .^{2}\right]^{2}+\mathrm{S}^{2}=\mathrm{h} . \mathrm{f}=$ $\mathrm{h} / \mathrm{T}=\mathrm{h} . \mathrm{v} / \lambda$, i.e. in every monad $\lambda . \mathrm{mv} / 2=\mathrm{h} . \mathrm{f}=\boldsymbol{\lambda} \Lambda$ and $\Lambda=\mathrm{hf} / \boldsymbol{\lambda}=$ Co.f where constant $\mathbf{C o}=\mathbf{E} / \mathbf{f} \mathbf{2}$ a gauge magnitude depended on the angular velocity $\overline{\mathbf{w}}$, the velocity $\overline{\mathbf{v}}$, and then wavelength $\lambda$ is conserved as momentum (m $\overline{\mathrm{v}}$ ) or angular momentum ( $\Lambda=$ r.m $\bar{v}=m . w \lambda^{2 / 4}$ ) or both. Considering oscillatory motion as the simplest case of Energy dissipation then Work embodied in dipole is a < Spring-mass System with viscous dumping > with co variants ,energy $\mathbf{E}$, mass $\mathbf{m}$, velocity $\overline{\mathbf{v}}=\overline{\mathbf{v}} E=\overline{\mathrm{x}}$ wavelength $\lambda$, and then Energy dissipation is the damping force equal $\mathrm{Fd}=\mathrm{C} \overline{\mathrm{x}}$ where $C=$ a constant and $\overline{\mathrm{x}}$ the velocity. Following the steady-state of displacement and velocity then , $\mathrm{x}=\mathrm{A} . \sin (\mathrm{wt}-\theta)$ and $\overline{\mathrm{x}}=\mathrm{w} \cdot \mathrm{A} \cdot \cos (\mathrm{wt}-\theta)$ where the energy dissipated per cycle is the executed work which is,
$\mathbf{W d}=\mathrm{Fd} . \mathrm{dx}=\oint \mathbf{C} \cdot \overline{\mathbf{x}} \cdot \mathbf{d x}=\oint \mathrm{C} \overline{\mathbf{x}}^{2} . \mathrm{dt}=\pi \mathrm{CwA}^{2}=(\pi / 4) \mathrm{C} \cdot \mathrm{w} \lambda^{2}=\left(\pi^{2} / 2\right) \mathrm{C} . \mathrm{f} . \lambda^{2} \rightarrow$ The Energy dissipated per cycle Wd by the damping force Fd, is mapped by writing velocity $\overline{\mathbf{x}}$ in the form $\overline{\mathrm{x}}=\mathrm{wA} \cdot \cos (\mathrm{wt}-\theta)= \pm \mathrm{wA} \cdot\left[\sqrt{ } 1-\sin ^{2}(\mathrm{wt}-\theta)\right]=$ $\pm w .\left[\sqrt{ } \mathrm{A}^{2}-\mathrm{x}^{2}\right]$ where then the dumping force Fd is $\mathrm{Fd}=\mathrm{C} \cdot \overline{\mathrm{x}}= \pm$ Cow.[ $\left.\sqrt{ } \mathrm{A}^{2}-\mathrm{x}^{2}\right]$ and by rearranging $\left[\cos ^{2}(\mathrm{wt}-\theta)+\right.$ $\left.\sin ^{2}(\mathrm{wt}-\theta)=1\right]$ then becomes, $\mathrm{Fd}^{2} /(\text { Co.w.A })^{2}+\mathrm{x}^{2} / \mathrm{A}^{2}=1$ i.e. An Ellipse with $\mathbf{F d}, \mathbf{x}$ mapped along the vertical and horizontal axes respectively and the Energy dissipated per cycle is the given by the area enclosed by the ellipse.

The total Energy $E=\lambda 2.4$ which is embodied in monad $A^{-} B$ is moving as an Ellipsoid in the Configuration of co variants $\boldsymbol{\lambda}, \boldsymbol{m}, \boldsymbol{v}=\overline{\mathbf{v}} \mathrm{E}$, as Kinetic (Energy of motion $\boldsymbol{\Omega}^{-}$) and Potential (Stored Energy in $\lambda, \boldsymbol{m}, \boldsymbol{v}$ ) energy by rotation and displacement, on the principal axis ( through the centre of monad) , which is mapped out , as in Solid material configuration by the nib of vector $\left(\boldsymbol{\Omega}^{-}=\delta \bar{r} c\right)=[\overline{\mathrm{v}} \mathrm{c}+\overline{\mathrm{w}} . \overline{\mathrm{r}} \mathrm{n}] . \delta \mathrm{t}$, as the Inertia ellipsoid [ the Poinsot's ellipsoid of construction ] in Absolute Frame which instantaneously rotates around vector axis $\tilde{w}, \theta$ with the constant polar distance $\overline{\mathrm{w}} . \mathrm{Fd} /|\mathrm{Fd}|$ and the constant angles $\theta \mathrm{s}, \theta \mathrm{b}$, traced on, Reference (Body Frame) cone and on (Absolute Frame) cone, which are rolling around the common axis of $\bar{w}$ vector, without slipping, and if $\boldsymbol{\Omega}^{-}=\mathrm{Fe}$, is the Diagonal of the Energy Cuboid with dimensions a,b,c then follow Pythagoras conservation law, with the three magnitudes ( J,E,B ) of Energy-state following Cuboidal , Plane, or Linear Diagonal direction. [ 25-26 ].

## C. The Fundamental Particles creation process .

The article shows The Fundamental Particles creation process from equilibrium $\pm \Lambda$ Momentum on Common Circle of Space, Anti-Space where ( $+\Lambda-\Lambda=0$ and opposite $\pm$ velocities $\circlearrowright \cup$ collide ). Rotational energy (Momentum $\pm \Lambda$ ) is entering gravity cave $\mathrm{Lg}=2 . \mathrm{r}=\mathrm{e}^{\wedge} \mathrm{i} .(-9 . \pi / 2) \mathrm{b}=3,969.10^{-62}$ where it is balancing on Common Circle .[F5-1]
1.. The rotated energy $\left[ \pm\right.$ Momentum $\rightarrow \pm \Lambda \nabla \mathbf{i}=\mathbf{r} . \mathrm{mv}=\mathrm{mr} .(\mathrm{wr})=\mathrm{m}\left(\mathrm{wr}^{2} / 2\right)$ ] Stabilizers at, Common Circle of 2r diameter which is the Sub-Space of the two opposite Momentum Spaces and Momentum Anti-Spaces.
2.. At Common Circle, and because velocities on the circumference are of opposite direction $+\overline{\mathrm{v}} \uparrow-\overline{\mathrm{v}} \downarrow$, collide.
3.. Collision of two vectors is equal to the Action of the two opposite quaternion ( $\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i}$ ).(©).( $\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i})=$ $\left.\mathrm{s}^{2}-|\overline{\mathbf{v}}|^{2}+[2 \overline{\mathrm{w}}] \cdot|\mathrm{s}||\mathrm{r}| . \nabla \mathrm{i}=[\mathrm{r} . \mathrm{w}]^{2}-[|\overline{\mathrm{w}} \overline{\mathrm{x}}|]^{2}+2 \overline{\mathrm{w}} .(\mathrm{sr}) . \nabla \mathrm{i}\right]$ which is composed of the three breakage quantities and

4.. The continually rotating velocity vector $\pm \overline{\mathrm{v}}$ collides also with the three breakage quantities, which are not more breakable, they do not decay) giving them Thrust [The Action $\overline{\mathrm{v}}=\overline{\mathrm{w}} . \mathrm{r}$ on quantities (1), (2), (3)], and thus getting them off the Sub-space (the common circle) and Anti-Space (anti-circle) in a new Space, in cylinder Layer producing thus the 6 different constituents of the three different breakage qualities from Space, Anti-Space and Sub-Space ( the common circle) qualities for each constituent $6 x 3=18$ particles, form the $\mathbf{6}$ Massive particles $[\mathrm{r} . \mathrm{w}]^{2} \rightarrow$ the Leptons and Quarks, the 6 Anti-massive particles $\left.-[\mid \overline{\mathrm{w}} \mathrm{x} \bar{r}]\right]^{2}=-[\mathrm{r} . \mathrm{w}]^{2} \rightarrow$ the Anti - Leptons and Anti-Quarks, the unsteady particles and others.
5.. The transport becomes through the Extreme triangles of Space Anti-Space [STPL mechanism ], a creative Valve (mould) Communicating Space Anti-Space Quantities (for all Dipole AB $=[\lambda, \pm \Lambda x \nabla]$ and all types of Energy). On this mechanism , in Space are created massive and positive particles and in Anti-Space less massive and negative particles and anti-particles.
6.. Each of the three qualities, becoming from Space, Anti-Space and Sub-Space (on the common circle) form the 6 Massive particles from Space, $[\mathrm{r} . \mathrm{w}]^{2}$ the Leptons, $-[\mid \overline{\mathrm{w}} \mathbf{x} \mathbf{r}]^{2}$ the Anti-Leptons, the 6 less massive particles, from Anti-Space, $[\mathrm{r} . \mathrm{w}]^{2}$ the Quarks, $-[|\overline{\mathrm{w}} \mathbf{x} \boldsymbol{f}|]^{2}$ the Anti-Quarks, unsteady because of their constituents, the more energy breakage becoming from the intrinsic of breakage energy constituents, all with $1 / 2 \mathrm{spin} \mathbf{s}=\mathrm{h} / 2 \pi=[\mathrm{r} . \mathrm{w}]^{2}$ with mass and energy, and because they are massive cannot occupy the same quantum state, and
7.. The third quality $2 .\left[\left(\bar{w}^{2} \mathrm{r}^{2}\right)\right.$. Vi$]$ is of double spin $\mathrm{S}=2 .(1 / 2)=1=2 .[\mathrm{r} . \mathrm{w}]^{2}$ and is a vector directed to velocity vector, forming 6 , the 3 massive Energy Colour particles $2 .\left[\left(\bar{w}^{2} \mathrm{r}^{2}\right) . \nabla \mathrm{i}\right]$, Gluons-Red $\rightarrow$ [gR], Gluons-Green $\rightarrow$ [gG], Gluons-Blue $\rightarrow$ [gB] and another 3 Weak and Zero forces particles 2.[( $\left.\left.\overline{\mathrm{w}}^{2} \mathrm{r}^{2}\right) . \nabla \mathrm{i}\right] \quad \mathbf{W}^{ \pm}, \gamma$ Bosons, The three Colour Anti-Gluon $\rightarrow[\mathbf{g R}] \rightarrow[\mathbf{g G}] \rightarrow[\mathbf{g B}]$, and the 3 Anti-Weak and Zero forces particles $-\mathbf{W}^{ \pm}=0=\gamma$ Bosons ( specially permeable for Space , Anti-Space only) [32].

### 2.1. Complex Numbers - Quaternion .

De Moivre's formula for complex numbers states that the multiplication of any two complex numbers say $\mathrm{z} 1, \mathrm{z} 2$, or $[\mathrm{z} 1=\mathrm{x} 1+\mathrm{i} . \mathrm{y} 1, \mathrm{z} 2=\mathrm{x} 2+\mathrm{i} . \mathrm{y} 2]$ where $\mathrm{x}=\operatorname{Re}[\mathrm{z}]$ the real part and $\mathrm{y}=\operatorname{Im}[\mathrm{z}]$ the Imaginary part of, z , is the multiplication of their moduli $r 1, r 2$, where moduli, $r$, is the magnitude $\left[r=|r|=\sqrt{\left.x^{2}+y^{2}\right] \text { and the addition of }}\right.$ their angles $, \varphi 1, \varphi 2$, where $\varphi=\arg . z=\operatorname{atan} 2(y, x)$ and so , z1.z2 $=(x 1+i . y 1) .(x 2+i . y 2)=r 1 . r 2[\cos (\varphi 1+\varphi 2)+$ i. $\sin (\varphi 1+\varphi 2)]$ and when $z 1=z 2=z$ and $\varphi 1=\varphi 2=\varphi$ then $z=x+i y$ and $z . z=z^{2}=r^{2}(\cos 2 \varphi+i \cdot \sin 2 \varphi)$ and for ,w, complex numbers $z^{w}=r^{w} .[\cos (w \varphi)+i \cdot \sin (w \varphi)]$ and so for $r=1$ then $\rightarrow z^{w}=1^{w} \cdot[\cos \varphi+i \cdot \sin \varphi]^{\mathrm{w}}=$ [ cos. $\mathrm{w} \varphi+\mathrm{i} . \sin . \mathrm{w} \varphi$ ]. The $n$.th root of any number $\mathbf{z}$ is a number $b(n \sqrt{n}=b)$ such that $b^{n}=z$ and when $z$ is a point on the unit circle, for $r=1$, the first vertex of the polygon where $\varphi=0$, is then $[b=(\cos \varphi+i \sin \varphi)]^{n}=b^{n}=z=$ $\cos (n \varphi)+i \cdot \sin (n \varphi)=[\cos (360 / n)+i \cdot \sin (360 / n)]^{n}=\cos 360^{\circ}+i \cdot \sin 360^{\circ}=1+0 . i=1 \quad$ i.e. the $\mathbf{w}$ spaces which are the repetition of any unit complex number $\mathbf{z}$ ( multiplication by itself ) is equivalent to the addition of their angle and the mapping of the regular polygons on circles with unit sides, while the $\mathbf{n}$ spaces which are the different roots of unit 1 and are represented by the unit circle and have the points $\mathrm{z}=1$ as one of their vertices, are mapped as these regular polygons inscribed the unit circle. Since also $z^{W}=z^{-n}$ and $z^{-n}=$ $\mathrm{z}^{-1 / w}=\mathrm{z}+\mathrm{n}$ therefore complex numbers are even and odd functions, i.e. symmetrical about yaxis (mirror) and also about the origin. Euler's rotation in 3D space is represented by an axis (vector) and an angle of rotation, which is a property of complex number and defined as $\overline{\mathbf{z}}=[\mathbf{s} \pm \overline{\mathbf{v}} . \mathbf{i}]$ where $\mathbf{s},|\overline{\mathbf{v}}|$ are real numbers and $\mathbf{i}$ the imaginary part such that $\mathrm{i}^{2}=-1$. Extending imaginary part to three dimensions v1.i, v2.j, v3.k
$\rightarrow \overline{\mathbf{v}} \nabla \mathrm{i}$ becomes quaternion which has $1+3=4$ degrees of freedom.

De Moivre's formula for the nth roots of a quaternion, where $q=k .[\cos . \varphi+[\nabla i]$.sin. $\varphi$ ] is for $w=1 / n$,
$\mathrm{q}^{\mathrm{w}}=\mathrm{k}^{\mathrm{w}} .[\cos . \mathrm{w} \varphi+\varepsilon . \sin . \mathrm{w} \varphi$ ] where $\mathrm{q}=\mathrm{z}= \pm(\mathrm{x}+\mathrm{y} . \mathrm{i})$, decomposed into its scalar (x) and vector part (y.i) and this because all the inscribed regular polygons in the unit circle have this first vertex at points 1 or at -1 (for real part $\varphi=0, \varphi=2 \pi$ ) and all others at imaginary part where, $\mathrm{k}=\mathrm{Tz}=$ Tensor (the length) of vector z , in Euclidean coordinates which is $\mathrm{k}=\mathrm{Tz}=\sqrt{ }$ $x^{2}+y 1^{2}+y 2^{2}+y n^{2}$, and for imaginary unit vector ã (a1, a2,a3,a.n...w),
the unit vector $\boldsymbol{\varepsilon}$ of imaginary part is $\rightarrow \boldsymbol{\varepsilon}=(\mathrm{y} . \mathrm{i} / \mathrm{Ty})=[\mathrm{y} . \nabla \mathrm{i}] /[\mathrm{Ty}]= \pm(\mathrm{y} 1 . \mathrm{a} 1+\mathrm{y} 2 . \mathrm{a} 2+) /\left(\sqrt{ }+\mathrm{y} 1^{2}+\mathrm{y} 2^{2}+\mathrm{yn}{ }^{2}\right)$ the rotation angle $0<=\varphi<2 \pi, \varphi= \pm \sin ^{-1}(\mathrm{Ty} / \mathrm{Tz}), \cos \varphi=\mathrm{x} / \mathrm{Tz}$, which follow Pythagoras theorem for them and for all their reciprocal quaternions ã' (ã.ã' $=1$ ). Since also the directional derivative of the scalar field
$\mathrm{y}(\mathrm{y} 1, \mathrm{y} 2, \mathrm{yn} \ldots)$ in the direction $, \mathbf{i}, \mathrm{is} \rightarrow \mathrm{i}(\mathrm{y} 1, \mathrm{y} 2, \mathrm{yn})=.\mathrm{i} 1 . \mathrm{y} 1+\mathrm{i} 2 . \mathrm{y} 2 .+\mathrm{in} . \mathrm{yn}$ and defined as i.grad $\mathrm{y}=\mathrm{i} 1 .(\partial \mathrm{y} / \partial 1)+$ $\mathrm{i} 2 .(\partial \mathrm{y} / \partial 2)+\ldots=[\mathrm{i} . \nabla]$.y , which gives the change of field, y , in the direction $\rightarrow \mathrm{i}$, and $[\mathrm{i} . \nabla$ ] is the single coherent unit , so coexistance between Spaces Antispaces and Sub-Spaces of any monad $\bar{z}=x+y . i=\bar{A} B$ and is happening through general equation which follows $\rightarrow \quad \mathrm{m}^{\wedge} \pm\left({ }^{\mathrm{a}}+₫ . \nabla \mathrm{i}\right)=\mathrm{q}^{\mathrm{w}}=(\mathrm{Tq})^{\mathrm{w}} .[\cos \cdot \mathrm{w} \varphi+\boldsymbol{\varepsilon} \cdot \sin . \mathrm{w} \varphi$ ] where ,

$$
\begin{aligned}
\mathrm{m} & =\lim (1+1 / \mathrm{w})^{\mathrm{w}} \text { for } \mathrm{w}=1 \rightarrow \infty, \mathrm{q}=\mathrm{z}= \pm(\mathrm{x}+\mathrm{y} . \mathrm{i}) \\
\sin \varphi & =\mathrm{y} / \sqrt{ } \mathrm{x}^{2}+\mathrm{y}^{2}, \cos \varphi=\mathrm{x} / \sqrt{ } \mathrm{x}^{2}+\mathrm{y}^{2},|\mathrm{z}|=\sqrt{ } \mathrm{x}^{2}+\mathrm{y}^{2}, \\
\mathrm{Tq} & =\sqrt{ } \mathrm{x}^{2}+\mathrm{y} 1^{2}+\mathrm{y}^{2}+\ldots . \mathrm{yn}^{2}, \mathrm{Ty}=\sqrt{ } \mathrm{y1}^{2}+\mathrm{y}^{2}+\ldots . \mathrm{yn}^{2} \\
\varepsilon & =(\overline{\mathrm{y}} . \mathrm{i} / \mathrm{Ty})=[\overline{\mathrm{y}} . \nabla \mathrm{i}] /[\mathrm{Ty}]=(\mathrm{y} 1 . \mathrm{a} 1+\mathrm{y} 2 . \mathrm{a} 2+\ldots) /\left(\sqrt{ } 1^{2}+\mathrm{y} 2^{2}+\ldots . \mathrm{yn}^{2}\right)
\end{aligned}
$$

2.2. Quaternion Actions : Action (©) of a quaternion $\overline{\mathbf{z}}=\mathrm{s}+\overline{\mathrm{v}} . \mathrm{i}=\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{Vi}$ on point $\mathbf{P}(\mathrm{a}, \mathrm{x}, \mathrm{y}, \mathrm{z})$ is $\mathbf{z a}=\overline{\mathbf{z}} \mathbf{p} \overline{\mathbf{z}}^{-1}$ ( screw motion ) and for $\mathrm{a} \neq 0$ then z and $\mathrm{a} \subset \mathrm{z}=\mathrm{az}$ which have the same action $\overline{\mathrm{z}} \mathrm{p} \overline{\mathrm{z}}^{1}$, meaning that quaternion is homogeneous in nature. Action of a Unit quaternion on a scalar $\mathbf{s}$ is $\overline{\mathbf{z}}=\overline{\mathbf{z}} \mathbf{s} \overline{\mathbf{z}}^{-1}=\mathbf{s}_{\mathbf{z}}^{\mathbf{Z}}{ }^{-1}=\mathbf{s}$ Action of a Unit quaternion $\overline{\mathbf{z}}$ on a vector $(\overline{\mathbf{v}} \nabla \mathrm{i})$ is $\overline{\mathbf{z}} \overline{\mathbf{z}}^{-1}$, i.e another vector $\overline{\mathbf{v}}^{\prime}$ (quaternion) $\overline{\mathbf{v}}^{\prime}=\left(0, \overline{\mathbf{v}}^{\prime} \nabla \mathrm{i}\right)$, and of vector type $\overline{\mathbf{v}}^{\prime} \cdot \nabla \mathrm{i}=\overline{\mathbf{z}}+2 \overline{\mathbf{v}}(\overline{\mathbf{v}} \times \overline{\mathbf{z}})+2 \overline{\mathbf{v}} \times(\overline{\mathbf{v}} \times \overline{\mathbf{z}})$.
When the components of a vector $\overline{\mathbf{w}}(w x i+w y j+w z k)$ are expressed in terms of the three Euler angles $\varepsilon, \varphi, \theta$ then is as quaternion $z(z o+z x i+z y j+z z k)$, where $z o=\cos (\varepsilon+\theta) / 2 \cdot \cos (\varphi / 2), z x=-\cos (\theta-\varepsilon) / 2 \cdot \sin (\varphi / 2)$, $\mathrm{zy}=\sin (\theta-\varepsilon) / 2 \cdot \sin (\varphi / 2), \mathrm{zz}=-\sin (\varepsilon+\theta) / 2 \cdot \cos (\varphi / 2)$, and the time derivative as $[\mathrm{dz} / \mathrm{dt}]=(\mathbf{z} / 2) \mathbf{x} \mathrm{w}$. Action of a Unit quaternion on a point $\mathbf{p}(\mathrm{a}, \mathrm{x}, \mathrm{y}, \mathrm{z})$ is $\mathbf{p}^{\prime}=\overline{\mathbf{z}} \mathbf{p} \overline{\mathbf{z}}^{-1}$, i.e. another point [ takes the point $\mathrm{P}(\mathrm{s}, \overline{\mathrm{v}} 1 \nabla \mathrm{i})$ to the point $\left.\mathrm{P}^{\prime}(\mathrm{s}, \overline{\mathrm{v}} 2 \nabla \mathrm{i})\right]$ and if the point is on the unit axes, then the unit quaternion is representing rotation through an angle $\boldsymbol{\theta}$ about the unit axis $\mathbf{v}$ and it is $\mathbf{p}^{\prime}=(\mathrm{p} \pm \sin (\theta / 2) \mathbf{v})$.
Action (©) of a quaternion $\overline{\mathbf{z}}=\mathrm{s}+\overline{\mathrm{v}} . \mathrm{i}=\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i}$ on itself is the Binomial type i.e. $(\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i})(\mathbb{C})(\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i})$ $=[s+\overline{\mathbf{v}} . \nabla \mathrm{i}]^{2}=\mathrm{s}^{2}+|\overline{\mathbf{v}}|^{2} . \nabla \mathrm{i}^{2}+2|\mathrm{~s}| \cdot|\overline{\mathrm{v}}| \cdot \nabla \mathrm{i}=\mathrm{s}^{2}-|\overline{\mathbf{v}}|^{2}+2|\mathrm{~s}| \cdot|\overline{\mathrm{w}} \mathrm{r}| \cdot \nabla \mathrm{i}=\mathrm{s}^{2}-|\overline{\mathrm{v}}|^{2}+[2 \overline{\mathrm{w}}] \cdot|\mathrm{s}||\mathrm{r}| \cdot \nabla \mathrm{i} \quad$ where,
$\mathbf{s}^{2} \rightarrow$ is the real part of the new quaternion and $-|\overline{\mathbf{v}}|^{2} \rightarrow$ the always negative Anti-space which is always
$[2 \overline{\mathrm{w}}] \cdot|\mathrm{s}||\overline{\mathrm{r}}| \cdot \nabla \mathrm{Vi} \rightarrow$ the double angular velocity term which is
a Positive Scalar magnitude. a Negative Scalar magnitude . a Vector magnitude.

The 3 BreaKages

The Action of quaternion $\overline{\mathbf{z}} . \overline{\mathbf{z}}=[\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i}]^{2}=\mathrm{s}^{2}-|\overline{\mathbf{v}}|^{2}+[2 \overline{\mathrm{w}}] .|\mathrm{s}||\mathrm{r}| . \nabla \mathrm{i}$
The three breakages of velocity $\overline{\mathbf{u}},-\overline{\mathbf{u}}=[\mathrm{r} . \mathrm{w}]^{2}-[\mathrm{r} . \mathrm{w}]^{2}+2 .[\mathrm{r} . \mathrm{w}]^{2}$

### 2.3. Example :

It has been shown in [26] example 2 that ,
When vector $\overline{\mathbf{w}}$ ( $w x i+w y j+w z k$ ) is the angular velocity vector only, in the absence of applied torques, $\mathbf{L}(\mathrm{Lx} \mathrm{i}+\mathrm{Lyj}+\mathrm{Lzk})=\mathrm{I} . \mathrm{w}=\overline{\mathrm{r} x m} \overline{\mathrm{v}}=\overline{\mathrm{r}} p$, is the angular momentum vector (where $r=$ lever arm distance and $m \cdot \bar{v}=p$, the linear or translation momentum $)$ and $\mathrm{I}=(\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 3)$ are the Principal moments of Inertia then angular kinetic energy $\quad \mathbf{E}=1 / 2 . \mathbf{w} \mathbf{L}=1 / 2 . \mathrm{I} 1 . \mathrm{w} 1^{2}+1 / 2 . \mathrm{I} 2 . \mathrm{w} 2^{2}+1 / 2 . \mathrm{I} 3 . \mathrm{w} 3^{2}$.
Since both L and E are conserved as $\mathrm{L}^{2}=\mathrm{L} 1^{2}+\mathrm{L} 2^{2}+\mathrm{L} 3^{2}$ and $\mathrm{E}=\mathrm{L} 1^{2} / 2 \mathrm{~J} 1+\mathrm{L} 2^{2} / 2 \mathrm{~J} 2+\mathrm{L} 3^{2} / 2 \mathrm{~J} 3$ and by division becomes $1=\left[\mathrm{L}^{2} / 2 \mathrm{TJ} 1\right]+\left[\mathrm{L}^{2} / 2 \mathrm{TJ} 2\right]+\left[\mathrm{L} 3^{2} / 2 \mathrm{TJ} 3\right]$, [ the Poinsot's ellipsoid construction] and when $\mathrm{L}^{2} / 2 \mathrm{EJ}=\mathrm{r}^{2} \mathrm{p}^{2} / 2 \mathrm{E} .2 \mathrm{E} /\left(\mathrm{w}^{2}\right)=\mathrm{w}^{2} . \mathrm{r}^{2} \mathrm{xp}^{2} /\left(4 \mathrm{~T}^{2}\right)=\mathrm{w}^{2} /[2 \mathrm{E} / \overline{\mathrm{r} x p}]^{2}$, then this is a Kinetic-Energy Inertial ellipsoid dependent on the total kinetic energy E , and the translational momentum, p , with axes $\mathbf{a}=[2 \mathrm{E} / \overline{\mathrm{r} x p} 1], \mathbf{b}=[2 \mathrm{E} / \overline{\mathrm{r}} \mathrm{xp} 2], \mathbf{c}=[2 \mathrm{E} / \overline{\mathrm{r} x p} 3] .\left(\right.$ Ellipsoid $x^{2} / a^{2}+y^{2} / b^{2}+z^{2} / c^{2}=1$ and when $a^{2}=b^{2}=c^{2}=r^{2}$ the circle $x^{2}+y^{2}+z^{2}=r^{2}$, and resultant $\mathrm{E}=\sqrt{ } a^{2}+b^{2}+c^{2}$.
Considering $\mathrm{L}^{2} / 2 \mathrm{~J}=\mathrm{J} . \mathrm{J} . \mathrm{w}^{2} / 2 . \mathrm{J}=\mathrm{Jw}^{2} / 2=\overline{\mathrm{r}} . \mathrm{p} . \mathrm{w} / 2$ then $\mathrm{E}=|\sqrt{ } \mathrm{r} 1 \mathrm{p} 1 \mathrm{w} 1|^{2}+|\sqrt{ } \mathrm{r} 2 \mathrm{p} 2 \mathrm{w} 2|^{2}+|\sqrt{ } \mathrm{r} 3 \mathrm{p} 3 \mathrm{w} 3|^{2}$ or $\left.\sqrt{E^{2}}=\sqrt{ } \mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2}\right)$, i.e. a cuboid $(\mathbf{a x b} \mathbf{x} \mathbf{c})$, rectangular parallelepiped, with dimensions $\mathrm{a}=|\sqrt{ } \mathrm{r} 1 \mathrm{p} 1 \mathrm{w} 1|$, $\mathrm{b}=|\sqrt{ } \mathrm{r} 2 \mathrm{p} 2 \mathrm{w} 2|, \mathrm{c}=|\sqrt{ } \mathrm{r} 3 \mathrm{p} 3 \mathrm{w} 3|$ and the length of the space diagonal $($ resultant $) \mathrm{E}=\sqrt{ } \mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2}$.

Because the position velocity of a quaternion $\overline{\mathrm{z}}=\mathrm{s}+\overline{\mathrm{v}} \nabla \mathrm{i}$ is [dž/ds] $=(\mathrm{dž} / \mathrm{ds}, 0)(\mathrm{s}+\overline{\mathrm{v}} . \nabla \mathrm{i})=\left(1+\mathrm{dv} / \mathrm{ds} . \mathrm{Vi}^{-1}\right)$ and acceleration $\left[\mathrm{d}^{2} \mathrm{z} / \mathrm{ds}^{2}\right]=(\mathrm{d} / \mathrm{ds}, 0)\left(1+\mathrm{d} \overline{\mathrm{v}} / \mathrm{ds}\right.$. $\left.\nabla^{-1}\right)=\left(0, \mathrm{~d}^{2} \overline{\mathrm{v}} / \mathrm{ds}^{2} . \nabla \mathrm{i}\right)$ and in Polar plane coordinates where angular momentum $\mathrm{L}=\mathrm{Iw}=\overline{\mathrm{r} x m \bar{v}}=\overline{\mathrm{T}} \mathrm{p}$, then
acceleration $\left[\mathrm{d}^{2} \overline{\mathrm{z}} / \mathrm{ds}^{2}\right]=(\mathrm{d} \bar{z} / \mathrm{ds}, 0)^{2}(\mathrm{~s}, \mathrm{rcos} \theta, \mathrm{rsin} \theta, 0)=\left(0, \mathrm{~L}^{2} / \mathrm{m}^{2} \mathrm{r}^{3}+\mathrm{r}, 2 \mathrm{Ldr} / \mathrm{ds} / \mathrm{mr}^{2}, 0\right)$ where ,
$\mathrm{L}^{2} / \mathrm{m}^{2} \mathrm{r}^{3}+\mathrm{r}=$ the acceleration in the $(\mathbf{r})$ radial direction ,
2Ldr/ds $/ \mathrm{mr}^{2}$ = the acceleration in $\boldsymbol{\theta}$ direction .
Since Points are nothing and may be anywhere in motionless space, so Position quaternion is referred to this space only , and generally the velocity and acceleration in a non-Inertial , rotating reference frame is as,

$$
\begin{aligned}
& \text { Acceleration } \rightarrow\left[d^{2} \check{z} / \mathrm{dt}^{2}\right]=(\mathrm{d} / \mathrm{dt}, \varpi)(-\varpi . \bar{z}, d \check{z} / \mathrm{dt}+\varpi \mathrm{x} \check{\mathrm{z}}) \\
& =\left(-\mathbf{d} \boldsymbol{d} \mathbf{d t} . \check{\mathbf{z}}, \mathbf{d}^{2} \check{\mathbf{z}} / \mathbf{d t}^{2}+2 \boldsymbol{\omega} \mathrm{x} \mathbf{d z ̌} / \mathbf{d t}+\mathbf{d} \boldsymbol{d} / \mathbf{d t} \mathrm{x} \check{\mathbf{z}}-\boldsymbol{\sigma} . \mathbf{z} \varpi\right) \quad \text { where }
\end{aligned}
$$

$\rightarrow-\mathrm{d} \varpi / \mathrm{dt} . \check{\mathrm{z}}=$ the intrinsic acceleration of quaternion,
$\rightarrow \mathrm{d}^{2} \check{z} / \mathrm{dt}^{2}=$ the translational alterations ( they are in the special case of rotational motion where rotation on two or more axes creates linear acceleration in, one only different rotational axis $J$ ),
$\rightarrow 2 \varpi \mathrm{xdz} / \mathrm{dt}+\mathrm{d} \varpi / \mathrm{dt} \mathrm{x} \check{\mathrm{z}}=$ the coriolis acceleration, a centripetal acceleration is that of a force by which bodies (of the reference frames [RF] ) are drawn or impelled towards a point or to a center (the known hypothetical motionless non-rotational frame [AF]),
$\rightarrow-\varpi . z \check{\varpi} \varpi)=-\varpi x(\varpi x z ̌)+\varpi^{2} \check{z}=$ the azimuthal acceleration which appears in a non-uniform rotating reference frame in which there is variation in the angular velocity of the reference point .
Time $\mathbf{t}$ does not interfere with the calculations in the motionless frame.
i.e. The conjugation operation ( The Action of $\check{\mathbf{z}}$ on $\overline{\mathbf{u}}$ ) is a constant rotational Kinetic-energy ( E ), which is mapped out ,by the nib of vector $\varpi$, as the Inertia ellipsoid in space which instantaneously rotates around vector axis $\varpi$ (the composition of all rotations) with the constant polar distance $\varpi . \mathrm{L} / \mathrm{L} \mid$ and the constant angles $\theta \mathrm{s}, \theta b$, traced on Space cone and on Body cone which are rolling around the common axis of $\varpi$ vector.
and if the three components of $E$ are on a cuboid with dimensions a,b,c then (Action of $\check{\mathbf{z}}$ on any $\bar{u}$ ) corresponds to the composition of all rotations only, by the rotation of unit vector axis $\bar{u}(0, u)$, by keeping a unit cuboid held fixed at one point of it, and rotating it, $\boldsymbol{\theta}$, about the long diagonal of unit cuboid through the fixed point ( the directional axis of the cuboid on $\bar{u}$ ).

Applying the fundamental equations on two points of stationary [PNS], zo $=[\lambda, \pm \Lambda \nabla \mathrm{i}], \mathrm{z}^{\prime} \mathrm{o}=\left[\lambda^{2}-|\Lambda|^{2}\right]$, ео $=[-\lambda \nabla, \nabla \mathrm{x} \Lambda]=0$ then $\rightarrow \mathrm{e}=\nabla \mathrm{x} \Lambda=\nabla @ \Lambda=\left[-\operatorname{div} \Lambda^{-}, \operatorname{curl} \Lambda^{-}\right]=[0, \pm \Lambda]$ i.e. the points are incorporating the equilibrium vorticity $\pm \Lambda$ either as even or odd functions. Since $\bar{z} o=[\lambda, \pm \Lambda \nabla \mathrm{i}]$, then positive $\overline{\mathrm{z}} \mathrm{o}$ $\overline{\mathrm{z} o}=[\lambda, \Lambda \nabla \mathrm{i}]$ and $\bar{z}^{\prime} \mathrm{o}=[\lambda,-\Lambda \nabla \mathrm{i}]$ is the conjugate quaternion and because $\overline{\mathrm{z}} \mathrm{o}$ is a unit quaternion then

Action on point is $\rightarrow \mathrm{A}=$ New quaternion $\mathbf{z}=\overline{\mathrm{z}} 0 \bigcirc \overline{\mathrm{o}}=\overline{\mathrm{z}} \mathbf{0} \cdot \bar{o} \cdot \overline{\mathrm{z}} \mathrm{z}^{\prime} \mathrm{o}=[\lambda, \Lambda \nabla \mathrm{i}] .[0, \Lambda \nabla \mathrm{i}] .[\lambda,-\Lambda \nabla \mathrm{i}]=$ $\left.=\left[-\Lambda^{2}, \lambda \Lambda+\Lambda \mathrm{x} \Lambda\right]\right] \cdot[\lambda,-\Lambda]=\left[0,\left(\lambda^{2}-\Lambda^{2}\right) . \Lambda+2 \Lambda(\Lambda \Lambda)+2 \lambda(\Lambda \mathbf{x} \Lambda)\right]$.
Since $\operatorname{div} \Lambda=0=|\Lambda| \cdot \operatorname{div} \Lambda^{-}+\Lambda^{-} . \nabla|\Lambda|=|\Lambda| \cdot \operatorname{div} \Lambda^{-}+\Lambda^{-} . \mathrm{d}|\Lambda| / \mathrm{ds}$ then $\Lambda^{-} . \nabla=\mathrm{d} / \mathrm{ds}$, which is the arc-length derivative of $\Lambda$ direction showing that on points exists directional vorticity as ,

| $\left(\lambda^{2}-\Lambda^{2}\right) . \Lambda$ | $=$ Euler | vorticity | $\cup$ | Positive Scalar magnitude |
| :---: | :--- | :---: | :---: | :---: |
| $2 \Lambda(\Lambda \Lambda)$ | $=$ Coriolis | vorticity | $\circlearrowright$ | Negative Scalar magnitude |
| $2 \lambda .(\Lambda \mathbf{x} \Lambda)$ | $=$ Centripetal | vorticity | $\cup \cup$ | Vector magnitude and for $\overline{\mathrm{v}} \perp \Lambda$ then |

$\mathbf{z}=[0, \Lambda \cdot \cos \theta+(\overline{\mathrm{v}} \mathrm{x} \Lambda) \cdot \sin \theta]$ which is the Euler-Rodrigues formula for the rotation by an angle $\theta$, of the vector $\Lambda$ about its unit normal $\overline{\mathbf{v}}$. Conjugation of $\overline{\mathbf{o}}$ on point $\mathbf{P}$ is $G=\rightarrow$
$[0, \Lambda] \odot[\mathrm{r}+\overline{\mathrm{r}} . \mathrm{i}]=-|\boldsymbol{\Lambda}| \cdot|\overline{\mathbf{r}}|, \mathrm{r} \boldsymbol{\Lambda}+\boldsymbol{K} \mathbf{x} \overline{\mathbf{r}}$ and for $\Lambda \perp \overline{\mathrm{r}}$ which is velocity $\overline{\mathbf{v}}$ then $\mathbf{G}=\left[\mathbf{0}, \mathbf{v} . \Lambda^{-}+\boldsymbol{\Lambda} \mathbf{x} \overline{\mathbf{v}}\right]$ and the normalized quaternion is $\mathrm{G}^{\prime}=[-|\Lambda| \cdot|\overline{\mathrm{V}}|, \mathrm{v} \Lambda+\Lambda \mathrm{x} \overline{\mathrm{v}}] /(\Lambda \mathrm{v} \sqrt{ } 3)$, which is Gravity as said of Spaces, i.e. A Potentially Rotational kinetic energy ( $\mathrm{mr} . \mathrm{w}^{2}$ ) as above without invoking laws of mechanics.

It was shown , that into Gravity cave $\operatorname{Lg}=2 . r=\mathrm{e}^{\wedge} \mathrm{i} .(-9 . \pi / 2) \mathrm{b}=3,969 \cdot 10^{-62} \mathrm{~m}$, is inversely balancing the Common Circle of Space Anti-Space, with Velocities ( $\overline{\mathrm{v}} \mathrm{g}=\overline{\mathrm{w}} \mathrm{r}$ ) that of light ,c, tending to zero . For rotations in caves Lc $>$ Lg then exist Velocities ( $\overline{\mathrm{v}} \mathrm{c}=\overline{\mathrm{w}}$ ) $>$ than that of light $, \mathrm{c},\left[\overline{\mathrm{v}}_{\mathrm{c}}>\mathrm{c}\right]$ tending to $\infty$. The hidden pattern of universe is ,STPL- line, which is off the Spaces and connect them ( maintain , conserve , and support all universe ), so , it is the Navel string of galaxies.

## 3.. Extremum Principle or Extrema :

All Principles are holding on any Point A.
For two points A, B not coinciding, exists Principle of Inequality which consists another quality .
Any two Points exist in their Position under one Principle , Equality and Stability,
In Virtual displacement which presupposes Work in a Restrain System . [12]
This Equilibrium presupposes homogenous Space and Symmetrical Anti-Space.
For two points A, B which coincide, exists Principle of Superposition which is a Steady
State containing Extrema for each point separately.
Extrema, for a point $A$ is the Point, for a straight line the infinite points on line, either these coincide or not or these are in infinite, and for a Plane the infinite lines and points with all combinations and Symmetrical ones which are all monads, i.e.
all Properties of Euclidean geometry, compactly exist in Extrema Points, Lines , Planes, circles . Since Extrema is holding on Points, lines, Surfaces etc , therefore all their compact Properties (Principles of Equality, Arithmetic and Scalar, Geometric and Vectors , Proportionality, Qualitative , Quantities, Inequality, Perspectivity etc), exist in a common context as different monads .
Since a quantity ( a monad AB ) is either a vector or a scalar and by their distinct definitions are,
Scalars ----- [s] , are quantities that are fully described by a magnitude ( or numerical value) alone, Vectors ---- [ $\bar{v} . \nabla]$, are quantities that are fully described by both magnitude and a direction ,
Quaternion [ $\mathbf{d} \hat{\mathbf{s}}=\mathbf{s}+\overline{\mathrm{v}} . \nabla \mathrm{i}$ ] is a vector with two components, the one $\mathbf{s}$, is the only space with Scalar Potential ( any field $\mathbf{\Phi} \mathbf{0}$ ), which is only half lengths of Space Anti-Space, ( the longitudinal positions ), $(x) \rightarrow(-x)$ straight line connecting Space [S] , Anti-Space [AS] in [PNS] and in it exist , the initial Work, Impulse, bounded on points which cannot be created or destroyed which is analogous to the (x) magnitude, and the other one $\mathbf{y}$ (is the infinite local curl fields So ) due to the Spin which is the intrinsic rotation of the Space and Anti-Space, therefore exists a common Extrema formulation for all monads.
In [17-22], The six, triple lines, points was shown that

```
Extrema of Space is Anti-space (Quaternion z'o \(=[\lambda, \Lambda \nabla \mathrm{i}]^{\mathrm{n}}\) ),
Extrema of Plane is Anti-Plane ( Quaternion z'o \(=[\lambda, \Lambda \nabla \mathrm{i}]^{\mathrm{n}-1}\) ),
Extrema of Line is Anti-Line \(\rightarrow 0 \pm \infty\left(\right.\) Quaternion \(\left.\bar{z} ' o=[\lambda, \Lambda \nabla \mathrm{i}]^{\mathrm{n}-2}\right)\)
```

i.e. a new Monad $A B=[s+\bar{v} . \nabla \mathrm{i}]$ with ,s, as the real part and $\overline{\mathrm{v}} . \nabla \mathrm{i}$ again as the Imaginary part.

The nature of geometry is such ( circular reference ) that through this intrinsic mechanism to transform
Quaternion $\overline{\mathbf{z}} \mathbf{o}$ to a different quaternion $\tilde{\overline{\mathbf{z}}} \mathbf{o}$, as is the causality dilemma of $<$ the chicken or the egg $>$.
Balancing of Space, Anti-Space is obtained by the Biaxial Ellipsoid ( $\boldsymbol{\sigma x}=\boldsymbol{\sigma} y$ ) which exists as momentum $\pm \Lambda$ in caves of diameter $2 r$. Recovery body (Stabilizer) of the two opposite magnitudes equilibrium the two Momentums by the collision of the two opposite ,Velocity Monads $\pm \tilde{\mathbf{v}}$, due to momentum $\pm \Lambda \nabla \mathrm{i}$. [25-26].

### 4.1. The Six , Triple points, Line .

It was proved as a theorem [16] that on any triangle $A B C$ and on circum circle exists one inscribed triangle AeBeCe and another one circumscribed Extremes triangle KaKbKc such that the Six points of intersection of the six pairs of triple lines are collinear $\rightarrow(3+3) .3=18$ lines $(\mathrm{F}-2)$
In Projective geometry, Space points are placed in Plane and in Perspective theory < Points at Infinity > and so thus are extremes points [17]. Extremes points follow Euclidean axioms and it is another way of mapping and not a new geometry contradicting the Euclidean .
It was also shown that Projective geometry is an Extrema in Euclidean geometry and [STPL] their boundaries . In case of Orthogonal system ( angle $A=90^{\circ}$ ) then the inscribed triangle $\operatorname{AeBeCe}$ is in circle and the Extrema triangle $\mathrm{K}_{\mathrm{A}} \mathrm{K}_{\mathrm{B}} \mathrm{K}_{\mathrm{C}}$ has the two sides perpendicular to diameter BC and the third vertice inoo so any non orthogonal transformational system on an constant vector $\overline{\mathbf{A}} \mathbf{B}$, which is the orthogonal system , is happening on the supplementary of $\theta$ angle i.e. ( $90-\theta$ ) where then on AB exists $\rightarrow \csc \theta=$ constant and equal to $\pm\left[1 / \sqrt{ } 1-\cos ^{2}(90-\theta)\right]= \pm\left[1 / \sqrt{ } 1-(\mathrm{BA} / \mathrm{BDB})^{2}\right]$ which is identified for say $\mathrm{AB}=\tilde{\mathrm{v}}$ to Lorentz factor $\gamma= \pm\left[1 / \sqrt{ } 1-\beta^{2}\right]$ where $\beta=v / c$, i.e $\csc \theta=$ constant $= \pm\left[1 / \sqrt{ } 1-(B A / B D B)^{2}\right]$, and it is the geometrical interpretation of Projective geometry as an Extrema in Euclidean geometry .
In Projective geometry, Space points are placed in Plane and in Perspective theory < Points at Infinity > and so thus are extrema points[17] . Extrema points follow Euclidean axioms either by translation geometry [s,0] or by rotation $[0, \bar{v} . \nabla \mathrm{i}]$ or both $[\mathrm{s}, \overline{\mathrm{v}} . \nabla \mathrm{i}]$, where $\mathrm{s}=$ scalar and $\overline{\mathrm{v}} . \nabla \mathrm{i}=$ vector .The Projective sphere comprehending great circles of the sphere as < lines > and pairs of antipodal points as <points> does not follow the Euclidean

Axioms 1-4, because < points at Infinity > must follow 1-4, which do not accept lines, planes, spaces at infinity. The same also for Hyperbolic geometry with omega point , so ???
Since Natural logarithm of any complex number b, can be defined by any natural and real number as the power , $\mathbf{w}$, which represent the mapping to which a constant say e , would have to be raised to equal b , i.e. $\mathrm{e}^{\mathrm{w}}=\mathrm{b}$ and or $\mathrm{e}^{\wedge} \ln (\mathrm{b})=\mathrm{e}$, [base e] $\wedge^{1}$ natural number $\mathrm{w}^{1}=\mathrm{b}$, therefore, represent mapping which is the regular polygonal exponentiation of unit complex monad $\overline{\mathrm{A}} \mathrm{B}=1$ on base ,e, of natural logarithms .
Using the generally valued equation of universe for zero work $\mathrm{W}=\mathrm{ds}$. © $\int \mathrm{A} \quad-\mathrm{B}$ [P.ds] $=0$, [20] for primary Space and anti-Space on monad $\bar{A} B$ with the only two quantized quantities dš $=|\bar{A} B|$ and $P=\bar{v} . \nabla \mathrm{i}$, then work is the action of the consecutive small displacements (shifts) along the unit circle caused by the application of infinitensimal rotations of $\mathrm{AB}=1$ starting at 1 and continuing through the total length of the arc connecting 1 and -1 , in complex plane.

### 4.2. Perspectivity :

In Projective geometry, (Desargues` theorem ) , two triangles are in perspective axially, if and only if they are in perspective centrally. Show that , Projective geometry is an Extrema in Euclidean geometry .

Perspective triangles. Corresponding sides of the triangles, when extended, meet at points on a line called the axis of perspectivity. The lines which run through corresponding vertices on the triangles meet at a point called the center of perspectivity. Desargues' theorem guarantees that the truth of the first condition is necessary and sufficient for the truth of the second. 3

F (4-2,3)

Two points $\mathrm{P}, \mathrm{P}^{\prime}$ on circum circle of triangle ABC , form Extrema on line $\mathrm{PP}^{\prime}$. Symmetrical axis for the two points is the mid-perpendicular of $\mathrm{PP}^{\prime}$ which passes through the centre O of the circle therefore Properties of axis $\mathrm{PP}^{\prime}$ are transferred on the Symmetrical axis in rapport with the center O ( central symmetry), i.e. the three points of intersection $A 1, B 1, C 1$ are Symmetrically placed as $A^{\prime}, B^{\prime}, C^{\prime}$ on this Parallel axis. F(4-1) .
a. In case points $\mathrm{P}, \mathrm{P}^{\prime}$ are on any diameter of the circum circle $\mathrm{F}(4-2)$, then line PP ' coincides with the parallel axis, the points $\mathrm{A}^{\prime}, \mathrm{B}^{\prime}, \mathrm{C}^{\prime}$ are Symmetric in rapport with center O , and the Perspective lines $A A^{\prime}, B B^{\prime}, C C^{\prime}$ are concurrent in a point $O^{\prime}$ situated on the circle.
When a pair of lines of the two triangles ( $A B C$, abc ) are parallel $\mathrm{F}(4-3)$, where the point of intersection recedes to infinity , axis $P P^{\prime}$ passes through the circum centers of the two triangles, (Maxima) and is not needed" to complete" the Euclidean plane to a projective plane .i.e. Perspective lines of two Symmetric triangles in a circle, on the diameters and through
the vertices of corresponding triangles, concurrent in a point on the circle .
b. When all pairs of lines of two triangles are parallel, equal triangles, then points of intersection recede to infinity, and axis PP` passes through the circum centers of the two triangles (Extremes ).
c. When second triangle is a point $\boldsymbol{P}$ then axis $P P^{\prime}$ passes through the circum center of triangle .

Now is shown that Perspectivity exists between a triangle ABC , a line $\mathrm{PP}^{\prime}$ and any point P where then exists Extrema, i.e. Perspectivity in a Plane is transferred on line and from line to Point This is the compact logic in Euclidean geometry which holds in Extreme Points.

Any Segment $A B$ between two points $A, B$ consist a Vector described by the magnitude $A B$ and directions ÃB , BÃ and in case of Superposition ÃA , AÃ. i.e. Properties of Vectors , Proportionality, Symmetry, etc exists either on edges $A, B$ or on segment $A B$ as follows :

Theorem : On any triangle ABC and the circumcircle exists one inscribed triangle AEBECE and another one circumscribed Extrema triangle КАКвКс such that the Six points of intersection of the six pairs of triple lines are collinear $\rightarrow(3+3) .3=18$

The Six Triple Points Line $\rightarrow$ The Six, Triple Concurrency Points, Line $\rightarrow$ [STPL] .. F(4-2)
It has been proved [16] that since Perspective lines, on Extremes Triangles AeBeCe, KaKbКc concurrent, and since also Vertices A , B , C of triangle ABC lie on sides of triangle КА,Кв,Кс, therefore all corresponding lines of the three triangles, when extended concurrent, and so the three triangles are Perspective between them i.e.

This compact logic of the nine points [ $\mathrm{A}, \mathrm{B}, \mathrm{C}],[\mathrm{A} \mathrm{\varepsilon}, \mathrm{Be}, \mathrm{Cе}],[\mathrm{KA}, \mathrm{Kв}, \mathrm{Kc}]$ of the inscribed circle ( $\mathrm{O}, \mathrm{ABC}$ ) when is applied on the three lines КАКв, КАКс, КвКс, THEN THE SIX pairs of the corresponding lines which extended are concurrent at points РА, Рв, Рс for the Triple pairs of lines [ $\mathrm{AAe}, \mathrm{BCe}, \mathrm{CBe}$ ] , [ $\mathrm{BBe}, \mathrm{CAe}, \mathrm{ACe}]$, [ $\mathrm{CCe}, \mathrm{ABe}, \mathrm{BAe}$ ] and at points $\mathrm{Da}, \mathrm{Db}, \mathrm{Dc}$ for the other Triple pairs of lines [ CB , $\mathrm{KbA}, \mathrm{BECE}],[\mathrm{AC}, \mathrm{KAB}, \mathrm{CeAe}],[\mathrm{BA}, \mathrm{KbC}, \mathrm{AEBE}]$ and lie on a straight line, and in case of points $A, B, C$ being on a sphere then [STPL] becomes a cylinder.

Conclusion :
1.. [STPL] is a Geometrical Mechanism that produces all Spaces, Anti-Spaces in the Common Sub-Space. 2.. Points $\mathrm{A}, \mathrm{B}, \mathrm{C}$ and lines $\mathrm{AB}, \mathrm{AC}, \mathrm{BC}$ of Space, communicate with the corresponding $\mathrm{Ae}, \mathrm{Be}, \mathrm{Ce}$ and $\mathrm{AeBe}, \mathrm{AeCe}, \mathrm{BeCe}$ of Anti-Space, separately or together with bands of three lines at points $\mathrm{P}_{\mathrm{A}}, \mathrm{Pb}, \mathrm{PC}_{\mathrm{C}}$, and with bands of four lines at points $\mathrm{D}_{\mathrm{A}, \mathrm{DB}, \mathrm{Dc} \text { on common circumscribed circle ( } \mathrm{O}, \mathrm{OA} \text { ) Sub-Space. }}^{\text {and }}$ 3.. If any monad AB (quaternion), $[\mathrm{s}, \overline{\mathrm{V}} . \mathrm{Vi}]$, all or parts of it, somewhere exists at points $\mathrm{A}, \mathrm{B}, \mathrm{C}$ or at segments $\mathrm{AB}, \mathrm{AC}, \mathrm{BC}$ then [STPL] line or lines ,is the Geometrical expression of the Action of External triangle KaКbКc, the tangents, on the two Extreme triangles ABC and AeBeCe (of Space Anti-space).

## 5. The method :

THE BALANCING OF SPACE $\rightarrow$ ANTI-SPACE .

Equilibrium vorticity $\pm \boldsymbol{\Lambda}$ (Rotating energy), Collision on common circle, Thrust on Breakages F.(5-1)
The work W , for the infinite points on the two tangential to $\mathbf{n}$ planes is equal to $\mathrm{W}=[\mathrm{n} . \mathrm{P}]=[\lambda . \Lambda]$ where
$\lambda=$ displacement of A to B and it is a scalar magnitude called wavelength of dipole AB .
$\boldsymbol{\Lambda}=$ the amount of rotation on dipole AB (this is angular momentum $\tilde{L^{2}}$ and it is a vector) .
Momentum $\pm \Lambda=$ r.m.v $=r m . w r=\mathrm{mr}^{2} . \mathrm{w}$, where $\mathbf{w}$ is the angular velocity (spin) which maps velocity vector $\overline{\mathbf{v}}$ on the perpendicular to $\pm \Lambda$ plane with the two components $\overline{\mathbf{v}} \mathrm{E} \perp \mathbf{\mathrm { v }}$ b. Tangential velocity $\overline{\mathbf{v}} \mathrm{E}=\mathrm{wr}$ is a quaternion $\overline{\mathbf{v}} \mathrm{E}=\mathrm{w} . \mathrm{r}=\overline{\mathbf{z}}=[\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i}]$ where $\mathrm{s}=|\overline{\mathbf{v}} \mathrm{E}|=|\mathrm{r} \cdot \mathrm{w}|$ and $\overline{\mathbf{v}} . \nabla \mathrm{i}=|\overline{\mathrm{w}} \mathbf{x} \overline{\mathrm{r}}|$.

In a spherical cave the Biaxial Ellipsoid ( $\boldsymbol{\sigma x}=\boldsymbol{\sigma}$ ) exists as momentum $+\Lambda$ on caves of diameter 2 r with parallel circles $\rightarrow 0$.The Biaxial Anti-Ellipsoid ( $-\sigma x=-\sigma y$ ) exists as equal and opposite momentum $-\Lambda$ on the same diameter $2 r$ with anti - parallel circles $\rightarrow 0$. Equilibrium of the two Ellipsoids $\pm \Lambda$, presupposes a Stabilizer system attached to Ellipsoids such that opposite Momentum is distributed to the Center of Mass of the total system and , recover equilibrium, which is the center of the spherical cave .
The Biaxial Ellipsoid and Anti-Ellipsoid are inversely directed and rotated in the same circle, so the two velocity vectors collide. This collision of the two opposite velocity vectors is the Action ( Thrust ) of the two quaternion and it is ,
Action of quaternions $(s+\overline{\mathbf{v}} . \nabla \mathrm{i})(\mathbb{C})(\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i})=[\mathrm{s}+\overline{\mathbf{v}} . \nabla \mathrm{i}]^{2}=\mathrm{s}^{2}+|\overline{\mathbf{v}}|^{2} . \nabla \mathrm{i}^{2}+2|\mathrm{~s}| \cdot|\overline{\mathrm{v}}| . \nabla \mathrm{i}=\mathrm{s}^{2}-|\overline{\mathbf{v}}|^{2}+2|\mathrm{~s}| \cdot|\overline{\mathrm{w}} \mathrm{r}| . \nabla \mathrm{i}$
$\mathbf{s}^{2}=(\text { r.w })^{2} \quad \rightarrow$ is the real part of the new quaternion ,
$-|\overline{\mathbf{v}}|^{2}=|\tilde{\mathrm{w}} \tilde{\mathbf{r}}|^{2}=-(\mathrm{r} . \mathrm{w})^{2} \rightarrow$ the always negative Anti-space (a vector $\perp_{\text {to }}$ w,r plane ), $[2 \overline{\mathrm{w}}] \cdot|\mathrm{s}| . \mid \overline{\mathrm{r}} . \nabla \mathrm{i}=2 \mathrm{w} .(\mathrm{sr}) . \nabla \mathrm{i} \quad \rightarrow$ the double angular velocity term.
i.e. In the recovery equilibrium (maybe a surface cylinder with 2 r diameter ), and because velocity vector is on the circumference, the infinite breakages (the only row material) identify with points $\mathrm{A}, \mathrm{B}, \mathrm{C}$ ( of the extreme triangles ABC of Space ABC ) and with points $\mathrm{AE}, \mathrm{BE}, \mathrm{CE}$ (of the extreme triangles AEBECE of Anti-Space ) all, on the same circumference of the prior formulation and are rotated with the same angular velocity vector $\overline{\mathbf{w}}$. The inversely directionally rotated Energy $\pm \boldsymbol{\Lambda}$ equilibrium into the common circle, so Spaces and Anti-Spaces meet in this circle giving ,Thrust, to the breakages of each other .
Extreme Spaces ( the Extreme triangles ABC ) meet Anti-Spaces ( the Extreme triangles AeBeCe) through the only Gateway which is the , Plane Geometrical Formulation Mechanism of the [STPL] line .

F.[5-2]

Index: $\mathrm{DA} \rightarrow \mathrm{PA}=\mathrm{x}$ axis, $\mathrm{A} \perp(\mathrm{DA} \rightarrow \mathrm{PA})=$ y axis , Positive vorticity $\cup+\uparrow$, Negative vorticity $\circlearrowright-\downarrow$ Thrust ( $\overline{\mathrm{v}}=\overline{\mathrm{w}} . \mathrm{r}$ ) on Breakages [ $\mathrm{s}^{2},-|\overline{\mathbf{v}}|^{2},[2 \overline{\mathrm{w}}] .|\mathrm{s}||\mathrm{r}|=2(\overline{\mathrm{w}} . \mathrm{r})^{2}$ ] produces $\overline{\mathrm{w}}^{3} \cdot|\overline{\mathrm{r}}|^{3}$. [1-1+2] magnitudes (w.r) ${ }^{3}$, is a Positive Scalar magnitude , with Positive or zero electric charge and spin $1 / 2$ and for ,

Breakage (w.r) ${ }^{2}$, is a Positive Scalar magnitude with Positive or zero electric charge and spin $1 / 2$,
1.. Breakage (w.r) ${ }^{2}$ being on Points A, Ae, collide with vector $\bar{v}=\bar{w} r$ and then are getting off the common circle at point DA, PA forming Leptons $\rightarrow \mathbf{v e}, \mathbf{e}$ and Quarks $\rightarrow \mathbf{u}, \mathbf{d}$
2.. Breakage (w.r) ${ }^{2}$ being on Points $B$, $B E$, collide with vector $\overline{\mathrm{v}}=\overline{\mathrm{w}} \mathrm{r}$ and then are getting off the common circle at point Dв, Рв forming Leptons $\rightarrow \mathbf{v} \boldsymbol{\mu}, \boldsymbol{\mu}$ and Quarks $\rightarrow \mathbf{c}$, $\mathbf{s}$
3.. Breakage (w.r) ${ }^{2}$ being on Points $C$, Ce, collide with vector $\overline{\mathrm{v}}=\overline{\mathrm{w}} \mathrm{r}$ and then are getting off the common circle at point Dc, Pc forming Leptons $\rightarrow \mathbf{v} \boldsymbol{\tau}, \boldsymbol{\tau}$ and Quarks $\rightarrow \mathbf{t}, \mathbf{b}$

Breakage $\left.-|\overline{\mathbf{w}} \mathbf{x} \overline{\mathbf{r}}|^{2}=-\mathbf{( w . r}\right)^{2}$, is a Negative Scalar magnitude with Negative or zero electric charge and spin $1 / 2$,
1.. Breakage - (w.r) ${ }^{2}$ being on Points A, Ae, collide with vector $\bar{v}=\bar{w} r$ and then are getting off the common circle at point Da, Pa forming Anti-Leptons $\rightarrow \overline{\mathbf{v}} \mathbf{e}, \overline{\mathbf{e}}$ and Anti-Quarks $\rightarrow \overline{\mathbf{u}}, \mathbf{d}^{-}$
2.. Breakage (w.r) ${ }^{2}$ being on Points $B$, Be, collide with vector $\bar{v}=\bar{w} r$ and then are getting off the common circle at point Dв, Рв forming Anti-Leptons $\rightarrow \overline{\mathbf{v}} \boldsymbol{\mu}, \overline{\boldsymbol{\mu}}$ and Anti-Quarks $\rightarrow \overline{\mathbf{c}}, \overline{\mathbf{s}}$
3.. Breakage (w.r) ${ }^{2}$ being on Points C , Ce, collide with vector $\overline{\mathrm{v}}=\overline{\mathrm{w}} r$ and then are getting off the common circle at point Dc, Pc forming Anti-Leptons $\rightarrow \overline{\mathbf{v}} \boldsymbol{\tau}, \overline{\boldsymbol{\tau}}$ and Anti-Quarks $\rightarrow \mathbf{t}, \mathbf{b}^{-}$

Breakage 2( $\overline{\mathbf{w} r})^{\mathbf{2}}$, is a Vector magnitude with Positive or Zero or Negative electric charge , spin (2w)=1,
1.. Breakage 2|sr|. $\bar{w}$, being on Points $A, A E$, collide with vector $\bar{v}=\bar{w} r$ and then are getting off the common circle at point DA, Pa forming $\rightarrow$ Gluons $\mathbf{g}, \mathrm{W}^{+}$Bosons the $\mathbf{W}^{+}$particle and the $\mathbf{W}^{-}, \mathbf{g} R$, Anti particles.
2.. Breakage $2|s r| \cdot \bar{w}$, being on Points $B, B E$, collide with vector $\bar{v}=\bar{w} r$ and then are getting off the common circle at point DB, Рв forming $\rightarrow$ Gluons $\mathbf{g}, \mathrm{Z}^{+}$Bosons the $\mathbf{Z}^{+}$particle and the $\mathbf{Z}^{-}$, $\mathbf{g} G$, Anti particles.
3.. Breakage $2|s r| \cdot \bar{w}$, being on Points C , Ce, collide with vector $\bar{v}=\bar{w} r$ and then are getting off the common circle at point Dc , Pc forming $\rightarrow$ Gluons $\mathbf{g}, \mathrm{H}^{+}$Bosons the $\mathbf{H}^{+}$particle and the $\mathbf{H}^{-}, \overline{\mathbf{g}} \mathbf{B}$, Anti particles.
4.. Breakage $2(\bar{w} r)^{2}$ on Points $\mathrm{A}, \mathrm{B}, \mathrm{C}$ and on points $\mathrm{Ae}, \mathrm{Be}, \mathrm{Ce}$ then on $\mathrm{P}, \mathrm{Pb}, \mathrm{Pc} \rightarrow$ the Photos $\gamma$, Graviton $\mathrm{G}^{ \pm}, \mathbf{M}^{ \pm}$, Bosons the $\boldsymbol{\gamma}, \mathbf{G}, \mathbf{M}$ particles and the $\boldsymbol{\gamma}^{-}, \mathbf{G}^{-}, \mathbf{M}^{-}$Anti particles ,

$\mathrm{QDc}=|\mathrm{AE}, \mathrm{BE}| .2|\mathrm{wr}|^{2}=|\mathrm{r} \cdot \mathrm{w}| \cdot 2 \cdot\left(\mathrm{r}^{2} \cdot \mathrm{w}^{2}\right)=2 \cdot\left(\mathrm{r}^{3} \cdot \mathrm{w}^{3}\right) \cdot[\cos (\mathrm{AEBE}, \mathrm{Dc})] \cdot \sin (\mathrm{AEBE}, \mathrm{Dc}) \quad \rightarrow \mathbf{H}^{-}$
d.. Breakages on Points $A, B, C$ and on points $A e, B e, C e$ then on $P A, P_{B}, P_{c} \rightarrow$ the Photos $\gamma$, Graviton $\mathrm{G}^{ \pm}, \mathbf{M}^{ \pm}$, Bosons the $\boldsymbol{\gamma}, \mathbf{G}, \mathbf{M}$ particles and the $\bar{\gamma}, \mathbf{G}^{-}, \mathbf{M}$ Anti particles.
$\mathrm{Q}^{\prime} \mathrm{PA}^{\prime}=\left|\mathrm{B}, \mathrm{CE}, \mathrm{PA}_{\mathrm{A}}\right| .2|\mathrm{wr}|^{2}=|\mathrm{r} \cdot \mathrm{w}| \cdot 2 .\left(\mathrm{r}^{2} \cdot \mathrm{w}^{2}\right)=2 .\left(\mathrm{r}^{3} \cdot \mathrm{w}^{3}\right) \cdot\left[-\cos \left(\mathrm{BCE}, \mathrm{PA}_{\mathrm{A}}\right)\right] \rightarrow \gamma$

$\mathrm{Q}^{\prime} \mathrm{Pb}^{\prime}=\left|\mathrm{C}, \mathrm{Ae}_{\mathrm{E}}, \mathrm{Pb}\right| \cdot 2|\mathrm{wr}|^{2}=|\mathrm{r} \cdot \mathrm{w}| \cdot 2 .\left(\mathrm{r}^{2} \cdot \mathrm{w}^{2}\right)=2 .\left(\mathrm{r}^{3} \cdot \mathrm{w}^{3}\right) .\left[\cos \left(\mathrm{ACE}, \mathrm{PB}^{2}\right)\right] \quad \rightarrow \quad \mathbf{G}$
$\mathrm{Q}^{\prime} \mathrm{PB}^{\prime}=|\mathrm{A}, \mathrm{Ce}, \mathrm{Pb}| \cdot 2|\mathrm{wr}|^{2}=|\mathrm{r} \cdot \mathrm{w}| .2 \cdot\left(\mathrm{r}^{2} \cdot \mathrm{w}^{2}\right)=2 .\left(\mathrm{r}^{3} \cdot \mathrm{w}^{3}\right) .[\cos (\mathrm{CAe}, \mathrm{Pb})] \quad \rightarrow \mathbf{G}^{-}$
$\mathrm{Q}^{\prime} \mathrm{Pc}^{\prime}=\left|\mathrm{A}, \mathrm{Be}, \mathrm{Pc}^{2}\right| \cdot 2|\mathrm{wr}|^{2}=|\mathrm{r} \cdot \mathrm{w}| \cdot 2 .\left(\mathrm{r}^{2} \cdot \mathrm{w}^{2}\right)=2 .\left(\mathrm{r}^{3} \cdot \mathrm{w}^{3}\right) \cdot[-\cos (\mathrm{ABE}, \mathrm{Pc})] \rightarrow \mathbf{M}$

Where $\cos (\mathrm{A}, \mathrm{DA}), \cos (\mathrm{Ae}, \mathrm{DA})=\cos$ of tangents at points $\mathrm{A}, \mathrm{B}, \mathrm{C}-\mathrm{Ae}, \mathrm{Be}, \mathrm{Ce}$ and the [STPL] , (x-x axis).
Spin $1 \rightarrow 2 \mathrm{x}^{1 / 2}$ :
$1 / 2$ Spin $\rightarrow \mathrm{S}=\mathrm{h} / 2 \pi=\mathrm{h}^{-}=6,626.10^{-34} \mathrm{Js}^{-1} / 2 \pi=1,05459.10^{-34} \mathrm{Js}^{-1}=6,5822 \cdot 10^{-16} \mathrm{eVs}^{-1}$ and it is the Energy of a Photon $=\mid \overline{\mathrm{w}} . \mathrm{r}^{2}$ for the Positive and Negative scalar Breakage magnitudes particles.
Quantity $\rightarrow 2|\bar{w} . r|^{2}=2 \cdot\left[|\bar{w} . r|^{2}=1 / 2\right.$ Spin] $=$ Spin 1 and equal to $2 \cdot\left[6,5822.10^{-16} \mathrm{eVs}^{-1}\right]=1,31644.10^{-16} \mathrm{eVs}^{-1}$.
Spin Anti-Spin is the rotational equilibrium of spaces.
Spin is an Intrinsic property of the three Breakage Quantities $6,5822.10^{-16} \mathrm{eVs}^{-1}$ for Leptons and Quarks and double $1,31644.10^{-15} \mathrm{eVs}^{-1}$ for the Vector Breakage magnitude particles.
Angular velocity $\mathrm{w}=2,5656.10^{-8} \mathrm{eVs}^{-1} / 1,9845.10^{-62} \mathrm{~m}=2,58564.10^{-54} \mathrm{eV} / \mathrm{m}$ of the rotational energy $\Lambda$ is a common property of all breakages resulting from the Action of velocity vector , $\overline{\mathrm{v}}$, on the breakages. Energy is equal to the velocity vector $|\vec{v}|=|\mathrm{w}| \mathrm{r}$, or $\mathrm{E}=\mathrm{w} \cdot \mathrm{rG}=2,5656.10^{-8} \mathrm{eVs}=2,5656.10^{-27} \mathrm{Js}$.

## 6.1.. Photoelasticity :

In Photo elasticity , the speed of light ( vector $\overline{\mathrm{v}}$ ) through a Homogenous and Isotropic material , ( transparency, outstanding toughness , dimensional stability , mold ability, very low shrink rate , etc. ), varies as a function of the direction and magnitude of the applied or residual stresses .
Light through a Polarizing filter (a Plane cavity of thickness L) blocks spatial components except those in the plane of vibration, and if through a second Plane cavity , then the components of the light wave vibrate in that plane only. Polarized light passing through different Flat caves (stressed material), splits into two wave fronts travelling at different velocities, each parallel to a direction of principal stress but perpendicular to each other. (Birefringence property of stress material with two indices n1,n2 of refraction ). The components of the light waves interfere with each other to produce a color spectrum .
[ Retardation $, \delta,(\mathrm{nm})$ is the phase difference between the two light vectors through the material at different velocities (fast ,slow) and divided by the material thickness ( L ) is proportional to the difference between the two indices of refraction i.e. $\delta / \mathrm{L}=\mathrm{n} 2-\mathrm{n} 1=$ C. $(\sigma 1-\sigma 2)$, where $\sigma 1, \sigma 2$ are the Principal stresses .
Retardation,$\delta$, determines color bands or fringes ( $A$ fringe $N$ is each integer multiple of the wavelength ) where the areas of lowest orientation and stress appear black followed by gray and white and as Retardation and stress $(\sigma)$ go up then the colors cycle through a more or less repeating pattern and the Intensity of the colors diminishes (decreases).
Because the colors repeat at different levels of retardation and stress , then is tracked as color band sequence from the black or white regions and are repeated periodically following the whole fringe of colors , as Black, Gray , White-Yellow , Yellow - Orange (dark yellow) ,Red , Violet ( $1^{\text {st }}$ order fringe), Blue , Blue-green , Green-yellow , Yellow ,Orange (dark-yellow), Red , Violet (2 $2^{\text {nd }}$ order fringe) $\rightarrow$
In Common circle, with different angular velocity vector, $v=w r$, in the absence of applied Torques produces a color Spectrum which is, the Color Forces $\rightarrow$ Gluon Red, Gluon Green, Gluon Blue .

Stability is obtained by the opposite momentum $-\Lambda^{-}$where $E=-(\bar{v} \mathbf{x B})=-(\bar{v} . B) \perp \rightarrow$ or and $\mathbf{B} \perp \mathbf{E}$. The two perpendicular Static force fields $\mathbf{E}$ and Static force field B of Space-Anti-Space, experience on any moving dipole $\mathrm{A}^{-} \mathrm{B}=[\lambda, \Lambda]$ with velocity $\overline{\mathbf{v}}$ (momentum $\Lambda^{-}=\mathrm{m} \overline{\mathrm{v}}$ only is exerting the velocity vector $\overline{v^{-}}$to the dipole $\lambda$ ) a total force $\mathbf{F}=\mathbf{F}$ е $+\mathbf{F}_{\text {в }}=(\lambda \mathrm{m}) . \mathbf{E}+(\lambda \mathrm{m}) . \overline{\mathbf{v}} \times \mathbf{B}$ which combination of the two types result in a helical motion and generally to any Space Configuration ( Continuum ) extensive property, as Kinetic (3-current motion) and Potential (the perpendicular Stored curl fields E, B) energy, by displacement ( the magnitude of a vector from initial to the subsequent position) and rotation and equation is as (N5)

$$
\begin{aligned}
& \text { The Total Energy State of a quaternion } \mathbf{E T}_{\mathrm{T}}=\sqrt{\left[\mathbf{m} . \mathrm{VE} .^{2}\right]^{2}+[\boldsymbol{\Lambda} . \mathrm{vB}+\boldsymbol{\Lambda} \mathrm{x} \mathbf{v B}]^{2}}=\sqrt{\left[\mathbf{m} . \mathbf{v E .}^{2}\right]^{2}+\mathbf{E}{ }^{2}}
\end{aligned}
$$

i.e. a moving Energy cuboid (axbxc), rectangular parallelepiped , with space diagonal length $\mathbf{E}=\sqrt{ } \mathbf{a}^{2}+\mathbf{b}^{2}+\mathbf{c}^{2}$ where $\rightarrow \mathbf{a}=\left|\mathbf{p}_{1} \mathbf{v B 1}^{2}\right|, \mathbf{b}=\left|\mathbf{p}^{2} \mathbf{v B}_{2}\right|, \mathbf{c}=\left|\mathbf{p}^{3} \mathbf{V B 3}_{3}\right| \quad$ and when
$\overline{\mathbf{v}} \mathrm{E}=\mathbf{0}$ then $\mathrm{E}_{\mathrm{T}}=\Lambda . \mathbf{v b} .+\Lambda \mathrm{x} \mathbf{v B} \rightarrow$ which is the accelerating removing energy $\Lambda$ towards $\mathbf{v B}$.
$\mathrm{m}=\mathbf{0}$ then $\mathrm{ET}=\Lambda . \mathbf{v b} .+\Lambda \mathrm{x} \mathbf{v b} \rightarrow$ which is the linearly removing energy $\Lambda$ towards $\mathbf{v b}$.
$\overline{\mathbf{v}} \mathrm{B}=\mathbf{0}$ then $\mathrm{Et}_{\mathrm{T}}=\mathrm{m}$. ve. $^{2} \quad \rightarrow$ which is the Kinetic energy in Newtonian mechanics towards $\mathbf{v e}$.

### 6.2. Conclusions :

Any moving monad [z=s+v.i] is transformed into $\rightarrow$
1..In Elastic material Configuration , as Strain energy and is absorbed as Support Reactions and displacement field $[\nabla \boldsymbol{\varepsilon}(\overline{\mathrm{u}}, \overline{\mathrm{v}}, \overline{\mathrm{w}})]$ upon the deformed placement, (where these alterations of shape by pressure or stress is the equilibrium state of the Configuration $\left.G \cdot \nabla^{2} . \varepsilon+[m \cdot G /(m-2)] . \nabla[\nabla . \varepsilon]=F\right)$, (Elasticity) [26],
2.. In Solid material Configuration, as Kinetic (Energy of motion v-) and Potential ( Stored Energy ) energy by displacement ( the magnitude of a vector from initial to subsequent position ) and rotation, on the principal axis (through center of mass of the Solid ) as ellipsoid, which is mapped out , by the nib of vector $(\delta \overline{\mathrm{r}} \mathrm{c})=[\overline{\mathrm{v}} \mathrm{c}+\overline{\mathrm{w}} . \overline{\mathrm{r}} \mathrm{n}] \delta \mathrm{t}$, as the Inertia ellipsoid [ Poinsot's ellipsoid construction] in (AF) which instantaneously rotates around vector axis $\bar{w}, \varphi$ with the constant polar distance $\bar{w} . \mathrm{Fe} / \mathrm{Fe}$ and the constant angles $\theta \mathrm{s}, \theta \mathrm{b}$, traced on , Reference (BF) cone and on (AF) cone, which are rolling around the common axis of $\bar{w}$ vector ,without slipping, and if Fe , is the Diagonal of the Energy Cuboid with dimensions a,b,c which follow Pythagoras conservation law , then the three magnitudes ( J,E,B ) of Energy-state follow Cuboidal , Plane, or Linear Diagonal direction, and If Potential Energy is zero, then vector $\overline{\mathbf{w}}$ is on the surface of the Inertia Ellipsoid. [26-27] .
3.. In Quaternion Extensive Configuration , as New Quaternions (with Scalar and Vector magnitudes ). Points in Space carry A priori the work $\mathrm{W}=\int_{\mathrm{A}-\mathrm{B}}[$ P.ds $]=0$, where magnitudes P , ds can be varied leaving work unaltered (N4). Diffusion (decomposition) of Energy follows Pythagoras conservation law where the three magnitudes (J,E,B ) of Energy-State follow Cuboidal , Plane , or Linear Diagonal [18].
4.. In Space conserved Extensive property Configuration ( Continuum ), as Kinetic ( 3-current motion) and Potential (perpendicular Stored curl fields) energy by displacement (the magnitude of a vector from initial to the subsequent position) and rotation. Energy is conserved in $E$ and $B$ curled fields .
5.. The dynamics of any system = Work = Total energy , is transferred as generalized force Qn . $\mathrm{Qn}=\partial \mathrm{W} / \partial(\delta \overline{\mathrm{q}} \mathrm{n}),(\delta \bar{q} \mathrm{n})=\overline{\mathrm{v}} . \delta \mathrm{t}=[\overline{\mathrm{v}} \mathrm{c}+\overline{\mathrm{w}} . \overline{\mathrm{r}} \mathrm{n}] \delta \mathrm{t}=($ Translational + rotational velocity $) . \delta \mathrm{t}$ or $\mathrm{Qn}=\overline{\mathrm{v}} .(\partial \mathrm{T} / \delta \mathrm{t})+\overline{\mathrm{w}} . \overline{\mathrm{I}} \mathrm{n}] .(\partial \mathrm{T} / \delta \mathrm{t}) \rightarrow$ Translational kinetic energy + Rotational kinetic energy.
6.. The ultimate Constituents of Monads ( $s, \bar{v}$ ) is the real part ,s, which is the Magnitude of Imaginary part, and the Imaginary part which is Vector $\overline{\mathrm{v}}$.
The [STPL] is a Geometrical Mechanism ( Mould ) which transfers the two Quantities of monads from one Level (Confinement) to another Level using Quantities or the Breakages of collision between monads. This Mechanism is not the Origin of monads, but it is the Mould (the Regulative Universe Valve).
In Common circle (the Sub-Space) of rotating Space Anti-Space $[ \pm \Lambda$ ], with maximum angular Velocity Vector, $v=w r$ on circumference, $[$ in the absence of applied Torques and because of the Birefringence property of stress material with different indices n of refraction, which creates the Retardation , $\delta$, determining Color Bands or Fringes ] Produces a color Spectrum which is, the Color Forces , $\rightarrow$ Gluon Red, Gluon Green , Gluon Blue .
7.. In Black holes Energy scale ( $\boldsymbol{\lambda} \boldsymbol{\Lambda} \boldsymbol{\Lambda}=\boldsymbol{k} \mathbf{1}$ ) there are infinite high frequency small amplitude vacuum fluctuations at Planck energy density of $10^{113} \mathrm{~J} / \mathrm{m} 3$ that exert action (pressure) on the moving Spaces dipole and their Stability is achieved by Anti-space also.
8.. Dipole vectors are quaternions (versors) of waving nature, i.e., one wavelength in circumference in energy levels, that conserve energy by transferring Total kinetic energy T into angular momentum $\mathrm{L}=\overline{\mathrm{r}} \mathrm{m} \overline{\mathrm{v}}=\overline{\mathrm{r}} \mathrm{p}=\overline{\mathrm{r}} \Lambda$, where mass $\mathrm{m}=$ is a Constant. Different versors with different Energy (scalar) possess the same angular momentum. A Composition of Scalar Fields (s) and Vector Fields ( $\overline{\mathrm{v}}$ ) of a frame, to a new unit which maps the alterations of Unit by rotation only and transforms scalar magnitudes ( particle properties) to vectors (wave properties) and vice-versa, and so, has all particle-like properties of waves and particles .In Planck Scale, when the electron is being accelerated by gravity which exists in all energy levels as above , the gravity is still exerting its force so Electrodynamics can be derived from Newton's second law.
9.. Dark matter Energy ( $\boldsymbol{\lambda} . \boldsymbol{\Lambda}=\boldsymbol{k} \mathbf{3}$ ) is supposedly a homogeneous form of Energy that produces a force that is opposite of gravitational attraction and is considered a negative pressure, or antigravity with density $6 \times 10^{-10}$ $\mathrm{J} / \mathrm{m} 3$ and $\mathrm{G}=$ gravitational constant $=\mathrm{L}^{3} / \mathrm{MT}^{3}=6,7 \times 10^{-} 11 \mathrm{~m}^{4} / \mathrm{N} . \mathrm{sec}^{4}$, Planck force $=\mathrm{Fp}=\mathrm{c}^{4} / \mathrm{g}=1,21 \times 10^{44} \mathrm{~N}$ and dynamic Plank length $=\sqrt{ } \mathrm{h} . \mathrm{G} / \mathrm{c}^{3}=1,616 \times 10^{-35} \mathrm{~m}$, and the reduced wavelength $\lambda=\lambda / 2 \pi=\mathrm{c} / \mathrm{w}$.
10.. It has been explained that on [STPL] are carried Leptons, Quarks and Bosons ,matter and Energy, which are all Particles with different intrinsic properties acquired from the prior mechanism . In recovery body Space, happen all interactions between Fermions, particles, and Bosons following all known laws.
The coupling of quantized Space and Energy ( ds and dP ) becomes on points of dipole AiBi through the Scalar potential field $\mathbf{P}(\mathbf{X}, \mathbf{Y}, \mathbf{Z})$ where $\mathbf{X}, \mathbf{Y}, \mathbf{Z}$ are the generalized Forces mapping to Flux Vector field $\mathbf{V p}=\nabla \cdot \mathbf{P}=[(\partial \mathrm{P} / \partial \mathrm{x}) \mathbf{x}+(\partial \mathrm{P} / \mathrm{dy}) \mathbf{y}+(\partial \mathrm{P} / \partial \mathrm{z}) \mathbf{z}]=[\mathrm{J} . \mathbf{x}+\mathrm{E} . \mathbf{y}+\mathrm{B} . \mathrm{z}]$ to the Density Scalar field $\mathbf{D p}=\boldsymbol{\nabla} . \mathbf{V p}=\boldsymbol{\nabla} .(\boldsymbol{\nabla} . \mathrm{P})$ and to the Changeable Vector field $\quad \mathbf{C p}=\boldsymbol{\nabla} \mathbf{~ V p}=\boldsymbol{\nabla} \times(\boldsymbol{\nabla} . \mathrm{P})$. Because the curl of the gradient of a Scalar field vanishes then, $\mathbf{C s}=\mathbf{C p}=\mathbf{0}$ (produced fields). The gauge freedom Unit vectors $\mathbf{d} \mathbf{s}=\mathbf{s}(\mathbf{n 1}, \mathbf{2}, \mathbf{3}), \mathbf{d P}=\mathbf{P}(\mathbf{n} \mathbf{1}, \mathbf{2}, \mathbf{3})$.© depended in Space and Anti-Space to be a source or $\sin k$ then $\mathbf{x}, \mathbf{y}, \mathbf{z} \leftrightarrow-\mathbf{x},-\mathbf{y},-\mathbf{z}$ which presupposes Impulses $\mathrm{PA}=-\mathrm{PB}$, is force P which is

$$
\begin{aligned}
& \mathbf{P}=\mathbf{W} / \mathbf{d s}=\partial / \partial \check{s}[\mathbf{W}]=\nabla \mathbf{W}=\nabla \cdot[\boldsymbol{\nabla} \mathbf{J} . \odot]=\nabla^{2} \mathbf{J} . \odot \\
& \text { Vector } \mathbf{J}=(\partial \mathrm{P} / \partial \mathrm{x}) \mathbf{x}=\operatorname{dP}(\mathrm{dx}) . \odot=\mathrm{Xp} \text { and }, \nabla^{2} \mathbf{J} \rightarrow \text { the Laplacian of vector field } \mathbf{J} \text { and } \\
& \mathrm{G} \cdot \boldsymbol{\nabla}^{2} .(\mathbf{a}) \pm \mathrm{G} \cdot \boldsymbol{\nabla}^{2} \cdot(\mathbf{b} \cdot \mathbf{i})=\mathbf{F}=\partial \mathbf{U} / \partial \mathbf{d} \mathbf{j}
\end{aligned}
$$

Electrons circulate around nucleus for ever by using conserved interchanged magnitude $\mathbf{J}$ as velocity field, magnitude E as atom's energy level field and B as energy exchanged field with the nucleus. Tangent acceleration is $a(t)=[\hat{u} /|u|] . d|u| / d t$, Centrifugal acceleration is $a(c)=|u| d / d t[\hat{u} /|u|]$
Using (cgs) conventional units then $\mathbf{E}$ and $\mathbf{B}$ have the same units. Spin is macroscopic (a) on bound charge of Space and Anti-Space, and microscopic (i) on any separate dipole AiBi , combined through [STPL] Mechanism to produce a Positive and Negative charge layer on both sides so the two fields split as $\mathrm{E}=\mathbf{E a}+\mathbf{E i}$ and $\mathbf{B}=\mathbf{B a}+\mathbf{B i}$ defining the unified Macroscopic and Microscopic bound conservation of Work. In a Stress System , the State of Principle Stresses ( $\boldsymbol{\sigma}$ ) at each point (it is the double refraction in Photo - Elasticity ) and it is as the Isochromatics lines [ $\boldsymbol{\sigma} \mathbf{\sigma} \mathbf{-} \boldsymbol{\sigma} \mathbf{2})=\mathrm{J} . \mathrm{k} / \mathrm{d}]$ or Isochromatics surfaces.
