Abstract

Cantor Dust (CD) is a hypothetical *large-scale topological condensate* of relic dimensions left over from the early stages of Universe evolution. Mirroring the ever-changing configuration of multifractal structures, CD offers a novel explanation for the distribution and behavior of Dark Matter (DM) and bridges concepts from complex dynamics, fractal geometry, and statistical physics to cosmology. Here we argue that CD offers a *unified Dark Matter model* with predictions confirmed by a wealth of astrophysical observations.

Key words: Dark Matter, Cantor Dust, continuous spacetime dimensions, multifractals and chaos, complex dynamics.

This version of the paper represents “work in progress”, as it includes minimal content - except few representative diagrams and a partial list of references.
