#### Abstract

Prime numbers are the basic numbers and are crucial important. There are many conjectures concerning primes are challenging mathematicians for hundreds of years. Goldbach's conjecture is one of the oldest and best-known unsolved problems in number theory and in all of mathematics. A kaleidoscope can produce an endless variety of colorful patterns and it looks like a magic, but when you open it, it contains only very simple, loose, colored objects such as beads or pebbles and bits of glass. Goldbach's conjecture is about all numbers, the pattern of prime numbers likes a "kaleidoscope" of numbers, we divided any even numbers into 10 groups and primes into 4 groups, Goldbach's conjecture becomes much simpler. Here we give a clear proof for Goldbach's conjecture based on the fundamental theorem of arithmetic and Euclid's proof that the set of prime numbers is endless.

Key words: Goldbach's conjecture, fundamental theorem of arithmetic, Euclid's proof of infinite primes

\section*{Introduction}

Prime numbers ${ }^{1}$ are the basic numbers and are crucial important. There are many conjectures concerning primes are challenging mathematicians for hundreds of years and many "advanced mathematics tools" are used to solve them, but they are still unsolved.

I believe that prime numbers are "basic building blocks" of the natural numbers and they must follow some very simple basic rules and do not need "advanced mathematics tools" to solve them. Two of the basic rules are the "fundamental theorem of arithmetic" and Euclid's proof of endless prime numbers.

## Fundamental theorem of arithmetic:

The crucial importance of prime numbers to number theory and mathematics in general stems from the fundamental theorem of arithmetic, ${ }^{[1]}$ which states that every integer larger than 1 can be written as a product of one or more primes in a way that is unique except for the order of the prime factors. ${ }^{[2]}$ Primes can thus be considered the "basic building blocks" of the natural numbers.

## Euclid's proof ${ }^{[2]}$ that the set of prime numbers is endless

The proof works by showing that if we assume that there is a biggest prime number, then there is a contradiction.
We can number all the primes in ascending order, so that $P_{1}=2, P_{2}=3, P_{3}=5$ and so on. If we assume that there are just $\mathbf{n}$ primes, then the biggest prime will be labeled $\mathbf{P}_{\mathrm{n}}$. Now we can form the number Q by multiplying together all these primes and adding 1 , so

$$
\mathbf{Q}=\left(\mathbf{P}_{1} \times \mathbf{P}_{2} \times \mathbf{P}_{3} \times \mathbf{P}_{4} \ldots \times \mathbf{P}_{n}\right)+\mathbf{1}
$$

Now we can see that if we divide Q by any of our n primes there is always a remainder of 1 , so Q is not divisible by any of the primes, but we know that all positive integers are either primes or can be decomposed into a product of primes. This means that either Q must be a prime or Q must be divisible by primes that are larger than $\mathrm{P}_{\mathrm{n}}$.

Our assumption that $P_{n}$ is the biggest prime has led us to a contradiction, so this assumption must be false, so there is no biggest prime and the set of prime numbers is endless.

## Discussions

Goldbach's conjecture is one of the oldest and best-known unsolved problems in number theory and in all of mathematics. It states:
Every even integer greater than 2 can be expressed as the sum of two primes.

If N is an even integer:
$\mathrm{N}=\mathrm{N} / 2+\mathrm{N} / 2=(\mathrm{N} / 2+\mathrm{m})+(\mathrm{N} / 2-\mathrm{m}) ; \mathrm{m}=0,1,2,3, \ldots \ldots \mathrm{M}$. We need to prove $[(\mathrm{N} / 2+\mathrm{m}]$ and $[\mathrm{N} / 2-\mathrm{m}]$ can be primes at same time.
A kaleidoscope can produce an endless variety of colorful patterns and it looks like a magic, but when you open it, it contains only very simple, loose, colored objects such as beads or pebbles and bits of glass. Goldbach's conjecture is about all numbers, the pattern
of prime numbers likes a "kaleidoscope" of numbers, if we divide all even numbers into 10 groups and primes into 4 groups, Goldbach's conjecture will be much simpler.

If a number $(\mathrm{N}>3)$ is not divisible by 3 or any prime which is smaller or equal to $N / 3$, it must be a prime. Any number is divisible by 7 , it have $1 / 3$ chance is divisible by 3 , any number is divisible by 11 , it have $1 / 3$ chance is divisible by 3 and $1 / 7$ chance is divisible by 7 , any number is divisible by 13 , it has $1 / 3$ chance to be divisible 3 and $1 / 7$ chance to be divisible by 7 , and $1 / 11$ chance to be divisible by 11 , so on, so we have terms: $1 / 3,1 / 7 \times 2 / 3,1 / 11 \times 2 / 3 \times 6 / 7,1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11 \ldots$,

Let $\mathrm{N}_{\mathrm{o}}$ represent any odd number, the chance of $\mathrm{N}_{\mathrm{o}}$ to be a non-prime is: $[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 11 \times 2 / 3 \times 6 / 7)+(1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11)+$ $(1 / 17 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13)+(1 / 19 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17)+(1 / 23 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19)$ $+(1 / 29 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23)+(1 / 31 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+$
$(1 / 41 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37)+$
$(1 / 43 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37 \times 40 / 41)+$
$(1 / 47 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37 \times 40 / 41 \times 42 / 43)+\ldots]\}---------F o r m u l a 1$

Any odd number cannot be divisible by 2 and any odd number with 5 as its last digit is not a prime except 5 .

Let $\sum$ represent the sum of the infinite terms and $\Delta=1-\sum$, according to Euclid's proof ${ }^{[3]}$ that the set of prime numbers is endless. $\Delta$ is the chance of any odd number to be a prime. $\sum$ may be very close to 1 when N is growing to $\infty$, but always less than 1 . Let $\Delta=1-\sum$, when N is growing to $\infty, \Delta$ may be very close to 0 , but always more than 0 according to Euclid's proof that the set of prime numbers is endless. If $\Delta$ is 0 , then there is no prime, that is not true.

The sum of first 20 terms $=[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 11 \times 2 / 3 \times 6 / 7)+(1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13)$
$+(1 / 19 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17)+(1 / 23 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23)$
$+(1 / 31 \times 2 / 3 \times 6 / 7 x 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29)+(1 / 37 \times 2 / 3 \times 6 / 7 \mathrm{x} 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+$
$(1 / 41 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37)+$

For the first 20 term: \(\sum=0.689015, \Delta=1-\sum=0.310985\)
The chance of \(\mathrm{N}_{\mathrm{o}}\) to be a prime is: \(\Delta=1-[[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 11 \times 2 / 3 \times 6 / 7)+(1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13)+\) \((1 / 19 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17)+(1 / 23 \times 2 / 3 \times 6 / 7 \mathrm{x} 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23)\) \(+(1 / 31 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+\) \((1 / 41 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37)+\) \((1 / 43 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37 \times 40 / 41)+\) ( \(1 / 47 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 36 / 37 \times 40 / 41 \times 42 / 43+\ldots]\}----------\) Formula 2
```

Let us consider the following cases:

1. When any even integer ( N ) has 0 as its last digit, such as $10,20,30,40,110,120,1120,1130, \ldots$, then $\mathrm{N} / 2$ has only 0 or 5 as its last digit:

1a. Except 5 and 2, any prime must have $1,3,7$, or 9 as its last digit. When both $N$ and $N / 2$ have 0 as their last digit, then $N$ must be 20,
$40,60,80,100,120, \ldots, N$. For enough large number $N$, Let's consider $N=O_{1}+O_{2}=(N / 2+L+3)+(N / 2-L-3), O_{1}$ and $\mathrm{O}_{2}$ is an odd number. $\mathrm{O}_{1}>\mathrm{O}_{2}, \mathrm{O}_{1}-\mathrm{O}_{2}=2 \mathrm{~L}+6, \mathrm{~L}=0,5,10,15,20,25,30 \ldots \mathrm{~L}, \mathrm{O}_{1}-\mathrm{O}_{2}=2 \mathrm{~L}+6=6,26,46,66,86,106,126, \ldots,(2 \mathrm{~L}+6)$, then $\mathrm{O}_{1}$ is an odd number with 3 as its last digit, $\mathrm{O}_{2}$ is an odd number with 7 as its last digit.

Also we can have $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+7)+(\mathrm{N} / 2-\mathrm{L}-7), \mathrm{O}_{1}$ and $\mathrm{O}_{2}$ is an odd number. $\mathrm{O}_{1}>\mathrm{O}_{2}, \mathrm{O}_{1}-\mathrm{O}_{2}=2 \mathrm{~L}+14, \mathrm{~L}=0,10,20,30 \ldots \mathrm{~L}, \mathrm{O}_{1-}-$ $\mathrm{O}_{2}=2 \mathrm{~L}+14=14,34,54,74,94,114,134, \ldots(2 \mathrm{~L}+14)$, then $\mathrm{O}_{1}$ is an odd number with 7 as its last digit, $\mathrm{O}_{2}$ is an odd number with 3 as its last digit.

Then, we have odd number pairs as listed in table 1:

Table 1. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+3)+(\mathrm{N} / 2-\mathrm{L}-3)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+7)+(\mathrm{N} / 2-\mathrm{L}-7)$

| $\mathrm{N}-7$ | $\mathrm{~N}-17$ | $\mathrm{~N}-37$ | $\mathrm{~N}-47$ | $\mathrm{~N}-67$ | $\mathrm{~N}-97$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}+3$ | $\mathrm{~N} / 2-\mathrm{L}-7$ | $\ldots$ | 83 | 73 | 53 | 43 | 23 | 13 | 3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 17 | 37 | 47 | 67 | 97 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}-3$ | $\mathrm{~N} / 2+\mathrm{L}+7$ | $\ldots$ | $\mathrm{~N}-83$ | $\mathrm{~N}-73$ | $\mathrm{~N}-53$ | $\mathrm{~N}-43$ | $\mathrm{~N}-23$ | $\mathrm{~N}-13$ | $\mathrm{~N}-3$ |

Let $\$ 1$ represents a prime with 1 as its last digit, such as $11,31,41,61,71,101,131,151,181,191, \ldots ; \$ 3$ represents a prime with 3 as its last digit, such as $3,13,23,43,53,73,83,103,113,163,193 \ldots$; $\$ 7$ represents a prime with 7 as its last digit, such as, $7,17,37,47$, $67,97,107,127,137,157,167,197 \ldots$; and $\$ 9$ represents a prime with 9 as its last digit, such as $19,29,59,79,89,109,139,149,179$, 199,....

Let O 1 represents an odd number with 1 as its last digit, such as $11,21,31,41,51,61,71, \ldots ; \mathrm{O} 3$ represents an odd number with 3 as its last digit, such as $3,13,23,33,43,53,63,73, \ldots$; O7 represents an odd number with 7 as its last digit, such as, 7, 17, 27, 37, 47, $57,67,77 \ldots$; and O 9 represents an odd number with 9 as its last digit, such as $9,19,29,39,49,59,69,79, \ldots$.

Fundamental theorem of arithmetic states that every integer larger than 1 can be written as a product of one or more primes in a way that is unique except for the order of the prime factors.

Every odd number with 3 as its last digit is a product of $\$ 3 x \$ 1$ or $\$ 7 x \$ 9 ; \$ 1$ is decided by $\$ 3$ or $\$ 3$ is decided by $\$ 1$ and $\$ 9$ is decided by $\$ 7$ or $\$ 7$ is decided by 9 , so we need to consider only $\$ 3$ and $\$ 7, \$ 1$ and $\$ 9, \$ 3$ and $\$ 9$, or $\$ 1$ and $\$ 7$.

For number N, there are $5 \times \mathrm{N} / 10$ odd numbers, $\mathrm{N} / 10$ odd numbers with 1 as its last digit, $\mathrm{N} / 10$ odd numbers with 3 as its last digit, $\mathrm{N} / 10$ odd numbers with 5 as its last digit, $\mathrm{N} / 10$ odd numbers with 7 as its last digit, and $\mathrm{N} / 10$ odd numbers with 9 as its last digit. Odd numbers with 5 as its last digit is not primes except 5. According to Euclid's proof, primes are endless and it is easy to prove that prime with $1,3,7$, or 9 as its last digit is also endless.

Let's select $\$ 3$ to be a product of $\$ 3$ and $\$ 1$ or $\$ 7$ and $\$ 9$. If a number ( $\mathrm{N}>3$ ) is not divisible by 3 or any prime which is smaller or equal to $N / 3$, it must be a prime; any number is divisible by 7 , it have $1 / 3$ chance is divisible by 3 ; any number is divisible by 13 , it has $1 / 3$ chance to be divisible 3 and $1 / 7$ chance to be divisible by 7 , so on, so we have terms: $1 / 3,1 / 7 \times 2 / 3,1 / 13 \times 2 / 3 \times 6 / 7 \ldots$. For number N , there are $\mathrm{N} / 10$ odd number with 1 as its last digit, $\mathrm{N} / 10$ odd number with 3 as its last digit, $\mathrm{N} / 10$ odd number with 7 as its last digit, and $\mathrm{N} / 10$ odd number with 9 as its last digit.

The chance of any odd number with 3 as its last digit to be a non-prime is: $[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)$ $+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+$ (1/47x2/3x6/7x12/13x16/17x36/37x22/23x42/43) +...]\} ---------(Formula 3)

The number ( n ) of primes in $\mathrm{N} / 10$ odd number with 3 as its last digit: $\mathrm{n}_{3}=\mathrm{N} / 10-\{\mathrm{N} / 10[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+$ $(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+$ $(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)+\ldots]\}--------(F o r m u l a 4)$

For infinite terms, the number will grow slowly and will be close to 1 , but never equal to 1 (if it equal to 1 , we will have 0 prime) according to Euclid's proof of endless prime numbers. Let $\sum_{3}$ represents the sum of the above infinite terms and $\Delta_{3}$ represents the chance of any odd number to be a prime. When N is growing to $\infty$, and $\Delta_{3}=1-\sum_{3}$ may be close to 0 , but never be 0 .

The sum of first 20 terms $=[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)+$ $(1 / 53 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43 \times 46 / 47)+(1 / 67 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43 \times 46 / 47 \times 52 / 53)+$

```

For the first 20 term: $\sum_{3}=0.6103, \Delta_{3}=1-\sum_{3}=0.3897$
For $N=600$, the smallest prime $\$ 1$ is 11 , it decided the possible largest prime $\$ 3$ is 53 , the smallest prime $\$ 9$ is 19 , but $3 \times 3$ is 9 , so the possible largest prime $\$ 7$ is 47 , $47 \times 3 \times 3=423$ (the next will $67 \times 3 \times 3=603>600$ ), so we have: Prime number with 3 as its last digit $=600 / 10-\{600 / 10[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 x 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 x 42 / 43)$ $+(1 / 53 x 2 / 3 x 6 / 7 x 12 / 13 x 16 / 17 \times 36 / 37 x 22 / 23 x 42 / 43 x 46 / 47)]=600 / 10-600 / 10[0.333333+0.095238+0.043956+0.031028+$ $0.021585+0.012834+0.010745+0.009602+0.008333=60-60 x 0.566654=60-34=26$, it is 3 less than 29 primes (in total 60 odd number) with 3 as their last digit from 1 to 600 because 600 is not a big enough number, when N is big enough, the calculated number will be very close to the real number of primes. For $\mathrm{N}=600$, we have $\Delta_{3}=1-\sum_{3}=1-0.566654=0.433346$, every odd number with 3 as its last digit has almost $43 \%$ chance to be a prime number smaller than 600, every odd number with 3 as its last digit has more than $43 \%$ chance to be a prime; for a number bigger than 600 , every odd number with 3 as its last digit has less than $43 \%$ chance to be a prime.

Every odd number with 7 as its last digit is a product of $\$ 3 \mathrm{x} \$ 9$ or $\$ 7 \mathrm{x} \$ 1 ; \$ 1$ is decided by $\$ 7$ and $\$ 9$ is decided by $\$ 3$, so we need to consider only $\$ 3$ and $\$ 7$ (we have other selections too, $\$ 9$ and $\$ 7$, $\$ 9$ and $\$ 1$, or $\$ 3$ and $\$ 1$ ).

The chance of any odd number with 7 as its last digit to be a non-prime is: $[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)$ $+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+$ (1/47x2/3x6/7x12/13x16/17x36/37x22/23x42/43) +...]\} ---------(Formula 3)

The number ( n ) of primes in $\mathrm{N} / 10$ odd number with 7 as its last digit is: $\mathrm{n}=\mathrm{N} / 10-\{\mathrm{N} / 10[(1 / 3)+(1 / 7 \mathrm{x} 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+$ $(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+$
$(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)+\ldots]\}-------F o r m u l a 4$.
That mean we have almost same number of primes with 7 as their last digit as the number of primes with 3 as their last digit. From above formula, we can know smaller number N has high percentage to be primes than bigger number N .

Let $\sum_{7}$ represent the sum of the above infinite terms. $\sum_{7}=\sum_{3}$, when $N$ is growing to $\infty$, and $\Delta_{7}=1-\sum_{7}$ may be close to 0 , but never be 0 .
For simple, to find out at least one pair primes of $(\mathrm{N} / 2+\mathrm{m})+(\mathrm{N} / 2-\mathrm{m})$, we need to fix $(\mathrm{N} / 2+\mathrm{m})$ or $(\mathrm{N} / 2-\mathrm{m})$ to be a prime as the list (half in left side and half in right side) in table 1. Let see $\$ 7=7$ first (left side of table 1), we can know there is a bigger chance for ( N $\$ 7$ ) to be a prime with 3 as its last digit than (N-O7). If N-7 can be divisible by 7 , then ( $\mathrm{N}-7$ ) $+7[7 \mathrm{a}+7=7(\mathrm{a}+1)$, 7 a and $7(\mathrm{a}+1)$ must be divisible by 7] will be divisible by 7 , but N with 0 as its last digit and only $70,140,210,280,350,420,490,560,630, \ldots$ are divisible by 7 , but we worked on only N and $\mathrm{N} / 2$ with 0 as their last digit, only $140,280,420,560, \ldots$,(1 in 14) can be divisible by 7 , so the term ( $1 / 7 \mathrm{x} 13 / 14$ ) should be taken off from Formula 3.

For the next prime $\$ 7=17$, ( $\mathrm{N}-17$ ) cannot be divisible by 17 except $340,680, \ldots$, so ( $1 / 17 \mathrm{x} 33 / 34$ ) should be taken off from Formula 3, so on.

Let $\mathrm{n}_{7}$ represents the total number of primes (\$7) with 7 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 7$ with 3 as its last digit to be a prime is: $\Delta_{3}=1-\sum_{3}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)$ $+\ldots,]-[(1 / 7 x 13 / 14)]+(1 / 17 x 33 / 34)+(1 / 37 x 73 / 74) \ldots .]\}.--------F o r m u l a 5$

When the number of $\$ 7$ is 5 or more, $5 \mathrm{x}[(1 / 7 \mathrm{x} 13 / 14)+(1 / 17 \times 33 / 34)+(1 / 37 \times 73 / 74) \ldots]>1$, so every 5 primes with 7 as their last digit (\$7) will have at least 1 prime of $\mathrm{N}-\$ 7$ to form 1 pair of primes in which one has 7 as its last digit and another has 3 as its last digit and their sum is any number N in which N and $\mathrm{N} / 2$ have 0 as its last digit.

For enough large number N , Let's consider $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+1)+(\mathrm{N} / 2-\mathrm{L}-1), \mathrm{O}_{1}$ and $\mathrm{O}_{2}$ are odd numbers. $\mathrm{O}_{1}>\mathrm{O}_{2}, \mathrm{O}_{1}-\mathrm{O}_{2}=2 \mathrm{~L}+2, \mathrm{~L}=0$, $10,20,30 \ldots . \mathrm{L}, \mathrm{O}_{1}-\mathrm{O}_{2}=2 \mathrm{~L}+2=2,22,42,62,82,102,122, \ldots(2 \mathrm{~L}+2)$, then $\mathrm{O}_{1}$ is an odd number with 1 as its last digit, $\mathrm{O}_{2}$ is an odd number with 9 as its last digit.

Also we can have $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+9)+(\mathrm{N} / 2-\mathrm{L}-9), \mathrm{O}_{1}$ and $\mathrm{O}_{2}$ are odd numbers. $\mathrm{O}_{1}>\mathrm{O}_{2}, \mathrm{O}_{1}-\mathrm{O}_{2}=2 \mathrm{~L}+18, \mathrm{~L}=0,10,20,30 \ldots . \mathrm{L}, \mathrm{O}_{1-}-$ $\mathrm{O}_{2}=2 \mathrm{~L}+18=18,38,58,78,98,118,138, \ldots,(2 \mathrm{~L}+18)$, then $\mathrm{O}_{1}$ is an odd number with 9 as its last digit, $\mathrm{O}_{2}$ is an odd number with 1 as its last digit.

These odd number pairs are listed in table 2 :

Table 2. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+1)+(\mathrm{N} / 2-\mathrm{L}-1)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+9)+(\mathrm{N} / 2-\mathrm{L}-9)$

| N-9 | N-19 | N-29 | N-39 | N-59 | N-79 | N-89 | $\ldots$ | $\mathrm{N} / 2+\mathrm{L}+1$ | $\mathrm{~N} / 2-\mathrm{L}-9$ | $\ldots$ | 101 | 71 | 61 | 41 | 31 | 11 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $9(3 \times 3)$ | 19 | 29 | 39 | 59 | 79 | 89 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}-1$ | $\mathrm{~N} / 2+\mathrm{L}+9$ | $\ldots$ | $\mathrm{~N}-101$ | $\mathrm{~N}-71$ | $\mathrm{~N}-61$ | $\mathrm{~N}-41$ | $\mathrm{~N}-31$ | $\mathrm{~N}-11$ |

Every odd number (O1) with 1 as its last digit is a product of $\$ 1 \mathrm{x} \$ 1, \$ 3 \mathrm{x} \$ 7$, and $\$ 9 \mathrm{x} \$ 9$. The first $\$ 9$ is 19 , but the odd number $9=3 \times 3$, so 3 is the smallest prime for $\$ 9$.

The chance of any odd number with 1 as its last digit to be a non-prime is: $[(1 / 3)+(1 / 11 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 10 / 11)+$ $(1 / 19 \times 2 / 3 \times 10 / 11 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23)+$ $(1 / 31 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29)+(1 / 41 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+$ (1/43x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41)+...]------------Formula 6

The number ( n ) of primes in $\mathrm{N} / 10$ odd number with 1 as its last digit is: $\mathrm{n}=\mathrm{N} / 10-\{\mathrm{N} / 10[(1 / 3)+(1 / 11 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 10 / 11)+$ $(1 / 19 \times 2 / 3 \times 10 / 11 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23)+$ $(1 / 31 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29)+(1 / 41 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+$ (1/43x2/3x10/11x12/13x18/19x22/23x28/29x30/31x40/41)+...]\} ------------Formula 7

Every odd number (O9) with 9 as its last digit is a product terms of $\$ 1 \mathrm{x} \$ 9, \$ 3 \mathrm{x} \$ 3$ or $\$ 7 \mathrm{x} \$ 7$. We need to consider only $\$ 1, \$ 3$, and $\$ 7$.
The chance of any odd number with 9 as its last digit to be a non-prime is: $[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 11 \times 2 / 3 \times 6 / 7)+(1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11)$ $+(1 / 17 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17)+(1 / 31 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31)+(1 / 41 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37)+$ $(1 / 43 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37 \times 40 / 41)+$ ( $1 / 47 \times 2 / 3 \times 6 / 7 x 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 x 30 / 31 \times 36 / 37 x 40 / 41 x 42 / 43) \ldots]-------------$ Formula 8
the number ( n ) of primes in $\mathrm{N} / 10$ odd number with 9 as its last digit: $\mathrm{n}=\mathrm{N} / 10-\{\mathrm{N} / 10[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 11 \times 2 / 3 \times 6 / 7)+$ $(1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17)+$ $(1 / 31 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31)+$ $(1 / 41 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37 \times 40 / 41)+$ (1/47x2/3x6/7x10/11x12/13x16/17x22/23x30/31x36/37x40/41x42/43)...]\}-----------Formula 9

Let see $\$ 9=9$ ( $3 \times 3$ ) first (left side of table 2 ), we can know there is a bigger chance for ( $\mathrm{N}-\$ 9$ ) to be a prime with 1 as its last digit than (N-O9). If N-9 can be divisible by 9 , then (N-9)+9( $=\mathrm{N}$ ) $[9 a+9=9(a+1), 9 a$ and $9(a+1)$ must be divisible by 3 or 9$]$ will be divisible by 3 or 9 , but N with 0 as its last digit and only $30,60,90,120,150,180,210,240,260, \ldots$ are divisible by 3 or $9, \ldots$, and we worked on only N and $\mathrm{N} / 2$ with 0 as their last digit, only $60,120,180,240, \ldots$, ( 1 in 6 ) can be divisible by 3 or 9 , so the term ( $1 / 3 \times 5 / 6$ ) should be taken off from Formula 6.

For the next prime $\$ 9=19$, ( $\mathrm{N}-19$ ) cannot be divisible by 19 except $380,760, \ldots$, so $(1 / 19 x 37 / 38)$ should be taken off from Formula 6 , so on.

Let $\mathrm{n}_{9}$ represents the total number of primes (\$9) with 9 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 9$ with 1 as its last digit to be a prime is: $\Delta_{1}=1-\sum_{1}=1-\{[(1 / 3)+(1 / 11 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 10 / 11)+(1 / 19 \times 2 / 3 \times 10 / 11 \times 12 / 13)$ $+(1 / 23 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23)+(1 / 31 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29)+$ $(1 / 41 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+(1 / 43 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 40 / 41)+\ldots]-[(1 / 3 \times 5 / 6)]+$ $(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots]\}.--------F o r m u l a 10$

When the number of $\$ 9$ is 4 or more, $4 \times[(1 / 3 \times 5 / 6)]+(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots.]>1$, so every $4 \$ 9$ will have at least 1 prime of $\mathrm{N}-\$ 9$ to form 1 pair of primes in which one has 9 as its last digit and another has 1 as its last digit and their sum is any number N in which N and $\mathrm{N} / 2$ have 0 as its last digit.

For $\mathrm{N}=600$ (see table 3), 600 can be expressed as the sum of 15 pairs of primes in which one prime with 3 as its last digit and another prime with 7 as its last digit and 600 can be expressed as the sum of 16 pairs of primes in which one prime with 1 as its last digit and another prime with 9 as its last digit.

| 7 | 17 | 37 | 47 | 67 | 97 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}+2$ | $\mathrm{~N} / 2+\mathrm{L}+2$ | $\ldots$ | $\mathrm{~N}-83$ | $\mathrm{~N}-73$ | $\mathrm{~N}-53$ | $\mathrm{~N}-43$ | $\mathrm{~N}-23$ | $\mathrm{~N}-13$ | $\mathrm{~N}-3$ |

Let see $\$ 7=7$ first (left side of table 3), we can know there is a bigger chance for ( $\mathrm{N}-\$ 7$ ) to be a prime with 3 as its last digit than ( N O7). If $\mathrm{N}-7$ can be divisible by 7 , then $(\mathrm{N}-7)+7(=\mathrm{N})[7 \mathrm{a}+7=7(\mathrm{a}+1), 7 \mathrm{a}$ and $7(\mathrm{a}+1)$ must be divisible by 7$]$ will be divisible by 7 , but N with 0 as its last digit and only $70,140,210,280,350,420,490,560,630, \ldots$ are divisible by 7 , but we worked on only N with 0 as their last digit and $\mathrm{N} / 2$ with 5 as their last digit, so only $70,210,350,490, \ldots,(1 \mathrm{in} 14)$ can be divisible by 7 , so the term ( $1 / 7 \mathrm{x} 13 / 14$ ) should be taken off from Formula 3.

For the next prime $\$ 7=17$, ( $\mathrm{N}-17$ ) cannot be divisible by 17 except $170,510, \ldots$, so $(1 / 17 \times 33 / 34)$ should be taken off from Formula 3, so on.

Let $\mathrm{n}_{7}$ represents the total number of primes (\$7) with 7 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 7$ with 3 as its last digit to be a prime is: $\Delta_{3}=1-\sum_{3}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)$ $+\ldots,]-[(1 / 7 \times 13 / 14)]+(1 / 17 x 33 / 34)+(1 / 37 \times 73 / 74) \ldots .]$.

When the number of $\$ 7$ is 5 or more, $5 \mathrm{x}[(1 / 7 \mathrm{x} 13 / 14)+(1 / 17 \mathrm{x} 33 / 34)+(1 / 37 \mathrm{x} 73 / 74) \ldots]>1$, so every $5 \$ 7$ will have at least 1 prime of $\mathrm{N}-\$ 7$ to form 1 pair of primes in which one has 7 as its last digit and another has 3 as its last digit and their sum is any number N in which N have 0 as its last digit and $\mathrm{N} / 2$ have 5 as its last digit.

Table 4. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-4)+(\mathrm{N} / 2-\mathrm{L}+4)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-6)+(\mathrm{N} / 2-\mathrm{L}+6)$

| N-9 | N-19 | N-29 | $\mathrm{N}-59$ | $\mathrm{~N}-79$ | $\mathrm{~N}-89$ | $\ldots$ | $\mathrm{~N} / 2+1-4$ | $\mathrm{~N} / 2-\mathrm{L}+6$ | $\ldots$ | 101 | 71 | 61 | 41 | 31 | 11 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $9(3 \times 3)$ | 19 | 29 | 59 | 79 | 89 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}+4$ | $\mathrm{~N} / 2+\mathrm{L}-6$ | $\ldots$ | $\mathrm{~N}-101$ | $\mathrm{~N}-71$ | $\mathrm{~N}-61$ | $\mathrm{~N}-41$ | $\mathrm{~N}-31$ | $\mathrm{~N}-11$ |

Let see $\$ 9=9$ ( $3 \times 3$ ) first (left side of table 4), we can know there is a bigger chance for ( $\mathrm{N}-\$ 9$ ) to be a prime with 1 as its last digit than (N-O9). If N-9 can be divisible by 9 , then $(N-9)+9(=N)[9 a+9=9(a+1), 9 a$ and $9(a+1)$ must be divisible by 3 or 9$]$ will be divisible by 3 or 9 , but N with 0 as its last digit and only $30,60,90,120,150,180,210,240,260, \ldots$ are divisible by 3 or $9, \ldots$, but we worked on only N with 0 as their last digit and $\mathrm{N} / 2$ with 5 as its last digit, only $30,90,150,210, \ldots,(1$ in 6 ) can be divisible by 3 or 9 , so the term $(1 / 3 \times 5 / 6)$ should be taken off from Formula 6.

For the next prime $\$ 9=19$, ( $N-19$ ) cannot be divisible by 19 except $190,570, \ldots$, so $(1 / 19 x 37 / 38)$ should be taken off from Formula 6 , so on.

Let $\mathrm{n}_{9}$ represents the total number of primes (\$9) with 9 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 9$ with 1 as its last digit to be a prime is: $\Delta_{1}=1-\sum_{1}=1-\{[(1 / 3)+(1 / 11 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 10 / 11)+(1 / 19 \times 2 / 3 \times 10 / 11 \times 12 / 13)$
$+(1 / 23 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23)+(1 / 31 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29)+$ $(1 / 41 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+(1 / 43 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 40 / 41)+\ldots]-[(1 / 3 \times 5 / 6)]+$ $(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots]$.

When the number of $\$ 9$ is 4 or more, $4 \times[(1 / 3 \times 5 / 6)]+(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots.]>1$, so every $4 \$ 9$ will have at least 1 prime of $\mathrm{N}-\$ 9$ to form 1 pair of primes in which one has 9 as its last digit and another has 1 as its last digit and the sum is any number N in which N has 0 as its last digit and $\mathrm{N} / 2$ has 5 as its last digit.
2. When any even integer $(\mathrm{N})$ has 2 as its last digit, such as $12,22,32,42,112,122,1122,1132, \ldots$, then $\mathrm{N} / 2$ has only 6 or 1 as its last digit.

2a. When any even integer $(\mathrm{N})$ has 2 as its last digit, such as $12,32,52,112,1132, \ldots$, then $\mathrm{N} / 2$ has 6 as its last digit:

Table 5. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-3)+(\mathrm{N} / 2-\mathrm{L}+3)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+3)+(\mathrm{N} / 2-\mathrm{L}-3)$

| N-9 | N-19 | $\mathrm{N}-29$ | $\mathrm{~N}-59$ | $\mathrm{~N}-79$ | $\mathrm{~N}-89$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}-3$ | $\mathrm{~N} / 2-\mathrm{L}-3$ | $\ldots$ | 83 | 73 | 53 | 43 | 23 | 13 | 3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $9(3 \times 3)$ | 19 | 29 | 59 | 79 | 89 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}+3$ | $\mathrm{~N} / 2+\mathrm{L}+3$ | $\ldots$ | $\mathrm{~N}-83$ | $\mathrm{~N}-73$ | $\mathrm{~N}-53$ | $\mathrm{~N}-43$ | $\mathrm{~N}-23$ | $\mathrm{~N}-13$ | $\mathrm{~N}-3$ |

Let see $\$ 9=9$ first (left side of table 5 ), if $N-9$ can be divisible by 9 , then $(N-9)+9(=N)[9 a+9=9(a+1), 9 a$ and $9(a+1)$ must be divisible by 3 or 9 ] will be divisible by 3 or 9 , but N with 2 as its last digit and only 12, 42, 72, 102, 132, 162, 192, 222, 252, 282, 312, $342,372,402,432,462,492,522,552, \ldots$ are divisible by 3 or $9, \ldots$, but we worked on only $N$ with 2 as their last digit and N/2 with 6 as their last digit, only $12,72,132,192,252, \ldots$, ( 1 in 6 ) can be divisible by 3 or 9 , so the term ( $1 / 3 \times 5 / 6$ ) should be taken off from Formula 3.

For the next prime $\$ 9=19$, ( $\mathrm{N}-19$ ) cannot be divisible by 19 except $552,932, \ldots$, so $(1 / 19 x 37 / 38)$ should be taken off from Formula 3 , so on.

Let $\mathrm{n}_{9}$ represents the total number of primes (\$9) with 9 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 9$ with 3 as its last digit to be a prime is: $\Delta_{3}=1-\sum_{3}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \mathrm{x} 2 / 3 \mathrm{x} 6 / 7 \mathrm{x} 12 / 13 \mathrm{x} 16 / 17 \mathrm{x} 22 / 23)+(1 / 43 \mathrm{x} 2 / 3 \mathrm{x} 6 / 7 \mathrm{x} 16 / 17 \mathrm{x} 36 / 37 \mathrm{x} 12 / 13 \times 22 / 23)+(1 / 47 \mathrm{x} 2 / 3 \times 6 / 7 \mathrm{x} 12 / 13 \mathrm{x} 16 / 17 \mathrm{x} 36 / 37 \mathrm{x} 22 / 23 \mathrm{x} 42 / 43)$ $+\ldots,]-[(1 / 3 x 5 / 6)]+(1 / 19 x 37 / 38)+(1 / 29 \times 57 / 58) \ldots .]$.

When the number of $\$ 9$ is 4 or more, $4 \times[(1 / 3 \times 5 / 6)]+(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots]>1$, so every $4 \$ 9$ will have at least 1 prime of $N$ $\$ 9$ to form 1 pair of primes in which one has 9 as its last digit and another has 3 as its last digit and their sum is any number N in which N has 2 as its last digit and $\mathrm{N} / 2$ has 6 as its last digit.

Table 6. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-5)+(\mathrm{N} / 2-\mathrm{L}+5)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-5)+(\mathrm{N} / 2-\mathrm{L}+5)$

| $\mathrm{N}-11$ | $\mathrm{~N}-31$ | $\mathrm{~N}-41$ | $\mathrm{~N}-61$ | $\mathrm{~N}-71$ | $\mathrm{~N}-101$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}-5$ | $\mathrm{~N} / 2-\mathrm{L}+5$ | $\ldots$ | 101 | 71 | 61 | 41 | 31 | 11 |

| 11 | 21 | 31 | 41 | 51 | 61 | 71 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}-0$ | $\mathrm{~N} / 2+\mathrm{L}-0$ | $\ldots$ | $\mathrm{~N}-81$ | $\mathrm{~N}-71$ | $\mathrm{~N}-61$ | $\mathrm{~N}-51$ | $\mathrm{~N}-41$ | $\mathrm{~N}-31$ | $\mathrm{~N}-21$ | $\mathrm{~N}-11$ |

Let see $\$ 1=11$ first (left side of table 8 ), we can know there is a bigger chance for ( $\mathrm{N}-\$ 1$ ) to be a prime with 1 as its last digit than ( N O1). If $\mathrm{N}-11$ can be divisible by 11 , then $(\mathrm{N}-11)+11(=\mathrm{N})[11 \mathrm{a}+11=11(\mathrm{a}+1), 11 \mathrm{a}$ and $11(\mathrm{a}+1)$ must be divisible by 11$]$ will be divisible by $11, \mathrm{~N}$ with 2 as its last digit and only $132,242,352,462,572,682,792,902, \ldots$ are divisible by $11, \ldots$, but we worked on only N with 2 as their last digit and $\mathrm{N} / 2$ with 1 as its last digit, only $22,242,462,682, \ldots,(1 \mathrm{in} 22)$ can be divisible by 11 , so the term ( $1 / 11 \times 21 / 22$ ) should be taken off from Formula 6.

For the next prime $\$ 1=31$, ( $\mathrm{N}-31$ ) cannot be divisible by 31 except $62,682, \ldots$, so $(1 / 31 \times 61 / 62)$ should be taken off from Formula 6 , so on.

Let $\mathrm{n}_{1}$ represents the total number of primes ( $\$ 1$ ) with 1 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 1$ with 1 as its last digit to be a prime is: $\Delta_{1}=1-\sum_{1}=1-\{[(1 / 3)+(1 / 11 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 10 / 11)+(1 / 19 \times 2 / 3 \times 10 / 11 \times 12 / 13)$
$+(1 / 23 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19)+(1 / 29 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23)+(1 / 31 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29)+$ $(1 / 41 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31)+(1 / 43 \times 2 / 3 \times 10 / 11 \times 12 / 13 \times 18 / 19 \times 22 / 23 \times 28 / 29 \times 30 / 31 \times 40 / 41)+\ldots]-[(1 / 11 \times 21 / 22)]$ $+(1 / 31 \times 61 / 62)+(1 / 41 \times 81 / 82) \ldots]$.

When the number of $\$ 1$ is 11 or more, $[(1 / 11 \times 21 / 22)]+(1 / 31 \times 61 / 62)+(1 / 41 \times 81 / 82) \ldots]>1$, so every $11 \$ 1$ will have at least 1 prime of $\mathrm{N}-\$ 1$ to form 1 pair of primes in which both have 1 as its last digit and their sum is any number N in which N has 2 as its last digit and N/2 has 1 as its last digit.

3a. When any even integer $(\mathrm{N})$ has 4 as its last digit, such as $24,44,64,84,104,1124, \ldots$, then $\mathrm{N} / 2$ has 2 as its last digit:
Table 9. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+1)+(\mathrm{N} / 2-\mathrm{L}+7)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2-\mathrm{L}+1)+(\mathrm{N} / 2+\mathrm{L}+7)$

| N-7 | N-17 | N-37 | N-47 | N-67 | N-97 | N-107 | $\ldots$ | $\mathrm{N} / 2+L-5$ | $\mathrm{~N} / 2-L-5$ | $\ldots$ | 107 | 97 | 67 | 47 | 37 | 17 | 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 17 | 37 | 47 | 67 | 97 | 107 | $\ldots$ | $\mathrm{~N} / 2-L+5$ | $\mathrm{~N} / 2+\mathrm{L}+5$ | $\ldots$ | $\mathrm{~N}-107$ | $\mathrm{~N}-97$ | $\mathrm{~N}-67$ | $\mathrm{~N}-47$ | $\mathrm{~N}-37$ | $\mathrm{~N}-17$ | $\mathrm{~N}-7$ |

Let see $\$ 7=7$ first (left side of table 9), we can know there is a bigger chance for ( $\mathrm{N}-\$ 7$ ) to be a prime with 7 as its last digit than ( N O7). If $\mathrm{N}-7$ can be divisible by 7 , then $(\mathrm{N}-7)+7(=\mathrm{N})[7 \mathrm{a}+7=7(\mathrm{a}+1), 7 \mathrm{a}$ and $7(\mathrm{a}+1)$ must be divisible by 7$]$ will be divisible by 7 , but N with 4 as its last digit and only $14,84,154,224,294,364,434,504,574, \ldots$ are divisible by 7 , but we worked on only N with 4 as their last digit and $\mathrm{N} / 2$ with 2 as their last digit, only $84,224,364,504, \ldots$, ( 1 in 14 ) can be divisible by 7 , so the term ( $1 / 7 \mathrm{x} 13 / 14$ ) should be taken off from Formula 3.

For the next prime $\$ 7=17$, ( $\mathrm{N}-17$ ) cannot be divisible by 17 except $204,544,884, \ldots$, so $(1 / 17 \times 33 / 34)$ should be taken off from Formula 3, so on.

Let $\mathrm{n}_{7}$ represents the total number of primes (\$7) with 7 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 7$ with 7 as its last digit to be a prime is: $\Delta_{7}=1-\sum_{7}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)$ $+\ldots,]-[(1 / 7 \times 13 / 14)]+(1 / 17 \times 33 / 34)+(1 / 37 \times 73 / 74) \ldots]$.

When the number of $\$ 7$ is 5 or more, $5 \mathrm{x}[(1 / 7 \mathrm{x} 13 / 14)+(1 / 17 \mathrm{x} 33 / 34)+(1 / 37 \mathrm{x} 73 / 74) \ldots]>1$, so every $5 \$ 7$ will have at least 1 prime of $\mathrm{N}-\$ 7$ to form 1 pair of primes in which both have 7 as its last digit and the sum is any number N in which N have 4 as its last digit and $\mathrm{N} / 2$ have 2 as its last digit.

Table 10. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+1)+(\mathrm{N} / 2-\mathrm{L}-1)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-1)+(\mathrm{N} / 2-\mathrm{L}+1)$

| $\mathrm{N}-11$ | $\mathrm{~N}-21$ | $\mathrm{~N}-31$ | $\mathrm{~N}-41$ | $\mathrm{~N}-51$ | $\mathrm{~N}-61$ | $\mathrm{~N}-71$ | $\mathrm{~N}-81$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}+1$ | $\mathrm{~N} / 2-\mathrm{L}+1$ | $\ldots$ | 103 | 83 | 53 | 43 | 23 | 13 | 3 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 11 | 21 | 31 | 41 | 51 | 61 | 71 | 81 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}-1$ | $\mathrm{~N} / 2+\mathrm{L}-1$ | $\ldots$ | $\mathrm{~N}-71$ | $\mathrm{~N}-61$ | $\mathrm{~N}-51$ | $\mathrm{~N}-41$ | $\mathrm{~N}-31$ | $\mathrm{~N}-21$ | $\mathrm{~N}-11$ |

Let see $\$ 1=11$ first (left side of table 10), we can know there is a bigger chance for ( $\mathrm{N}-\$ 1$ ) to be a prime with 1 as its last digit than ( N O1). If $\mathrm{N}-11$ can be divisible by 11 , then $(\mathrm{N}-11)+11(=\mathrm{N})[11 \mathrm{a}+11=11(\mathrm{a}+1), 11 \mathrm{a}$ and $11(\mathrm{a}+1)$ must be divisible by 11$]$ will be divisible by $11, \mathrm{~N}$ with 4 as its last digit and only $44,154,264,374,484,594,704,814, \ldots$ are divisible by $11, \ldots$, but we worked on only N with 4 as their last digit and $\mathrm{N} / 2$ with 2 as its last digit, only $44,264,484,704, \ldots,(1 \mathrm{in} 22)$ can be divisible by 11 , so the term ( $1 / 11 \times 21 / 22$ ) should be taken off from Formula 3.

For the next prime $\$ 1=31$, $(N-31)$ cannot be divisible by 31 except $124,744, \ldots$, so $(1 / 31 \times 61 / 62)$ should be taken off from Formula 6 , so on.

Let $\mathrm{n}_{1}$ represents the total number of primes ( $\$ 1$ ) with 1 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 1$ with 3 as its last digit to be a prime is: $\Delta_{3}=1-\sum_{3}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 16 / 17 \times 36 / 37 \times 12 / 13 \times 22 / 23)+(1 / 47 \times 2 / 3 \times 6 / 7 \times 12 / 13 \times 16 / 17 \times 36 / 37 \times 22 / 23 \times 42 / 43)$ $+\ldots,]-[(1 / 11 \times 21 / 22)]+(1 / 31 \times 61 / 62)+(1 / 41 \times 81 / 82) \ldots]$.

When the number of $\$ 1$ is 11 or more, $[(1 / 11 \times 21 / 22)]+(1 / 31 \times 61 / 62)+(1 / 41 \times 81 / 82) \ldots]>1$, so every $11 \$ 1$ will have at least 1 prime of $\mathrm{N}-\$ 1$ to form 1 pair of primes in which one prime has 1 as its last digit and another has 3 as its last digit and their sum is any number N in which N has 4 as its last digit and $\mathrm{N} / 2$ has 2 as its last digit.

3b. When any even integer $(\mathrm{N})$ has 4 as its last digit, such as $14,34,54,74,94,1114, \ldots$, then $\mathrm{N} / 2$ has 7 as its last digit:
Table 11. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+0)+(\mathrm{N} / 2-\mathrm{L}+0)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2-\mathrm{L}+0)+(\mathrm{N} / 2+\mathrm{L}+0)$

| $N-7$ | $\mathrm{~N}-17$ | $\mathrm{~N}-37$ | $\mathrm{~N}-47$ | $\mathrm{~N}-67$ | $\mathrm{~N}-97$ | $\mathrm{~N}-107$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}+0$ | $\mathrm{~N} / 2-\mathrm{L}+0$ | $\ldots$ | 107 | 97 | 67 | 47 | 37 | 17 | 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| N-9 | N-19 | $\mathrm{N}-29$ | $\mathrm{~N}-59$ | $\mathrm{~N}-79$ | $\mathrm{~N}-89$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}-0$ | $\mathrm{~N} / 2-\mathrm{L}+0$ | $\ldots$ | 89 | 79 | 59 | 29 | 19 | $9(3 \times 3)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $9(3 \times 3)$ | 19 | 29 | 59 | 79 | 89 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}+0$ | $\mathrm{~N} / 2+\mathrm{L}-0$ | $\ldots$ | $\mathrm{~N}-89$ | $\mathrm{~N}-79$ | $\mathrm{~N}-59$ | $\mathrm{~N}-29$ | $\mathrm{~N}-19$ | $\mathrm{~N}-9$ |

Let see $\$ 9=9$ first (left side of table 19), if $N-9$ can be divisible by 9 , then $(N-9)+9(=N)[9 a+9=9(a+1), 9 a$ and $9(a+1)$ must be divisible by 3 or 9 ] will be divisible by 3 or $9, \mathrm{~N}$ with 8 as its last digit and only 18, 48, 78, 108, 138, 168, 198, 228, 258, 288, 318, ... are divisible by 3 or $9, \ldots$, but we worked on only N with 8 as their last digit and $\mathrm{N} / 2$ with 9 as their last digit, only $18,78,138,198$, $258,318, \ldots$, ( 1 in 6 ) can be divisible by 3 or 9 , so the term ( $1 / 3 \times 5 / 6$ ) should be taken off from Formula 3.

For the next prime $\$ 9=19$, ( $\mathrm{N}-19$ ) cannot be divisible by 19 except $38,418,798 \ldots$, so ( $1 / 19 \times 37 / 38$ ) should be taken off from Formula 3 , so on.

Let $\mathrm{n}_{9}$ represents the total number of primes (\$9) with 9 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 9$ with 9 as its last digit to be a prime is: $\Delta_{9}=1-\sum_{9}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 11 \times 2 / 3 \times 6 / 7)+(1 / 13 \times 2 / 3 \times 6 / 7 \times 10 / 11)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13)+$ $(1 / 23 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17)+(1 / 31 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23)+(1 / 37 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31)$ $+(1 / 41 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37)+(1 / 43 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37 \times 40 / 41)+$ $(1 / 47 \times 2 / 3 \times 6 / 7 \times 10 / 11 \times 12 / 13 \times 16 / 17 \times 22 / 23 \times 30 / 31 \times 36 / 37 \times 40 / 41 \times 42 / 43)+\ldots,]-[(1 / 3 \times 5 / 6)]+(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots]$.

When the number of $\$ 9$ is 4 or more, $4 \times[(1 / 3 \times 5 / 6)]+(1 / 19 \times 37 / 38)+(1 / 29 \times 57 / 58) \ldots.]>1$, so every $4 \$ 9$ will have at least 1 prime of $\mathrm{N}-\$ 9$ to form 1 pair of primes in which both have 9 as its last digit and their sum is any number N in which N has 8 as its last digit and $\mathrm{N} / 2$ have 9 as its last digit.

Table 20. The odd number pairs in $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}-2)+(\mathrm{N} / 2-\mathrm{L}+2)$ and $\mathrm{N}=\mathrm{O}_{1}+\mathrm{O}_{2}=(\mathrm{N} / 2+\mathrm{L}+2)+(\mathrm{N} / 2-\mathrm{L}-2)$

| $\mathrm{N}-11$ | $\mathrm{~N}-31$ | $\mathrm{~N}-41$ | $\mathrm{~N}-61$ | $\mathrm{~N}-71$ | $\mathrm{~N}-101$ | $\ldots$ | $\mathrm{~N} / 2+\mathrm{L}-2$ | $\mathrm{~N} / 2-\mathrm{L}-2$ | $\ldots$ | 97 | 67 | 47 | 37 | 17 | 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 11 | 31 | 41 | 61 | 71 | 101 | $\ldots$ | $\mathrm{~N} / 2-\mathrm{L}+2$ | $\mathrm{~N} / 2+\mathrm{L}+2$ | $\ldots$ | $\mathrm{~N}-97$ | $\mathrm{~N}-67$ | $\mathrm{~N}-47$ | $\mathrm{~N}-37$ | $\mathrm{~N}-17$ | $\mathrm{~N}-7$ |

Let see $\$ 1=11$ first (left side of table 20), we can know there is a bigger chance for ( $\mathrm{N}-\$ 1$ ) to be a prime with 1 as its last digit than ( N O1). If $\mathrm{N}-11$ can be divisible by 11 , then $(\mathrm{N}-11)+11(=\mathrm{N})[11 \mathrm{a}+11=11(\mathrm{a}+1), 11 \mathrm{a}$ and $11(\mathrm{a}+1)$ must be divisible by 11$]$ will be divisible by $11, \mathrm{~N}$ with 8 as its last digit and only $88,198,308,418,528,638,748,858,968, \ldots$ are divisible by $11, \ldots$, but we worked on only N with 8 as their last digit and $\mathrm{N} / 2$ with 9 as its last digit, only $198,418,638,858, \ldots$ ( 1 in 22 ) can be divisible by 11 , so the term ( $1 / 11 \times 21 / 22$ ) should be taken off from Formula 3.

For the next prime $\$ 1=31$, ( $\mathrm{N}-31$ ) cannot be divisible by 31 except $558,1178 \ldots$, so ( $1 / 31 \mathrm{x} 61 / 62$ ) should be taken off from Formula 6 , so on.

Let $\mathrm{n}_{1}$ represents the total number of primes ( $\$ 1$ ) with 1 as their last digit in any number N , the chance of every $\mathrm{N}-\$ 1$ with 7 as its last digit to be a prime is: $\Delta_{7}=1-\sum_{7}=1-\{[(1 / 3)+(1 / 7 \times 2 / 3)+(1 / 13 \times 2 / 3 \times 6 / 7)+(1 / 17 \times 2 / 3 \times 6 / 7 \times 12 / 13)+(1 / 23 \times 2 / 3 \times 12 / 13 \times 6 / 7 \times 16 / 17)+$ $(1 / 37 \mathrm{x} 2 / 3 \mathrm{x} 6 / 7 \mathrm{x} 12 / 13 \mathrm{x} 16 / 17 \mathrm{x} 22 / 23)+(1 / 43 \mathrm{x} 2 / 3 \mathrm{x} 6 / 7 \mathrm{x} 16 / 17 \mathrm{x} 36 / 37 \mathrm{x} 12 / 13 \times 22 / 23)+(1 / 47 \mathrm{x} 2 / 3 \times 6 / 7 \mathrm{x} 12 / 13 \mathrm{x} 16 / 17 \mathrm{x} 36 / 37 \mathrm{x} 22 / 23 \mathrm{x} 42 / 43)$ $+\ldots,]-[(1 / 11 \times 21 / 22)]+(1 / 31 \times 61 / 62)+(1 / 41 \times 81 / 82) \ldots]$.

When the number of $\$ 1$ is 11 or more, $[(1 / 11 \times 21 / 22)]+(1 / 31 \times 61 / 62)+(1 / 41 \times 81 / 82) \ldots.]>1$, so every $11 \$ 1$ will have at least 1 prime of $\mathrm{N}-\$ 1$ to form 1 pair of primes in which one prime has 1 as its last digit and another have 7 as its last digit and their sum is any number N in which N has 8 as its last digit and $\mathrm{N} / 2$ has 9 as its last digit.

For any even number, Goldbach's conjecture is true.
