The antisimmetric wave function for a state with Q identical particles is:

$$\Psi(\mathbf{r}_1, s_1, \cdots, \mathbf{r}_Q, s_Q)$$

I suppose that the wave function is given by a convergent antisimmetric power series (I write to simplify a two particles system in two dimensions):

$$\Psi(\mathbf{r}_1, s_1, \mathbf{r}_2, s_2) = \sum_{p+q+r=2N+1} P(\mathbf{r}_1, s_1, \mathbf{r}_2, s_2)_{ijklmnopqr} \begin{vmatrix} x_1^i & x_2^i \\ y_1^j & y_2^j \end{vmatrix}^p \begin{vmatrix} x_1^k & x_2^k \\ x_1^l & x_2^l \end{vmatrix}^q \begin{vmatrix} y_1^m & y_2^m \\ y_1^n & y_2^n \end{vmatrix}^r$$

 $P_{ijklmnopqr}$  is an elementary simmetric polynomial multiplied for a constant.

The antisimmetric elementary polynomial for two identical particle, in a three-dimensional space, is:

$$P(x_1^a - x_2^a)^p (y_1^b - y_2^b)^q (z_1^c - z_2^c)^r \begin{vmatrix} x_1^d & x_2^d \\ y_1^e & y_2^e \end{vmatrix} \stackrel{s}{=} \begin{vmatrix} x_1^f & x_2^f \\ z_1^g & z_2^g \end{vmatrix} \stackrel{t}{=} \begin{vmatrix} y_1^h & y_2^h \\ z_1^i & z_2^i \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} x_1^j & x_2^j \\ x_1^k & x_2^k \end{vmatrix} \stackrel{v}{=} \begin{vmatrix} y_1^l & y_2^l \\ y_1^m & y_2^m \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^o & z_2^o \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} x_1^j & x_2^j \\ x_1^k & x_2^k \end{vmatrix} \stackrel{v}{=} \begin{vmatrix} y_1^l & y_2^l \\ y_1^m & y_2^m \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^o & z_2^o \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{vmatrix} \stackrel{u}{=} \begin{vmatrix} z_1^n & z_2^n \\ z_1^n & z_2^n \end{matrix}$$

the space can be covered by a three-dimensional grid, and I can choose some representative points to obtain an estimate of the ground state:

$$\frac{<\Psi(\alpha)|H|\Psi(\alpha)>}{<\Psi(\alpha)|\Psi(\alpha)>}\leq\frac{<\Phi|H|\Phi>}{<\Phi|\Phi>}\,\forall\,\Phi$$

so that I can approximate the potential on a infinitesimal grid cube described by  $\max\{|x - x_i|, |y - y_i|, |z - z_i|\} \le \epsilon$ :

$$\begin{array}{ll} V(x,y,z) &= V(x_i,y_i,z_i) + (x-x_i) \frac{V(x_i+\epsilon,y_i,z_i)-V(x_i,y_i,z_i)}{\epsilon} + \\ &+ (y-y_i) \frac{V(x_i,y_i+\epsilon,z_i)-V(x_i,y_i,z_i)}{\epsilon} + (z-z_i) \frac{V(x_i,y_i,z_i+\epsilon)-V(x_i,y_i,z_i)}{\epsilon} \end{array}$$

and it is possible to integrate the complex function in these infinitesimal cube, and for a large number of cubes, an estimate of the energy of the ground state is obtained, because of there is a neighbourhood of the cube where the potential and the wave function have little variations: the sum of the integrals over the orthogonal cubes is an approximation of the expectation value of the Hamiltonian: the integrations are only simple power series integrations, for an unique wave function over infinitesimal cubes.

The free parameters of the polynomial approximation can be minimized using optimization algorithm, using a unique polynomyal series for the wave function in all the space.

I think that this solution is a good approximation on a finite region of space, but to infinity it is not zero, so that if it is necessary a true wave function in all the space one can use an exponential reduction like a simmetric function.
