# The minimum sum 

Ihsan Raja Muda Nasution

May 31, 2015

In this paper, we propose an idea of TSP-algorithm for any graph.
MSC: 05C12
Keywords: graph, traveling salesman problem

## 1 Introduction and results

The traveling salesman problem (TSP) is equivalent to the phenomena of bee colony. The algorithm which is based on the phenomena can be constructed [Kar05]. In this paper, we use the arithmetical approach to the TSP. Our mission is to minimize the summability of a graph.

In general, the weighted graph has a minimum and maximum. Indeed, the sum of small numbers is a small number too. Just one large number can affect the summation. We assume the sum is finite. The sum is denoted by $\Sigma$.

Definition 1. A number is close to the minimum denoted by $\ell$.
Definition 2. A number is close to the maximum denoted by $\mu$.
Definition 3. $N$ denotes the number of terms in $\Sigma$.
Thus, the object of the TSP is the minimization of the weights-summation in a graph. Thereby, we introduce the method for solving the TSP. The method has three steps:

1. The sum $\Sigma$ must contain the small totality of the numbers $\mu$.
2. The sum $\Sigma$ should be dominated by the numbers $\ell$.
3. $N$ should be small.

This method can be applied to any graph.
