**Abstract:** *I can still remember my expression and feeling when we were asked to show that  $\sup(A + B) = \sup(A) + \sup(B)$ . It was an herculean task because the concept was too difficult to grasp with the use of approximation property until I discovered an easy route. In a bid to restrict my papers to just few pages, I will focus more on examples than theorems.*

**Introduction**

Let  $A \subseteq \mathbb{R}$  be any non-empty subset of  $\mathbb{R}$ , then  $A$  is said to be bounded from above in case there exists a real number  $L \in \mathbb{R}$  such that  $x \leq L, \forall x \in A$ .

**Remark:** An upper bound for a set  $A$  may not be unique. If  $L$  is an upper bound for  $A$  and there exists  $c \in \mathbb{R}$  such that  $L \leq c$ , then  $c$  is also an upper bound for  $A$ .

Let  $A \subseteq \mathbb{R}$  be any non-empty subset of  $\mathbb{R}$ , then  $A$  is said to be bounded from below in case there exists a real number  $W \in \mathbb{R}$  such that  $x \geq W, \forall x \in A$ .

**Remark:** A lower bound for a set  $A$  may not be unique. If  $W$  is a lower bound for  $A$  and there exists  $d \in \mathbb{R}$  such that  $d \leq W$ , then  $d$  is also a lower bound for  $A$ .

A non-subset of  $\mathbb{R}$  may have both lower and upper bound. Such subsets are special in the sense that they can be contained in some close interval. These subsets have name

**Definition:** A non-empty subset  $A \subset \mathbb{R}$  is said to be bounded if  $A$  has both upper and lower bound ( $A$  is bounded from below and above).

**Remark:** A set is said to be unbounded if it is not bounded.

**Definition:** Let  $A$  be a non-empty subset of  $\mathbb{R}$  such that  $A$  has an upper bound.  $L \in \mathbb{R}$  is called the supremum of  $A$  if the following conditions are satisfied;

1.  $L$  is an upper bound
2. If  $z$  is any other upper bound. Then  $L \leq z$

**Notation:**  $\sup(A)$  denotes supremum of  $A$

**Remark:** The second condition above means a supremum is the least element of all the upper bounds. Hence, the name least upper bound is sometime used to mean supremum and we write  $\text{lub}(A)$  for  $\sup(A)$ .

The following propositions will be stated only

1. Let  $A$  be non-empty subset of  $\mathbb{R}$  such that the infimum (supremum) exists, then it is unique.
2. Let  $A \subseteq \mathbb{R}$  such that  $\inf(A)$  and  $\sup(A)$  exists, then  $\inf(A) \leq \sup(A)$ .

**Examples**

1. Show that  $\sup(A+B) = \sup(A) + \sup(B)$

**Solution:** Let

$$A = \{x : x \in A\}$$

$$B = \{y : y \in B\}$$

$$A + B = \{x + y : \forall x \in A \text{ and } \forall y \in B\}$$

$$x + y \leq \sup(A + B)$$

fix  $y$ ;

$$x \leq \sup(A + B) - y$$

Since  $x$  is arbitrary in  $A$ , it means that,

$$\sup(A) \leq \sup(A + B) - y$$

Similarly;

$$\sup(A) \leq \sup(A + B) - y$$

$$y \leq \sup(A + B) - \sup(A)$$

Since  $y$  is arbitrary in  $B$ , it means that,

$$\sup(B) \leq \sup(A + B) - \sup(A)$$

$$\sup(A) + \sup(B) \leq \sup(A + B) \quad (1)$$

Considering the other part; since

$$x \leq \sup(A)$$

$$y \leq \sup(B)$$

then;

$$x + y \leq \sup(A) + \sup(B)$$

since  $x+y$  is arbitrary in  $A+B$ , then

$$\sup(A + B) \leq \sup(A) + \sup(B) \quad (2)$$

Combining both equations

$$\sup(A) + \sup(B) = \sup(A + B)$$

Let  $\alpha \in \mathbb{R}$ . Let  $A$  and  $B$  be non empty subsets of  $\mathbb{R}$  such that  $\inf$  and  $\sup$  in the following statements all exist. Prove that

2.  $\sup(\alpha + A) = \alpha + \sup(A)$
3.  $\inf(\alpha + A) = \alpha + \inf(A)$
4.  $\sup(AB) = \sup(A) \sup(B)$
5.  $\inf(AB) = \inf(A) \inf(B)$
6. If  $\alpha > 0$ ,  $\sup(\alpha A) = \alpha \sup(A)$
7. If  $\alpha > 0$ ,  $\inf(\alpha A) = \alpha \inf(A)$
8. If  $\alpha < 0$ ,  $\sup(\alpha A) = \alpha \inf(A)$
9. If  $\alpha < 0$ ,  $\inf(\alpha A) = \alpha \sup(A)$
10.  $\sup(\frac{1}{A}) = \frac{1}{\inf(A)}$ , where  $0 \notin A$

**Solution (8):** Using the same set defined above, then

$$\alpha A = [\alpha x : \forall x \in A], \text{ where } \alpha < 0$$

$$\alpha x \leq \sup(\alpha A)$$

$$\frac{\sup(\alpha A)}{\alpha} \leq x$$

Since  $x$  is arbitrary in  $A$ , then

$$\begin{aligned} \frac{\sup(\alpha A)}{\alpha} &\leq \inf(A) \\ \alpha \inf(A) &\leq \sup(\alpha A) \end{aligned} \tag{3}$$

Similarly;

$$\begin{aligned} \inf(A) &\leq x \\ \alpha x &\leq \alpha \inf(A) \end{aligned}$$

Since  $\alpha x$  is arbitrary in  $\alpha A$ , then

$$\sup(\alpha A) \leq \alpha \inf(A) \tag{4}$$

Combining both,

$$\sup(\alpha A) = \alpha \inf(A)$$
