

Title : The possibility of coming to life again after death: part two including part one

Abstract : This article aims to present the possibility of humans to come to life again after they die and that after spending infinite time.

Author: Yahya Awad Sharif Mohammed

Article :

Part one :

Time is infinite, i.e. time continues in the future infinitely, after we die we will spend, million years, billion years, going forward infinitely, there is not an end for time, or a point when time stops from elapsing.

According to probability if we tried something infinitely, like tossing a die infinitely we will obtain all numbers at some time, 1,2,3,4,5, and 6, and that is for sure.

Let consider time, the time spend after death is infinite, so the probability of a human being to come to life again is 100%, in fact any event in space has a probability to happen of 100%, the only event in space and vacuum could happen is a big bang in addition to what happened after the big bang” I believe matter came from nowhere before the big bang, and that is obvious matter can’t exist in the past infinitely, we can’t say mass existence spent infinite time in the past, infinity is not a real number”

Some one might say, not everything could happen, for instance if we toss a die infinite times a 7 won’t appear at all, its probability is 0! But let’s consider coming to life again:

As matter came from nowhere before the big bang, the possibility of multiple big bangs at infinite time is 100%, and the possibility of a repetition of our universe with its same scenario “all of its history and all the same humans with same DNA who lived on earth” is also 100%, There might be infinite choices for our universe when it repeats and these choices will occur with a possibility of 100%.

Part two:

What makes multiple universes not to exist whether in the past or in the future? Nothing, the universe was first” before the big bang” a point with very high energy, if this point came from nothingness, other points”during time” will occur as well, we have the place where the point appeared”which is space” and we have enough time for this event to occur “infinite time”, there is not a hinder for other points to occur, if space produced our universe from nothing”the point before the big bang” then it has the capability to produce more points.

The existence of the point from nothingness has some physical laws, the laws are the answer to the question: what makes the point appear? While we have the same space “identical space, the same every where “and vacuum the same vacuum, and matter came from nothing that is there there is not a limit for its production “something like energy from perpetual motion machines “then this law will apply to other points in space.

Indeed if the next big bang happened after say million years, it has little probability for that new universe to be identical to our universe, but what about infinite points and infinite universes? It will indeed result in our universe and its people will be the same people of this world.

Is it possible I will find myself with my existence and identity in another universe some day? Meaning I feel again life but not remembering anything of my previous life? This is certain as well, the identity of a human being is just a complex connection of cells, DNA , mind, etc, it possible to make Einstein with his identity and his feelings if we composed all everything he possess as an entity , complete composition, and that what the bang does ,it creates body and soul and everything to form a human being as well as all matter and energy with their physical laws, In some universe in the past or the future Einstein might be born not complete perhaps with medium intelligence, if the number of tries are infinite the exact Einstein will occur with 100% probability, It means a person will come to life again
